With the Danish Bible translations of the 20th century (OT 1931, NT 1948; new translation of the whole Bible in 1992), the traditional Resen text was abandoned and completely new translations made from the original languages. The development of modern Bible research was taken into consideration, and the contemporary Danish language situation was observed much more than earlier. A sample translation of the New Testament (1942) led to intense and sometimes vehement discussions; many people felt the break with tradition was too strong. But on the whole, the congregations received the new Danish church Bibles positively.

2.2. Unlike the other Nordic countries, Norway did not receive a national Bible translation during the Reformation. The political union with Denmark meant that the country was provided with the Danish Bibles from Copenhagen until as late as 1814. For the educated, relatively small part of the population, this did not cause a serious problem. But for most people the linguistic distance from the archaic Resen-Svane text was even greater than in Denmark. After the foundation of the Norwegian Bible Society, they therefore soon took up producing Norwegian Bible editions. At first, they had to be content with revisions of the Danish church Bible. By 1891, the Old Testament was translated into Norwegian from the Hebrew text, and by 1904 a corresponding new translation of the New Testament was finished.

Until the middle of the 19th century, Danish was the written language in Norway. Then – National Romanticism was flourishing in Norway at the time – a resolute policy of Norwegianising began and determined the linguistic development for the following hundred years. During this period, the Norwegian written language went through a much more

radical development than the neighbouring languages. The 1891 translation of the Old Testament, which deliberately chose a careful course of action and has been characterised as "Golden Age Danish", was already behind the general development of language at the time it was published. The 1904 edition of the New Testament, which did not represent a radical break with tradition either, had gone one step further with regard to language. The discrepancy called for mutual adaptation, and a revised edition came into use in 1930, based on the spelling reform of 1917.

But the Norwegianizing of the Danish written language ("Bokmål") was only one aspect of Norwegian language policy after 1850; the other was the attempt by the linguist I. Aasen to create a completely new language ("Nynorsk") based on Old Norse and on Norwegian dialects. The New Testament came out in Nynorsk (at that time called "Landsmål") for the first time in 1889, by private initiative, and the complete Bible in 1921; a thoroughly revised edition followed in 1938 under the direction of the Norwegian Bible Society.

The fast pace of development of both Norwegian languages soon entailed the need for further adaptation of the Bible to modern spoken and written language. The use of the Bible at school and in confirmation courses had become problematic. In this situation the Bible Society settled for a double strategy. First, the most urgent problem was to be solved: a revised translation considering the needs of the youth ("ungdomsoversettelsen": Bokmål 1959, Nynorsk 1961); then followed a new Norwegian church Bible in both languages (completed in 1978, revised edition in 1985). More emphasis was laid on conveying the meaning of the original text in a language that was up-to-date than on rendering every single word. A relatively moderate course was followed as a compromise between conservative and radical language policies, but there were still many people – especially on the Bokmål-side – who felt the new Bible language was far from what they were accustomed to.

The number of private Bible translations has traditionally been lower in Norway than in Denmark. But as a reaction to the translation of 1978, a group of low- and free-church leaders published an alternative Bokmål-edition (*Norsk Bibel*, 1988) which was not only motivated by stylistic but also by theological considerations. Their conservative view of the Bible led them, above all, to miss some classical religious terms (e.g. *kjød* for the Greek

sarx) which had been replaced by various equivalents.

2.3. In the 18th century, a translation of Christian IV's Danish Bible was used in Iceland. A new translation by Bishop Steinn Jónsson (1728) was neither stylistically nor typographically up to standard and never gained any importance. But after the Icelandic Bible Society was founded, new revised editions of the Bible were published (NT 1827, 1851; the complete Bible 1841, 1859). This work took also account of the Hebrew and Greek original, but held a conservative line, and on the whole, the text bears witness to a strong influence from Danish and German translation traditions. An entirely new Icelandic Bible translation, the first fully based on the original languages, was completed in 1912. It was received with a good deal of scepticism by the theologically conservative side, but nevertheless soon found general acceptance. In the revised edition of 1981, parts of the New Testament (the Gospels, the Acts of the Apostles) were reworked linguistically, while the Old Testament was left mostly unchanged. A new Bible is under way, but it is too early to say if the result will be a revision of the traditional text or a completely new translation.

2.4. During the 16th and 17th centuries, the Swedish language underwent such big changes in style and vocabulary that the text in Gustav Vasa's Reformation Bible of 1541 began to seem old-fashioned, despite minor adjustments. But the people who demanded a renewal of the language of the Bible were not heard. Even in Carl XII's Bible of 1703 only slight changes were made, as the editors still thought the traditional language of the Bible could continue being an exemplary Swedish language norm. At least a list of explanations of over 200 difficult words was included, in consideration of the population of the regions captured from Denmark-Norway during the 17th century.

In the second half of the 18th century, the time had come for another official Bible commission. It was appointed in 1773 and was to try to combine two diverging interests: to have regard for the traditional text and to also consider the wish for a more natural and comprehensible language. This controversial task could be interpreted in favour of traditionalists as well as revisionists; in any case, the starting point for a more far-reaching revision was better. During the 18th century, a gen-

erally accepted prose style had gained ground, a literary form of expression used in scientific presentation as well as public debate, thus presenting a respected alternative to the archaic language of the Bible. A sample translation of the New Testament submitted in 1780 was clearly influenced by precisely this cultivated written language of the time. Morphology, syntax and vocabulary had undergone profound changes. At the same time, great importance was attached to a precise and objective style quite in the spirit of the time where abstract and general notions played a considerable part. In this way, this Gustavian translation could be judged a typical product of its time, when it for instance has Jesus' Galilean audience appear with "traits of a cultivated 18th century public, an assembly of literary gourmets" (Stähle 1970, 57).

A sample translation of the Old Testament followed some years later (1792). But there was no agreement concerning the drafts, and therefore they were not authorised. So various commissions continued the translating work throughout the 19th century, sometimes with quite different translation ideals. Romanticism brought a renewed respect for the traditional text at the same time as spokesmen for a more nationally minded direction took to clearing the Swedish Bible of traces of Hebrew, Greek and German influence. Finally, there was a strong desire in revivalist circles for a text as close to the original as possible but still comprehensible to most people.

This long procedure did not lead to a new Swedish church Bible in the 19th century, either. Still, a "standard edition" of the New Testament was authorised in 1883 for catechesis and religious education, while the liturgical text still had to follow the old translation. Thus, a "church Bible" and a "popular Bible" came to complement each other during the following years. Finally, in 1917 – after 144 years of committee work – the goal was reached: for the first time, Sweden had an official Bible based on the original languages.

The Swedish 1917 Bible sought to solve the tension between commitments towards tradition and modernity by compromise: words and expressions no longer customary were maintained to a certain degree, while the syntax of everyday language was used as far as possible. The new translation met with a certain amount of criticism from the theological as well as the literary side, mainly because of the use of explanatory particles (*ju-bibeln*) but it soon was accepted and served its purpose. Meanwhile,

it did not take many decades before more and more people pointed out the need for a text that was more in accordance with modern Swedish, a need which also expressed itself in several private translations of the New Testament after the Second World War. For this part of the Bible, an officially nominated committee (1968) had recommended two versions, a “church” and a “popular” edition. But this strategy was not successful; the aim once more is a uniform Swedish Bible text, a text for the 21st century. The New Testament was authorized in a preliminary edition in 1981, while the complete Bible followed in 1999.

2.5. While the New Testament had already been published in Finnish during the Reformation, a complete Finnish Bible was not ready until 1642. A revised edition of this translation followed in 1776 and remained the official church Bible for almost 200 years; for even though language development in Finland during the 19th century necessitated a new Bible, no agreement was reached at first. A private translation by A. W. Ingman in a style bearing the stamp of the Finnish national epic *Kalevala* did not find sympathy either, and the work done by official Bible committees (from 1861) was not authorized until 1933 for the Old Testament, and 1938 for the New Testament. This translation conserved the archaic Bible style but also took up expressive elements from colloquial Finnish. It aimed at an accurate rendering of the original text and avoided a paraphrasing style. A new Finnish translation of the whole Bible, carried out according to the same dynamic principle of equivalence as other recent Bible translations in the North, appeared in 1992.

2.6. In Sweden, biblical and other religious texts began to be translated into the Sami language in the 17th century; at first, this concerned parts of Luther’s Small Catechism and of church handbooks. The New Testament appeared in Ume Sami in 1755, and the whole Bible was finished in 1811. A Lule Sami translation of the New Testament was first published in 1913, a thoroughly revised version came in 2000.

In Denmark-Norway, Sami Bible translations began about 100 years later; they were motivated by increased missionary interest at the time of Pietism. However, a complete Northern Sami translation of the New Testament did not appear until 1840, and a translation of the whole Bible only in 1895.

As a result of common Nordic translation efforts, a completely new edition of the New Testament in Northern Sami was published in 1998. The starting point for this translation was the new Norwegian translation of 1978/85, but it also built in the Greek original and – to a certain extent – on the Finnish translation of 1992. Like in other modern Nordic Bible translations, more importance was laid on rendering idiomatic expressions; Norwegianisms and other Scandinavianisms were removed, and importance was attached to using syntax which conformed better to Sami linguistic structures. A corresponding new translation of the Old Testament is under way and is planned to be finished within 2010.

3. Church hymnbooks

Apart from the Bible, other religious literature has also played an important role in the Nordic language areas in recent times. Even before the Bible was disseminated among most people, the official hymnbook and Luther’s Small Catechism naturally belonged to many homes. For several generations these “oldest folk books” (Pleijel 1967) therefore influenced both Christian life and language usage in a large part of the population. The hymnbook was often used as a first reader. And those who could not read could learn the hymns by heart and in that way gain a personal relationship to religious language.

In the wake of the Pietistic revivals, a series of religious song collections appeared and were used at home and in various conventicles. To a certain degree, these collections mirror the characteristics of the new spirituality, where individual moods and feelings received a more prominent place at the cost of the classic, more collective forms of expression. Many of the texts differ both in form and content from the hymns authorised for church use, and will therefore be treated separately in a concluding paragraph of this survey (cf. 4.2.). Yet, this does not mean it is possible to operate with an absolute division between the two genres. Of course, church hymns were also influenced by changing religious ideals, and gradually a large number of the free-church songs have found their way into the authorized hymnbooks.

3.1. In 1699 Denmark received a new official hymnbook. About a third of the hymns were written by T. Kingo, a typical representative

of the Baroque period. Not without reason, then, the book bore his name, a name which remained one of the most important in Danish literary history. A number of Kingo hymns are still used in revised editions, not only in Denmark but also in the other Nordic countries.

The most important contribution to Danish hymn writing in the 18th century came from H. A. Brorson. In his translation of German hymns and in his own writing, he gave expression to Pietism's fervent, subjective religious experience. A central motif is the love of Jesus ("the most graceful rose"), which he often described with erotic metaphors drawn from the Song of Solomon, and which corresponds to a strong longing for heaven. Some Brorson hymns were included in alternative hymnbooks of the 18th century (Pontoppidan, 1740; Guldberg, 1778), but it was only in the middle of the 19th century that he received an acknowledged position in the Danish hymnbook tradition. Separate editions of Brorson poems, however, were widely found in pious homes, and – thanks to H. N. Hauge's support – he was especially well received in Norway, where his texts were sung to popular melodies and where he probably has played a more important role than any other hymnist.

A new Danish hymnbook, *Evangelisk-christelig Psalmebog*, authorized in 1798, has been treated harshly by posterity; the critics thought it was influenced too heavily by the rationalist Christianity of the Enlightenment and therefore was neither evangelical nor Christian. It was replaced by *Psalmebog for Kirke og Huusandagt* in 1855, which itself was succeeded by *Salmebog for Kirke og Hjem* (1898) and *Den danske salmebog* (1953). Another new edition of the Danish hymnbook is expected for the beginning of the new millennium. In an outline of the history of Danish hymns over the last two hundred years, however, one must above all include the name of Grundtvig (cf. 1.4.), the third great hymnist besides Kingo and Brorson. Through his many-sided and voluminous literary works, his rare power of language and imagination, and his pedagogical innovation, he influenced Danish – and to a certain degree also Norwegian – cultural life more than any other individual.

3.2. Until the middle of the 19th century, the same hymnbooks were used in Norway as in Denmark: Kingo's, Guldberg's and *Evangelisk-christelig Psalmebog* (cf. 3.1.). Then there gradually appeared a number of private collections, and in 1869 a Norwegian *Kirkesal-*

mebog was authorised. It was mainly the work of the clergyman M. B. Landstad, who already was known as a publisher of Norwegian folk songs. Landstad did not only take account of the traditional German and Danish hymns, but also included older Norwegian authors (e.g. P. Dass, D. Engelbretsdatter, J. N. Brun) and more recent hymns (e.g. Grundtvig). He also contributed several hymns himself.

Both as translator and as writer, Landstad tried to be a language innovator. Through his occupation with Norwegian folk song traditions, he found his personal style of writing, and he used popular words and expressions in a way that aroused considerable criticism. Many people found that "rural language" and "urban language" were mixed in an improper manner. As a consequence, Landstad had to follow the suggestions of an official committee and accept some modifications.

Through his sympathy for Norwegian dialects and folk literature, Landstad challenged not only the cultural elite but also a large part of the revivalist circles. For theological reasons, they were sceptical about his work with songs, legends and folk tales, and efforts were made to authorize an alternative hymnbook in the spirit of Pietism (1871). In the long run, this collection could not compete with Landstad's, which gradually became the only one used and which in 1924 was published in a revised edition.

The New Norwegian (Nynorsk) language tradition has also produced important hymnists and translators. As early as 1892, *Nokre Salmar* by E. Blix was authorized for church use, and in 1925 a complete *Nynorsk salmebok* followed. In connection with liturgical revision after the Second World War, a joint *Norsk salmebok* for both Norwegian languages appeared in 1984; it provided more space than previous books for translated texts from English speaking churches and revivalist circles.

3.3. In Iceland, Guðbrandur Þorláksson published a new hymnbook in 1671 which contained, among others, Hallgrímur Pétursson's passion hymns of 1666; these are texts which came to occupy a central position in Icelandic Christian life. New hymnbooks appeared during the 18th century, although one can hardly talk of important innovation at that time. A rationalistic counterpart to the Danish *Evangelisk-christelig Psalmebog* was published in 1801 by Magnús Stephensen, the most important spokesman of the Enlightenment in Iceland.

As a result of long committee work under the direction of Helgi Hálfðanarson, leader of the theological seminary, Iceland received a new hymnbook in 1886. The contribution of Hálfðanarson himself was first of all the translation of a long list of central hymns from different periods, but also some poetic work of his own. Other important contributors were Valdimar Briem and Matthías Jochumsson, one of the most productive and gifted poets in Iceland in recent times. In the 20th century, the years 1945, 1972 and 1996 brought new editions of the Icelandic hymnbook; the biggest changes came with the 1972 edition.

3.4. In the history of Swedish hymnbooks there are two remarkable years: 1695 and 1819. In 1695 the first hymnbook appeared which (in 1698) became authoritative for the whole kingdom. Because of its exclusive authorisation, this “old” hymnbook, which mainly represented orthodox Lutheran Christianity, gained a very special position in Swedish church and everyday life; it practically reached the status of a creed. Still, its old-fashioned language soon brought demands for revision, but the solutions proposed in the 18th century (1765, 1793) were not accepted.

Finally, in 1819, the efforts to produce a new Swedish hymnbook were successful. The leading force in the committee nominated (in 1811) was J.O. Wallin, one of Sweden’s most important preachers and hymnists. Originally he was influenced by the Enlightenment, but over the course of time he began to share the Romantic interest in historical and national heritage. He carefully revised old hymns but also provided about 150 of his own and 200 translated or adapted texts, so that the hymnbook rightfully carried his name.

In accordance with Wallin’s own wish, use of the new hymnbook was not imposed this time but left to the congregation’s own choice. All the same, this book also soon reached an exceptional position of importance in Christian life and religious education that cannot be overestimated. But it also attracted scepticism and criticism in revivalist circles, both in southern Sweden and in Norrland (among the so-called *nylåsare*). Their objections concerned both the urban ideal of Christianity which permeated the anthology and, according to their opinion, the excessive amount of space given over to the preaching of civil duties and virtues compared to the Pietistic concentration on sin, repentance and mercy. In addition,

the refined, classicist-rhetorical mode of language and style felt unfamiliar to them.

At the first synod of the Swedish church (1868), it was proposed that Wallin’s hymnbook be revised. But the suggestions (1889 and 1896) presented by an official committee were not accepted. During the first decades of the 20th century, further committees and suggestions followed, and finally, in 1937, a new Swedish hymnbook was approved. The newest edition came in 1986 and caused much discussion, as it had replaced many old hymns with simpler songs that broke with the liturgical tradition of the Swedish church, both in literary and musical respects.

3.5. The “old” Finnish hymnbook of 1701 marks the end of the first phase of post-Reformation hymn history in Finland. The idea was that it should be a counterpart to the corresponding old Swedish hymnbook of 1695 (cf. 3.4.), and a large number of those hymns had also been translated. But the main part consisted of old Finnish hymns, which to a large extent also were translated from other languages.

On the anniversary of the Reformation in 1817, an initiative for a new hymnbook was taken, but it was only in 1886 that its result could be approved. The folklorist and philologist E. Lönnrot, the collector of the Kalevala songs, was a driving force in this process. But developments in language and church history soon called for further revision; this task was taken up after Finnish liberation in 1917. In the new hymnbook (1938), the classical heritage was strongly adapted, and the more popular revivalist songs received much more space.

In the Swedish-speaking congregations in Finland, the Swedish hymnbook of 1695 held its central position until 1886. The new hymnbook, which on the whole followed the tradition of 1695, had several important contributors like J.L. Runeberg and Z. Topelius. A thorough revision in the 1930s led to a new hymnbook in 1943; here too, the song culture of revivalist circles filled more space.

4. Other religious literature

The religious literature that had an impact on thought and language usage in the Nordic countries also includes several postils, collections of sermons and spiritual songs, prayer books and other devotional texts. Most of the literature is translated from other languages;

during the first centuries after the Reformation, translations from German dominated, then gradually the influence of Anglo-American Christianity grew in importance. But Nordic religious literature also comprises a large number of original works. It is not possible to give a short summary of this large and varied literature, where a long list of names ought to be mentioned. Instead, certain aspects of oral preaching will be characterised in brief, with a quick look at the free-church song tradition.

4.1. While many of the sermons of the 17th century give evidence of the great pleasure derived from rhetorical devices and their frequent use, the Pietistic ideal in the following century was directed towards a simpler and less elaborate style. E. Pontoppidan, one of the central personalities of Danish-Norwegian state Pietism, recommended “an open style, a light, fluent and sensible style” and warned against “oratorical courtesies” and “mere verbalism”; instead, one ought to keep to “pure and clear words of the kind the congregation is used to in daily speech, but without improper coarseness or naughty, rude and all too rustic expressions” (Skautrup III, 252). In Sweden also, the language of sermons went through a modernising process, as with Anders Båld, one of the period’s most recognised clergymen: “the predicates are moving from the end of the subordinate clauses into their centre, and the Latin loanwords are practically gone” (Wifstrand 1943, 34).

Homiletic theory is one thing; the question of whether a sermon in practice really lived up to the ideal of simplicity and comprehensibility is another. The Danish ministers in the period of Pietism often turned to an even stronger use of classical rhetorical devices, “so that the movement with its use of language in a remarkable way came to unite subjective-heartfelt and ponderous objective-formal elements” (Skautrup III, 250). Besides, there is the question whether ministers at that time generally wrote their own sermons. It is likely that most of them still were “sermon riders” (Pontoppidan), relying on printed sermon texts they adapted to their audience’s linguistic faculties.

Pietism also brought changes to religious vocabulary; besides a whole series of Pietistic “key words” (e.g. *värld*, *ondska*, *fiender*, *anfäktning*, *skrymtare*, *pröva*, *invärtes*, *utvärtes*), the number of more emotional words and phrases increased (*välsignad*, *mild*, *huld*, *dyr*,

öm, *ljuf*, *hjärteligen*, *outsäglig*, *rörelse*, *känsla*, *barmhärtighet*; *en stor och obegrundelig nådenes rikedom*, *en oändelig nådesfullhet*). A word like *salighet*, which earlier mainly described heavenly bliss, was now used more and more often for the salvation which the “awakened” experienced already here on earth (Wifstrand 1943, 35). A characteristic element of the preaching in many Pietistic circles is the frequent use of the metaphors “lamb” for Jesus and “bride” for the believer. Both cases are from the classical Christian heritage, but in the notion of Jesus as a sacrificial lamb, the attention was now focused on the blood and the wound in Jesus’ side. And the bride motif from the Song of Solomon, which both Jewish and Christian tradition had used for the congregation, was now linked to the individual believer as an expression for the intense and intimate love for the Saviour.

An emotional style of preaching was usual throughout a large part of the 18th century, although some preachers influenced by the ideals of the Enlightenment preferred a more sober form of language. Towards the end of the century, many preachers were also influenced by a more refined academic, secular rhetoric of the classicistic type, and both elements – the emotional as well as the rhetorical – were passed on to the preaching of the 19th century. In the lay movement, however, a simpler, more enthusing kind of preaching had always been the most wide-spread form. Of course, this is not to say that capable revivalist preachers did not know how to make use of striking rhetorical figures – on the contrary. But their use of popular phraseology and dramatic metaphors is more prominent, and the appeal to the audience is more direct and aggressive and is heightened by rhetorical questions and the regular use of interjections.

4.2. A good insight into the low- or free-church spirituality of the North can be gained by reading the anthologies of “spiritual songs” which appeared in Sweden – partly anonymously, partly also illegally – during the 18th century, some of them published in new editions right up to the 20th century. The oldest one, *Mose och Lamsens Wisor* (1717), has been characterised as “the most notable document” on the part of conservative Pietism in Sweden (Pleijel 1935, 163). In these texts, which have a simpler form and therefore are often more easily understood than church hymns, erotic and sentimental traits are not

yet as strongly represented as in Moravian and radical Pietistic songbooks. But even here, noticeable elements of blood and bride mysticism are found, for instance in all the sighing about “(snow)white clothes”, or in contexts where Jesus is called “Blood Bridegroom” or “sweet” Saviour (Liedgren 1926, 347/354).

No indications of date or place of publication are given for the radical Pietistic songbook *Andeliga Wijsor / Om Hwargehanda Materier och Wid Åtskilliga Tillfällen*. It includes texts written in mild and soft tones about the longing to escape from the outer world and about the happiness of an inner world, as well as texts expressing “fiery polemics against the Babel of the world church, excited apocalyptic expectations, hot Jesus eroticism and ecstatic intoxication”. Sometimes, religious ecstasy is described with an “unabashed preference” for naturalistic and strongly sensual metaphors: every drop of blood “burns” and “jumps” for joy, the body “sweats” because of the “fire” of love, and the poet attains mystical rapture at the thought of the Saviour’s embrace (Liedgren 1926, 371/374).

Two collections of songs originating from several Moravian groups were more in line with mainstream Lutheran Pietism: *Sions Sånger* (1743–48) and *Sions Nya Sånger* (1778). Here, the emphasis lies on unmerited salvation through Jesus’ humiliation, suffering and death. The Saviour is preferably described as the “lamb”, and mercy, the cross, blood and wounds are frequently used terms. Again, the believer receives “clothing” or “vestments” as a gift, but the white colour of innocence is less important than the red colour of blood, symbol of reconciliation and forgiveness. Consciousness of sin – the perception of one’s own hard and unfeeling heart – is well developed, as well as the certainty of one’s lack of personal merit (*blott och arm, blott och bar, hel utfattig*); salvation is given “for nothing” and experienced by the individual already here and now through the alliance with Jesus. The frequent use of possessive pronouns in descriptions of the relationship between God and man (*min Gud, min själ, min synd*) is typical of this Pietistic tendency to individualise Christian life.

From the start, *Sions Såger* were criticised by orthodox, conservative theologians. By studying the language used in the songbooks, they thought they could find proof of a one-dimensional preaching style which emphasized the message about God’s love and forgiveness over the demands of the law and over

themes like repentance and betterment, which – in their opinion – were not given proper attention. Because of this controversy, both sides carried out frequency studies which showed that it was not so much the individual words that distinguished the songbooks from the official hymnbook, but rather the way they were used and the weight they had within preaching as a whole. In any case, the dissemination of these songs and their vitality show that they appealed to a large part of the population. Although they were mostly written by men and women of a relatively high level of education, they also appealed to all those who perhaps had less education but committed plenty of sins and, with this background, found their own situation described in the songs (Dovring 1951, 143).

1. Introduction

This article will deal with the vocabulary of natural and technical sciences and its history. This vocabulary partly consists of terminology different from general language, in particular taken from Latin and Greek, partly of general language in specialized use. The natural sciences are said in a narrow sense to comprise biology, physics and chemistry. The vocabulary of science and technology, however, shows so many similarities in origin, word formation and usage that it is impractical to distinguish sharply between these, related, sciences such as astronomy, botany, mathematics and medicine, and technical sciences, engineering and the language of industry. To a large extent they will therefore be treated as one field, much in the spirit of the medieval and later pioneers in science and technology, many of whom were active in several fields, employing their knowledge and skills in the one when turning their attention to the next. Professions among early inventors of the typewriter (*skrivemaskin*) were pianist, blacksmith, watchmaker, carriagemaker and steam engine builder, apart from the famous Danish school administrator and teacher of the deaf and dumb, H. R. M. Malling-Hansen (1835–1890), who invented his *skrivekugle* ‘writing globe’ in 1870 and *tørtryk* ‘dry-print’, ‘xerography’ in 1872.

2. The Nordic language area

To a large extent Denmark, Norway and Sweden can be treated as one area when dealing with borrowed terminology and technical language. Different adaptations led to some differences, such as *faner* (Sw.), *finer* (Norw.) ‘plywood’, *vanadin* (Dan., Sw.), *vanadium* (Dan., Norw.). From the 16th until well into the 19th century, written Norwegian hardly differed from Danish. In more recent times the

three Scandinavian languages have come to differ somewhat in the adaptation of borrowed words: In Danish the foreign spelling is kept more often than in the other two, while Sweden has a long tradition in adapting borrowed words to the vernacular spelling. Norway has done the same, though more gradually. Towards the end of the 20th century Norwegian as well as Swedish language policy has been to adapt the spelling of borrowed words where possible, and for the rest to look for adequate candidates for replacement in the vernacular, e. g. from *metalimnion* to *sprangsjikt* (Norw.), *språngskikt* (Sw.). In such cases the foreign word may be felt to be the more terminological one, especially where no one-word replacement has been found. In Faroese (Poulsen 1997) many earlier borrowed words, especially from Danish, have been replaced by words from the more closely related Icelandic language, e. g. *verkfroðingur* ‘engineer’, *ravmagn* ‘electricity’, *tøkni* ‘technique’, or by new words coined on indigenous patterns, e. g. *mýl* ‘molecule’, *eyðkvæmi* ‘aids’, *telda* ‘computer’. Iceland (Jónsson 1997) has a centuries long tradition of replacing borrowed words; its first set of principles for this was published in 1779, and words such as *farfugl* ‘migrant bird’, *fel-libylur* ‘hurricane’ are almost as old. In some cases a foreign and an indigenous word coexist as synonymus, e. g. *baktería* – *gerill*. In such cases the indigenous word is felt to be more closely tied to written language than the foreign one is.

3. Science and art

Videnskab (Dan.), *vitenskap* (Norw.), *vetenskap* (Sw.) – like *science* – originally meant ‘knowledge’, and from the 17th century were also used in the current sense of a system of known methods used to discover and describe natural phenomena. *Fróðskapur* (Far.) and *fræði* (Icel.) also have both meanings.

Beside *vitenskap*, *kunst* (Dan., Norw.), *konst* (Sw.), through German from Latin *artes*, came into use in the 16th century, e. g. Peder Månsson’s (Sw.) description of the “konst” of mining. Though *legevitenskap* and *legekunst*, OIcel. *lækningariþrótt*, have both been used with reference to medicine, *kunst* implies the practical side, the curative one, and from the beginning *kunst/konst* was used especially for practical fields such as engineering

and technological works, e.g. mills (*mølle*, *kvern*, Dan., Norw.) or fountains (*vannkunst*, ‘water art’, Norw.). Engineer (*ingeniør* (Dan., Norw.), *ingenjör* (Sw.), *fæstnings-* ell. *krigsbygmester* (Norw. 1854) and pioneer (*pioner* (Dan., Norw.), *pionjär* (Sw.)) were military titles for builders of defence structures, bridges, artillery, etc. In early Nordic books engineering was called *stridskonst* (Sw., ‘war art’), e.g. in Peder Månsson (d. 1534; KLNLM 13, 156) and J. Wårnschiöld 1673 (Nilsson 1987, 23). The latter also contained some mathematical terms, e.g. *fyrhörning* ‘rectangle’, *månghörning* ‘polygon’.

4. The human body as a source of terminology

The use of body parts as so-called ‘natural measurements’ may be timeless. *Fot* (Norw., Sw.), *fod* (Dan.), *hand* (Norw., Sw.), *hånd* (Dan., Norw.), *famn* (Norw., Sw.), *favn* (Dan., Norw., ‘fathom, cord of firewood’), etc. have survived as practical approximations or become exact measures, such as *tomme* (Dan., Norw.), *tum* (Sw.) ‘thumb’, ‘inch’, said to be the breadth of King Henry VIII’s thumb, now = 2.54 cm. Components of machinery are given metaphoric names such as (Norw.) *hode* ‘head’, *øye* ‘eye’, *arm*, *finger*, *tunge* ‘tongue’, *kne* ‘knee, bend’, *ben* ‘leg’, *fot* ‘foot’, *jomfru* ‘maiden, a double-handled paving rammer’, etc. Even animals have contributed: *oksehode* ‘hogshead, a liquid measure’, *hale* ‘tail’, *vinge* ‘wing’, *kran* ‘crane’, *rotterumpe* (Norw.), *rottehale* (Dan.), *råttsvans* (Sw.) ‘rat-tail, a file’, *kubein* (Norw.), *koben* (Dan.), *kofot* (Sw.) (‘cow’s foot’, crowbar), and lately *mus* ‘mouse, a computer cursor steering device’.

5. Science in the Middle Ages

5.1. Folk science

Man’s need from the earliest times to describe natural phenomena and their importance to him led to a blend of actual observations and folk belief that not only are reflected in medieval vocabulary, but which survived in modern vocabulary, e.g. in medicine: *elleblæst* (Dan., borrowed from Norw.), *alvblåst*, *elveblest* (Norw.), *älvblåst* (Sw.) ‘elves breath, urticaria’. Zoology included catalogues of *pisces monstrosi* (KLNLM 15, 349) and *mirabilia* (KLNLM 4, 110f.). A particularly rich field of folk nomenclature is sea monsters, e.g. (OIcel.) *sjóskrimsl*, *marmennill* ‘sea manikin’,

margýgr, *sjógýgr*, *sjókona* (all female), *hafstrambr*, *hafgufa* (also whale “heiti” in Snorri Sturluson’s *Edda*, in later Norw. folk tradition *krake*, (*sjó*)*horv* and *sjoorm* ‘sea serpent’. *Finnwalk(a)n* and *elgfroði* were centaur-like creatures, *dreki* on the ground and *flugdreki* in the air were dragons or serpents. Some were counted as human freaks, e.g. (KLNLM) *ein-foting* ‘monopode’, *skuggfoting* ‘monopode using his big foot as a sunshade’. At least some of these creatures were part of serious natural history throughout the Middle Ages. Some terms have survived to this day, though re-defined: (Norw.) *akefal*, now ‘a headless and stillborn foetus’, *sjoorm* (Norw., Sw.), *søslange* (Dan.), German *See-Schlange*, English *sea-serpent*, now ‘a possibly surviving ichthyosaurus’ (*fiskeogle*, Dan., Norw.). The element names *kobolt* (Dan., Norw., Sw.) and *nikkel* (Dan., Norw.), *nickel* (Sw.), both from German (*nickel* from *Kupfernickel*), were named after mountain gnomes believed by the miners to have changed valuable ore into worthless substances.

5.2. Imported and indigenous science

Before the Nordic countries established their own universities (in Uppsala in 1477, in Copenhagen in 1479), their students had to go abroad for higher education. This brought them into contact with European science and its terminology, which was almost exclusively Latin. Exceptions occur, e.g. Icel. *fill* (Arabic) as a synonym for *elephantus*. Northern medieval terminology became a blend of Latin and vernacular. Of the latter, Snorri Sturluson’s *kringla heimsins* ‘Earth’s circumference’ has had the most lasting fame.

The ON *Konungs skuggsjá* ‘The King’s Mirror’ (ca. 1250) deals with tides, winds, the round (!) earth, creatures of the ocean, etc. in vernacular terms. A contemporary source (cf. Brun 1981, 209) credited the Icelanders with mathematical proficiency above the other Northerners. A major encyclopaedic compilation is the OIcel. (possibly partly ONorw.) *Hauksbók* (early 14th century), owned by and written for Haukur Erlendsson (d. 1334). It is famous for introducing the Arabic (originally Indian, as is stated in the *Hauksbók*) digits 0–9 in *Algorismus* (1892–96 edition p. 417; cp. Brun 1962). Zero is called *cifra* (from Arabic *sifr* ‘zero, empty’). Otherwise mathematical concepts are presented in vernacular terms, such as the seven branches of algebra: *viðrlagning* ‘addition’, *afdráttir* ‘sub-

traction', *margfaldan* 'multiplication', *taka rót undan ferskeyttri/átthyrndri tölum* 'take the root from four-edge/eight-edge numbers, i. e. extraction of the square/cubic root', etc. Apart from this work and original contributions by the Dane Peder Nattergal (KLN 11, 498 f.), medieval mathematics were mostly presented in Latin.

Astronomy, OIcel. *stjörnufræði*, was important in navigation and the computation of time. Especially important was the *dagstjarna* 'Arcturus'; among other terms are *hneiging* 'declination' and the *sólmarkahringr* 'zodiac' with the twelve signs given in the vernacular (KLN 2, 619; 3, 40, 121; 16, 413 f.; 17, 186 f.). Early instruments of navigation were the *sólarsteinn* 'calcite', catching polarized light, and from the 13th century *leiðarsteinn* 'magnetite', a primitive floating compass, whereas the *kompassa* 'compass' came into use during the 15th century (KLN 12, 262).

In medicine some terms are translations, e. g. OIcel. *lækningarbragð* (Latin *medicamentum*), *læknisfingr* (*digitus medicus* 'ring finger'), *blóðspýja* (Greek *haimatemesis*). Our forefathers' life style made for a goodly number of composites with *blóð-*. Genitals had vernacular names such as *kúkr*, *flann* (male) and *fuð* (female); two Norw. legal terms for a person breaking his/her engagement were *fuðflogi* 'male' and *flannflugá* 'female; literally man/woman who flees from the *fuð/flann*'. Medieval zoology and especially botany were closely tied to medicine. The principle of "like cures like" (e. g. dressing a wound with "the hair of the dog that bit you") and the "signature" theory, i. e. that nature has put its mark on some plants to show their curative qualities, is still reflected in plant names with (Norw.) *lege-* 'healing', *nyre-* 'kidney', *lever-*, *lunge-*, etc. or saints' names (*jon-*, *mari*). The old humoral pathology, the "four fluids" theory (*firesaftslæren*), is reflected in *humor* 'humour', *humør* 'mood', and phrases like "snakke rett fra leveren" (Norw., 'speak straight from the liver', i. e. straightforwardly), and "vara vid sunda vätskor" (Sw.), 'be of sound fluids, i. e. in good health'.

6. The dawn of modern science and technology

6.1. Use and replacement of Latin

All through the Middle Ages, Latin was the language of learning. Nordic lexicography (cp. Hannesdóttir 1998) was bilingual, with Latin as the source or target language, and

its aim was to ease the Northerners' contact with Latin. Some early attempts at an indigenous terminology were "barbarisms" coined on Latin patterns, but unknown in classical Latin (Nilsson 1987), e. g. *cavitas* 'cavity', *extremitas* 'extremity, arm or leg, in medicine still called *ekstremitet*'. Such Neo-Latinisms are still coined and included in dictionary etymologies and termed "international scientific vocabulary" (ISV). Not till the 18th century was the Latin structure of dictionaries gradually replaced by a lexical description in the editor's own language; monolingual lexicography emerged around 1800. The first complete monolingual Danish dictionary, by Chr. Molbech, appeared in 1833. He had previously participated in a Danish dictionary project on a much larger scale, started on the initiative of The Danish Academy of Sciences; volume 1 appeared in 1793, and it was finished in 1905. The first complete monolingual Swedish dictionary (Dalin) appeared in 1850.

6.1.1. Latin in international systems: Linné

The most outstanding international system of classification is doubtlessly that of Carl v. Linné (1707–78), who laid down his 365 rules of systematization in his work *Fundamenta Botanica* in 1736 (Nilsson 1974, 77 ff.). He preferred Latin as the language of classification; if a science cannot be described uniformly through one language, he felt a situation like the Tower of Babel would arise. Linné excluded very long names (> 12 letters), names with many consonants, and words differing from others used in botany. Where two words were joined, the first should be genitive in form. Generic names should be nouns rather than adjectives. An older generic name still in use should not be discarded till a better one has been found, and should not be transferred to another plant genus even if this would be more suitable. The generic name gives the *genus proximum* 'hyperonym' and the specific one the *differentia specifica* 'hyponym', a distinction introduced by Aristotle and still the principle used in dictionary definitions of the analytical type. Both parts of Linné's two-part names are based on the geometrical categories of number, shape, position and proportion.

6.1.2. From Latin to mother tongue

"The language of science was Latin for its devotees (*dyrkere*), but where its facts and results were intended for wider circles the

mother tongue had to be employed” (Skautrup II, 20). Next to Latin, German was the main source for word borrowing, Low German before the Lutheran reformation, then gradually High German. German loanwords contributed to the replacement of Latin by being more easily adaptable to the Scandinavian languages. Skautrup (II, 253) mentions craft names such as *dönniker* ‘stucco worker’, *isen-snyder* ‘stamp cutter’, *sejermager* ‘watchmaker’, etc.

Especially in the 17th and 18th centuries the coining of *kunstord/konstord* – a German loanword (ca. 1630), itself a translation of *terminus technicus* – increased heavily (listed exhaustively in Nilsson’s works). The Dutchman Simon Stevin (1548–1620), a pioneer on the Continent, was a model and an inspiration to term coiners such as Christoffer Dybvad (Dan., 1577?–1622) and Georg Stiernhielm (Sw., 1598–1672). Among Dybvad’s words were *dele* ‘divide’, *flade* ‘plane’ and *grundlinie* ‘basis’. Stiernhielm had great, though unfulfilled, ambitions of writing a series of textbooks on mathematics, *mätvishet* or *mätekonst* (German *Messkunst*) in Swedish. An expressed aim of The Swedish Royal Academy of Sciences, established in 1739, was to provide the language with words that it so far lacked, in order to divest the arts and sciences of their foreign terms. A study of the success or failure of neologisms could throw light upon contemporary thinking about language and patterns in word formation; e.g. that root words were more common in the 17th and 18th centuries than in the 19th and the 20th until they came into common use again after the second World War. Thus J. Faggott (Sw., 1699–1777) tried out *tvär* for ‘diameter’. New knowledge of electricity in the 18th century led to terms in Sw. such as *glasaktig* ‘glassy’ and *kådaktig* ‘resinous’, from materials used to produce static electricity, or “*excessiv* or *ökad/jakad*”, “*defectiv* or *minskad/nekad*” as (unsuccessful) attempts at replacing B. Franklin’s *positive* and *negative* of electricity.

6.2. Chemistry

(Cp. Rancke-Madsen 1984.) For a period during the 18th and 19th centuries chemistry was almost a Swedish and Danish specialty. This was an era of discovery. The Swedish place-name Ytterby occurs in the names of four rare earth metals: *erbium*, *terbium*, *ytterbium* and *yttrium*. Even pre-Christian gods lent their names: *thorium*, *vanadium* (from *vanadis*, i.e.

Freyja, a name chosen by Sefström and Scheele; earlier discovered, but misunderstood, by A.M. del Rio in 1801 and going by names such as *panchromium* and *erythronium*). *Tungsten* (Sw.), ‘heavy stone’ was chosen because Cronstedt found the mineral to be heavy. The name was changed to *wolfram*, but is still used in English and French. *Tantal* alludes to the Tantalos myth because tantal oxide cannot “drink” acid, i.e. be dissolved. This is a good example of the pioneers’ impressive knowledge of classical culture as well as of the classical languages; it was part of everybody’s secondary education.

Among the numerous proposed neologisms based on the vernacular, only a few survived, e.g. H.C. Ørsted’s *ilt* ‘oxygen’, from *ild*, ‘fire’ and *brint* ‘hydrogen’, from *brände*, ‘burn’, and J.A. Afzelius’ (Sw.) *kväve* ‘nitrogen’, from *kväva*, ‘choke’, *syre* ‘oxygen’, from *sur*, adjective, ‘acid’, *väte* ‘hydrogen’, from *vät*, ‘wet’. Some discoveries were shared by two or more scientists; the following list of “Nordic” elements may differ somewhat in the various presentations of the history of chemistry: Arfwedson, J.A. (Sw., *lithium* 1818), Arrhenius, C.A. (Sw., *yttterbium* 1787), Berzelius, J.J. (Sw., *cerium* 1804, *selen* 1818, *zirkonium* 1824, *thorium* 1828), Bohr, N. et al. (Dan., *hafnium* 1922, corrected to *danium*, but the correction was not published), Brandt, G. (Sw., *kobolt* 1735–39), Cleve, P.Th. (Sw., *thulium*, *holmium* 1879), Cronstedt, A.F. (Sw., *nickel* 1751, *tungsten* 1751, cp. Scheele), Ekeberg, A.G. (Sw., *tantal* 1802), Gadolin, J. (Finnish, but wrote in Sw., *yttrium* 1794), Gahn, J.G. (Sw., *mangan* 1774), Hisinger, W. (Sw., *cerium* 1803–49), Hjelm, P.J. (Sw., *molybden* 1781), Mosander, C.G. (Sw., *lanthan* 1839, *erbium*, *terbium* 1843), Nilson, L.F. (Sw., *scandium* 1879), Sefström, N.G. (Sw., *vanadium* 1830), Scheele, C.W. (Sw., *mangan* 1774, *oxygen* 1771–72, *klor* 1774, *barium* 1774, *molybden* 1778), *wolfram* 1781 (of the element, 1730 of the mineral; cp. Cronstedt), Thomsen, J. (Dan., anticipated several inert gases (*edelgasser*)), Ørsted, H.C. (Dan., *aluminium* 1825). Berzelius also was the discoverer of *protein*, the name was meant to signify ‘the first, most important matter’.

7. A common scientific scene

7.1. International terms

To a large extent Nordic scientific terminology is identical with international usage, with the

necessary adaptation of orthography and derivational and inflectional elements. Some examples: *atto*, *femto* ('decade prefixes', H. Højgaard Jensen, Dan., ca. 1960), *bakterie* (C.G. Ehrenberg, German, 1795–1876), *bar* (V. Bjerknes, Norw., 1862–1951), *base* (in chemistry, G.F. Rouelle, French, 1703–70), *biologi* (J.-B. de Lamarck, French, 1744–1829), *bronsealder* (C.J. Thomsen, Dan., 1788–1865, see *jernalder*), *dinosaur* (R. Owen, English, 1804–92), *elektrode* (M. Faraday, English, 1791–1867), *elektron* (G.J. Stoney, Irish, 1846–1911), *euforisere*, *euforiserende* (P. From Hansen, K.O. Møller, Dan., 1945–46), *fenotype* ('phenotype', see *gen*, *genotype*), *fraktal* (B. Mandelbrot, French, 1924–), *gass* (J.B. van Helmont, Flemish, d. 1644), *gen* 'gene', *genotype* (W. Johannsen, Dan., 1857–1927), *jod* (Gay-Lussac, French, 1778–1850), *jernalder*, *stenalder* (L.S. Vedel Simonsen, Dan., 1780–1858; his proposal *kobberalder*, 'Copper Age', was changed into *bronzalder* by C.J. Thomsen), *kitin* (Odier, French, 1823), *mikrobe* (C.E. de Sédillot, French, 1804–1883), *mutasjon* (H. de Vries, Dutch, 1848–1935), *pH* (S.P.L. Sørensen, Dan., 1868–1939), *proton* (E. Rutherford, English, 1871–1937), *robot* (K. Čapek, Czech, 1890–1938), *sentrifugal*, *sentripetal* (I. Newton, 1643–1727), *syk-lon* (H. Piddington, English, 1855), *taksonomi* (A.P. de Candolle, French, 1778–1841). Nordic family names used as terms are *sievert*, *ørsted*, *ångström* 'units' and *celsius* 'temperature scale'. This too is part of international practice, as are proper names used in the names of industrial processes, diseases, etc., e.g. *gramfarging* (Gram, Dan.), *soderberg-elektrode* (Søderberg, Norw.), *brinellhardhet* (Brinell, Sw.), *Hansen's sykdom* 'H.'s (Norw.) disease, lepra', *Perman-Rovsings tegn* 'P. (Sw.)-R. (Dan.)'s sign, symptoms of appendicitis'.

7.2. Loans from Nordic

The lexicographical maxim "the word comes with the thing" can be exemplified by the great extent of word borrowing into the Nordic languages. Some examples of the opposite, Nordic coinages for internationally accepted terms, have been given in subsection 7.1. Otherwise, loans from Nordic have for the most part been confined to Nordic specialities, present or past, such as *ombudsman*, *smorgasbord* and *slalom*, and to export articles such as minerals (e.g. *larvikite*, *skutterudite*).

8. The present time

8.1. Borrowings from English

Since the end of World War II, English, especially American English, has been the main source of terms imported to the Nordic countries. (As to the adaptation of terms, see section 2 above.) Some fields have had such a rapid technical development that the vernacular has had no chance of competing with English terminology; importing the term with the product has been a matter of course. A good example is *svart boks* 'black box', Norw., box with unknown technical contents; Dan. *den sorte boks*, Sw. *svart låda* now means a flight recorder, Norw. *ferdskriver*, which is often orange. Some words have been re-borrowed, e.g. *sensor* in its technical meaning. Words are borrowed in (usually one of) their denotative senses, without their older connotations, such as the oilfield jobs *roughneck* 'drilling assistant' and *roustabout* 'auxiliary worker'. The sometimes colloquial or humorous background of the borrowed term is lost in transit, e.g. *woofer* 'bass amplifier' (*woof*, the bark of a very big dog). English loanwords based on Latin are more easily adapted to Scandinavian patterns of orthography and pronunciation than words of Anglo-Saxon or French origin (e.g. *sightseeing*, *guide*, Norw. optional spelling: *gaid* (noun), *gaide* (verb)). In scientific milieux, opinions differ as to whether one should prefer the internationalisms or try to replace them with neologisms based on the vernacular. A difficulty lies in the word-formation rules of the Nordic languages. Here one-word composites are preferred, which may lead to very long words (e.g. from *helicopter fuel tank* to *helikopterbrennstofftank*). Though the system allows for this, very long words (more than ca. 25 letters) are generally felt to be impractical. The alternative is multi-word terms (e.g. *brennstofftank for helikopter* or *tank for helikopterbrennstoff*). Andersen (1998) refers to one-word terms as "wrapped up" (*innpakket*) and multi-word ones as "unwrapped" (*utpakket*). The latter type contains more linguistic information (through function words, esp. prepositions) than one-word compounds, but look less terminological and more like general language. However, a multitude of borrowed English terms consist of two words, which has led to a common deviation from written standard in the Scandinavian languages, namely writing the parts of composite words separately.

Longer terms may be abbreviated; examples from ca. 1870–90 are *buss* (Norw., Sw.), *bus* (Dan., from *omnibus*), *trikk* (Norw., ‘tramway’, from *electric*); *bil* from *automobil* was introduced by the Danish newspaper *Politiken* on March 14, 1902. A newer example is *el* (Dan., Norw., Sw.) for *electricity*; *plast* (1946, for *plastik(k)*), *data* (for *datamaskin*, computer), *lab(b)* (*laboratorium*, ‘laboratory’, *trafo* (*transformator*, ‘transformer’). Such abbreviations are more often found as shop jargon than as formal terminology.

8.2. Consumer goods

Consumer goods, like other products, are mostly imported, and they keep their foreign and protected brand names. This important sector of Nordic vocabulary is almost entirely exempt from standardization. In fact English spelling – sometimes called “status spelling” – or deviation from the standard is often used as an eye-catcher in the marketing of products. In the 19th century a few Nordic inventions were given vernacular brand names, e.g. *sikkerhedsnål* ‘safety pin’, Dan., *binders* ‘paper clip’, Norw., *skiftnyckel* ‘spanner’, Sw.

8.3. From terminology to general language

The natural sciences have a reputation for being exact, and their terminology enjoys a corresponding status. Developing a terminology is an important element in new sciences or new branches of older ones, often leading to the transfer of terms, e.g. *batteri* ‘battery’. Some newer disciplines, e.g. electronic data processing, have come into vogue with the general public, and the element of being fashionable or marking their users as “in” has led to the extended use of terms from these disciplines, e.g. *opdatere* (‘update’, competing with *ajourføre*, *modernisere*), *implementere* (also *iverksette*). They have become “buzz words”.

9. Standardization

All the Nordic countries have official language councils whose task it is to standardize the orthography of their languages and in general follow their development. They are also in contact with other bodies dealing with vocational language, such as Tekniska Nomenklaturcentralen (Swedish Centre for Technical Terminology, TNC) and Rådet for teknisk terminologi (The Norwegian Council for

Technical Terminology, RTT). Since the Nordic languages are, and always have been, great borrowers and the sources of borrowing limited, their area of work today is an increasingly demanding one.

49. Nordic language history and literary history I: Denmark

1. Introduction
2. Orthography
3. Vocabulary
4. Proverbs and familiar quotations
5. Imagery
6. Morphology and syntax
7. Literature (a selection)

1. Introduction

In Denmark the beginning of literature in the widest sense coincides with the first use of runic script, the oldest inscriptions dating back to about 200 A. D. The runes of the Iron Age and the Viking Age, preserved almost exclusively in short memorial inscriptions, were superseded by the Roman letters introduced together with Christianity and Latin but known only from around the middle of the 13th c. in Danish texts. Medieval Danish manuscript literature comprises laws, legal documents, leech-books, prayerbooks, legends and other devotional texts, didactic works, proverbs, annals and chronicles, romances about chivalry, ballads, lyric poetry, drama. The religious strife preceding the Lutheran Reformation in 1536 produced diatribes as well as versions of the New Testament in print, and the 16th and later centuries saw the further development of translating the Bible, of hymn-writing, storytelling, historiography, essays, scholarly literature of all kinds, journalism, etc. Most of these genres, however, are beyond the scope of this article, which will focus chiefly on the interaction between standard Danish usage and the language of prose fiction and poetry, excluding the scanty dialect literature. In the following, which is not a chronological account, the essential linguistic aspects will be treated separately. Unless otherwise stated, the quotations are examples representing the language of

several authors or even a general literary trend.

2. Orthography

In spite of the gap between the runes of the Viking Age and the Roman letters of the 13th c., it is obvious that the use of both alphabets was based on a fairly clear idea of the contemporary phonemic structure of Danish. While runic spelling seems to represent one standard language, the early medieval manuscripts written in the Roman alphabet reveal dialectal differences, but the underlying orthographic principles are identical. The great changes in Danish pronunciation and grammar which took place during the Middle Ages caused spelling conventions to waver, but by 1550 the majority of writers and printers followed the example set by Christiern Pedersen whose spelling was remarkably consistent. Over the succeeding centuries certain conventions changed, but it is characteristic that such changes were never brought about by poets; Jon Jakobsen Venusinus' use of the Swedish letter *å* instead of the digraph *aa* and his omission of the silent *h* in words beginning with *hj* and *hv* in a poem published in 1594 remained unique. As a rule, poets and fiction writers endeavoured to comply with the spelling conventions of their time, including the use of initial capitals for nouns (originated in the Bible of 1550, following Martin Luther's example). Not until the late 19th c. did a serious dispute arise when a group of conservative writers, facing an official spelling reform to be introduced by the Government, agreed on what they called "den literaire Retskrivning" [the literary orthography] (1888). But they made no impact, and history repeated itself in 1948 when only a small minority of authors,

among them Karen Blixen (Isak Dinesen), opposed another official reform which abolished initial capitals for nouns and prescribed the use of *å* instead of *aa*. This reform had been advocated and practised for almost a century by a good many scholars and folk high school teachers (cf. the song book *Folkehøjskolens sangbog*, 1894ff.) but by only a few poets and fiction writers, e.g. Niels Møller, while Valdemar Rørdam and Tom Kristensen accepted only *å*, and Nis Petersen and Mogens Klitgaard used small initial letters but retained *aa*; yet, soon after 1948 nearly all writers adopted the new official orthography.

Nevertheless, one typical deviance from conventional spelling has occurred widely for centuries. Corresponding to their highly frequent monosyllabic pronunciation, a few disyllabic present tense forms may be shortened either for metrical reasons in poetry or as an intentional reflection of spoken language. Thus, for instance, *bliver*, *giver*, *lader*, *tager* may be written *blir*, *gir*, *lar*, *tar* or more often *bli'r*, *gi'r*, *la'r*, *ta'r*. On the other hand, the shortened past tenses or infinitives *ku'* and *sku'* for *kunne* and *skulle*, though unremarkable in everyday speech, are likely to be interpreted by the reader as reflecting the speaker's lower-class membership or vulgarity. Using an apostrophe as a means to create this sociolinguistic illusion, authors like Karl Larsen and Robert Storm Petersen would moreover write e.g. *ka'*, *ska'*, *ha'de*, *si'er*, *no'en*, *li'e*, *li'*, *hva'*, *te'* instead of *kan*, *skal*, *havde*, *siger*, *nogen*, *lige*, *lide*, *hvad*, *til*, and *a'* representing *af* as well as *ad* and *at*. In Soya's prose, however, the same spellings *ka'*, *sku'* etc. were used regularly in the informal conversation of educated people, too, while very few writers went as far as Harald Herdal who over the years became fairly consistent in generalizing spellings like *hade*, *sier*, *noen*, and *sa* with no apostrophe for *sagde*, *ga* for *gav*, *lissom* for *ligesom*, besides *blir*, *tar* etc. An attempt by the poet Gustav Christiansen to introduce an apparently phonetic "working class" spelling (*Degte på døns*, 1980; *Dæn levne tsid*, 1984) has so far had no followers.

3. Vocabulary

While Skautrup (1944–70) has presented the general history of the Danish lexicon (cf. also his 1958 monograph *Arv og gæld i ordenes samfund*), only some aspects of usage will be outlined in this article. Unless it is clearly related to the development of literary style, a lexical

change will be left out of consideration, e.g. the fact that a word may become obsolete, attested in 1472 when a scribe copying the Jutlandic Law chose to change *limmæ* into *grenæ* in the phrase "swo langt sum limmæ lutæ" [as far as the branches reach]; or the reluctance to accept the recently coined new word *genstand* 'object' in a dictionary, reported from 1777 (cf. ODS VI, 873).

One important aspect of the development of the Danish vocabulary is the use of archaisms. The first step was taken by Anders Sørensen Vedel in his translation (1575) of Saxo Grammaticus' Latin history of Denmark *Gesta Danorum* from ca. 1200. Among his borrowings from the medieval Danish ballads (a fine selection of which he edited in 1591), from the medieval *Rhymed Chronicle* and other old texts were e.g. (in modern spelling) *frille*, *mø*, *manddrab*, *strådød*, *ulivssår*, *dannis*, *meGLE*, *give sin tro*. Inspired by Vedel, 17th and 18th c. poets continued, to some extent, to draw on his sources, and in 1780 Professor Jacob Baden in a Latin essay pointed to Vedel's translation of Saxo as a treasure trove for the literary language. A new standard was set by Adam Oehlenschläger, the pioneer of Romanticism in Denmark, who in his *Vaulhundurs Saga* (1805) did not take the Old Nordic saga style but Vedel's archaizing 16th c. prose for his model; the use of archaic words, primarily taken from the medieval ballads, was an essential element of his poetry. Becoming himself a model for the following generations, Oehlenschläger basically formed the general idea of a specific poetic vocabulary. Even Christian Wilster's translations of Homer's *Iliad* (1836) and *Odyssey* (1837) were markedly influenced (cf. the quotation in 6.4.). This concept, though not unaffected by the change in literary taste after 1870, was to last well into the 20th c., supported by wide reading and singing of the classics of the previous century. But modern poetry has done away with tradition, and archaisms formerly cherished as specifically poetic are likely to become obsolete and incomprehensible.

One of Oehlenschläger's followers was N. F. S. Grundtvig, who in 1818–22 published his new translations of Snorri Sturluson's *Heimskringla* and Saxo's *Gesta Danorum*. In these, Grundtvig combined archaisms appropriate to the nature of the source texts with harsh vulgarisms in an intended popular style which he labelled *Borgestuedansk*, approximately 'servants' hall Danish'. However, not only his academic critics but also his intended

uneducated readers were outraged; the latter target group was fully aware of the written standard, which they refused to see mingled with vulgar speech in print. According to Skautrup (1953, III, 142) the two works were hardly read until the late 19th c. By then literary naturalism had come closer to various levels of speech, even including swear words. A phrase like the stationmaster's "Satan til lidt Forslag i Tiden" [damn it, time goes too fast] (Herman Bang, 1886) would be current in most social classes whereas, reflecting vulgar Copenhagen pronunciation, *kraftedeme* (meaning literally 'cancer eat me') and similar coarse expressions were originally quoted only in a distinctly proletarian setting (C. Staun, *Proletardrengens Læreaar*, 1911).

The literary fate of the ancient word *røv* 'arse' (identical with OWN *rauf* 'hole, opening', cf. ODan. *næsæ rof* 'nostril') may illustrate the changing attitude of the linguistic community. In the medieval proverb "Mwss fiærther ej som hæst vdhen røffwen reeffner" [a mouse will not fart like a horse without her arse bursting], the semantic value may still be neutral. But in the 1540s Bishop Peder Palladius apologized for the word, talking about the churchgoers who should turn their faces to the pulpit and not "uende deeris røff (med forloff sagt) til deeris sognepræst" [turn their arses (saving your reverence) to their parson]. The debasement of the word appears in a trial before a local court in 1682 where the mayor's maid was reported to say *ende* 'bottom, behind' while five ordinary women said *røv* (Skautrup 1947, II, 391). Ludvig Holberg, who used this word only in his mock-heroic poem *Peder Paars* (1719–20), refrained from spelling it out; he wrote *R..* or left it to be guessed as a rhyme with *døv* 'deaf'. In his standard dictionary *Dansk Ordbog* (1833, 1859), Christian Molbech referred *røv* to "den laveste Talebrug" [the basest speech], and ODS (1939, XVIII, 265) labelled it "meget uhøvisk" [very indecent]. However, the latter half of the 20th c. saw a rapid change. In a Royal Theatre staging of G. B. Shaw's *Pygmalion* in 1953, Eliza's "not bloody likely" was rendered "rend mig i røven" [put it up your arse], and in 1967 the current usage in radio and television cultural and dramatic programmes caused an angry listener to name the overall trend *røvkulturen*. Nowadays, *røv* is frequently seen in print, in books as well as newspapers, included also in recent set phrases like *røvrende* or *tage røven på én* 'stab somebody in the back', *let røven* or *få din røv i gear* 'get moving, pull your finger

out' and in new compounds like *røvkedelig* and *røvsyg* 'deadly (dull), annoying'. The formerly offensive word may even occur in film titles, e.g. *Med røven i vandskorpen*, approximately 'in a tight corner' (the original Canadian title was "Meatballs"). It is symptomatic of the modern attitude, particularly among younger people, that such expressions may be used by women, though they are still used mostly by men.

In his special prose style, the already mentioned *Borgestuedansk*, as well as in his poetry, Grundtvig included quite a few dialect words; but like those used sporadically by 17th c. poets, they remained by and large alien to standard Danish. Not until Steen Steensen Blicher introduced them in his outstanding short stories from Jutland (1824ff.) were dialect words appreciated by the readers as a means of adding local colour to a tale. Of course this element became integrated in regional literature after 1870, for instance in novels by Jeppe Aakjær and Thorkild Gravlund, while dialect words interacted with the rest of Johannes V. Jensen's huge vocabulary in his multifarious works. But on the whole, few dialect words have been accepted in the spoken standard, e.g. *luffe* 'mitten', *trals* 'tiresome, annoying', *svirpe* 'to flick', *al den stund* 'inasmuch as'.

4. Proverbs and familiar quotations

Danish proverbs are known to have existed in the Middle Ages. The earliest collection made by one Peder Låle was printed in 1506 but dates back to before 1400. It was followed up by the learned philologist Peder Syv in his edition of *Aldmindelige Danske Ordsproge* in two volumes, 1682–1688. In context, proverbs occur sparsely in medieval Danish literature, e.g. in the 15th c. *Rhymed Chronicle* "I ær muss alt som hwn maa/i fattig kones posæ" [a mouse will always take her chance in a poor woman's bag]. Some were quoted by the Lutheran reformers in the 16th c., for example by Bishop Peder Palladius: "den gaass kæger icke der hoffuedt er aff" [a goose will not cackle after her head has been chopped off]. Anders Sørensen Vedel introduced Danish proverbs into Saxo's history of Denmark, both in his translated text and in his own marginal notes. Similarly, Grundtvig included proverbs particularly in his *Borgestuedansk*, while e.g. Oehlenschläger, Blicher and later Henrik Pontoppidan and Martin A. Hansen

would quote proverbs in the speech of peasants and other ordinary people.

Nowadays, proverbs are of small literary importance. But in everyday speech, quite a few figurative proverbs of universal validity are current, including medieval ones; in the following examples, a literal translation precedes the equivalent English idiom (if any): *brændt barn skyr ilden* [burnt child avoids the fire \approx once bitten twice shy]; *nød lærer nogen kvinde at spinde* [need teaches naked woman how to spin \approx necessity is the mother of invention]; *tyv tror hvermand stjæler* [thief thinks everyman steals]; *liden tue vælter ofte stort læs* [little tuft often overturns big load \approx little strokes fell great oaks]; *mange bække små gør en stor å* [many brooklets make a big stream \approx every little bit helps]; *smuler er også brød* [crumbs are also bread \approx half a loaf is better than no bread]; *små gryder har også ører* [small pots, too, have ears \approx little pitchers have big ears]; *tomme tønder buldrer mest* [empty barrels rumble most \approx empty vessels make the most noise]; *én fugl i hånden er bedre end ti på taget* [one bird in the hand is better than ten on the roof \approx a bird in the hand is worth two in the bush]; *enhver so synes bedst om sine grise* [any sow likes her (own) pigs best]; *når katten er ude, spiller musene på bordet* [when the cat is out, the mice play on the table \approx when the cat is away, the mice will play]; *nu sidder vi alle godt, sagde katten, (den sad på flæsket)* [now we are all well seated, said the cat (she was sitting on the meat)]; *ingen roser uden torne* [no roses without thorns \approx no rose without a thorn]. The third member of a Wellerism (in parentheses here) may be silently implied. The most recent type is the last one with no verb.

The historical role of quotations in Danish literature, e.g. the use of biblical quotations in sermons, is not important in the present context. On the other hand, a store of familiar quotations, on a par with proverbs, is available to the Danes who, in many cases, are ignorant of their origin. For instance, the phrase “at rette bager for smed” [to execute the baker instead of the smith] may also be quoted “at rette smed for bager” [to execute the smith instead of the baker], probably due to the awkward phrasing in Johan Herman Wessel’s poem from 1784 where the judge finds nothing “hvorved forbuden er, for Smed at rette Bager”; and most people, having forgotten that Hans Christian Andersen says “et lille Barn”, will refer to “den lille dreng” who in *Keiserens nye Klæder* sees through the self-

deception of the grown-ups. But it is general knowledge that the idea of Denmark as a country where “få har for meget og færre for lidt” stems from a still popular song written by Grundtvig in 1820. A couple of lines in Oehlenschläger’s *Aladdin* (1805) “naar I kun sparer mig, min Hustrue og/min lille Hassan, med de skieve Been” are the background of the set phrase in which someone’s “egen lille Hassan (med de skæve ben)” represents his or her narrow self-interest. Similarly, it is sufficient to say “hvad hjertet er fuldt af” when, perhaps unwittingly, quoting Matthew 12:34, for everybody knows the unquoted continuation “løber munden over med”. Unlike this current biblical quotation, several others, clinging to tradition, disagree with the latest authorized version (1992), e.g. “I dit ansigts sved skal du æde dit brød” (Genesis 3:19; *æde* was replaced by *spise* already in 1931) and “Hvi ser du skæven i din broders øje?” (Matthew 7:3, Luke 6:41; *Hvi* was changed into *Hvorfor* in 1907, and in 1948 *skæven* was replaced by *splinten*). In addition to the biblical quotations, a few other familiar ones have a foreign (but generally unknown) background, e.g. “godt brølt, løve!” from Shakespeare’s “well roared, lion!” and “træerne vokser ikke ind i himlen” reflecting Goethe’s dictum “Es ist dafür gesorgt, daß die Bäume nicht in den Himmel wachsen”.

5. Imagery

Being figurative, proverbs may be said to involve imagery. But there has always been a gap between elaborate literary imagery and the use of metaphors and comparisons in plain Danish. Johannes Ewald’s following stanza from 1775 may exemplify the classical diction of poetry:

Hvor Hiordene brøle,
 Mod Skovens letspringende Sønner,
 Og puste, og føle
 Den Rigdom, i hvilken de stønner –
 Hvor Meyeren synger
 Blant gyldene Dynger,
 Og tæller sin Skat, og opløfter
sit Raab,
 Til den, som har kroned hans Haab. –

The distinctive element in this poetic style is paraphrase: “Hiordene” (not *Qvæghjordene) stands for herds of cattle, “Skovens letspringende Sønner” for deer, “Rigdom” for the fatness of the pastures, “Meyeren” for the

harvesting farmer, “gyldene Dynger” for the reaped crop, “Skat” for the yield, “opløfter sit Raab” for the farmer’s thanksgiving, and “den, som har kroned hans Haab” for God who crowned, i.e. fulfilled, his material hope. The metaphors imply comparisons but are bolder than the formal literary comparison, a classical example of which, including an explicit *tertium comparationis*, occurs in one of Ludvig Holberg’s comedies from 1724: “Kierlighed er ligesom et oprørt Hav, hvilket jo meer det indskrænkes og indknibes, jo meer bruser det”. Much later, Henrik Pontoppidan would sometimes still make use of elaborate, almost Homeric comparisons, e.g. in a novel from 1914:

Som det skamskudte Vildt bryder ud af
Flokken, naar det mærker Døden
komme, og vakler ind i Tykningen for at
forbløde i Ensomhed, saaledes havde han
søgt herop til sin forladte østjyske
Fædrenegaard med den Beslutning at
dø uden Vidner.

By then, however, this style had generally become obsolete in prose, though it was still appreciated in poetry, e.g. in a popular song written by Jeppe Aakjær in 1916:

Som dybest Brønd gi’r altid klarest
Vand,
og lifligst Drik fra dunkle Væld
udrinder,
saa styrkes Slægtens Marv hos Barn
og Mand
ved Folkets Arv af dybe, stærke Minder.

In everyday speech, metaphors occur in a good many set phrases, e.g. (with approximate translations) *fare i blækhuset* ‘rush into print’, *gå for lud og koldt vand* ‘be neglected’, *spænde livremmen ind* ‘tighten one’s belt’, *sætte lus i skindpelsen* ‘make mischief’, *ikke til at skyde igennem* ‘irrefutable, invincible’. Some metaphorical phrases are reminiscent of proverbs, e.g. *man skal ikke skue hunden på hårene*, literally ‘one should not judge a dog by its coat’, i.e. appearances are deceptive; *efter de forhåndenværende som’s princip*, literally ‘according to the principle of available nails’, i.e. determined by the accidental resources, was originally known to be a quotation from an eccentric MP. Comparisons are concrete, e.g. *det passer som hånd i handske* ‘it fits like a glove’, *det går som en leg* ‘it goes swimmingly’, *det er så let som at klø sig i nakken* ‘it is as easy as falling off a log’, in slang (supposed

to have been coined by a sports reporter in 1965) *kold som en brøndgravers rov* ‘as cold as a well digger’s arse’.

6. Morphology and syntax

6.1. Morphology vs. syntax

Because of the interdependence between literary and language history, it is not possible to isolate morphology from syntax, except maybe for the use of a few obsolete inflections as poetic archaisms, e.g. adjectives with the original nom.masc. ending *-er* irrespective of the gender and function of the relevant noun, like Vedel’s “en trædsker Quinde”; or Oehlen-schläger’s past tense *aatte* instead of *eiede*, imitating medieval ballad style. In contrast, the original acc.masc. ending *-en* in adjectives was combined only with a governed noun, like Ewald’s “Kong Christjan stoed ved høien Mast”; owing to Oehlen-schläger’s frequent use of them, such collocations became a current element in romantic poetry. A number of archaic verbal forms were also dependent on their syntactic surroundings, e.g. 2sg. *du est/skalt/løjst* and imp. *gak* ‘go’, and pret.pl. *vi/I/de drukke/finge* etc. used by Oehlen-schläger both in his prose imitation of Vedel and in his poetry and copied by other romantic poets.

6.2. Verbal singular and plural

Unlike these poetic archaisms, the general distinction between verbal sg. and pl., though it was probably already about to fall into disuse in the spoken language by 1300, remained a convention in written Danish for centuries. In poetry, exceptions were permitted, cf. Ewald’s stanza quoted in 5 where the pl. subject *Hior-dene* is correctly combined with pl. *brøle/puste/fole*, whereas *Sonner* necessitates sg. in the corresponding rhyme *de stønner*. In Oehlen-schläger’s lines “I som raver i blinde/skal finde/et ældgammelt Minde”, the metre demands sg. *skal* instead of pl. *skulle*, and *raver* may be seen as the result of analogy; but in his following stanza

Underlige Aftenluft!
Hvorhen vinker I min Hu?
Svale, milde Blomsterdufte:
Siig, hvorhen I bølge nu!
Gaaer I over hviden Strand
Til mit elskte Fødeland?
Vil I der med Eders Bølger
Tolke hvad mit Hierte dølger?

it is obvious that he chose sg. *vinker I, Gaaer I* and *Vil I der* (instead of **Ville I*) in order to avoid hiatus, cf. *I bølge*. Such considerations, of course, did not make themselves felt in prose where, however, the force of tradition showed itself in the fact that Hans Christian Andersen stuck to the bookish grammatical distinction even in his fairy tales. The first writers to do away with it were the literary naturalists after 1870. After the year 1900, when schoolchildren were officially granted permission to drop it in their exercises, the distinction soon disappeared from public use; and until it was also abolished in the modern versions of the Old and New Testament (1931 and 1948 respectively), it came to be felt as a characteristic biblical archaism. Nowadays, many Danes no longer understand the implication. For example, Matthew 19:30 may still be quoted “de første skulle blive de sidste og de sidste de første”, but the obsolete pres.pl. *skulle* is likely to be misinterpreted as the past tense, written *skulde* before 1948; the familiar quotation “Vi alene vide”, ascribed to the absolute king Frederik VI in 1835, occurs frequently reshaped with a subject in the sg. though the verbal form is left unchanged, e.g. “han tror at han alene vide” (instead of *ved*).

6.3. Pronoun and article

The enclitic use of pronouns, attested already in some medieval texts, was frequent in the 16th c. reformer Hans Tausen’s popular style, e.g. *tillen, henten, meget* instead of *til den, hente den, mig det*. But it was never fully accepted in the written standard. In modern fiction, e.g. in works by Karl Larsen, Staun and Soya, spellings like *a’et, er’et, gi’en, gaar’et, ha’et, i’en, om’et, var’et* for *af det, er det, give den* etc. clearly signal everyday or even lower-class speech. In the informal spoken standard of today, such pronunciations are considerably less frequent than they used to be. An additional example of the difference between literary and standard usage is the omission of the definite article in a noun phrase with an attributive adjective, e.g. in Oehlenschläger’s verses “Fælt knager Granen i kolde Nat” and “Forladte Hakon fnyser og flygter”. Copied by his romantic followers, this use came to be felt as distinctly poetic but was never admitted to standard prose. It is a curious coincidence that around 1960, similar noun phrases, e.g. “sexede Sophia Loren”, “nyskilte Sybil Burton”, popped up in journalism, not as a revival of 19th c. poetry but obviously modelled on English.

6.4. Syntactic licence

Imitating medieval Danish ballad style, 19th c. romantic poetry exercised some forms of syntactic licence which did not spread to prose: the use of a proclitic pronoun as a kind of definite article, and of post-positional adjectives or pronouns, e.g. “de Nætter”, “den Ganger graa”, “kier Moder min”, quoted from Oehlenschläger. On the whole, syntactic licence had often been resorted to in poetry since the beginning of the 17th c., owing to the stricter metrical demands. One outstanding exception is the 18th c. poet Johannes Ewald, in whose elevated work there is hardly one verse in which the word order is incompatible with prose. His complete opposite in that respect was Grundtvig, whose poems were often marred more or less by very awkward syntax, e.g. “saa lukke maa med Flid jeg tit/for Verdens Klarhed Øie mit”. However, it is noteworthy that poetical deviance from normal syntax was tolerated to a much greater extent in the 19th c. than nowadays; compare the romantic diction in Christian Wilster’s translation of Homer’s *Iliad* 5, 297–301:

Frem Aineias da sprang med sit Skjold
og sin mægtige Landse,
Frygtende svart, at hans Liig af
Achaierne bort skulde slæbes.
Trindt den Faldne han gik i Lid til sin
Kraft som en Løve,
Og over Dødningen holdt han sit Spyd
og sit blankede Rundskjold,
Sindet ihjel at slaae hver den, som
kom ham imøde

with Otto Steen Due’s syntax in his modern translation (1999):

Da sprang Aineias frem med sit skjold
og sin mægtige lanser
for at forhindre Achaiernes folk i at
bortslæbe liget.
Over den døde stod han så tryk ved
sin kraft som en løve,
rede med lanser og skjoldets behændigt
rundede plade,
klar til at dræbe enhver der voved sig
frem i hans nærhed.

Even nursery rhymes were affected, cf. the following lines from *Den store Bastian*, translated from German in 1867: “Hvo ei rede la’r sit Haar, / sine Negle skjære, / han til Spot som Konrad gaaer, / Øgenavn maa bære”. But to-

wards the end of the 19th c., poetic syntax came gradually closer to prose and eventually merged with it in the 20th c., though traditional licence might still occur in metric poetry, e.g. in a modern hymn: “bittert var bægret, som fyldt vi dig rakte, / da med dit legeme døden du brød” (by Holger Lissner, 1990). However, metric rhymed poetry had had its day soon after the middle of the 20th c., surviving only in poems intended to be sung, particularly hymns and popular ballads.

6.5. Legal and academic syntax

The oldest Danish prose texts, after the brief and rather monotonous runic inscriptions, were the medieval provincial laws, for which the Preface of the Jutlandic Law in 1241 expressed the aim that they should be “opænbaræ, swa at allæ mæn mughæ witæ oc undærstandæ hwat loghæn sighær” [clear, in order that all men may know and understand what the law says]. In general, the provincial laws did live up to this claim, but sometimes the intricacy of the matter in question would cause the lawmaker’s syntax to waver, reflecting probably also the looseness of everyday speech. For example, where the Jutlandic Law provides that a man’s concubine may, under certain circumstances, obtain the position of a wedded wife, the lawmaker’s view and, consequently, the grammatical subject change suddenly from the man to his concubine:

Hwa sum hauær slækæfrith i garth
mæth sik, oc gangær opænbarlich
mæth at souæ, oc hauær laas oc
lykki, oc sökær atæ oc dryk mæth
opænbarlich i thre wintær, hvn
skal wæræ athalkunæ oc ræt hwsfrø.

Legal instruments other than laws, e.g. royal orders, were originally written in Latin; and when, towards the end of the 14th c., the central administration changed the language to Danish, its model remained the elaborate Latin style. The resulting Danish civil service style (*kancellistil*), with its intended clarity expressed in lengthy periods, had a lasting influence on the literary language, though less on fiction than on historical narratives, essays and scholarly literature. It is obvious in the following quotation from one of Ludvig Holberg’s essays, published in 1748:

og varede dette [viz. an unsuccessful marriage] indtil paafulte Skilsmisse, da efter

et nyt Ægteskab, som ogsaa havde et ulykkeligt Udfald, hun omsider tredie Gang begav sig udi Ægteskab med en gemeen Matrods, med hvilken, endskiønt han dagligen handlede ilde med hende, hun sagde, sig at leve langt meere fornøyet, end udi det første Ægteskab.

The generation after Holberg, feeling his style to be obsolete, took the syntactic elegance of contemporary French belles-lettres for their new model, but the general idea of standard written Danish was not shattered. It is symptomatic that passages like the following occur in B. S. Ingemann’s highly popular historical novel *Valdemar Seier* (1826):

Den tidlig vakte Æresfølelse i det barnlige Sind fandt Saxo det betænkeligt ved Mistillid at krænke; men for at forebygge alle farlige Følger, som Tiden, Stedet og Drengens levende Indbildningskraft kunde medføre, besluttede han, hemmelig at blive der i Nærheden, og forlod kun Capellet for ubemærket, gennem en Sidedør fra Sacristiet, at vende tilbage og skjule sig i den mørke Krog, hvorfra han, ved Skinnet af Lygten paa Gravstenen og den nylig opstaaede Maane, kunde bemærke enhver af den unge Helts Bevægelser.

6.6. Syntax of speech

While specimens of the syntax of speech occur in Holberg’s comedies and e.g. in a novel by J. C. Tode (1791; cf. the quotation in Skautrup 1953, III, 229), it was not until the 1830s that Hans Christian Andersen ventured to introduce it into the very narrative of his fairy tales (except for the traditional distinction between verbal sg. and pl., cf. 6.2). After 1870, literary naturalism and particularly impressionism endeavoured to close the gap between written and spoken language, though, of course, the author’s narrative would still be less “natural” than the direct speech of his characters with perhaps an anacoluthic and/or sociolectal colouring, like the following quotation from a short story by Karl Larsen (1896):

Som nu med min Kone, jeg véd ikke rigtig, men det ka’ godt være engang i en Kæfer, dengang vi var forlovede, at jeg har fortalt hende, jeg ha’de saadan en [viz. an ex-girlfriend with the speaker’s illegitimate child], for *no’et* forberedt paa den første, det var hun.

Fiction writers after 1870 would often mingle the use of direct and reported speech with free indirect speech. This intermediate mode was felt by many contemporary readers to be a novelty characteristic of modern narrative style. However, free indirect speech occurred sporadically already in medieval narration, e. g. in a legend in *Jesu Barndoms Bog* (1508) where young Jesus is accused of having caused the death of a playmate:

Wor herre ihesus bad thet døde barn, at thet sculde siæ for alth folket obenbare, huar thu æst fallen, oc om ieg sloo teg eller giorde teg noget ont, tha sig ræth sanningen ther pa.

Brøndum-Nielsen (1953) has shown that free indirect speech originated in popular narrative style. Having, of course, introduced it into his fairy tales, Hans Christian Andersen made use of free indirect speech also in his last novel *Lykke-Peer* (1870): “Faermoer [told that she] havde boet paa Postgaarden, det var dyrt til Forfærdelse”. But it is true that this element of narrative style became particularly frequent in impressionistic fiction after 1870. Growing less remarkable in 20th c. fiction, it occurred even in Karen Blixen’s deliberately old-fashioned style.

6.7. Conclusion

It is apparent from the preceding outline that in the history of Danish language and literature, there has been a constant interaction between literary and standard usage. The 20th c. has seen a growing influence from the mod-

ern spoken language on literary style which, in the case of syntax, may seem to match a purely native diction in the oldest medieval texts. It is, however, noteworthy that the traditional view held by Skautrup (1944) was severely criticized by Diderichsen (1968, 93–98) who pointed to Latin syntactic models even for the style of the Old Danish provincial laws. As to foreign influence on syntax after ca. 1500, Skautrup (1947–68, II–IV) took only original Danish texts into consideration; the possible intermediary influence of translations from foreign languages has so far not been investigated.

50. Nordic language history and literary history II: Sweden

1. Introduction
2. Literary and non-literary genres
3. Research situation
4. The genre of poetry
5. The genre of drama
6. The prose genre
7. Final words
8. Literature (a selection)

1. Introduction

An account of the development of a language can be made from the standpoint of “language as a system” or “language as practised”. The history of the Swedish language has been charted from the perspectives of both language and style. For language history all aspects of linguistic development can be studied and all kinds of written documents can serve as sources. For stylistic development the focus is on linguistic variation which is determined by different factors: epoch, genre and author. Such variation can involve both quantitative and qualitative deviations from “standard language”. However, the history of language and the history of style are not entirely distinct concepts, as can be seen in work from the various research traditions.

2. Literary and non-literary genres

The concept of “literature” has been restricted here to fiction, divided into three main genres: poetry, drama and prose. Below, the development of the Swedish literary language will be presented by genre and in chronological order. Only original Swedish texts will be dealt with. In addition, aspects of how literature is related to the “standard language” will be considered. This will in fact cover a wide spectrum of different genre languages, including the fundamental difference between spoken and written language. There are features of the language of a period that are in the main common to all genres. On the whole, literature reflects contemporary language. However, the traditional Swedish poetry right up to the end of the 19th century also reflects the poetic language of older times. In the modernistic literature of the 20th century there is, on the other hand, a need to shake off traditional restraints, disregarding established grammatical forms and “correct” language. In surveys of Swedish literature the term “syntactic revolt” has been coined, applied above all to poetry but also to prose.

The great writers are regarded as highly conscious stylists who have in various ways influenced the development of the language. An interesting task for linguists is to compare the development of literary and non-literary language. As non-literary texts are almost without exception in prose form, such a comparison can only be made with literary prose, while the genres of poetry and drama have to be left aside. Attempts have been made to consider literary and non-literary prose side by side in order to find out whether they develop in parallel, whether one text genre influences the other and, in that case, which one directs the development.

3. Research situation

Comprehensive research on the development of the language of Swedish literature compared to “ordinary language” and based on recurring patterns has not been carried out so far. Some isolated investigations can, however, be mentioned. Engdahl (1962), in his studies of non-literary prose from 1878 to 1950, has shown that sentence structure, measured in terms of the number of words and clauses, was clearly simplified during this period and that this development was paralleled in literature. The same pattern applies to words and forms close to spoken language. For example, the Swedish negator *inte*, which is the common spoken alternative, first gained ground in dialogue, then penetrated into narrative passages and finally into light non-literary texts. The singular verb form represented by the type *de går* first entered literary prose, then the language of the press and other forms of non-literary prose. A similar development has been pointed out by Östman (1992) in her study of the rise of short word forms in written language. The short forms were first used to differentiate dialogue and narrative, and then gained a foothold in narrative and non-literary light prose. A conclusion reached in these studies is that the modern emergence of such elements in the standard language during the 20th century originates in the language of literary prose. A third study concerns grammatical words such as pronouns, prepositions and conjunctions, which have not been considered to be of any stylistic importance (Thavenius 1972). This study shows that prose, in comparison with poetry, has a much higher fre-

quency of grammatical words. In lyric poetry, only a few conjunctions are used to mark relationships, while prose employs the whole register. Thelander (1970) also carried out an investigation based on literary and non-literary prose, showing that change has been more rapid in the former. Some of his findings are that the length of sentences in literary prose has decreased, just like the length of clauses and words. Finally, mention should also be made of the investigation by Haskå (1972) on the use of the deviant phrases *det vida hav* ('the wide ocean') and *vida havet* alongside the normal standard variant *det vida havet* in Swedish poetry between 1500 and 1940. To some extent these deviant forms also occur in prose, but they must be considered typical of traditional poetry, where considerations of rhyme and meter and an idealised archaic style ideal have guided the use of linguistic forms.

Isolated investigations have also been carried out concerning epoch styles, writers and genres, most of them in the form of monographic descriptions of authorship or of individual works. The greatest part of the material available has not, however, been studied. Some historical surveys have been published. The first was written by Svanberg, *Svensk stilistik* (1936), which describes the development of styles in Swedish literature, and it is still the only survey of its kind. In *Epoker och prosastilar* (1967) Holm has surveyed the development from Icelandic sagas to modern prose, which mainly involves a progression from simple colloquial syntax to complex Latin-influenced syntax with its focus on sentence structure. In a large-scale work Hallberg (1982) has described the development of figurative language. After a theoretical introduction, he offers a description of important older sources of metaphor (e.g. the Bible, Homer), followed by a survey of the figurative language of some authors and groups of authors from the 17th century to the present.

4. The genre of poetry

4.1. The ballad

During the Middle Ages, literary language in Sweden was mostly in the form of translations, even though original Swedish poetry has been found. An important genre was the medieval ballad. The *ballad* is a genre common to all the Nordic countries and is perhaps the first Swedish secular genre that can be called literary. A distinction is made between the West

Nordic and the East Nordic ballad. Since ballads were handed down orally for centuries and were only at a late stage recorded in several variants, they reflect the language of different periods, which changed more rapidly in the East than in the West Nordic countries. The ballads use an epic-dramatic technique where dialogue is frequent. Although ballads occur in many variant forms, they also have linguistic traits in common which have been preserved. They use older inflectional forms: e.g. the definite form of a noun is similar to German (*den hind* 'the hind'). In syntax, inversion and parataxis stand out. The ballads contain older poetic words and phrases, which occur as stereotypes in several ballads, e.g. words for girl, weapons and articles of clothing. However, metaphors are very unusual. The language of the ballads is formulaic but provides information about medieval vocabulary (Wessén 1928).

The modes of expression typical of the ballad form the basis for a popular Swedish song tradition, and even 19th century poets were inspired by the ballad style, which they thought was popular in origin. Swedish poetic licence is based on this ballad language, for the language of poetry is largely determined by the requirements of rhythm, metre and sound and thus exhibits many deviations from standard language. This is especially true of traditional poetry right up to the 20th century. Such poetry often preserves older elements of language. Later, at the end of the 19th century, when free verse was introduced, the genre was modernized, and new and bolder types of deviations from standard language appear.

4.2. From baroque to classicism

Swedish literature in the modern sense originates in the 17th century. Swedish baroque style took its models from Europe and applied them to verse. Baroque style aims at striking and surprising effects, achieved by means of a rich rhetorical apparatus and linguistic devices. The most famous baroque poem is Georg Stiernhielm's *Hercules*, the first hexametric poem in the Swedish language. The model is Latin hexameter, with the important difference that Latin hexameter is based on the quantitative measure of long and short syllables while Stiernhielm's relies on the alternation of stressed and unstressed syllables. The poem contains phonetic effects, long multi-segmented epithets (*frisk-dagg-drypande*), bold metaphors, antitheses, circumlocutions and

puns, mythological allusions, exclamations etc. The wealth of vocabulary is impressive with its mixture of ornamental words, archaisms and specific words, which give an insight into contemporary colloquial language. The choice of words is Swedish with a sprinkling of Old Nordic archaisms, which led the author to add an explanatory glossary (Ståhle 1975).

Stiernhielm was not only a poet but also a philosopher and linguist. He was fascinated by the Old Nordic words and was convinced that they phonetically expressed the original divine meaning. He had a definite conception of the effect of different vowels and consonants in the language. In his poetry he has also, by coining numerous new words, demonstrated the wide possibilities in Swedish for creating compounds. This gives Stiernhielm a place also in the history of Swedish word-formation.

The development of Swedish verse led by Stiernhielm is an important explanation for the extensive publication of verse in the 17th century. Also, Andreas Arvidi published a handbook on composing poetry with the accent on problems concerned with versification: *Manuductio ad Poesin Svecanam* (1651; Ståhle 1975). Other poets who used verse and language with masterly skill, for instance forming new imaginative compounds, were Lars Lucidor and Johan Runius. These and many other less distinguished poets also wrote commissioned honorific poems, so-called personal verse, for weddings, birthdays and funerals. This particular verse genre was marked by conventional structure and language.

A great part of 17th-century poetry has been classified in literary history as baroque. The delimitation of baroque as an epoch style has, however, been questioned by Olsson (1980). He examined texts from the period 1600–1760, showing a difference in substance and language progression. Olsson characterizes the period between 1640 and 1670 as Renaissance style and the time up to 1740 as baroque, followed by classical style.

4.3. Classicism

Classicism was a general European reaction against the linguistic exaggerations of the baroque period and the mixture of different stylistic levels. The period is characterized by strong linguistic awareness and the beginning of public concern for language. In this period the Swedish Academy was founded with the purpose of guarding the development of the

Swedish language. A group of writers appeared who created the first golden age of Swedish poetry, which was the main genre of the period. Two of these writers, Carl Gustaf af Leopold and Johan Henrik Kellgren, made public appearances dealing with linguistic questions and influenced the development of the Swedish language. The linguistic ideal of classicism was based on the poetics of Boileau, where a strict dividing line was drawn between genres: high, middle and low. A linguistic purge involved the weeding out of concrete and popular words and phrases. The result was an impersonal, more abstract kind of language with a highly restricted vocabulary in genres such as the epic, didactic poetry and tragedy. To the extent that concrete words did occur, their meaning often glided into common symbolism, e.g. *aska* ('ashes') takes on the meaning 'mortal remains of a dead person'. Such poems made constant references to ancient mythology and culture. The dominance of nouns during French classicism, the inclination to establish abstractions and to nominalize adjectives and verbs, have often been mentioned as definitive of classical style. The rhetorical apparatus was more or less retained from the baroque period but was used in a more sober manner so that for instance metaphors, and vocabulary generally, were standardized, while loanwords and imitation were more highly regarded than neologisms. In other genres, for instance the epigram and satire, writers strove for an elegant and natural language representing contemporary spoken language typical of conversation in the higher social circles. The most prominent writers of these genres were Johan Henrik Kellgren and Anna Maria Lenngren. Both supported the ideas of the Age of Enlightenment but presented them in different ways, Kellgren more abstractly and Lenngren more concretely. This has been thought to illustrate the difference between male and female, but this aspect has not been more closely studied. The greatest poet of the period, Carl Michael Bellman, nevertheless broke the rules of classicism and in *Fredmans epistlar* created his own unique genre with its own language, which contained both classical and naturalistic features, often in the same poem, and in which the colloquial speech of the lower classes was represented, more attention being paid to the demands of the verse and the context than to rules (Modéer 1953). Bellman used a concrete vocabulary, for instance, common nouns like *gädda* ('pike') and *svala* ('swal-

low'). Bellman created his own metrical patterns which conformed to borrowed melodies and were adjusted to the content. This technique contrasts with the Alexandrine form cherished in classicism. Bellman's vocabulary has invited research, leading to a glossary of *Fredmans epistlar* (Larsson/Hellqvist 1967) and a large number of studies. Bellman's vocabulary was not influenced by French, in spite of the fact that there was abundant borrowing of French words into Swedish during this period. French also influenced the poetic language of this period syntactically. Typical instances were the use of a preposition in verb phrases (e. g. *neka ngi åt ngn*) and periphrasis of the future aspect with an infinitive: *gå att* (Stenfors 1994).

4.4. From classicism to romanticism

During the last stage of the classical period, literature displayed an emotive trend which had in fact existed before as an undercurrent, but which now increased in strength and contrasted with the previous markedly intellectual attitude. The transition was already noticeable in Kellgren, who had earlier been one of the chief defenders of reason. During the preromantic period that followed classicism and was a reaction against it, emotively and formally innovative poets like Thomas Thorild and Bengt Lidner appeared. Thorild emphasized in theoretical writings the right of the poet to break rules in order to create his own. The preromantic movement is linguistically characterized by highly emotional or intimately ordinary vocabulary, and new irregular structures violate the classical genre patterns. An excellent example of this new style is the large poem *Grevinnan Spastaras död* by Lidner, where strongly subjective and emotional words and a great number of outbursts, interruptions, exclamation and other punctuation marks in irregular lines of verse form a sharp contrast to the ideals of classicism.

The transition from one epoch to another can also be studied in one and the same author, Esaias Tegnér, who became perhaps the chief representative during the romantic period proper. His youthful poetry has been studied, and proves him to be a disciple of the classical movement (Mjöberg 1911). The central principle here was not to create an individual style but to conform to existing models and in this way show familiarity with classical literature. Tegnér was no exception. But in spite of this, new features emerged in Tegnér

which came to be typical of the romantic period: an interest in the Nordic past and its mythology ("gothicism"), and a striving for fresher metaphors, now not only from the over-used metaphorical resources of classicism but from down-to-earth, prosaic reality, in this respect heralding Strindberg's revitalization of metaphorical language. As one of the greatest creators of figurative language in Swedish literature, Tegnér stands out through his readiness to seek the right and effective metaphor.

What is of interest when considering the transition from one period to another is what is retained as an achievement and what is added. This has been dealt with in a lengthy description of the heyday of the Swedish romantic movement focusing on one of the leading poets, Erik Johan Stagnelius (Malmström 1961). The romanticists retain the baroque rhetorical devices but concretize the vocabulary, at the same time introducing a number of highly poetic simple words and compounds of these. Different verse forms are used with great mastery, e. g. the canzone and the sonnet of the Romance Renaissance, and great stress is laid on the purely musical sound effects of the words. The most conspicuous feature is the use of so-called ornamental words, both as simple words and as compounds, e. g. *purpur-purpurnmoln*, *guld-guldmoln*. In Gothic poems, i. e. poems with Old Nordic themes, Old Nordic words and proper nouns were used, while poetry inspired by folk songs is characterized by poetic words as well as concrete words side by side. The poet who more than others utilized everyday words, giving them a poetic touch, was Johan Ludvig Runeberg, the Finnish national poet, above all in hexametric poems and in the collection of poems called *Fänrik Ståls sägner* ('The Tales of Ensign Stål'). A study of poetic licence in 19th-century poetry (Berg 1903) demonstrates that there were a great number of grammatical deviations from prose texts, for instance as regards inflections and word forms, phraseology and word order. The deviations do not stem solely from metrical factors but are also used deliberately to create a specific poetic style, but the result is often a deviant use of language. Another effect is the frequent use of reduced word forms e. g. *solen-soln*, *sedansen*), which coincide with those of spoken language. Other reductions in the form of elision and syncope may, on the other hand, be of a type unknown in spoken language, e. g. *papegoja* from *papegoja* ('parrot').

4.5. Late 19th-century poetry

In the 1880s, when naturalism prevailed, a trend was broken and different levels of style were utilized in verse: highly poetic styles side by side with sober naturalistic ones. This had happened before in Swedish poetry. Free verse was now introduced and involved a partly naturalistic choice of words and more colloquial language, represented by authors like August Strindberg (e.g. *klorofyllgrönt* ('chlorophyll-green'), *schäslong* ('coach')). In the 1890s, Swedish literature witnessed another golden age with poets like Verner von Heidenstam, Gustaf Fröding and Erik Axel Karlfeldt. Rhythm and sound, highly poetic words, among them Biblical and archaic ones, played an important part, as did everyday words and metaphors. The chief exponent of such a style, both poetic and colloquial, was Fröding. During this period, pastiche was also cherished, and ballad style, baroque style and classical style were imitated with great skill.

4.6. 20th century poetry and modernism

In the first decades of the 20th century, free verse was used by symbolism and expressionism. The symbolism is based on nature and musical effects but relies on traditional syntax and metaphorical language. It is represented in Swedish poetry above all by Vilhelm Ekelund and Edith Södergran. Expressionism has a distinctive, peculiar syntax and ungrammatical clause structure, ellipses and long compound words, strongly emotive and dynamic words, often in semantically unusual combinations, as well as a bold use of figurative language in which there is often no clear semantic relationship between image and content. The chief expressionist poets are Edith Södergran, Elmer Diktonius, Pär Lagerkvist and Birger Sjöberg (the collection *Kriser och kransar*; Helén 1946). Sjöberg also created the lyrics and music for *Fridas visor* in a partly colloquial style with conscious stylistic violations. Sjöberg carried on a tradition from Bellman and was succeeded by Evert Taube, who was also both poet and musician. An entirely individual, fragmentary and syntax-violating poetic style was, however, developed by Gunnar Björling. It should be pointed out here that three of the leading modernists, Södergran, Diktonius and Björling, hail from the Swedish-speaking part of Finland. In the 1930s and 1940s surrealism arose, with texts dominated by rather obscure metaphorical

language. The chief representatives of this movement in Sweden are Gunnar Ekelöf and Erik Lindegren. Collectively, all these movements can be labelled as modernism, but this concept is consequently very heterogeneous. Its characteristics include: (1) Free verse, often close to prose, changing with the content and thus giving rise to nonrecurrent forms; (2) New structural approaches: associative structure, a stream of metaphors, composition imitating music; (3) Linguistic compression, both syntactic and visual; (4) Associative, autonomous metaphors which often support the central content; (5) Bold collocations in the form of phrases and compounds; (6) Often a mixture of styles with literary language, specialist terms and everyday language. It is, however, important to observe that, alongside modernistic poetry, traditional verse with regular rhythm and a "poetic" vocabulary was also written. In the 1950s, as a reaction against the obscurity of modernism, so-called neo-simple verse, close to prose and in imitation of colloquial language, was written (e.g. by Sonja Åkesson). In the 1960s, use was made of the collage technique and concretism as non-linguistic modes of expression, such as pictures and emblems of different types.

5. The genre of drama

5.1. 17th-century dramas

Drama forms a special genre in the sense that the text almost exclusively consists of turns of speech, possibly interrupted by brief stage directions. The turns of speech may resemble spoken language or, on the other hand, may be stylized in a manner foreign to colloquial speech. The latter is true of verse dramas, produced in Sweden up to the middle of the 19th century, when prose took over. The history of Swedish drama can be said to begin in the 17th century with Biblical and historical plays, comedies and school dramas. They were written in medieval doggerel verse, which to some extent imitated spoken language, and they were characterized by a concrete, often harsh and colloquial language with invectives and expletives (Stähle 1975). An important verse unit was the rhymed couplet. The word order was most often natural, but more archaic features were also in evidence. There are also dramas containing a mixture of language styles. In realistic dramas one can for instance follow the emerging use of a singular verb

form with a plural subject. A study has been produced of how the language has changed in this respect starting from the 17th century (Larsson 1988).

5.2. 18th-century drama

In the 18th century, drama was a highly appreciated genre. A stylistic convention of the time decreed that tragedies should be written in verse and comedies in prose. Many of the dramas of the period, perhaps mainly comedies, were translations from French. In the 1830s, three Swedish comedies were written, one by Carl Gyllenborg, *Swänska Sprätt-höken*. It is written in a natural colloquial style, so that the characters representing various social levels speak in different ways (Widmark 1969). Spoken language is also rendered naturalistically in A. F. Ristell's *Några mil från Stockholm* (Grip 1901). Some other comedies from this century have also been preserved, and we are fortunate that the contemporary Stockholm pronunciation has been marked in many of the actors' copies of the texts (Hillman 1973).

5.3. August Strindberg

Between 1830 and the 1870s, before Strindberg, many historical dramas were written, usually in blank verse, sometimes with inserted colloquial prose passages, as in Shakespeare. A new type of drama emerged in the 1870s with Strindberg's *Mäster Olof* plays, written in three main versions. Their language has been analysed by Liljestrand (1976, 1980). Strindberg's ambition was to write in close imitation of spoken language. He reached this goal only partly, but he created an effective dramatic prose language based on the Icelandic style of dialogue. In his subsequent and prolific output of dramas, which reached most of the stages in the world, Strindberg developed his dramatic technique, which he adapted to the content: contemporary language for contemporary action and mixed with archaic language for historical events. In his late works, especially his chamber plays, Strindberg developed an associative dialogue language that more closely imitated colloquial speech. A comprehensive analysis of Strindberg's linguistic development as a dramatist has not yet been made. This could be accomplished using linguistic methods and conversational analysis.

5.4. 20th-century dramas

The dramas of the 20th century have not been studied from a linguistic point of view. Prominent authors of the first half of the century are Hjalmar Bergman, who published some of his novels in dramatic form as well, and Pär Lagerkvist, who in his expressionistic dramas followed in the footsteps of the late Strindberg. The most recent period is represented by Lars Norén, who has imitated an everyday form of language and in addition experimented by letting the actors themselves construct their dialogue. To this must be added radio and TV dramas, all uninvestigated from a linguistic point of view.

6. The prose genre

6.1. 18th-century prose

The genre of original literary prose had a late start in Sweden. A limited range of Swedish prose literature did exist, for instance recorded folk tales. Olof von Dalin can therefore be considered the first author in this genre. In the 1730s he wrote short stories on different themes for *Den svenska Argus*, and in *Sagan om hästen* he dealt with a section of Swedish history in the style of Swedish folk tales. Dalin created a modern journalistic style which does not imitate Latin but is based on Swedish vocabulary, syntax and clause structure. Dalin opposed French influence, adjusted his language to content and was a master of style imitation. In a second edition, 20 years later, Dalin elevated his stylistic level and made it more classical and less colloquial. The style became more formal. Dalin's prose played an important part in the development of written Swedish as many of his grammatical features became normative (Hillman 1970, Widmark 1998). In the travel accounts of the scientist Carl von Linné there are passages with a literary flavour, and this is also the case in other travel writing during this period. Linné's use of language draws attention to the exact factual terms ("factual poetry"). His clause structure is distinctive, as Linné often introduces a clause by a thematic word which serves as a heading. His matter-of-factness and simplicity set a fashion in Swedish descriptions of nature (Fries 1971).

6.2. The prose of the 19th century

The first Swedish prose novel was published as late as the 1740s. In the early 19th century,

there were a few novelists like Fredrik Cederborgh and Claes Livijn, but then Carl Jonas Love Almqvist appeared. In his vast body of work, Almqvist mastered both romantic and realistic language, mixing various modes of expression (drama, poetry, letters etc.). Almqvist's realistic prose is an important source of knowledge about the language of the 19th century. Studies of Almqvist's language focus on his synaesthesia, changes made in his manuscripts and his realistic dialogue. Individual novels and short stories have been studied, and Almqvist's work is also included in dissertations on 19th-century prose (Janzén 1946, Wieselgren 1971). In spite of this, most aspects of Almqvist's language and narrative technique still remain to be investigated.

As regards female writers from the first half of the 19th century, Emilie Flygare-Carlén's use of language has been studied (Janzén 1946) in connection with dialogue in 19th-century novels. In Flygare-Carlén's novels, the dialogue is markedly dialectal, even for the main characters, which was something new in Swedish prose. Janzén shows how the dialogue in the novels of the 19th century became socially differentiated: the upper classes used speech typical of written language and the lower classes used every-day colloquial language. Examples of the language of the lower classes are enclitic forms of pronouns (e.g. *tro't* = *tro det*, 'believe it'), reduced forms of common verbs e.g. *ta* = *taga*, 'take') and adverbs (e.g. *lite* = *litet*, 'little'), every-day words and syntax, for instance singular verb forms with plural subjects (e.g. *de tror* = *de tro*). Another prominent female writer was Fredrika Bremer; a few more could be mentioned. A new field of research might be a comparison of the language and narrative technique of these female writers and of their male colleagues.

Viktor Rydberg, poet, prose writer and an important personality in the field of culture, imitated Latin sentence structure in *Den siste atenaren*, but opposed German influence on Swedish as regards the choice and formation of words. This can be studied in his novels *Singoalla* and *Vapensmeden*. Rydberg was active not only as a literary figure but also as a journalist, which gave him the opportunity to spread his puristic conception of language. A number of Swedish words which Rydberg used to replace loanwords have gained a foothold in the language, for instance *kynne* 'character' and *flertal* 'majority' (Holm 1918).

6.3. August Strindberg and Selma Lagerlöf
Modern Swedish prose emerged with August Strindberg's *Röda rummet* (1879). This novel contains both traditional features of written language and modern elements taken over from spoken language. The choice of words and the phraseology are concrete, with a sprinkling of traditional formal words, while the sentence structure is of both an older and newer type. Strindberg's dialogue is rapid and effective, imitating speech, and is comparable to the language of his dramas. His vocabulary is extensive in many fields: natural science, technology, medicine etc. and is considered to be unsurpassed in range and precision in Swedish literature. For instance, the novels *Hemsöborna* (1887; Dahlbäck 1974) and *I havsbandet* (1890) jointly contain a very great number of highly specific words referring to scenery, the sea, nature, plants, birds etc. This precision and concreteness could be said to follow in the tradition started by Linné. A glossary of Strindberg's language is being compiled. Through for instance dynamic and dramatic force he enlivens even his prose texts. Strindberg's rich metaphorical language is innovative and varied both formally, involving a modification and extension of over-used metaphors, and in the choice of images, as he progressively utilized more and more new terms and concepts, found in contemporary technology and science (Kärnell 1962).

Selma Lagerlöf made her debut in 1891 with the novel *Gösta Berlings saga*. It is characterized by rhetorical and emotive language with many stylistic figures and interjections but with simple sentence structure. This style is exceptional in Selma Lagerlöf's output, which comprises prose exclusively. In *Nils Holgersson* (1906–1907), written as a textbook for elementary schools, and in subsequent works, she used a different type of language based on oral narrative tradition and folk tales. This book paved the way for a closer connection between Swedish written and spoken language.

Strindberg and Lagerlöf have influenced both the literary and the standard language. At the end of the 19th century, the language debate was led by influential scholars who, opposing Latin-influenced written language, held up the spoken language as a model. Noreen considered Strindberg the foremost stylist of his time and prophesied that his language would become classic and normative. Strindberg is considered to have contributed

to the establishment of modern language by his use of colloquial elements not only in dialogue but also in narration. This probably contributed to the adaptation of similar elements in lighter non-literary prose genres.

6.4. The turn of the century and the early 20th century

In 1895 Hjalmar Söderberg made his debut. He used a stylized form of spoken language which followed French and Danish prose style as regards the choice of words, syntax and clause structure. Rhetorical figures are almost completely lacking. Söderberg's seemingly simple style and narrative technique have been admired and imitated. In the domain of lyric poetry, he had a contemporary counterpart in Bo Bergman who, in opposition to the romantic style of the 1890s, created a simple but expressive poetic language.

The following period (1910–1920) is marked by a more academic style with complex clause structures based on the written language. In the 1920s a “syntactic revolt” began, the main representatives of which were Pär Lagerkvist and Tage Aurell. Consciously approaching colloquial language, Lagerkvist wrote sentence fragments and main clauses linked by commas. Lagerkvist's choice of words is simple and lacks rhetorical figures. Aurell used sentence fragments where clause constituents were reduced to the utmost, and deviant punctuation. In Aurell's prose the dividing line between narrative, reflection and dialogue has been dispensed with, also linguistically. In spite of colloquial elements and a sparse use of rhetorical figures, the language is far removed from spoken language. Aurell's technique is similar to that of lyric modernism and has been further developed by other writers. This is a field that has not been investigated.

In the 1930s the so-called working-class writers appeared, among them Jan Fridegård and Ivar Lo-Johansson. They were self-taught and came from a non-bourgeois milieu. They described the environment in which they had grown up and used a colloquial type of language with every-day, often harsh words, simple syntax and clause structure. One of them, Eyvind Johnson, little by little widened his world picture and described various environments in different periods, which required more complex language. The intricate structure and symbolism of one of his novels, *Hans nådes tid*, has been studied by Söderberg

(1980). In the 1930s most prose writers stopped using plural verb forms, and the same development took place in the weeklies.

6.5. Modern prose

The prose literature over the next five decades is almost boundless in content, narrative techniques and language variety. Here only the main features can be indicated. The realistic writers continued to stick to the colloquial trend and developed it both in narration and dialogue. Statistically this has meant shorter words, shorter sentences with fewer clauses and shorter clause constituents, more sentences consisting of a single clause and more nominal sentences. Many writers have also developed an effective technique of rendering authentic spoken language in its different social and individual variants. A characteristic feature of modern realistic prose is that large portions of the text, in some cases up to 50%, are made up of dialogue. This technique already occurs in older narratives, for instance in the folk tale, where action and dialogue are dominant. In modern times the technique is also supported by the fact that colloquial language has attained a position of its own and that many writers have lent an attentive ear to authentic speech. But stylized dialogue which does not imitate spoken language occurs as well. Spoken communication in literary prose has been illustrated in theory and practice in two works (Liljestrand 1983, London 1989). Great epic writing is above all represented by Vilhelm Moberg in novels that have become classic, e. g. in a series of novels about Swedish emigration. Moberg is an eminent stylist, displaying a rich variety of colloquial simplicity, including dialectal elements and American-Swedish as well as archaisms and rhetorical figures. Documentary prose (e. g. Per Olof Sundman and Per Olov Enqvist) imitates informal non-literary prose with a sprinkling of specialist terms, with simple syntax and clause structure and an absence of rhetorical figures. Close to this style is also that of other realistic writers, for instance P. C. Jersild, who has rendered medical and administrative jargon as well as the Swedish and the diary style of immigrants. In the tradition of Linné, Harry Martinson used detailed scientific vocabulary and a great number of neologisms and advanced metaphorical language. Writers like Sara Lidman and Torgny Lindgren use the dialect of Norrland, combined with scriptural language. Hovering between

different modes of presentation, choices of words and metaphors, syntax and clause structure, Lidman creates an individual style, based not only on spoken language, while Lindgren builds on oral narrative tradition with forms and compounds from the Norrland dialect.

7. Final words

It is clear from this brief survey that Swedish literary language will have to be described with due regard to different genres. It also is obvious that there are great gaps in our knowledge, due to the fact that most research efforts have been sporadic. Language ought to be described in a manner that transcends boundary lines, so that, for instance, structure, cohesion, narrative technique and dialogue structure are integrated with linguistic analysis. Ideas for such research can be found for instance in a relatively recent collection of studies of style, *Stilstudier* (1996). It is also an urgent matter to study the role of dialects, not least in the prose of the last few decades.

The variation found in the language of literature over the course of time fluctuates between a complex style based on the written language and a simple style representing spoken language. Colloquial language in non-literary prose, literary prose and drama, has played an important role in the development of written language from the Latin tradition to the original Swedish one based on spoken forms of morphology, syntax and clause structure. This is probably related to factors described above: first the spoken language was established in literary dialogue, then also in narrative and simultaneously in lighter non-literary prose. When elements closely related to spoken language have penetrated into all types of text, including the modern translation of the Bible, they become neutral on the stylistic scale. This has been a link in the democratization of language. The fact that more exclusive views of language also exist, for instance in the literature of modernism, is in this connection a marginal phenomenon.

9. Literature (a selection)

This article focuses on various aspects of the relationships between the language history and literary history of Norway from the last decades of the 18th century up to the present day. Taking a mainly chronological perspective, the article describes and discusses the development of the two literary languages of Norway, within the frames of general language development and the changing aesthetic norms of literature.

1. Introduction

A glimpse at the table of contents of a Norwegian language history book convinces us of the close connection between language history and literary history. To take Vemund Skard's *Norsk språkhistorie III. 1814–1884* as an example, most of the chapters of his book borrow their names from the canon of Norwegian authors of fiction: Henrik Wergeland, Ivar Aasen, Aasmund O. Vinje, Henrik Ibsen, Bjørnstjerne Bjørnson, Jonas Lie, Alexander Kielland. The only linguist, apart from Aasen, who is given a separate chapter is Knud Knudsen, Aasen's contemporary and a father figure

for the Bokmål movement which advocated the gradual Norwegianization of the Danish written language. This example strongly signals the impact that writers of fiction are supposed to have had on language development in the 19th century, not only in their capacity as competent and innovative users of the written language, but in many cases as participants in the public debate on language issues as well.

The road to literary and linguistic independence, especially from Denmark, was long and difficult, but in many senses was the *same* road. Thus the literary history of the 19th c. deals to a large extent with questions of language, vocabulary, syntax and style, just as the history of the language is very much concerned with literature, with how and what sort of Norwegian language authors of fiction use. This mingling of literary and linguistic matters is the topic of this article. In a century with few competing medias authors of fiction traditionally have been regarded as the most competent and influential users of language. The historian Ernst Sars coined the term “poetocracy” to express the power of the poets in many fields of society in the last third of the 19th c.

The main focus of this article will be directed towards the two last centuries. Historical conditions and circumstances make the 19th c. crucial to our study, marked as it is by the foundation of a new Norwegian state in 1814, and by nation building efforts in several political, social and cultural fields. As far as language and literary history are concerned, the Norwegianization of the Danish literary language through the century and the creation of a new Norwegian written lan-

guage, Aasen's *Landsmål*, around the middle of the century, are historical phenomena that are focal points for the subject matter of this survey article.

2. The situation at the beginning of the 19th century

In 1814, a Norwegian literary language and a Norwegian literature, produced and received within its own literary institutions, were non-existent. What did exist was a national enthusiasm and a strong urge to develop a national literary language, a national literature and literary institutions. But this patriotic enthusiasm was, in most cases in the first two decades after 1814, stronger than the poems and songs it employed.

The Norway of 1814 had fewer than a million inhabitants, scattered in small rural and coastal communities and in small towns. With an acceptable degree of simplification, one could divide the small population into three social groups: the farmers, the bourgeoisie and the civil servants. According to the historian Jens Arup Seip, these three social layers were so different in their economic basis and way of living, as well as in their world view and norms of behaviour, that one could consider them as three societies living side by side (Seip 1974, 63). They lived in different worlds, and they knew it. The farming group was by far the biggest. Nearly 90% were dependent on agriculture and a barter economy, as farmers, cotters, servants and casual workers. The once wealthy, mercantile aristocracy was displaced due to the blockade during the Napoleonic wars and the economic depression in the years after that, so the leading political and cultural role was taken over by the new intellectual upper class of civil servants, comprising three juxtaposed hierarchies: the lawyers, the clergy, and the officers. They were not wealthy and not numerous, but they were spread across the entire country as a social class and a political institution. There was a cultural gap between the civil-servant class and the others due to their education and knowledge of Latin. Their spoken language also separated them from the dialect-speaking rural population and their university studies in Copenhagen and their mastery of Danish connected them to a literary culture outside Norway.

Seip (1974, 68) comments that by taking responsibility for matters of common concern, the isolation of the Norwegian civil-servant

class as a political power was broken. They based their political hegemony on *national* interests, against Swedish threats of amalgamation, but at the same time they had to choose allies either in the farming class or among the middle classes in the towns. They tried both, but around the middle of the century most parts of the bourgeoisie supported and relied on the leadership of the civil servants. The period of 1814–1884 is commonly called “*embetsmannsstaten*”, the civil-servant state. Up to 1884 the civil-servant class managed to stay in office due to support from the upper classes in the rural districts and in the towns, but the alliances were never strong or permanent and finally the breakdown of the “*embetsmannsstat*” led to the introduction of a parliamentary system. The fathers of the 1814 constitution had themselves contributed to future conflicts by stipulating that two-thirds of the members of the Storting should come from the rural districts, that is to say from the farmers. In order to understand the history of Norwegian culture, and in our case the history of language and literature, one has to be familiar with these two cultures of 19th c. Norway, the civil-servant class and the farming class. The relations, in a wide sense, between these two cultures provide a frame of reference for understanding the complex topic of this article.

The main issue was: on which bases should Norway develop her own independent culture? The farming society had its own local forms of culture; wood carving and the peasant style of decorative painting (*rosemaling*) were flourishing, and popular poetry was still alive in the first decades of the 19th c. The *nystev*, a short improvised poem sung at wedding celebrations and similar occasions, was probably enjoying its richest period just at the time. Local poets, writing in their own dialect, were probably part of most rural communities, and some of them were even known outside their local borders. But all in all, the farming culture was marginal and isolated. It received little input from outside, and it was for a large part unknown or not appreciated by those who were in power.

But even academic poets were drawn to the dialect of their home place and life among ordinary farmers. The *Norske Selskab* poets Edvard Storm and Thomas Stockfleth had written popular dialect poems (from Gudbrandsdalen) in Copenhagen, and Henrik Anker Bjerregaard had written the musical *Fjeldeventyret* (1824) using a Norwegian

setting and with Norwegian local colour, including a dialect-speaking dairy-maid, Aagot who performs as the lyrical highlight of the play an evening-song in Vågå dialect (Gudbrandsdalen): “Sole gaar bak Aasen ned,/ Skuggjin bli saa lange [...]”. Waldemar Thrane wrote the music for the play.

Compared to the literary tradition, the dialogues in this musical are rather close to daily speech, and the vocabulary excels in Norwegianisms. Several local poets carried on the dialect genre. The most prominent of them, Hans Hanson, wrote his most famous poem, *Sveinung aa Aastri*, in Telemark dialect, as a rather free adaptation of Horace. When Horace was used as a model even for dialect poems, one can easily imagine the general impact of classical Greek and Latin authors on the literary language of the writers of the civil-servant class. Their Danish literary language was based on Latin models of rhetoric and style. Even their patriotism took on a Roman feel, stressing ideals such as duty, self-sacrifice and modesty together with those of the Enlightenment and the French Revolution that were written into the Constitution of 1814.

With the sparse production of Norwegian books in the first decades of the 19th c., the reading public turned to Danish literature, to popular European and American authors in Danish translation, or to original German, French and English literature. The book market and the weak literary institutions in the fledgeling Norway strengthened the impact of the Danish literary language. A translation of some of the Icelandic sagas around 1820 introduced quite a few Norwegian words and the saga style into Danish literary language, and initiated a language dispute. But the tendency to break with the Danish models as far as vocabulary and syntax were concerned, was followed by many authors, among them the most prolific, Maurits Hansen, whose farmers and craftsmen used dialect words and a spoken variety in the dialogues that was closer to the Norwegian linguistic reality.

Most of the Norwegian authors of fiction in the 19th c. were sons and daughters of civil-servant families. Ivar Aasen, Aasmund Olavson Vinje and Arne Garborg were the most prominent exceptions. Aasen constructed a literary language based on the dialects of the farming or rural population and was the first to use it as a literary language. Vinje and Garborg adapted Aasen's *Landsmål* and developed a subtle literary language only a few decades later. This fact illustrates rather strikingly

the connection between social heritage and choice of literary language. However, in the last three decades of the century or so, the authors' social background became more varied. A meta-perspective on the national history of language and literary genres will underline their origin in romanticism. The change of paradigm from classicism to romanticism is paralleled by the political and economic liberation of the middle classes. The static and normative classicist aesthetics of feudal society was challenged and undermined by the notion of progress and development in the ideology of the middle classes. The classicist cultural view and the classicist aesthetics of imitation were destroyed by the theses of human progress, together with Montesquieu's idea of historical development as a causal phenomenon. The new perspective on history and development established the basis for the new historical sciences. Herder took up Montesquieu's view that phases of culture are periods with their own specific life, causes and conditions. He asserts that these phases are links in an organic course of development. The history and culture of a country develops as an organism dependent on the surroundings and the conditions of growth. This implies a view of culture as a *national*, not a general, phenomenon, as the classicists saw it. And it stresses that the people of a country form an organic unity with a common spirit expressing itself in their cultural activities. The concept of the organism applied to history and culture entails the idea of a phased course from birth, through childhood, youth, mature age, old age and death. The notion of the organism and development equipped historians with tools that put them in a position to situate and explain the texts of the past as manifestations of national growth and progress towards true national identity and comprehension.

The Norwegian poets of the period 1800–1830 certainly did not constitute a “poetocracy”. This period was a golden age in the literature of Denmark and Sweden, but the romanticist movement was not blessed with highly gifted poets in Norway, until Henrik Wergeland. But sentiments usually associated with romanticism, such as national pride, love of home, nature and countryside, had already been developed by members of *Norske Selskab* in Copenhagen in the last decades of the 18th c., and continued to be used by the new generation of authors after 1814.

3. Henrik Wergeland and National Romanticism

In Norway's language history, Henrik Wergeland (1808–45) is the first and most powerful advocate of the Norwegianizing of the Danish written language. He strongly asserted the need for cultural independence from Denmark, and in the struggle for national independence, language and literature had to play an important role. In his article *Om norsk sprogreformation* (1835), a central document in Norwegian language history, he sees the unhappy language situation from the poet's point of view: only minor poets can work in Danish; true Norwegian poets are drawn to the richness of the language of the people. In his own literary works Wergeland used many words from spoken Norwegian, his revolution being more concerned with words than syntax.

In Norway's literary history, Wergeland has become a legend, and is seen as an unsurpassed literary genius, the only true Norwegian romantic poet and an engaged champion of freedom and equality, a symbol for most progressive forces in Norway later on – politically, socially and culturally. His lack of fame outside Norway is explained as a consequence of the small number of people who can read Norwegian; his own poetic explanation for his isolation being taken as a fact: “med et sprog/som ei rekker fra sin krog,/lenger enn dets lebers ånde” (“Følg Kaldet!”, *Jodinden*, 1844). Or, as he sums up his life in the autobiographical text *Hassel-Nodder* (1845): “jeg var – og det var min ulykke med et så sneverbegrenset språk – intet annet enn dikter”.

Wergeland's negative assessment of contemporary Danish literature, which he called “Sofa-Literatur”, came from his view of the poet as a politically engaged teacher of the people. Wergeland was a child of Romanticism, but also of the Enlightenment. According to this romanticist view, there was a close connection between the natural environment, the people, and the language of a country. Poets had to exploit the riches of common people's speech in order to be genuine Norwegian poets. The real people, in opposition to the upper classes, were the basis on which an independent Norwegian culture had to develop. We can see this cultural program most clearly in the linguistic issue, in Wergeland's use of Norwegian vowels, diphthongs and words in his more traditional classical-rhetoric style. But even stylistically there is some development towards simplicity in his

works, although his attempts at Norwegianizing the stylistic tradition cannot be described as consistent or extensive.

Wergeland's article *On Norwegian language reformation* was written as an answer to an attack by his literary adversary, Johan S.C. Welhaven (1807–73), who characterized his language mixture as “det wergelandske sprogforderveri”, the Wergelandian language corruption. The two opponents personify conflicting views on and strategies for political, cultural and literary development of the young Norwegian nation. Wergeland's claim for cultural and literary independence from Denmark was ridiculed by Welhaven, who clearly saw the dilettantism of early 19th c. poetry, and the need for inspiration, not least from Danish literature.

On March 29, 1849 there was a performance at the Christiania Theater that has been viewed as the epitome of Norwegian National Romanticism. The most effective scene was the *Brudefærden i Hardanger*, a tableau representing Tidemand and Gude's famous painting accompanied by Andreas Munch's poem “Der ånder en tindrende sommerluft/varmt over Hardangerfjords vanne”, set to music by Halfdan Kierulf and sung by the Student Chorus. The audience for this idealized rural scene were city dwellers with a strongly aroused enthusiasm for the *national*, for natural scenery and the cultural value of folk art. This infatuation with folk culture by the civil-servant class led to the “national breakthrough”, understood as an intellectual movement that came to characterize the 1840s–50s and give direction to the development of Norwegian culture.

The “national breakthrough” did not create much distinguished poetry, apart from Welhaven's, but for him and the other central poet of the time, Andreas Munch (1811–84), the *national* concept did not include the language. But the tradition of Norwegianizing the written language that Wergeland initiated was taken up and advanced by the writers and famous collectors of Norwegian folk tales, Peter Chr. Asbjørnsen (1812–85) and Jørgen Moe (1813–82). Wergeland's rather abstract reference to the richness of folk culture was concretized by Asbjørnsen and Moe and other National Romanticists, who collected and wrote down the oral folk tales and legends. Their editions of *Norske Folkeeventyr*, (1841–44), together with Asbjørnsen's *Norske Huldreeventyr og Folkesagn* (1845–48), were of great importance for the development of

19th c. Norwegian prose. Their intent to preserve the storyteller's language, at least as far as vocabulary and paratactic syntax were concerned, resulted in a norm-breaking prose style that aesthetes like Camilla Collett and her husband Jonas Collett found too rough and unpolished. The main edition of the folk tales from 1852 was "collected and *told*" by Asbjørnsen og Moe, signalling their intent not to render the tales as true to the dialect and the specific wording of the storyteller, but rather to render it as stylistically and syntactically coloured by the mode of telling that had prevailed for centuries in Norway. Norwegian language history is concerned with the linguistic documentation of the "eventyrstil", the style of the folk tale, but we need not go into that here. One issue is important to stress, though: the simple style that Asbjørnsen and Moe introduced, in contrast to the traditional prose style of the time, illustrates perhaps more the difference between popular and literary style than between Norwegian and Danish.

The influence of the linguistic, or rather stylistic, adaptation of the folk tales may be seen in the next generation of Norwegian authors, Ibsen's and Bjørnson's generation. The new stylistic pattern of the folk tales was, in Asbjørnsen's case, only applied to the tale itself, not to Asbjørnsen's framework for the story, which was kept in the rather traditional classical-rhetoric literary style of the period. But when we come to Bjørnson's peasant tales in the 1850s, there is a radical break with the stylistic tradition. The peasant tales were not Bjørnson's invention – Steen Steensen Blicher (Denmark), Berthold Auerbach (Germany) and Jeremias Gotthelf (Switzerland) were predecessors – but the ideological basis for Bjørnson's tales, as for many of the different cultural endeavours in the mid-19th c., had a distinctive national stamp, a growing national consciousness, a conviction that Norway, young as a country but ancient as a kingdom, was intimately related to its heroic past, and that it was important to foster that inherent relationship. The Norwegian peasant was the connecting and custodial figure in this ideology, the bearer of a set of traditional moral, spiritual and existential values. In a speech late in life, in 1908, Bjørnson said that the peasant tales were intended as a plea on behalf of the peasant, and concerning the language he stressed that we "had come to understand that the language of the sagas lived in our peasants, and their way of life was close to the sagas.

The life of our nation was to be built on our history; and now the peasants were to provide the foundations". But the peasants themselves were not aware of this fact, of course; it had to be passed on to them. This cultural and literary program largely influenced the style and language of the peasant tales, which were not only written *about* the peasants, but *for* them, as well. In the light of their popularity and appeal, they undoubtedly affected the readers' social and stylistic conceptions.

The use of distinctively Norwegian words and idioms is extensive in the peasant tales, while the orthography and mode of inflection is rather traditional. When Danish readers experienced the peasant tales as "et ravnorsk, lavet Idiom" [a broad Norwegian, artificial idiom], the reason is mainly their vocabulary, the syntax and the style. In general the nationalistic ideology and the cultural and literary program behind Bjørnson's peasant tales put the focus on the literary language and favoured its Norwegianization. The peasant tale *Arne* (1858) was the culmination of Bjørnson's efforts in that direction and it shocked the public with his radical linguistic solutions that approached the norms of Ivar Aasen's Landsmål. What probably worked against the Norwegianization of the language was the close connections between the Norwegian authors and the Danish editorial house Gyldendal. Considerations on behalf of the Danish reading public presumably made the publisher, the famous Frederik Hegel, reluctant to implement a radical division of the literary language of Denmark and Norway.

4. The Modern Breakthrough

In the anti-idealistic, and anti-metaphysical cultural climate of the 1870s and 80s, prompted not least by positivism (Auguste Comte), utilitarianism (John Stuart Mill), and Darwinism (Charles Darwin), Norwegian literature came to concern itself with the present-day realities, not a heroic and idealized past. This development towards realistic, problem-oriented literature was inspired and defined by Georg Brandes in his public lectures in Copenhagen, starting in 1871, and later published under the title *Hovedstrømninger i det nittende Aarhundredes Literatur* (1872–90). *The Modern Breakthrough*, Brandes' term for the realism he advocated, turned out to be a great period in Norwegian literature, the period of Ibsen, Bjørnson, Elster, Lie, Kielland, Skram,

Garborg, and other minor authors. The “realism” and the “naturalism” of these authors were of course a linguistic phenomenon, an attempt to render “reality” in a true and accurate way. The literary language changed, as paradigmatically demonstrated in Amalie Skram’s naturalistic short story *Karens Jul*, (1885). Instead of calling the physical centre of the story a miserable shelter, the narrator presents an extremely thorough and detailed description of it in the opening of the text. A later description of the weather on the cold December night is just as detailed. This intentionally logical stylistic consequence of the objective, scientific attitude of naturalism can be seen in the texts of several authors of the 1880s and 90s, and most strikingly in some of the works of Skram and Garborg.

But, perhaps surprisingly, the dominant stylistic mode of naturalism and realism in Scandinavia is designated by the term *impressionism*. The main feature of impressionism was to substitute the detailed description with the characteristic and characterizing detail. Impressionism, in Denmark and Norway, is first of all a stylistic concept, not a concept of literary period. Impressionism influenced literary language in many ways and on many levels, concerning narratology, style and syntax. The mimetic aesthetics of impressionism, intended to create a strong illusion of reality, concealed, to some degree, the literary quality of the discourse. The means of perception, more than the rules of grammar, were given priority in the impressionistic ideal of language and style. The impression that the literature of the 1880s and 90s was closer to spoken language was the effect of a highly artistic, literary style. Scenic representation and the use of dialect is consistently practised for instance by Amalie Skram in her naturalistic work *Hellemyrsfolket*, even if her mimetic strategy made the reading of the text difficult, not least for her Danish audience.

Neither Skram nor Henrik Ibsen (1828–1906) were propagandists in language matters. Any activity that distracted Ibsen from his literary work was avoided, but still, according to Trygve Knudsen, Ibsen had a most potent influence on the development of Norwegian literary language and style, achieved first and foremost through the impact of his realistic dramas. And from the point of view of stylistic history, his work is of particular interest because it mirrors, in a way more typical and more independent than that of any other author, the sequence of the various phases of

style and linguistic expression in nineteenth-century Norwegian literature (Knudsen 1967, 143–144).

In *Kongsemmerne* (1863), Ibsen turned against his earlier attempts to imitate the saga style and adopted Bjørnson’s view that the characters of the drama, whether a saga or not, should speak a modern, living language. Under the influence of Knud Knudsen (1812–95), he mocked the attempt to fabricate a Norwegian language on the basis of Old Norwegian (in *Sancthansnatten*, 1853) and worked seriously to make the existing literary language a completely Norwegian linguistic medium. He also supported Knudsen’s attempts to Norwegianize the language of the theatre. Up to the 1860s only Danish pronunciation was accepted there. Ibsen’s rhymes had presupposed a Danish pronunciation (e.g. ryggen: lykken), but from *Kjærlighedens komedie* (1862) and *Peer Gynt* (1867) onwards, he is careful to base his rhymes on the pronunciation of his own Norwegian language. *Kjærlighedens komedie* is supposed to represent an important phase in progress towards *linguistic realism* – in spite of the verse form of the play. But towards that goal, he had to create a prose style that was based on the actual speech of living people, and more specifically on “the speech of Norwegian townspeople of the upper and middle classes” (Knudsen 1967, 162), which was the social setting of his modern plays. The Norwegianization of vocabulary, style and syntax was a necessity in order to give a natural sound to the dialogue. To that aim, to enhance the “idiomatic authenticity of the whole movement of the speech of his characters” (Knudsen 1967, 162), Ibsen introduced linguistic material that was at that time uncommon in traditional literary language, such as the double article, for instance in *Rosmersholm: de hvide hestene, alle de nye tankerne, alle de gamle fordommene*. Ibsen’s mastery in characterizing through language comprises, on the lower social ladder, his rendering of “illiterate” and “vulgar” speech, as in the case of Engstrand in *Gengangere* (1881) and Gina Ekdal in *Vildanden* (1884), and on the higher social scale, the bureaucratic, formal language of Peter Stockmann in *En folkefiende* (1881), far away from the colloquial levels of speech of the other characters of the play.

Ibsen’s rendering of language in his plays is certainly not, as Trygve Knudsen puts it, “a tape-recording of everyday urban speech with all its trifling and incidental elements” (Knud-

sen 1967, 165). It is rather a linguistic creation on the basis of everyday language, in which certain typical and significant elements of the spoken idiom are integrated in the literary language. In addition to the double definite article, Knudsen mentions peculiarities of word order, e. g. Hilde's "Var der tårn på det huset også?" (*Bygmester Solness*, 1892), her use of repeated unstressed pronouns as in "Jeg synes det er så liketil, jeg", her use of pronominal terms referring to complex, emphatic parts of the sentence, e. g. "Alle mulige småting, så husker han dem på flekken", and the large number of interjections and unstressed modifiers, e. g. Hilde's "Isch, neida" and "Nei, det har jeg da ikke". These linguistic features and the special tone they evoke defy direct translation.

The urban speech of Kristiania (Oslo) and other towns in southeast Norway lies behind Ibsen's stage language. The speech of eastern Norway had not been accepted on the stage during Ibsen's National Romantic period. Most of the actors were Danish, and even Norwegian actors had to adopt Danish pronunciation. Educated Bergen speech was for a while the only accepted version of spoken Norwegian on the stage, until Ibsen moved the linguistic centre of gravity to eastern Norway. It is due to Ibsen's modern plays, Trygve Knudsen maintains, that the utterly formal vocabulary and syntax of Peter Stockmann in *En folkefiende* (1881), the language of official documents, has "disappeared almost entirely from Norwegian literature" (Knudsen 1967, 170). That is a strong assertion, but even if it is partly true, the modern plays of Ibsen have had a thorough and widespread linguistic influence.

5. Landsmål – a new literary language

P. A. Munch (1810–63), who defended the Danish standard and attacked Wergeland for his superficial Norwegianization, suggested in an article from 1832 that a genuine Norwegian standard could be created only by bringing one of our purest dialects into a proper form, using Old Norse as a guide. Twenty years later the self-taught linguist and poet Ivar Aasen (1813–1896) carried out Munch's idea, not by converting one Norwegian dialect to a proper form, but by creating a proper form out of a large collection of dialect material. In 1853 Aasen published *Prover af Landsmaalet i Norge*, in which he demonstrated the ability of the language to express a wide variety of

speech acts and genres of literature. The Landsmaal that Aasen created (from 1929 called Nynorsk) got a flying start as the language of fiction, and that position, acquired in the latter half of the 19th c., has been retained until today. Based on Aasen's linguistic achievement, a new literature and, gradually, a new literary institution developed. Even though Bjørnson and some other authors from the civil servant class were attracted to the Landsmaal movement, the most prominent authors using Aasen's Landsmaal were from the farming society, as Aasen was himself, Aasmund Olafsson Vinje (1818–1870) and Arne Garborg (1851–1924), the two most famous Landsmaal authors of the 19th c. It is remarkable that within a period of thirty years, Aasen's Landsmaal had become an adequate linguistic tool for all types of fiction and non-fiction writing. Aasen, himself a minor poet, wrote poems that grew very popular as songs, for instance *Millom bakkar og berg utmed havet*, a poem typical, as well, for its focus on general feelings, attitudes and concerns.

The poet and journalist Aasmund O. Vinje took up Aasen's Landsmaal in 1858 in his weekly journal *Dølen*, and even if he developed his own version of Aasen's norm, his achievements as a poet and a journalist were of the greatest importance to the expansion of Landsmaal to new discursive fields. Vinje's poetry, compared to that of Aasen, was more personal; the often ironic journalist more often chose the role of *Den Særde* in his poems. His nature poetry, e. g. poems like *Ved Rondarne* and *Vaaren*, were made popular through Grieg's music and contributed, probably decisively, to the widespread notion, even among Nynorsk adversaries, that Landsmaal or Nynorsk is a language well suited for poetry. Perhaps it is too easy to connect that idea with the sonority of the language, but the notion came to support an extensive tradition of nature poetry that several recent Nynorsk poets have felt obliged to oppose and alter. Vinje's journalistic writing in *Dølen* comprises a wide range of topics that thoroughly transgressed the ties to rural and domestic ways of thinking and acting. Vinje made his version of Aasen's Landsmaal to a flexible, expressive and modernized variety. By simplifying the syntax, he brought Landsmaal closer to the structure of everyday speech, and by loosening the purism of Aasen, he made room for foreign words that Aasen did not accept. In the creation of a new journalistic style, Vinje was a model for

both norms of written Norwegian. The year before Vinje died, the political party Venstre was founded, and this party supported the Landsmaal movement. By 1892, municipalities were given the opportunity to choose which language norm they wanted to use in their schools, thus establishing Landsmaal as the second official Norwegian language.

Arne Garborg has a central position in the history of Norwegian language and literature as an eminent writer of fiction and as an influential participant in the debate on the language situation. As a leading intellectual of his time, well read and informed on the ideas of the day, he added authority and prestige to Landsmaal, which, in his hands, proved adequate for many different types of intellectual and artistic discourse. Poetry, which had been Aasen's and Vinje's genre, was written splendidly by Garborg in his poem cycle *Haugtussa* (1895), in which the inspiration of folk tale and folk songs was crucial. And he was the first one to make Nynorsk a language of modern novels, thematizing the conflicts between rural and urban culture, the great morality debate of the 1880s, and the strict pietism and religious fanaticism within the farming communities in naturalistic novels like *Bondestudentar* (1883), *Mannfolk* (1886), *Hjaa ho Mor* (1890), published simultaneously in Dano-Norwegian with the title *Hos Mama*, and *Fred* (1892). *Hjaa ho Mor* exposes Garborg as a purist, like Aasen, wishing to exploit the resources of Norwegian vocabulary, giving hundreds of foreign terms in the Dano-Norwegian version Norwegian equivalents. Garborg strongly stressed that Nynorsk was a *modern* language, and thus had to develop as one; but the modernity of the dialects was sometimes concealed by Aasen because of a romantic misunderstanding, Garborg asserted in a fierce debate in 1887 with Bjørnson, who had accused the Nynorsk movement of being reactionary. Garborg's greatest European success, the fin de siècle novel *Trøtte Mænd* (1891) was written in Riksmål, signaling, perhaps, a feeling that Nynorsk had shortcomings as a language for modern topics.

6. A literary shift of focus: The 1890s

While the Ibsen generation of prominent authors were still prolific, the 1890s in Norwegian literary history are distinguished by a new generation of prose authors, first of all

Knut Hamsun and Hans E. Kinck, the poet Sigbjørn Obstfelder and a group of regional prose writers. As we have shown in section 4, the impressionism of the realistic authors of the 1880s aimed to express feeling and atmosphere through suggestive words, and this subjectivity was further developed in the expressionistic pattern of style characterizing an important part of the literature of the 1890s, not to mention the paintings of Edvard Munch. Kinck's style and language is a literary counterpart; his projection of states of mind on the surroundings make nature and landscape images of anxiety and loneliness. Kinck's literary language, Riksmål, drew heavily on the dialects of western Norway and made him a linguistic innovator. Knud Knudsen, the leader of the Norwegianization movement, looked upon him as an important ally, but Kinck himself was totally indifferent to the programmatic effort to develop the language in certain directions. He was a linguistic artist who succeeded in creating a language that appeared fresh and new, a language with a literariness one cannot fail to sense.

With a shift of focus from the outer world to the inner, from society to mind, literature in the 1890s developed a new language and style. Kinck and, in certain ways, Knut Hamsun (1859–1952), were the main exponents for this inward expansion of literary language, but the precise and meticulously detailed observations of the phenomena of the life of the mind, as a technique, may be said to be inherited from the naturalism of the 1880s. The new style aimed at capturing the fine nuances of the soul. Literature, for Hamsun, was to a large degree an artistic struggle with literary language. His linguistic consciousness, combined with his exquisite powers of language and style, made him one of the great innovators of Norwegian prose. The reception of his works proves that he succeeded in wooing the reader, but the enticing powers of his style have been used against him as well. The assertion that his enthralling or seductive style covers an intellectual emptiness or reactionary ideology makes him a dangerous author to those practising a rather widespread tradition of ideological criticism.

We have seen that the dialects, especially those of western Norway, were important to Kinck's literary language. The speech rhythms and idioms of northern Norway play an important role in many of Hamsun's works. Dialect is tied to identity and origin, valuable ideas in Hamsun's ethics.

The literary theme of origin is dependent on the feeling of strangeness. In Hamsun's literary world this dichotomy is central, existentially and linguistically, as it is in the high literature of the 1890s. Sigbjørn Obstfelder has been called the first Norwegian modernist poet, and he focussed on the themes of alienation, of isolation, of being estranged from life, with a typical powerfulness that has given him classical status, not at least based on the famous poem "Jeg ser". While Hamsun's literary production is spread over six decades, Obstfelder belongs totally to the 1890s, he died from tuberculosis at the very turn of the century. Obstfelder's search for the unsayable made him an innovator of language and form, a creative explorer of poetic language. The result of his break with literary tradition, with rhyme and metre, was an extremely reductive style, a formal simplicity that startled the traditional readers of poetry and many competent readers were critical and deprecatory, seeing only banality or nonsense in the poems. Obstfelder exploited the tonal qualities and the rhythmical patterns of the words (*Rain, Orkan*), but more and more he came to see the expressive inadequacy of the words, and his obsession with the themes of death and decay grew.

7. Literary language and dialect. Ideological invocations

The history of the Norwegian language in the 20th c. is marked by the development of the two official forms of written Norwegian, Bokmål and Nynorsk (until 1929 Riksmål and Landsmål). The expansion and reform of Nynorsk and the Norwegianization of Bokmål, both adopted through a number of orthographic reforms, reached its peak with the reform of 1938. Nynorsk has, on the whole, kept the results of those reforms, while Bokmål has regained the opportunity to choose traditional alternatives. By the end of the Second World War, the percentage of Nynorsk pupils in primary schools was 34.1, compared to the rather stable 16–17% during the last two decades of the 20th c. As we have seen, Nynorsk gradually and rather rapidly developed a literature of its own in the last half of the 19th c., and Garborg proved its suitability for all literary genres. This early success as a language of literature may have triggered its expansion and acceptability in the schools, the church and the press. A vital relationship in

the literary discussion of the period is that between literature and dialect. The poet Olav Aukrust spoke for many authors of fiction, Nynorsk as well as Bokmål writers, when he stressed that the written language could not live without a direct and organic relationship to the dialects, a relationship which the language of literature first and foremost communicated.

Not only poets, but literary critics of the academic type as well, have stressed the intimacy between Nynorsk literature and life. Bjarte Birkeland asserts that the reason why Nynorsk writers of fiction have succeeded in coming so close to naked life is not that they are more genius than authors writing in Bokmål, but that they are using their mother tongue, their home language which contains in itself a richness of life, "all the syntactic variations that are the very life of spoken language" (Birkeland 1964). Ideological postulations like Birkeland's add literary quality to the use of the dialect source, and many assessments of literature are based on similar beliefs. It is beyond doubt that the dialects are artistically important to Nynorsk authors like Olav Duun, Kristofer Uppdal, Olav Aukrust, Tore Ørjasæter, Tarjei Vesaas, Olav H. Hauge, Aslaug Vaa and many, many others. But still there is a tension, too, between dialect and standard language of several poets and in the more official attitudes to the relationship between dialect and literature. Kristofer Uppdal e.g., changes his view on this over the course of a few years: from the traditional view that closeness to the dialect enriches the Nynorsk poetry, to a warning against that same closeness. Uppdal's new priority is a high-Norwegian ideal, an artistic language that may unite Nynorsk authors from different parts of Norway and at the same time make room for some dialectal variations. Using this high-Norwegian literary language, he achieves a higher level, he maintains, than he would have if writing in "Trønder" dialect (Uppdal 1965).

Birkeland's point of view, quoted, has a rather strong touch of exclusiveness: Nynorsk literary language, based on dialects, communicates life more subtly than Riksmål does. A consequence of that view would be that only readers belonging to the same geographic area could participate fully and completely in literary communication. Uppdal's view opposes Birkeland's romantic idea, and we could add: what about literature that does not primarily intend to reflect life intimately and subtly?

Birkeland's view seems to presuppose a mimetic ideal of literature, but as we know, the stress on the autonomy of literature in the 20th c., which accompanied the many modernistic "isms" of the century, makes this presupposition problematic.

A recent, personal assessment of Nynorsk as a literary language by the author Einar Økland points to the linguistic difficulties a writer of Nynorsk still may experience. His point of view is the opposite of Birkeland's, and is a heresy from within the movement, coming from an experienced author from the core area of Nynorsk. In "the core of my experiences and insights", Økland admits, he is confronted with the following two sore points: "Nynorsk is an unfinished language which at any time has to serve as a finished language. To write Nynorsk is unpleasant (*ubehagelig*) because so much has to be written in another way than one wishes, and because there are so many things one does not manage to write" (Økland 2000: 310). These provocative assertions are elaborated in the essay not in order to discount Nynorsk, which is his only alternative as a literary language, but in order to point to problems that have not been raised because "your Nynorsk is a standpoint in a battle" (p. 311); it has thus become impossible to separate Nynorsk as a language from Nynorsk as a popular movement. "Your writing is, in the end, either a handshake or a betrayal" (p. 311).

Another central Nynorsk author, Kjartan Fløgstad, seems to have quite an opposite view on this matter. According to him, Nynorsk is a "peripheral language", and as such, is in a better position to express popular experiences than the dominant Bokmål. If language history were interested in the changing qualities that make a text a "literary" text, a special version of language, then Fløgstad would deserve a prominent place in the history. Here we present some of these changing forms of literary language in the 20th c., focusing first of all on the breaks with established norms. Fløgstad will be taken up again in that connection, but before we turn to the literary movements, let us take a glimpse at the situation of Riksmål.

The Norwegianization of Riksmål, later Bokmål, led to fierce debates, culminating in the 1950s. The authors of fiction were officially involved in the debate in 1952 when 28 Riksmål authors founded a new organisation (Forfatterforeningen av 1952), protesting against the participation of the existing or-

ganisation of authors (Forfatterforeningen) in the Norwegian language committee (Norsk språknemnd) which was established to revise the orthography once again and to reduce the number of optional forms. This protest may be seen as a reaction against the official Norwegianization, or it may be seen more in line with Økland's point of view: as a protest against an official linguistic construction that at least some authors refused to accept as a language of literature. With the revision of the orthographic norm in 1981, optional forms were reintroduced, meeting the demands of the Riksmål movement.

As we have seen, the language of literature, either in the Nynorsk or in the Bokmål version, is related to the issue of spoken language. The attitudes to the potential linguistic and psychological resources of the dialects are many, and they are connected to the question of poetics, or aesthetics. The aesthetics of Birkeland is that of mimesis and identification; the value of literature lies in the ability of literary language to communicate life fully and intimately to the reader, to stimulate perception by means of a language both writer and reader are closely tied to. In other words, it is a matter of *language and identity*.

8. Modernism – Nynorsk and Bokmål

Literature in the 20th c. was not only viewed in a mimetic perspective. Literature won an autonomy that made it less dependent on the real world and the ability to create vivid illusions of reality. In literary theory this autonomy may be followed through the century from the Russian formalists to the post-structuralists, and in literature itself through the many versions of modernistic movements. Even though a mimetic and realistic norm kept a strong grip on Norwegian literature through decisive parts of the last century, the modernistic impact is important.

Like their predecessors from the *modern breakthrough* period in the 19th c., the new epic writers wrote in a realistic mode. They were not iconoclasts, like Ibsen, but responsible authors writing about Norwegian social and individual life in the past and present, often intending to stress the continuity between past and present, a *realism* that literary historians have called "new", and a responsibility that made the literary critic Daniel Haakonsen coin the term "ethical realism" for the period

between the wars. The period certainly includes more or less forgotten examples of prose modernism, produced by authors like Ernst Orvil, Gunnar Larsen, Rolf Stenersen, Paul Gjesdahl, Emil Boyson and Edith Øberg, but they have been dominated and upstaged by the great epics of the period, Undset, Duun, Uppdal, Falkberget, or by the radical Freudians like Hoel and Krog. The slow and late change in poetry towards modernism in Norway occurred in the first postwar years communicated first of all by poets and critics like Paal Brekke and Erling Christie. Brekke had been a fugitive in Sweden during the occupation, where he became acquainted with *fyr-titalister* (poets of the forties) such as Erik Lindegren and Karl Vennberg, exponents of European Modernism. The manifestation of modernistic form in their poetry encountered strong denunciation, led by the poet Arnulf Øverland. His essay "Tungetale fra Parnasset" (1953) produced a fierce debate in the press in 1954. The title of Øverland's essay indicates the heart of the dispute, the opposition between two ideals of *poetic language and form*, clarity and distinctness against fragmentation and obscurity.

Modernism may also be connected to the question of the form of language, Bokmål or Nynorsk. In literary criticism there has been a strong tendency to stress the theme of *nature* in Nynorsk poetry, an idea of nature as a living spirit that closed the doors to modernistic pessimism and absence of meaning. Partly true as this view may be, there were few modernistic poets writing in Nynorsk in the 1940s and 50s, but there is at least one exception, Tarjei Vesaas, who published five collections of poems between 1946 and 1956 in which nature is still a prevailing theme, but not as a guarantee of metaphysical wholeness, unity and meaning.

Modernism represents a break with ordinary language and as such is an interesting linguistic phenomenon. "Literariness" is defined through the distance to everyday language. Another modernistic thrust, the so-called "Profil rebellion" in the 1960s, mostly affected prose fiction. The closely knit group around the student journal *Profil*, included many gifted new writers, such as Dag Solstad, Tor Obrestad, Espen Haavardsholm, Einar Økland, Jan Erik Vold, Paal-Helge Haugen, Liv Køltzow, who wanted to guide Norwegian literature in the direction of modernism. Tarjei Vesaas had long before that, in the 1940s, developed a modernistic type of discourse for

the novel that could serve as an inspiration more than a model, but the type of modernism the "profilists" promoted in 1966 was only modestly realized, and in the early 1970s many of them converted to the Maoist form of Marxism/Leninism and adopted a new literary program in which everyday reality, presented in documentary form, took the place of "modernism", and purely literary questions had to yield to political matters. A literary revolt concerned with a new form of language directed first of all against popular realism, was transformed into a political revolt with a realistic program.

Dag Solstad's literary works have been divided into phases by literary critics and literary historians, phases that may be seen as paradigmatic for more general changes and debates in the literary development in Norway from the 1960s to the 1990s. But even if the focus on realism or modernism, on politics or literariness may be connected to certain phases of his literary works, a more thorough study of them would uncover a tension between the two parts of the dichotomy in most of his works. The focus on language and writing which was so central in his modernistic period in the 1960s, never leaves his sight. The search for a language, the testing of different types of language and the thematizing of the relationship between language and literature never cease to fascinate the novelist Solstad. He focusses not only on the instrumental function of language, but also on its primary function, the insight that reality is nothing but a linguistically perceived and communicated reality. This focussing on and foregrounding of language and writing is often acutely present in modern literature, but represents a field of inquiry that is beyond traditional studies of language history. On the other hand, what has been coined "AKPml"-language, a sort of radical Bokmål intended to reflect the speech of working class people from the Oslo region, would be a possible topic for the history of the Norwegian language in the 1970s and 80s.

Solstad's artistic aim is to fascinate the readers by means of mundane topics. The fascination is consequently left to literariness, to the romanesque quality of the discourse. This is hard to define (for Solstad and for us), but as it is not dependent on the subject matter, it must be a matter of form, of language. The stress on literature as language and form is a dominant idea in the theory and in literary practice of the 20th c.

We have seen that literary language, Nynorsk and Bokmål, has taken inspiration from the spoken dialects as a sign of both national and social solidarity. Fløgstad's solidarity with working-class culture is unquestionable, but as a marked intellectual writer he rejects the traditional form of the social novel and the psychological novel. The tension between the popular and the intellectual attitude, which is typical of the literary culture of the 1970s, expresses itself in a very special form in the case of Fløgstad, called grotesque realism, fantastic realism or magic realism after the South American literary tradition he is influenced by. If we divide the concept of style into three levels, low, middle and high, Fløgstad rejects the middle level, the dominant style of society's rationality, and creates a "grotesque" mixture of low and high styles modelled on the debasing of the high and holy in the carnival tradition. The attitudes to Fløgstad's style among literary critics are many, but none can deny his important contribution to a renewal of Norwegian prose style.

Jon Fosse is another Nynorsk author who has developed a prose style of his own, and a very different one from Fløgstad's. In the last half of the 1990s Fosse also wrote a number of plays that have been staged in Norway and abroad with great success. Fosse's stylistic trademark involves suggestive, rhythmic repetitions both at the micro and macro level. Words, sentences, rhetorical figures, scenes, characters, motifs and themes are repeated over short or longer intervals within the text, giving his prose a very special quality of rhythm and musicality. His prose avoids foreign words and complex vocabulary, striving to be concrete and sensuous.

Literary realism is a many-sided and pervasive phenomenon in the literary history of the 20th c. Central novelists of the 1980s and 1990s like Herbjørg Wassmo, Lars Saabye Christensen, Ingvar Ambjørnsen, Roy Jacobsen, Erik Fosnes Hansen and many others are writing within a realistic norm in a wide and varied sense. The non-realistic prose of the same period is tentatively divided into two main categories by the literary historian Øystein Rottem: a "modernistic" and a "fantastic" one, which often mingle within many texts. The first is characterized by a formal break with realism. Linguistic distortions, breaks with grammatical rules and normal syntax, strange techniques of composition etc. undermine the very basis for a realistic aesthetics.

Jan Kjærstad (born 1953), some ten years younger than Solstad and Fløgstad, is a central novelist of the 1980s and 90s, and at the same time a talented essayist. He began his literary career by forcefully rejecting the realistic poetics of the 1970s. To create "credible" characters was not at all his intention. On the contrary, the sign of literary greatness and novelty was tied to the quality of *construction*; "true" and "genuine" were no longer terms of literary value. Kjærstad's anti-mimetic attack resembled that of Hamsun's in 1890, both in form and content. Accepted, traditional versions of man, depicted in generally accepted versions of philosophy, psychology, sociology, and in literary fiction had to be banned from modern literature. In his own novels he searches for a new way of constructing man within the modern frames and forms that surround him in today's media-, computer- and information society. In his *En poetikk for 80-årene* (1984) he wants to transcend "saboterende språkekspesimenter", the modernistic tendency to experiment with language in order to sabotage it. He wishes to be constructive, to create an alternative to the destructive language practice of modernism and the confirmative forms of mimetic ideals. He makes the novel a medium for this complex constitution of modern man in a context of knowledge and information from very different areas of society, from complex forms, models and matrices, and from combinations of these models. Kjærstad's characters are not recognisable as "real", or "living", they are constructs that intend to say something relevant and true about our postmodern world.

To conclude, we may say that the "modernism" (in a broad and general sense) of the 1980s has a strong "metafictional" aspect, whether this is concerned with the narration or with the language itself. Kjærstad's literary discourse, in fact, comprises both these aspects, but his theoretical consciousness and knowledge about his literary activity is combined with a desire to fascinate and enchant the readers. He intends to be open and readable, and in that sense he differs from "metafictional" novelists who put a radical focus on linguistic with the effect to be unreadable to most audiences. But perhaps he is in tune with a tendency in the new literature, or among the new authors of the 1990s?—a tendency to give preference to "reality", to "the story", and to a communicative literary language.

2. The oldest literature
3. Different categories of saga literature
4. Poetry
5. Danish and German influence
6. Fjölfnir to Neo-Romanticism
7. The literary renewal
8. Modernism and tradition
9. Literature (a selection)

1. Beginnings of Icelandic literature

1.1. It has been said of the Icelanders that they are “the only nation in Europe able to recall their origins” (Nordal 1942, 42). Written sources certainly provide us with a terminus a quo – not that every archaeologist would agree with this starting date. The *Íslendingabók* by Ari Þorgilsson (1067–1148) tells of the colonization of the country and its earliest history, the founding of the National Assembly at Þingvellir around 930, the acceptance of Christianity in 999 and the first bishops. The *Landnámabók* (‘Book of Settlements’) accounts for the original settlers in all parts of the country and tells of their ancestors and descendants.

1.2. Christianity brought books and learning to the country. The oldest extant manuscripts date from the 12th century, but most of the literature is preserved in volumes written a good deal later. Thus, *Íslendingabók* itself is preserved only in two 17th century copies of a transcript from around 1200.

1.3. From the 12th century *First Grammatical Treatise* we learn about the types of literature which were first written in the vernacular, namely “laws, genealogies, or sacred writings, and also that historical lore which Ari Þorgilsson has recorded in his books with such understanding wit” (Haugen 1972, 13). Another independent source is *Hungrvaka*, a brief history of the first bishops of Skálholt, written around 1200. According to the preface, its main purpose was “to induce young men to read books written in their native language such as those on law, histories and ancestral records” (cf. Turville-Petre 1953, 203). Let us look briefly at these early literary categories.

2. The oldest literature

2.1. Fragments of the Free State laws, the so-called *Grágás*, are indeed among the oldest preserved Icelandic manuscripts, dating from the middle of the twelfth century, i. e. not long after the first codification of these laws which began in 1117/18. There is no significant difference between the syntax and style of these fragments and the preserved comprehensive codices of *Grágás*, written towards the end of the thirteenth century (Naumann 1979, 174–175). Stylistically, the early laws of western Scandinavia have been grouped with the Family Sagas under the category of “popular style” (Nygaard 1896). Naumann (1979, 71–72) has shown that the Old Norse law style

is in fact unique, neither comparable to the style of the sagas nor the “learned style” of Saints’ Lives, homilies, etc. The features which some scholars have associated with Scandinavian laws in their oldest orally transmitted state, such as “alliteration, assonance, rhythmic constructions with syntactic parallelism” (Foote 1977, 49), are also notably absent in these laws. Indeed, the few examples of such features in *Grágás* are often found to belong to younger text segments, i.e. they are more likely to be symptoms of “learned” rhetorical amplification than mnemonic transmission (Naumann 1979, 86).

2.2. The early genealogies or ancestral records were no doubt of vital importance for Icelandic saga writing. A couple of old genealogical poems and some genealogical tables can be found in medieval Icelandic manuscripts; Ari’s *Íslendingabók*, written between 1122 and 1133, ends with an impressive genealogical table whose last member is Ari himself.

The narrative of *Íslendingabók* is quite brief and compact, mostly written in a sober and dispassionate style. Some Latin influence has been detected in the syntax, but the vocabulary is largely free from foreign loans, and in general the style is remarkably fresh and independent (Benediktsson 1968, XXVI–XXIX).

2.3. Most of the first written manuscripts must have been sacred writings or directly designed to promote Christian instruction and serve the cause of the Church. Many such manuscripts were probably destroyed after the Reformation, but we have remnants from as early as the 12th century containing homilies, didactic religious works (such as the *Elucidarius* by Honorius Augustodunensis) and Lives of Saints. The word ‘histories’ in *Hungrvaka* probably applies to this last category. Some encyclopaedic works were known and partly translated. A few secular translations must also have preceded the writing of *Hungrvaka*; this must be the case with *Rómverjasaga*, for example, a translation of Sallust’s *Iugurtha* and *Catilina* and Lucan’s *Pharsalia*.

3. Different categories of saga literature

3.1. Not every kind of Old Icelandic literature had been entrusted to parchment around 1200; some were still preserved orally. This

applies to the Eddaic and scaldic poetry (cf. 4.1.–2.) and the Heroic Sagas (*Fornaldarsögur*).

3.2. The term Contemporary Sagas usually refers to the Sturlunga collection; the most important of these sagas is the *Íslendingasaga* composed by Sturla Þórðarson (1214–1284). This is an extremely important contemporary source on the civil war raging in Iceland during the last decades of the Free State. The author’s detachment in the narrative is most remarkable considering how thoroughly involved he himself was in the brutal and tragic episodes described. Sturla was at the same time a historian and a superb story-teller: some of his eyewitness episodes are among the most memorable ones in all the saga literature. This is contemporary history, not an epic, but the style and the structure of the narrative is closely related to that encountered in the Family Sagas (3.5., cf. Sørensen 1988; Ker 1926, 249–267).

3.3. Bishops’ Sagas are among the oldest biographies in Iceland, and they were later reworked and expanded in various ways. In these sagas one can discern various stylistic layers, from the sober and sparse first biographies, reminding one of Ari’s *Íslendingabók*, through the more entertaining, anecdotal story-telling, resembling the Family Sagas, to the expanded versions in “florid” style dating from late thirteenth and fourteenth centuries (Foote 1978). The classical story-telling tradition still survived in the late life story of Laurentius of Hólar, written soon after his death in 1330.

3.4. The years 1170–1230 represented a lively period for writing sagas about the kings of Norway, both in Norway (cf. art. 51) and in Iceland, probably inspired by the upsurge of nationalism associated with the 12th century Renaissance.

With Snorri Sturluson (1179–1241), the Kings’ Sagas reach their perfection. His *Heimskringla* is a complete dynastic history of Norway from prehistoric times down to 1177 when King Sverrir was about to make his entrance. We are fortunate enough to have access to some of the older Kings’ Sagas dealing with the same period, sagas which Snorri used as his sources. Through comparison with them, we can gain some insight into his stylistic choices (Nordal 1920; Lie 1937; Hauksson/Óskarsson 1994, 236–255).

In the main, the style of *Heimskringla* resembles that of the Family Sagas. The narra-

tive is neutral, objective, presenting events without explaining them. All interpretation is left to the reader. Often the chain of events in the older sagas is rearranged in *Heimskringla*, resulting in a more coherent and vivid presentation. To the same end, Snorri often compressed the dialogue, making it more pointed, dramatic or humorous, often by use of puns (antanaclasis). Other features, e. g. in the speeches, also show Snorri's acquaintance with precepts of classical rhetoric. He made some use, albeit sparingly, of figures such as parallelism, chiasmus, antithesis, climax, and some rather simple metaphors and similes. *Heimskringla* occasionally resembles "learned" writings by reason of the explicit intrusion of the narrator, who refers to his sources and sometimes weighs them against each other.

3.5. The Family Sagas or Sagas of Icelanders (*Íslendingasögur*) have been called "the sole original contribution of the Nordic countries to world literature" (Hallberg 1964, 1). Scholars now generally agree about the comparatively late age of this genre. The writing of these sagas seems to have begun in the thirteenth century, culminating at the end of that century. There are also indications that Family Sagas were composed far into the fourteenth century or even later. The emergence of this literature is an unsolved riddle. Some scholars have shown parallels in motifs between sagas supposed to be among the oldest ones and the French romances which were introduced and partly translated at the Norwegian Court in the beginning of the 13th century (Rubow 1936; Einarsson 1976). Others have pointed out similarities between characters and episodes in Contemporary Sagas and certain Family Sagas, which then could be seen as echoes of or a subtle contribution to the power struggle in the Sturlung Age (see, e. g. Guðmundsson 1958; Foote 1963, 130–131; Vilmundarson 1991, XLVI–LXVII).

The Family Sagas display some syntactic and stylistic characteristics which are otherwise unique in European medieval literature. The syntax is characterized by parataxis or simple hypotaxis, rather short, compressed sentences and an absence of all Latinate constructions. There are almost no descriptions of scenery, and we get only occasional glimpses "indispensable for advancing the story and for delineating character" (Springer 1939, 112). This is accompanied by the absence of descriptive adjectives, adverbs and

verbs; epitheta ornantia do not occur. There is not much use of phraseological variations; the vocabulary is relatively small – much more limited than that in common use in modern novels. The tone is subdued and objective; the narrator conceals his presence. The proportion of dialogue is relatively high; the dialogue is compact and can be very charged and dramatic.

Portrayal of character is an essential element in these sagas. When a person is introduced, there usually follows a short description of his or her ancestry, appearance and character. It is also the case that this description can come later on at a dramatic point where the focus is on the person involved. As a rule, the persons are described from the outside; it is left to the reader to judge them from the way they look, how they act and what they say, and occasionally from public opinion about them. Tropes and figures of any kind are very rare in this literature; instead, we have

the bleak objectivity, or appearance of objectivity and the ever-present sense of laconic understatement which represent such a contrast to the turbulent subject matter of the sagas that it encourages the reader to investigate the silences, and assign to the words and deeds a deeper meaning than they seem at first sight to possess (Ólason 1998, 114; cf. Springer 1939; Hallberg 1964, 63–72; Hauksson/Óskarsson 1994, 273–293).

3.6. Most of the genres found in old Icelandic manuscripts have been traditionally labelled as having special types of style: learned style for Homilies, Lives of Saints and other clerical translations; court style for the translated French romances; more recently, florid style for the late 14th-century Lives of Saints, with their heavy rhetorical ornament (Widding 1965, 133–136). All these types of style are of course learned and literary, and they are balanced against the popular style, traditionally ascribed to the Family Sagas and also the oldest lawbooks (cf. 2.1.).

Many problems are still unsolved in connection with individual Family Sagas, and only some of them are available at present in adequate philological editions. However, textual research has yielded valuable information. For example, contrary to the general belief of scholars and saga enthusiasts, where two different versions of a saga exist, the one with a more verbose and expansive style is more likely to be closer to the original version (see e. g. Jansson 1945, 115–171; Einarsson 1977, CXXXI; Kolbeinsson/Kristjánsson 1979).

The translations of Saints' Lives are a genre which both preceded and outlived the native Family Sagas. This large body of literature has been rather neglected; recent research has shown that it is not as homogeneous as people have tended to think; for example, it has been demonstrated that the oldest preserved Saints' Lives are characterized by a relatively simple style. The conclusion is that there may not have been so great a difference in style between the oldest Saints' Lives and the Family Sagas in their original form apart from the difference necessarily dictated by subject matter. The mature classical saga style is a highly literary form which was gradually developed by saga writers and even scribes, culminating towards the end of the 13th century or even later. This style may have been a conscious reaction against the verbosity and exuberance of hagiographic literature during the same period.

3.7. The idea of some older scholars that the Family Sagas acquired a fixed form in an oral stage of transmission and that this was then "committed to the parchment almost verbatim" (Springer 1939, 117–118) has now been generally rejected. Although there is ample evidence for a lively oral tradition in medieval Iceland, it is very difficult to say very much about the oral form of sagas from the evidence of the written texts. However, Hofmann (1982) and Benediktsson (1992) have compared old translations with the original Latin texts and pointed out a couple of stylistic traits typical of the Family Sagas which can be found in the translations independent of the originals and which therefore belong to a preliterary, oral mode. Kristjánsson's comparison (1981) of the oldest preserved Saints' Lives with their Latin originals shows that Nygaard's (1896) syntactic criteria for learned style are almost totally absent in them; every sentence is reshaped in accordance with the rules of the mother tongue. Research by Collings (1974) has shown that the same applies to a good many of the Saints' Lives in the *Codex Scardensis*. Translators of these texts also frequently omitted the explications and the rhetorical figures of the originals, concentrating solely on the narrative sequences. Another trait which seems to be ingrained in the preliterary native tradition is a kind of an "episodic narrative" with scenes following one upon another. These scenes have a remarkably fixed structure and are one of the main characteristics of the Family Sagas; they also occur in translations of Saints' Lives and Heroic

Sagas independent of the originals (Clover 1974).

4. Poetry

4.1. Prose is the Old Norse medium for epic literature. When, for instance, the French *romans* and *chansons de geste* were translated during the 12th and 13th centuries, it was into (more or less embellished) prose.

The old poetry falls into two categories: scaldic and Eddaic poems. In the latter, the subject matter is either historical or mythological, but the presentation of the subject is different from classical epic poetry, no doubt due to the concentrated metres. The most common metre, "fornyrðislag", for example, has only four or five syllables in each line. The story is told through the presentation of a few major episodes and through dialogue. This results in a very highly concentrated dramatic account. Through, or in spite of, this concentrated form, the poem *Völuspá* surveys the whole history of the universe and of the gods from the creation to the final battle and destruction of Ragnarök. Besides describing the heathen cosmology, the mythological poems also present rules of conduct and vivid pictures from daily life. Imagery is essential in the fabric of this poetry, from the simplest metaphorical applications of individual words to highly elaborate comparisons (Hallberg 1983).

Much of the scaldic poetry is panegyric, composed in praise of a monarch. Among the oldest poems are some describing pictures, mostly on decorated shields. There are further lyrical strophes, love songs, battle songs and other occasional verse from everyday life. The most common – and the most fashionable – metre, the "dróttkvætt", was extremely strict and demanding, with a fixed number of syllables, rhyme scheme (half-rhyme in the odd lines, full rhyme in the even lines), alliteration of course, and a deliberately scrambled word order. It employs a special vocabulary, usually not found in the prose texts, and an abundant use of the complicated figurative paraphrases called "kennings".

We have scaldic verse dated from as early as the 9th century. The panegyric poems were used as sources in the Kings' Sagas, and besides, this poetry has been most important for the preservation of heathen myths and as a link between native tradition and classical learning. G. Nordal (2001) has emphasized the role of scaldic verse in the development of the

textual culture in Iceland. With reference to the abundant scaldic material in the 13th century grammatical literature, she assumes that scaldic verse was part of the syllabus for those who enjoyed formal education.

4.2. In the 14th century, a new form of epic poetry emerged which became the most popular literary form over the next 500 years, the *rímur*. They are long narrative poems in short stanzas, usually versifications of written sagas. They were composed in blocks of different metres, and it soon became obligatory to introduce every block with a *mansöngur* ('maid-song'), a few lyrical stanzas unconnected with the narrative. The *rímur* adhere to very strict metrical structures with regard to alliteration and rhyme, and the poets made frequent use of the kennings of scaldic poetry. The *rímur* have traditionally been considered an isolated Icelandic phenomenon, born of a marriage between native scaldic poetry and imported ballads. Recent research, however, has shown some parallels with late medieval narrative verse on the Continent (Ólason 1982, 52–82).

5. Danish and German influence

5.1. The vocabulary of written Icelandic, with comparatively few loanwords, does not seem to have changed much during its first centuries of use. In translations of mainly religious prose from the 15th and early 16th centuries, one comes upon a growing number of especially Danish and Low German loanwords. These texts were translated from the vernaculars – English, German, Danish – and many of them are heavily dependent on the syntax and even the vocabulary of the originals.

5.2. The Reformation, finally effected in 1550, was followed by a concentrated effort by churchmen to make all the necessary Christian literature accessible in Icelandic. The translation of the New Testament, made by Oddur Gottskálksson, was published as early as 1540 and became the model for the religious prose of the Reformers. It is partly written in the tradition of the later Lives of Saints and shares with them some "learned" features of syntax in imitation of Latin usage. In addition, it shows considerable influence from Luther's German original in syntax and vocabulary (Helgason 1931, 38–39). Nearly 50 years later, the first Icelandic Bible was printed, and this was accompanied by prayer books, hymns and sermons, commentaries, meditations, etc. Westergård-Nielsen (1946) has recorded a

considerable number of loanwords from this period. Only a few of them have survived to the present day, largely owing to the 19th-century puristic campaign to get rid of them.

5.3. At the same time, during the first decades of the Reformation, a growing interest in and concern for the Icelandic language can be detected. In his *Crymogæa*, for example, Arngrímur Jónsson (1568–1648) maintained that the Icelandic of his time was practically the same language that was once called Danish or Norwegian and which was spoken all over Scandinavia. Its purity, he said, was partly due to the preservation of old manuscripts written in an unadulterated and elegant language and partly to little communication with foreigners. And he expressed the hope that his countrymen would refrain from imitating Danish or German when they wrote or spoke and would instead seek their models in the richness and elegance of the native tongue (Benediktsson 1951, 30). This Humanist attitude is echoed in the writings of some of Arngrímur's contemporaries, even if it was rarely put into practice. The 17th century saw a growing interest in the old literature in spite of its profane content; as an example we can cite the gifted hymn-writer Hallgrímur Pétursson (1614–1674), who in his leisure wrote very competent interpretations of scaldic poetry.

5.4. Written documents from the 17th and 18th centuries show a strong influence from contemporary Danish and German in vocabulary, syntax and style. The majority of the printed texts from this period were issued by the secular and clerical authorities: all kinds of religious literature, as well as official announcements, verdicts and decrees. But during this period, a rather rough distinction between "learned style" and "popular style" can be clearly seen, the historical writings and folk tales belonging to the latter category. Little of this was printed until around 1900. Neither, in fact, were some of the most valuable "learned" writings of the time, such as travel books and autobiographies.

5.5. Interest in the Golden Age and its literature was widespread, and some 18th-century writers even tried to imitate the old language, with rather poor results. Knowledge of the language was most imperfect; no adequate grammar was available until Rasmus Kristian Rask's *Vejledning til det Islandske eller gamle Nordiske Sprog* was published 1811. At the same time, there was a great progress in edit-

ing and studying classical Icelandic literature. One of the central figures in this enterprise was Sveinbjörn Egilsson (1791–1852), author of the *Lexicon poeticum*, who was a teacher at Bessastaðir, the only grammar school in the country. Sveinbjörn was also one of the pioneers of modern prose writing through his translations of the *Odyssey* and *Iliad* in a narrative style which combined saga-style syntax with the poetic diction of the Eddas.

6. Fjölfnir to Neo-Romanticism

6.1. The periodical *Fjölfnir* was launched in 1835 by four students in Copenhagen, among them the poet Jónas Hallgrímsson (1807–1845) and Konráð Gíslason (1808–1891), who later became Professor of Old Norse at the University of Copenhagen. All the editors of *Fjölfnir* had studied at Bessastaðir and no doubt had acquired some philological grounding there, even though neither Icelandic language nor literature was part of the curriculum.

It is not unusual to speak of *Fjölfnir* as having inaugurated a revolution in Icelandic prose. This was not a revolution in subject-matter, except for the poetry of Jónas Hallgrímsson and a couple of translations of contemporary romantic literature in the first issue. The main concern of the editors was the purity of the language. Although, for obvious reasons, the journal's founders had to be extremely careful about sending the Danish authorities any explicit message of political independence, they made up for this by waging a merciless war against Danicisms in the Icelandic language, showing by their own example that one could develop a rich vocabulary while avoiding all the Danish features that had come to be so deeply ingrained in the written language. Their model was not so much the older literature but rather the natural spoken language of the countryside (Ringler 1998; cf. Hauksson/Óskarsson 1994, 468–469, 482–490). The vocabulary is extraordinarily extensive and varied, and instead of letting the syntax follow prescriptive rules, they used a word order as free as that of the sagas, shaping every sentence with care and to the best aesthetic effect. In the translations of Tieck, Heine and H. C. Andersen, and not least in the short stories of Jónas Hallgrímsson, published posthumously in the last issue of *Fjölfnir*, a new style of literary narrative was born. This style flows freely, even playfully, without any syn-

tactic stiffness, being at once colloquial and poetic.

The romanticism in *Fjölfnir* appears mainly in the worship of nature and in the idea of a mystical connection between Icelandic nature and the life and literature of the Golden Age, e.g. as brilliantly expressed in Jónas Hallgrímsson's poem "Ísland" in the first issue. The poetic ideals of Jónas were made manifest in the third issue of *Fjölfnir* where he fired a harsh broadside against the most popular rímur poet of the day, Sigurður Breiðfjörð (1789–1846). In his own poetry, he sought his models in the more classical forms of especially Eddaic and even scaldic poetry. One of Jónas' most brilliant achievements is how he succeeded in revitalizing these old metrical forms. His language is never archaic or affected; on the contrary, he managed to combine the ancient poetical wording with the living colloquial language of his own time. His own exquisite neologisms, most often adjectival compounds, sound so natural that they often go unnoticed. His poetry also includes imaginative and original adaptations of a variety of foreign metres.

6.2. The first published Icelandic novel was *Piltur og stúlka* (1850) by Jón Thoroddsen (1818–1868). His two novels were inspired partly by Dickens and Sir Walter Scott and partly by Icelandic folklore and folk tales, a systematic collection of which was in progress all over the country at the time. The novels are set in the Icelandic countryside, and their rather uninteresting plots about lovers finally united are compensated for by vivid settings and a mixed array of comic secondary characters.

The chivalric and heroic sagas were the main sources for the novel *Sagan af Heljarlóðarorrustu* (1861) by Benedikt S. Gröndal (1826–1907). This is a burlesque portrayal of a contemporary event, the battle of Solferino in 1859.

6.3. The last decades of the century were the era of the Romantic so-called "National Poets" who were extremely prolific and dominated the cultural life of the country, inspired by the new optimism and dreams of national independence. The most popular poets, Steingrímur Thorsteinsson (1831–1913) and Matthías Jochumsson (1835–1920) were also active as translators of foreign literature, both in verse and prose.

6.4. In 1882, the "modern breakthrough", inspired by the famous lectures of Georg

Brandes at the University of Copenhagen, reached Iceland through the periodical *Verðandi*. The founders were again four Icelandic students in Copenhagen. The opposition against the glorification of the Golden Age of the sagas is reflected in the opening poem by Hannes Hafstein (1862–1922), and the contributions of the novelists in the group, Gestur Pálsson (1852–1891) and Einar H. Kvaran (1859–1938), were realistic short stories from contemporary daily life which made “problems a matter of debate”. Only one issue of *Verðandi* was published, but Gestur Pálsson and Einar H. Kvaran continued their literary and journalistic careers, partly in Iceland, partly in the Icelandic settlements in Canada.

These two authors, in fact, mark the beginning of modern Icelandic prose writing. Their style is characterized by avoidance of any imitation of the sagas. The syntax is dominated by parataxis and simple hypotaxis; the language is the educated, spoken language of the day. Another characteristic, as opposed to previous 19th-century novel writing, is the disappearance of the omniscient narrator. The characters step into the foreground, their thoughts are related in *erlebte Rede*, which in Gestur’s hands becomes a sophisticated instrument for subtle irony; in Einar’s case, it constitutes his means for identification and empathy, involving the reader in the fate of his humble and unheroic protagonists.

Even more radical innovations, inspired by the reading of contemporary Scandinavian literature, are found in the style of a farmer in the north of Iceland, Þorgils gjallandi (pseudonym for Jón Stefánsson, 1851–1915). In his writings, e.g., the traditional logical syntax often breaks down, reflecting swift action or the inner turmoil of the characters.

6.5. At the turn of the century there was a fierce debate between the spokesmen of idealism versus those of realism, and in a newspaper article in 1897, Einar Benediktsson (1864–1940) advocated a program incorporating both: the poets should seek “soul in nature” but at the same time stand with their feet planted firmly on the ground. In fact, Einar Benediktsson was the only poet who followed this program, even though the social radicalism of his early poetry was gradually muted. In his poems he combined brilliant descriptions of visible nature with a kind of a pantheistic mysticism. Einar was a master of poetic language, metaphor and antithesis, but

his diction and syntax are complicated and his later poetry becomes increasingly abstruse.

6.6. The turn of the century marks the beginning of modern Icelandic novel writing. Following the debut of the *Verðandi* writers and Þorgils gjallandi, the first decade of the century saw the publication of ten new novels with contemporary settings. In his first two full-length novels, *Ofurefli* (1908) and *Gull* (1910), Einar H. Kvaran takes a Jesus-figure and places him as a parish priest in the Cathedral in the midst of the corruption and hypocrisy of contemporary Reykjavík. In *Upp við fossa* (1902), Þorgils gjallandi writes about erotic and social conflicts in a rural society, revealing how the natural instincts of man are suppressed through conformity, cowardice and self-deception. Even though the novels of Þorgils gjallandi are written in the colloquial language of the day, his prose also displays an intimate knowledge of the saga style and of the popular narrative traditions of the countryside.

Another self-taught novelist making his debut during this period was Jón Trausti (pseudonym of Guðmundur Magnússon, 1873–1918) who in the following years wrote a number of realistic novels about people and life on the small inland farms and about the burgeoning conflicts in the developing villages. In style, these novels in fact differ somewhat from those immediately preceding them, with a comparatively intrusive narrator commenting and interpreting and at the same time revealing the thoughts of the protagonists in *erlebte Rede*. Other traces of influence from an earlier romantic tradition include the considerable use of metaphors and similes. The novels of Jón Trausti have been acclaimed for their “typical Icelandic” character portraits and milieu descriptions, and they have served as the principal models for later epic prose, such as that of Gunnar Gunnarsson (1889–1975) and Halldór Laxness.

6.7. The upsurge of the social novel barely outlived the first decade of the century. Jón Trausti converted to National Romanticism and began to write historical novels, and Einar H. Kvaran moved away from the cares and concerns of this world and became a spiritualist. At the same time, a new literary generation was entering the scene, poets who in Iceland are often called Neo-Romanticists and who are quite different from the “old ones”. Instead of a pompous diction and proud collective dreams for the future of the nation,

their voice is simple and natural and their poetry highly individualistic and emotional. Besides contemporary Scandinavian symbolist literature, it was above all the popular heritage of folksongs, ballads and lullabies, with their musical sounds and rhythm and their mystical content, which served as the literary models of these poets. From this period we also have the first modernistic experiments in poetry. The most popular of these poets were Jóhann Sigurjónsson (1880–1919), Stefán frá Hvítadal (1887–1933) and Davíð Stefánsson (1895–1964).

7. The literary renewal

7.1. From the time of *Fjölnir* and far into the 20th century, even up to the present day, there has been a general consensus on what constitutes good and correct Icelandic language. It should be “pure”, i.e. free from foreign influence in vocabulary and syntax; so instead of borrowing foreign words, great effort has been made to create new ones. The recommended models are either the saga literature or the unspoiled language of the countryside. This view is represented in numerous periodical articles at the beginning of the 20th century, where the authors express their fear that the “language mixture” of the towns will in the course of time prevail in the countryside as well. And they lay the blame not least on careless translations of trivial novels which at the time were being published in cheap editions. To restore the balance, the years 1891–1902 saw the publication of the first cheap edition of the sagas and the Eddas in 38 volumes, which became very popular. Times were changing; the economic stagnation that had gripped the country for centuries was finally being overcome, resulting in an increasing movement of people from the countryside to the coastal towns. The transformation of society was beginning.

Among the literary novelties in the first decades of the 20th century was essay writing in which the intellectuals connected with the new University of Iceland strove to enlighten and guide the public; the authors made an effort to write readable and inviting texts while using classical vocabulary. Their essays are full of neologisms for modern ideas and instruments. The general message of many of these essays is that one must be cautious in adapting innovations without reservation and not reject the old indiscriminately in favour of the new. So it was no wonder that some younger writers

identified this style with the cultural conservatism of the message.

Bréf til Láru (1924) by Þórbergur Þórðarson (1889–1975) has been called “the first real breach against the purist style which had reigned supreme since *Fjölnir*” (S. Einarsson 1957, 291). This book is written in all kinds of styles, thanks to the author’s skill and extensive knowledge of the entire Icelandic literary tradition. It is a long essay in the form of a letter with all kinds of digressions: polemic, humorous autobiographical sketches, short stories, parodies, pastiches, etc. In the words of Halldór Laxness (1902–1998), the author of *Bréf til Láru* “broke many barriers and opened many doors for us, the writers who followed and made many things permissible and natural which were previously forbidden and unthinkable”. In the writings of Laxness himself from around 1925, he rejects all the accepted standards of pure and beautiful language, both the rural and classical models, and he also claims that an author has the right to use foreign words when appropriate for the occasion.

7.2. As mentioned before, sporadic modernistic experiments in poetry were made in the first decades of the 20th century. A similar tendency is seen in the novel writing of this period. *Hel* (1919) by Sigurður Nordal (1886–1974) and *Vefarinn mikli frá Kasmír* (1927) by Halldór Laxness break the tradition of Icelandic story-telling by presenting extreme subjectivism, fragmentary narrative, bold and vivid imagery and even surrealistic experiments. The intellectual life and shifting emotions of the hero are centre-stage while the social background is vague or non-existent.

7.3. In the early thirties, international repercussions of the Great Depression affected Iceland too. There were serious class conflicts, and literature became dominated by social realism. Laxness had now converted from psychological to social novels and from international themes to the social life of his own country. During the 1930s, he published three cycles of novels, one with a fisher girl, another with a small farmer and a third with a parish pauper and poet as the central character. In these works, he renews the novel as a realistic story-telling form but does not turn to the early sagas for his models. Indeed, in writings from this period, he declared that he wanted to write “the language of the living” and refused to “tailor my thoughts to the fashions of Icelandic 600–700 years ago”.

An examination of these novels shows the gradual development of his personal narrative style. The subtitle of the first one, *Salka Valka* (1931–32), was “a political love story”, so readers might expect a good deal of left-wing propaganda, but they don’t get it. Even though it is apparent with whom the author sympathizes, irony is the most conspicuous device in this novel, both with regard to the political issues and the love story. The riots connected with the strike, for example, are always described with a touch of humour and in the courtship of the protagonist Salka and the revolutionary leader Arnaldur, you find a subtle parody of the neo-romantic tendency to project the feelings of lovers on Nature.

Already in these early novels, Laxness demonstrates his versatility as a writer, never adhering to any fixed models or traditions, always adapting his style to the different subject matters. This is particularly evident in the case of *Sjálfstætt fólk* (1934–35), a book about the unbending small farmer Bjartur and his struggle for independence. Here, Laxness’ propensity to write “the language of the living” takes a new turn. In the vocabulary, there are masses of rural words not previously found in dictionaries, mainly designating all types of weather or connected with work on an old-fashioned farm. The narrative mood is more flexible than in *Salka Valka*; the style is closer to the sagas in that the characters often are allowed to present themselves through their actions and speech, and one notable characteristic of *Sjálfstætt fólk* is the use of different types of discourse. The reader will find here a conscious and sophisticated elaboration of the literary tradition: the saga literature, folk songs, folk tales and legends, even *rímur*. When Bjartur is struggling through a heavy snowstorm out in the wilderness, he keeps his courage up by reciting to himself one of the *rímur* he knows, thereby identifying himself with the ancient hero of the poem as he fought against immense odds or defended himself against the improper advances of alluring giantesses. This episode about the power of poetic language says a good deal about the role and importance of this literature in the life of the common people over the centuries. Moreover, the author has made use of jargon; even whole speeches are lifted from contemporary ideological and political debate. This applies to the solemn rhetoric of the local official’s wife about the delights of the modest and carefree life of the

small farmers, here presented in an ironic, glaring contrast with reality.

Such contemporary allusions and parodies are much more fierce in *Heimsljós* (1937–40), which is the story of a poet of every and any age, localized in an Icelandic countryside and seaside village. Here the narrative style is entirely new. It is mainly through the consciousness of the sensitive poet that the scenes and events are presented, and the narrative abounds with poetic descriptions and imagery as a consequence. This also legitimizes the use of exaggeration and caricature, and irony, because sometimes the poet’s fantasy causes him to misunderstand what the reader does not. The subject is touching and tragic, but this is still one of the novels where Laxness conveys a most delicate sense of humour.

In the historical novel *Íslandsklukkan* (1943–46), Laxness has overturned his pronounced rejection of the saga literature. In fact, by this time he had become engaged in intense studies of the sagas, declaring that “an Icelandic writer cannot live without constantly thinking about these old books”. Influence from the sagas manifests itself above all in his economy of phrasing and his objectivity. The narrator conceals his presence. He presents events without commenting on them; the characters are seen from the outside, and their thoughts can only be guessed at by the way they react and what they say. The scene of *Íslandsklukkan* is Iceland in the 17th century, and the vocabulary is skilfully coloured with the official language and the religious rhetoric of the period.

Another historical novel, *Gerpla* (1956), borrowed its subject-matter from Family and Kings’ Sagas and for the most part used their style as a model. But besides this, the author drew a good deal on the early medieval learned writings, on the Heroic Sagas and the Edda. Laxness then used sources from the entire Old Icelandic/Old Norse literary tradition, but always felt it possible to parody and exaggerate, with an amusing and sometimes shocking effect. He announced that his rule was never to use a word in this novel which could not be proved to have existed in the language of the 11th century. In this respect the author has left himself with considerable freedom of action: the burden of proof is on the reader!

Between these two historical novels, Laxness published a thoroughly modern novel, set in postwar Reykjavik: *Atómstöðin* (1948) where through his style he tries to capture “the scattered and hectic features of the environ-

ment he wishes to describe” (Hallberg 1971, 164).

As these short descriptions have shown, all these books are totally different one from another; each of them is a world of its own, cast in its own special style. A stranger might think that they were produced by many different authors.

The model, or rather the highest standard of story-telling from the classical sagas, hovers in the background of all the later works of Laxness. In view of his unrivalled supremacy among 20th-century writers, his return to the saga models has no doubt served to consolidate the classical realistic tendency in modern Icelandic prose writing. But he has also availed himself of many later narrative traditions, autobiographies, popular annals, and local history. Sometimes the narrator presents himself as a disinterested annalist. *Kristnihald undir Jökli* (1968) can be said to mark a temporary return to Modernism on Laxness’ part. In it he depicts a “neutral recorder” who becomes inextricably involved, quite against his will, in a confusing human situation which he has unsuccessfully tried to reconstruct in a coherent report.

7.4. The most important works of Þórbergur Þórðarson following *Bréf til Láru* were two novels describing a few years in the author’s own life, *Íslenskur aðall* (1938) and *Ofvitinn* (1940). *Íslenskur aðall* takes place mostly during the summer of 1912 and is at the same time a kind of an autobiography and an acute and witty portrait of the author’s own Neo-Romantic generation. The style is versatile and humorous with bursts of expressionism, skilfully adapted to the various moods and emotions of the hero.

8. Modernism and tradition

8.1. Modernism in verse was introduced in the late forties and fifties of the 20th century and met with considerable criticism, even hostility, for obvious reasons. An Icelandic reader had in fact direct access to an unbroken tradition of poetry which had preserved the use of alliteration and even rhyme for more than one thousand years. What had above all set the standard at this stage were the lyrics of the National Poets which had enjoyed immense popularity, inspiring optimism, confidence, solidarity, some of them even put to music. The poetry of Steinn Steinarr (Aðalsteinn Kristmundsson, 1908–1958), beginning with

his second collection, *Ljóð* (1937), marks the beginning of lyrical modernism. In fact, this poetry was not so great a departure from traditional forms; the metres and rhythms are freer than before, but most of the poems are alliterated and a good many have rhymes as well. What is new are the startling metaphors, antitheses, paradoxes, not to mention the overriding sense of futility and alienation, disillusionment and skepticism.

The revolt against the poetic tradition expressed itself in a number of ways during these years. In his third collection of poems, *Þorpið* (1946), Jón úr Vör (1918–) rejected both alliteration and rhyme. This is a cycle of poems describing the poet’s childhood and youth in a poor village in the west of Iceland, written in a kind of lyrical realism in a simple, everyday language. In spite of the poverty and hard living conditions described, the atmosphere is depicted in a kind of a romantic light. A similar combination of lyrical realism and romantic imagery can be seen in the poems of Vilborg Dagbjartsdóttir (1930–).

Some leading modernist poets of the period were called the Atomic Poets after the designation given to a couple of bizarre characters in Laxness’ *Atómstöðin*. Among them, Stefán Hörður Grímsson (1919–) exhibits a very personal style which is entirely different from previous poetry, being more compact and introspective, with fresh, surrealistic imagery, building up a poetic world of his own in direct opposition to the factual world. In his latest poems, there are increasing elements of mysticism, as the world of Nature is brought in opposition to the world of “civilized” man.

The third alternative to the tradition is represented by Snorri Hjartarson (1906–1986) who made his debut in *Kvæði* (1944), where he follows the example of Jónas Hallgrímsson and tries to renew the lyrical tradition by introducing foreign metres and revitalizing the old ones. Some of these poems are tapestries of alliteration and rhyme, sounds and images. Among the characteristics of Snorri’s early poems are his fresh compounds of adjectives and nouns, not least in his exquisite descriptions and images of Nature. In his later poems, all this romantic splendour is discarded in favour of a simple style with few and pregnant images.

In fact, many of the poets tried in various ways to renew the old poetic forms while revolting against them. So even though the battle against the lyrical tradition was fought

and completed during the fifties, this tradition still reverberates in the works of many modern and modernistic poets. For example, the poems of Þorsteinn frá Hamri (1938–), in spite of their modernistic diction, are interwoven with the tradition, expressing the questions and problems of modern man through inherited themes and symbols.

8.2. The first genuine Modernist prose writer was Thor Vilhjálms­son (1925–), who made his debut in 1950 with *Maðurinn er alltaf einn*, a collection of sketches and short stories. The Modernist breakthrough, however, did not come until the late sixties with Thor's novel *Fljótt fljótt sagði fuglinn* (1968), the short stories and novels of Svava Jakobsdóttir (1930–), *Veizla undir grjótvegg* (1967) and *Leigjandinn* (1969), and *Tómas Jónsson metsölubók* (1966) by Guðbergur Bergsson (1932–). These three "Modernists" do not, however, have very much in common. The style of Thor Vilhjálms­son is very visual, almost exuberant, with vivid powerful imagery and a kind of a suggestive rhythmical quality. He flouts nearly every maxim of traditional story-telling, caring nothing for coherent plot, consistency of character, or unity of time, space and action. Svava Jakobsdóttir writes about modern, everyday life in a realistic style, free of any kind of rhetorical embellishment. Or so it seems, but her style may quite suddenly glide over into the grotesque and fantastic in a way that may remind us of fairy tales and folk tales. These stories often focus on language conventions, not least those revealing rooted prejudice. They are heavy with symbolism, and the protagonist is generally a woman, a middle-aged housewife. The narrative method of Guðbergur Bergsson's early novels hinges on a kind of a grotesque realism, which infuriated many readers who thought that the author focused too much on the repulsive side of contemporary life. The setting of these novels is, at first sight, realistic, an Icelandic seaside town with a stinking fish factory in the centre and an American military base nearby. As they proceed, some of the characters tend to split in two, the sense of time is confused, and so is the sequence of events. In Guðbergur's later novels, his style has become increasingly introspective and surrealistic.

8.3. Icelandic literary language was preserved and developed over the centuries in isolation, in primitive and static farming communities. A part of its heritage is a great number of idioms which nobody can explain without

reference to antiquated methods connected with farming and fishing. The basic vocabulary has remained the same for centuries, but a great number of neologisms have been created in order to make the language more able to express a totally different world and ways of living.

The Icelandic authors now in their prime are the first generation to have been born and bred mainly in Reykjavik and have this as their natural starting point. In many respects, the quartet by Pétur Gunnarsson (1947–) beginning with *Punktur punktur komma strik* (1978) can be said to have paved the way. This is the life story of a young man from his conception to his manhood. The scene is Reykjavik during the fifties and sixties; the novels describe how the protagonist appropriates the world through the discovery of the language around him and later, as an adolescent aspiring writer, through the books of older authors, above all Halldór Laxness. The style, accordingly, is full of puns and fresh metaphors, and the narrative and situations are extremely comical. The first three books follow the pattern of the developmental novel (*Bildungsroman*), but in the last book, *Sagan öll* (1985), it turns out that the protagonist is in fact a character in the work of another character, or perhaps his alter ego.

8.4. Foreign cultural influence has increased dramatically over recent decades, through frequent communication, films, mass media, etc. However, many modern Icelandic writers have reverted to national and historical themes, even some of the Modernists. Svava Jakobsdóttir, e.g., in her novel *Gunnlaðar saga* (1985) deals with a mythological subject from the Eddas, trying to give it a contemporary relevance. Thor Vilhjálms­son's latest novel, *Morgunþula í stráum* (1998) is an epic "rhapsody" based on the dramatic life of one of the principal characters from Sturla Þórðarson's *Íslendingasaga*.

Younger writers have also made use of and developed the tradition in various ways. In many modernistic texts one can find frequent allusions to the traditional Romanticism of Nature, e.g. in the poetry and prose of Steinunn Sigurðardóttir (1950–). The popular tradition of story-telling has been extended in the novels of Einar Kárason (1955–), partly influenced by the saga literature. Others, such as Einar Már Guðmundsson (1954–) and Gyrðir Eliasson (1961–) have, in various ways, combined the influence of modernism

and the folklore tradition into a kind of “magical realism”.

Let us conclude with two examples. Þórarinn Eldjárn (1948–) is one of the writers who combines traditionalism with modernism. His latest novel *Brotahöfuð* (1996) is based on 17th-century sources and written in 17th-century language. One of his first published works was *Disneyrímur* (1978), a “heroic epic” from the modern world dealing with the life and work of Walt Disney but composed throughout in the metre and poetic diction of the traditional rímur. The lyrics of the poet and troubadour Megas (Magnús Þór Jónsson, 1947–), influenced by the American Beat Generation, can be said to belong to an international world characterized by drug dealers, pimps and petty criminals, but they follow all the traditional rules of alliteration and rhyme and are packed with allusions to the literary heritage: the ancient sagas, 17th-century hymns, the National Romantic poems, folklore and folk tales.

53. Nordic language history and literary history V: Faroe Islands

1. Introduction
2. The Faroese *kvæði*
3. The period 1846–1888. A standard norm for written Faroese is created
4. From 1888 to 1912.
5. From 1912 to 1948
6. Language and literature after 1948
7. Literature (a selection)

1. Introduction

When the history of written Faroese literature begins, the phonological and morphological structure of the language is already next to identical with today's Farøese.

The Faroese are probably one of the smallest nations in the world (ca. 45000 inhabitants) that has a comprehensive printed literature in its own national language. However, 150 years ago, there was no written standard norm, nor were there any printed works of original literature in the Faroese language. When the Faroese became part of the great Dano-Norwegian kingdom in the Middle Ages, Danish was introduced as the language of administration. The ON writing tradition died out, and after the introduction of the Danish Bible during the Reformation, Danish was the only language used in writing, in court, and in church. For hundreds of years, Faroese existed exclusively as spoken dialects without a written norm.

2. The Faroese *kvæði*

Strong support for the Faroese language during the centuries after the Reformation was provided by its unique treasure house of oral

tradition, especially the old epic ballads, the famous Faroese *kvæði*. The medieval chain-dance, preserved only in the Farøes, has been the most popular social entertainment up to the present. Since the singing of the dancers is the only music, and the texts are mainly the *kvæði*, these have been perpetuated through the centuries through the dance. More than 200 old ballads have been preserved in this way. The contents are much the same as in medieval Nordic literature. Thus there is a mighty cycle of Charlemagne and his paladins, and another tells the story of Sigurd the Dragon-Slayer.

2.1. Language and style of the *kvæði*

Characteristic of the Faroese *kvæði* is its length; 200–300 rhymed stanzas is not exceptional. The story in the ballad is as a rule told with considerable circumstantiality. Dramatic episodes are often repeated in parallel stanzas, sometimes identical, sometimes with slightly varied wording. A refrain (Far. *niðurlag*), consisting of one or several lines, is repeated after every stanza throughout the ballad. As an illustration three stanzas from the *Sjúrdar kvæði* (Lyngbye 1822, 88f.) will be quoted here, rendered with normalized spelling:

110. Tað var hin snari Sjúrdur, / sínum svørði
brá, / Hann kleyv tann hin Frænarorm / sundur
í lutir tvá.

Grani bar gullið av heiði, / Brá hann sínum
brandi av reiði, / Sjúrdur vann av orminum, /
Grani bar gullið av heiði.

111. Vant var tað høggið,/ið Sjúrdur gav tann stund./Tá skalv báði leyv og lund/og øll verøldins grund. Grani bar etc.

112. Tá skalv báði leyv og lund/og øll verøldins grund./Sjúrdur brá sín bitra brand,/og hjó hann í miðju sundur. Grani bar etc.

In the ballads a great number of words and expressions which are extinct in today's Faroese have been preserved, many of them used metaphorically as in ON poetry. Thus *brandur* for 'sword' is used exclusively in the *kvæði*. Other examples: for 'fight' or 'battle' are found poetic expressions as *randarný* (ON *randargný*; lit. 'clang of shields') and *brynjugiðlvur* (lit. 'storm of armour'); 'blood' may be called *benjardogg* (lit. 'dew from wound'), etc. (Matras 1958, 90). Besides metaphoric expressions, hyperboles are common, as a rule used to give force to dramatic episodes. Thus the whole world quakes when Sigurd slew the dragon. Obsolete word forms are frequent, e.g. *sjá* for *siggja* '(to) see' (ON *sjá*); *tvá* for *tveir* 'two' (ON masc. acc. *tvá*); *tú ár* for *tú eigur* 'you own' (ON *þú átt*).

2.2. The *kvæði* are written down

A pioneer in the recording of the *kvæði* was Jens Christian Svabo (1746–1824), who invented a kind of phonetic-phonological orthographic system, and wrote down a large number of ballads in the 1770s and 1780s, spelling the words as they were pronounced in his West-Faroese dialect. He also inspired others to record *kvæði*, and during the 19th century several handwritten collections were produced.

2.3. Tættir

A vital and specially Faroese variety of the ballad is the *táttur*, a satiric lay, where local events or ridiculous behaviour are made fun of. Unlike the medieval *kvæði*, the themes of the *tættir* are always Faroese. The most famous specimen of this genre is *Fuglakvæði* ('Lay of the Birds') by Poul Nolsøe (1766–1809). It is a political satire directed against the Danish officials, who are depicted as birds of prey, whereas the Faroese population are represented by the small birds, defended by the oystercatcher, symbolizing Poul Nolsøe, the national hero.

3. The period 1846–1888

3.1. A standard norm for written Faroese is created

Svabo's ultimate goal had been purely scientific and antiquarian: to save the language from oblivion. He accepted Danish as the principal language of the islands and did not believe that Faroese could ever be used as a literary and national language. A decisive year in the history of the Faroese language was 1846. In that year a young theologian in Copenhagen, V.U. Hammershaimb (1819–1909), published a number of folklore texts in an entirely new orthography, founded less on pronunciation than on etymology. In the following years Hammershaimb published many ballads and other specimens of oral tradition, and in 1854 his *Færoisk Sproglære* 'Faroese Grammar' appeared. Many years later, in 1891, he issued *Færoisk Anthologi*, containing his grammar of 1854, slightly revised, and a large number of *kvæði*, riddles and folk tales. Included were also nine short sketches of rural everyday life, the oldest examples of literary Faroese prose. The themes are haymaking, fishing, whalehunting, wedding, etc. On the whole, the language is the same as in the rendering of the folk tales, especially regarding vocabulary and syntax.

3.2. The birth of modern Faroese poetry

The birth of modern Faroese poetry can be dated to the 1870s, when Faroese students in Copenhagen began to write lyric verse which had no connection with the poetic idiom of the ballads. These poems, which were read or sung at their social gatherings, were drinking or patriotic songs, generally in the somewhat old-fashioned romantic style that was the rule in that kind of poetry.

4. From 1888 to 1912

4.1. National revival

When the patriotic movement among the Copenhagen students was transferred to the Faroese, it became more concerned with practical and political questions. An increasing number of Faroese began to be proud of their culture and of their language, which was felt to be the most important unifying symbol for the Faroese as a nation. A significant event was a meeting in Tórshavn at Christmas 1888, held in order "to discuss how to defend the

Faroese language and customs". After the meeting the *Føringafelag* (Faroese Union) was formed, the aims of which were to raise the status of the Faroese language, and to work for unity, progress, and self-sufficiency of the Faroese people (Debes 1982, 149 ff.). It was hoped that Faroese – instead of Danish – would eventually be used for all public business, and that a national Faroese literature would develop. An important outcome of the activity of the *Føringafelag* was the publication of *Føringatiðindi*, the first newspaper (a monthly) written exclusively in Faroese.

4.2. Language planning and language cultivation

The efforts to guide the development of the language in a national direction was called *Reformbevægelsen* 'The Reform Movement' in a newspaper article 1889 by the Faroese philologist Jakob Jakobsen (1864–1918). He suggested three methods to counteract the decay of the Faroese language, which he found threatened by the strong impact of Danish: to revive obsolete Faroese words, to replace foreign words with neologisms, and to exchange Danish affixes for Faroese equivalents. Jakobsen's principles for language cultivation were generally accepted, and during the 20th century literary Faroese has become more and more "pure". Thus most of the examples of the affixes *an-*, *be-*, *for-*, *heit* (Dan. *-hed*) found in *Føringatiðindi* are not used in modern Faroese prose.

4.3. Development of prose literature

Most of what was written in Faroese before the turn of the century was somewhat limited in scope. However, in the beginning of the 20th century a more diversified literature began to unfold, consisting not only of patriotic lyric verse in a neoromantic style, but also of imaginary prose sketches on different themes. The first novel in the Faroese language, *Bábelstornið* ('The Tower of Babel') by Regin í Líð (pen-name for Rasmus Rasmussen, 1871–1962), was published in 1909. The theme is the conflicts between two families through three generations in a Faroese village, against the background of the social and political development that took place from the 1840s onward. The happenings are told in simple chronological order in the style of the continental realistic novel. The language, although rather refined, is not innovative. More successful were Regin í Líð's short stories, and

still more so were Sverre Patursson's (1871–1960) at the same time realistic and poetic descriptions of Faroese nature, above all of Faroese bird life.

4.4. Poetry

Ever since the rise of Faroese literature in the 1870s, poetry has dominated over prose, probably to some extent due to the influence that the perpetual singing of the ballads has exerted. The poetic idiom of the *kvæði* is clearly recognizable in the verse of several poets, among others Jóan Petur Gregoriussen (1845–1901) and Jógvan Dánjalsson (1843–1926) from the village of Kvívík, both of whom preferably wrote somewhat lengthy poems about rural and national themes. More sophisticated lyrics were produced by the men who were directly engaged in the Reform Movement, above all Jóannes Patursson (1866–1946), whose vigorous and audacious language was innovative, with puristic neologisms such as *lunnavagnur* 'tram' and *snarlýsismáttur* 'electricity' (lit. 'lightning-power').

5. From 1912 to 1948

5.1. Faroese in public life

During this period, thanks to the Reform Movement, several important changes took place in the status of Faroese in public life, in domains, where the Danish language had been totally dominant. Thus oral Faroese was made a compulsory subject in the schools in 1912, followed by written Faroese in 1920. In 1938 Faroese became allowed as the language of instruction on all levels of education. The same development took place in the use of Faroese in church, ending with an ordinance in 1939 which allowed ministers to use Faroese in all parts of the divine service. These changes in the status of Faroese naturally required a considerable corpus of printed texts. Readers for the schools had already been produced at the beginning of the century, particularly by the clergyman A. C. Evens (1874–1917). A Faroese religious idiom was created above all by Jákob Dahl (1878–1944), who translated most of the Bible from the original. The New Testament appeared in 1937, the Old Testament in 1961 (completed after Dahl's death by K. O. Viderø). Dahl's language is at the same time homely and worthy. In texts where a solemn style is required, he effectively uses obsolete word forms and syntax. Thus, for in-

stance (in the Service Book, 1929): *Vær tókum tær* ('We thank Thee') instead of *Vit takka tær*; the possessive pronoun *vár* ('our') instead of *okkara*; abundant use of constructions with the genitive such as *fyri syndarinnar skuld* 'because of our sins', and *doypa [...] til navns faðirins og sonarins og heilaga andans* 'christen [...] in the name of the Father, of the Son, and of the Holy Spirit'.

5.2. Poetry

A break-through towards a more personally coloured poetry came with Jens Hendrik Oliver Djurhuus (1881–1948). His *Yrkingar* ('Poems') 1914 was the first collection published by a Faroese poet. With Djurhuus Faroese poetry left behind the provincialism and romanticism that had been hovering over the lyrics of the earlier poets. His themes are both personal and universal. By his abundant use of symbols and metaphors, as well as by his vigorous language – with alliteration and bold syntax – Djurhuus has exerted a strong influence on later poets. His most eminent follower was Christian Matras (1900–1988), who during his long life published a considerable number of collections of poetry. His lyrics show great variation in themes and style – from traditionally formal stanzas to utterly concentrated aphoristic verses –, always precise in diction and with a personal tone of warm imagination. His nature poetry, combining description and vision, reflects with a religious undertone Matras' deep love of his country. More decidedly modernistic than Matras were Karsten Hoydal (1912–1990) and Regin Dahl (b. 1918). Titles such as *Myrkrið reyða* ('The Read Darkness') and *Syngjandi grót* ('Singing Stone') of two collections by Hoydal reveal the poet's view of nature as animated, and of natural scenery as symbols of human feelings. During this period a great number of poets appeared who were more or less original. One of the most popular was Hans Andrias Djurhuus (1883–1952). He was an accomplished and versatile versifier who wrote a large amount of melodious poetry in a traditional style, displaying a pleasant optimism.

5.3. Fictional prose

The first novel to be published in the Faroese language after *Bábelstornið* was the two-volume story *Lognbrá* ('Mirage', 1930) and *Fastatøkur* ('A firm Grip on Life', 1935) by Heðin Brú, pen-name for the agricultural consultant Hans Jacob Jacobsen (1901–1987). In this

story of a dreamy and melancholic boy in a remote Faroese village, of his childhood, his growth and progress to maturity, the author gives a vivid and true picture of rural Faroese life on land and at sea at the beginning of the 20th century. The story, although rather simply told, enthralls the reader through its style and its language, as well as through the author's imaginative strength. Later on Heðin Brú published four more novels – among them the masterpiece *Fedgar á ferð* ('Father and Son on the Go', 1940) – and five collections of short stories. Heðin Brú was deeply rooted in the old stable peasant society, where most of his stories are set; the scene is as a rule the small village and the powerful, dangerous nature, and the characters are peasants and fishermen – Faroese to the core – who led a life far from the modern conveniences of Tórshavn. No other Faroese author has so successfully transformed spoken Faroese into literary language as Heðin Brú, and his style remains artistic, even when it is audaciously colloquial. Relying on the rich and pure vocabulary of his native village of Skálavík on Sandoy, he is admirably independent of Danish syntax and grammar. Thus he often deletes the conjunction and the relative particle at the beginning of subordinate clauses, and as a rule he writes *Tú er/var/fekk/komdi*, etc. 'You are/was/got/came' instead of *Tú ert/ vart/fekkst/komst*, etc., which are the forms prescribed in normative grammar.

Of the same generation as Heðin Brú was Martin Joensen (1902–1966), who published a few novels and a large number of sketches and short stories, some of them of high literary value. In his two-volume novel *Fiskimenn* ('Fishermen', 1946) and *Tað lýsir á landi* ('There is Light over the Country', 1952), where the main theme is the conflicts between the shipowners and the fishermen, Joensen introduces social realism into Faroese literature, probably influenced by Danish authors such as Hans Kirk and Martin Andersen Nexø.

6. Language and literature after 1948

6.1. The Home Rule Act and the status of Faroese

When the Home Rule Act was passed by the Danish Parliament in 1948, Faroese was declared the principal language of the islands, and so Faroese began to be used both orally and in written communication within the sections of administration that were taken over

by the Faroese authorities. These political changes have revealed large gaps in the vocabulary of Faroese, particularly with reference to administration and science. Much work has gone into creating new words in these fields. Thus a number of word-lists have been produced, e. g. of terminology for administration, for the postal system, for grammar and linguistics.

6.2. Modern poetry

During this period a considerable number of poets have emerged. Among the most talented are Steinbjørn Jacobsen (b. 1937), Guðrið Helmsdal Nielsen (b. 1941), and Rói Patursson (b. 1947). Their poetic works from the 1960s and later may be characterized as modernistic and post-purist. The literary language has now attained such inner strength that authors dare to use the whole range of the vocabulary, unconcerned with the etymology of words. Jacobsen and Patursson in particular use colloquial, sometimes harsh everyday expressions freely in their political poems, where they criticize modern Faroese society. Patursson's verses have an extremely free form; in his collection *Likasum* ('As if', 1985) there are no rhymes, no capitals, no punctuation marks. Repetitions are used in a suggestive way. The themes are often wholly philosophical and without reference to a Faroese background. G. H. Nielsen has a taste for diminutive poems in unrhymed free form. Her collection *lýtt lot* ('mild breeze', 1963) is the first book of poetry published by a Faroese woman writer.

6.3. Fictional prose

With the rapid material and economic progress after World War II, a more international and urban trend is noticeable in the works of the younger writers of literary prose. Among these Jens Pauli Heinesen (b. 1932) is outstanding. Up to now he is the only writer of Faroese fiction that has been able to make a living as an author. He is by far the most productive of all writers of Faroese fiction. His many novels and short stories include a great variety of themes. In a series of semi-autobiographical novels – six volumes from 1980–1988 – Heinesen gives a detailed picture of Faroese life and scenes from his childhood and adolescence, combining the old delight in story-telling with modern realism. Heinesen's most impressive novel is *Frænir eitir ormurin* ('The Dragon's Name is Frænir', 1973). The title alludes symbolically to *Sjúrðar kvæði*, and

the main theme is evil, realized as deep and pervasive corruption in human life. This novel abounds in sarcastic pictures of Faroese post-war social and political life, the problems of which are made obvious, relevant, and tangible. Like most of Heinesen's stories it is a novel with a purpose, and the characters are created with a view to illustrating his thesis. Heinesen uses the whole stylistic range of Faroese. Some of his short stories, told in simple and vigorous language, thrill the reader with their deliberate harshness and cruelty. After Heinesen many young fiction writers have appeared on the literary scene, some of them determined critics of contemporary Faroese society and hostile to its traditional ideals.

6.4. Recent linguistic developments

The most clearly distinguishable trends in post-war Faroese are the considerable increase in vocabulary, the great variation in literary style, and the effects of energetic language cultivation, which has led to widespread consciousness of what is considered good and bad language. The gap between a more pure, "high" literary language and a conversational parlance with a high frequency of loan words is still a reality, an unavoidable consequence of the heavy impact of Danish due to the bilingual situation.

54. Nordic language history and the history of philosophy

1. Introduction: the framework
2. The dichotomies in action
3. Literature (a selection)

1. Introduction: the framework

The strategy of unavoidable simplification in this article is the following: Only those branches of philosophy which have a bearing on language are accounted for, and the treatment as a matter of course does not aim at any complete coverage whatsoever. Rather what I shall do is to take up certain recurrent themes in the philosophical treatment of language in order to exemplify their consequences, if any, for the Nordic languages. Let it be remembered at the outset that it has always been a hallmark of the philosophical endeavour that it is *not empirical* in the ordinary sense of empirical, i. e. leading to scientific descriptions of the linguistic facts.

I take the following three dichotomies to be basic:

- (a) universalism vs. particularism
- (b) idealism vs. materialism
- (c) nature vs. culture

2. The dichotomies in action

2.1. Outline

A universalistic point of view would stress the fact that language as such, *langage* in the Saussurian sense, is a universal feature of the human being. Since universalists have this priority, they are less interested in the particular languages and tend to see them as (less significant) variations on a common theme. Universalism may be coupled with idealism, which would give us an idealist universalism referring to God-given ideas, or to innate ones, or to both at the same time. On the other hand, a materialist universalism would be based on biology and would tend to see development of language as one step only on the evolutionary ladder, stressing the continuity of communication at all stages.

Particularism takes as its point of departure that the differences between the various languages are what matters. In its idealist version the effects of language structures are coupled with psychological functions so that differences among languages reflect, and by the same token bring about, differences among their users.

The dichotomy of nature vs. culture with reference to language involves rival stances as to what a language is ontologically. If language or languages are first and foremost natural phenomena, then human agency is futile. You cannot change the laws of nature. If, on the other hand, language and languages are instead cultural phenomena, it becomes perfectly natural for human agents to design it/them and to mould it/them for the future, in short to cultivate it/them. One variant of the culture vs. nature dichotomy places speech as the (most) natural linguistic domain, while writing is defined as being cultural. Thus writing systems may be changed by human agents, whereas spoken language is beyond the reach of the linguist, who only has to analyze it.

2.2. Medieval ideas about language

Idealist universalism has been dominant in most of the history of the philosophy of language. In the vast epoch which we may conveniently label “the Christian era”, the divine nature of language made it incomprehensible to speculate along other lines. The medieval *modistae* formulated questions about language and cognition in a language which was not their mother tongue, viz. Latin, and they answered by pointing to the relationship between grammar and logic (Ebbesen/Friedman 1999). Framed in a universalistic mode, the specific relationship between a language and thought simply could not be posed.

2.3. The Sorø group – between universalism and particularism

It is not the place here to go into the influence of French rationalist thinking in the history of Nordic thinking. Suffice it to say that the universalism of the *grammaire générale* deeply influenced teaching as well as philosophy of language. In Denmark the influence of Leibniz was felt through the Sorø group (middle of the 18th c.), who consciously followed in the footsteps of Wolff and wanted to be able to philosophize in Danish as Wolffians did in German. Since Danish did not have a philosophical vocabulary, the group, Eilschov, J.S. Sneedorff and Kraft, faced the challenge of either translating or creating the necessary terms in Danish.

As J. Christensen has noted in his booklet on Aristotle (1961), the common European

words for abstract matters all go back in some version to the influence of the Greek philosophers in general and Aristotle in particular. Thus the problem which the Sorø group, and the Wolffians before them, had to solve was how to integrate classical thinking as reflected in its terminology into the vocabulary of a Germanic language.

Lollesgaard quotes from Eilschov's deliberations on translation as follows:

I Modersmaals-Terminologien følger jeg den berømte Wolfs Fremgangsmaade. Hvis Ordet er mig bekendt i Modersmaalet, saaledes at det i sin almindelige Brug svarer til det latinske Ord, indlader jeg mig ikke paa at danne et Ord. Hvis der maa dannes nye Udtryk, oversætter jeg ikke Ord for Ord, men danner dem i Overensstemmelse med Sprogets Aand. Jeg danner undertiden helt nye Ord, og jeg søger derved at træffe den tekniske Nomenklatur's Mening.

(Eilschov, quoted in Lollesgaard 1925, 24f.)

We see here an awareness of the particularistic viewpoint that language structures differ significantly ("Sprogets Aand") while the thought of having parallel structures in Danish and Latin is universalistic. Note that Eilschov's main work was written in Latin (cf. J. Christensen 1986) and that the whole idea of being able to philosophize in the mother tongue was part of a democratic effort, not a means to supersede Latin.

2.4. Herder, the first particularist

With Herder and his pre-romanticist thinking, particularism enters the scene. Pre-romanticism may be hailed as the introduction of historicism, or as the first philosophical trend to introduce particularism into cultural studies, or as a forging of the two. For the human sciences this meant that thinking in genetic terms became the hallmark of the scientific approach. This made history, a human science, the key to understanding the world. The distinction between the natural sciences and the historical ones or *Geisteswissenschaften* did not have the same meaning in the pre-romantic and the romantic period proper as it has now, as witnessed by the fact that (part of) the natural sciences became "natural history" and both were seen as contributing to the same endeavour. A celebrated "modern" chemist such as the Dane H. C. Ørsted was part and parcel of the romantic quest for the unity of scientific insight (D. C. Christensen 1995).

More important for the study of language, however, was Herder's insistence on the com-

plex relationship between what we would now typically call "culture" and "ethnicity" on the one hand and language on the other. Herder started off with the problem of the role of language in the making of the human species, a favourite subject of rationalist thought on language, but his thinking developed from this problem, which we would now treat as the relationship between biology, neurology and language, towards a cultural anthropology of language and humankind.

Through a complex argument reaching from the biologically based unity of mankind to the family as the smallest group, Herder reaches his strange conclusion: the apparent unity of humankind is "naturally" (this argument is called "the third law of nature" in his famous treatise on the origin of language) fragmented into smaller groups that perpetuate themselves through their cultural and architectural monuments and thus become a nation. Since the different groups, ultimately all individuals, create infinite variations in the use of language, we lack a framework to maintain some sort of stability. The small group, the family, is taken as this stabilizing factor:

Und welcher Schatz ist Familiensprache für ein werdendes Geschlecht! Fast in allen kleinen Nationen aller Weltteile, so wenig gebildet sie auch sein mögen, sind Lieder von ihren Vätern, Gesänge von den Taten ihrer Vorfahren der Schatz ihrer Sprache und Geschichte und Dichtkunst, ihrer Weisheit und ihrer Aufmunterung, ihr Unterricht und ihre Spiele und Tänze [...]

(after Heintel (ed.) 1964, 74).

Thus Herder's thinking has no level between that of the small interacting group and the nation; or better, he conceptualizes the nation and the *Volk* as an enlarged small group, i. e. as some sort of family. This particular characteristic of Herder's theoretical stance is relevant for the study of language in that the relationship between the language of small interacting groups (usually called dialects) is thought of as parallel in kind to the language of whole societies (national languages). A language is thought of as a particular dialect promoted to the status of a standard language.

So far, the influence of Herder is primarily that with his works he overturned the earlier view of the divine character of language; but the influence of Herder is much deeper in his introduction of the concept of the nation and the relationship between language and the genius of the people that make up the nation. Writing about the *desideratum* of a book on

the German language written by a philosopher versed in linguistics, Herder states:

Wiefern hat auch die Sprache der Deutschen eine Harmonie mit ihrer Denkart? Wiefern ihre Sprache Eindrücke auf die Gestalt ihrer Literatur gemacht? Wie kann man es ihrer Mundart, von ihren Elementen, von ihrer Aussprache und Silbenmassen an, bis zu dem ganzen Naturell derselben an kennen, dass sie unter dem deutschen Himmel gebildet worden, um unter demselben zu wohnen und zu wirken? [...]
Der ganzen Nation wäre ein solches Buch ein Schatz: ein Schatz für ihre ganze Literatur. Denn der Genius, der über die Wissenschaften eines Volks wacht, ist zugleich der Schutzgott der Sprache desselben [...]
(after Heintel (ed.) 1964, 104f.).

This passage has all the qualities which were to influence the thinking of language in Western Europe deeply: each ethnic group is simultaneously characterized by a genius and a language, and the two are interrelated at all linguistic levels from phonology to semantics. The complex interrelationship will illuminate the specific *Denkart* and the peculiarity of the literature of the nation since it is reflected in both (and partly, we may infer, determines it).

It is an interesting problem in itself to follow the influence of this thinking into the language sciences. Taking Rasmus Rask as the prime influence for the romantic school of linguistics, and leaving aside for a moment the controversy surrounding this stance, we may note that Herder is not mentioned in the letters of Rask at all (Bjerrum 1968) and that Diderichsen (1960), in his study of the origin of the ideas in Rask's early work, always resorts to indirect influence, i.e. via Adelung or other more directly linguistic writers. On the other hand, Skautrup outlines a possible route of influence into the Danish milieu via the historian Laurids Engelstoft who visited Herder in 1798 (Skautrup 1953, 131; cf. Diderichsen 1968, 234). What is important, however, is that Herder's formulation of the complex relationship between language, people and cognition had to be transformed into a framework for doing linguistics by others.

As documented above, Herder's particularism was strongly idealist. Nowhere can this be seen as clearly as in his ideas of the *Volksgeist*, and an essential part of this spirit was the language. This naturally entails differences between peoples. What the specific nature of the relationship between a language and its people or the other way round was like became

the logical next question. But the linguists had no need for an answer. They felt that Herder had provided the necessary reason for the importance of the analysis of the national languages: simply that languages were important in themselves as documents of the *Volksgeist*; if one was able to trace them back to their earliest appearances, one would by the same token contribute to documenting the history of the ethnic group.

2.5. The curious case of Humboldt

It cannot be overlooked that if we see the history of the 19th-c. human sciences in general and the linguistic sciences in particular as dominated by the *Leitmotiv* of history, we fall all too easily prey to so-called whig history. The conquering current wrote the histories of the linguistic sciences by focussing on the line of thinking relating Jakob Grimm, Franz Bopp and Rasmus Rask as the founding fathers to August Schleicher, Karl Brugmann and B. Delbrück as the perfectors of the same science, i.e. Indo-European comparative philology. This is the line most convincingly taken by Holger Pedersen (1924) in his famous history of linguistics in the 19th-c.

But another line might just as convincingly be drawn. The fact is that Herder was not the only pre-romanticist to influence thinking on language in Europe; Wilhelm von Humboldt, as well, had a lasting importance. Humboldt was probably construed as a linguistic thinker by his pupil Heymann Steinthal, in particular as concerns the concept of the *innere Sprachform* (cf. Borsche 1989; Di Cesare 1998, 85ff.), the concept that Chomsky mentions with approval as equivalent to his "deep structure" (Chomsky 1965, 198). Still, it remains true that Humboldt's link between grammar and mind has inspired a tradition of so-called philosophical grammar. The results of this German school of philosophical grammar have been an important source of inspiration, e.g. for the Danish structuralist Louis Hjelmslev's work on case systems (1935). The path from Humboldt through Steinthal and Misteli to modern typological work is short, but the link connecting Humboldt to the linguistic relativity of Edward Sapir and Benjamin Lee Whorf is equally obvious. The challenge is permanently with us; what does it mean (for the user's cognizing of his or her surroundings) that languages diverge in structural features?

Thus the Humboldtian trend in linguistics (cf. Koerner 1977) is not the main trend in

19th-c. linguistics but constitutes a line of opposition to mainstream historicism. It has severe problems getting in touch with the realities of empirical work, whether typology or grammar, and yet it is undeniably there as a theoretical challenge. In a sense Chomsky is right in connecting this line with the rationalist Port Royal view which he sees himself as continuing. Rationalism and Humboldtianism – as well as Chomskyanism – are concerned with the deepest layers of language, not the nitty-gritty levels of empirical detail. They are all in some sense philosophical linguists.

Humboldt's question is simple. He starts with the fact that there are several different languages, even several different types of languages, and he asks what this means for the individual and for the speech community in general. The answer has been difficult to formulate – precisely because Humboldt was an idealist particularist confronting the universality of language. I can think of two possible paths to follow. One line of thinking says that the various structures of different languages mean that those who speak them perceive their worlds in accordance with their language structure. The extreme version of this stance is called linguistic relativity and is traditionally taken as being the stance of the American linguist Benjamin Lee Whorf, who himself coined the term. The other possible answer is that the linguistic differences are contingent, even accidental. They can be explained and they do not mean anything for the perception of the world. Needless to say, linguists of all kinds could be tempted to endorse the first stance (linguistic relativity) simply because it seems to furnish their work with a strong legitimation. In fact, however, most linguists since the beginning of the 20th c. have taken the second view if they have given this philosophical question much thought.

It may be seen as a characteristic feature of the modern stance, the post-Saussurian stance, in linguistics that all forms of Humboldtianism are discarded without further ado as being out of date. But this was not the case during the 19th c. In all thinking about language stemming from that century we find that the national question is a central problem. The earlier idealist treatment of the question by Rask and N. M. Petersen forms the basis for the later naturalistic concerns, but the question remains on the centre stage. One reason for this is that the professional structure at the universities and the curriculum in schools still reflect the national, if not nationalistic,

view in their combination of language, literature and history for the subjects of e. g. Danish, Swedish, Nordic. This handbook itself reflects the thinking we are concerned with here.

2.6. Esaias Tegnér, the naturalist idealist

The Swedish linguist Esaias Tegnér the younger wrote his treatise on *Språkets makt öfver tanken* in 1880. His book was one part of an effort to make the naturalistic viewpoint popular in Sweden, and he seems to have been eminently successful. The book was part of a series called “Ur vår tids forskning” [from modern research] and is explicitly called a popular account. This notwithstanding, the book is part of the long tradition of philosophical arguments about the nature of language and thus explicitly takes issue first and foremost with Humboldt.

The Swedish background for Tegnér's treatise is probably most significantly Kristian Claëson's work (Tarschys 1955, 71 ff.). Claëson wrote his two papers on the philosophy of language as part of an attempt to elucidate the relationship between language and nation. His point of departure is that modern empirical linguistics has pointed out so many specifics of the different languages that the earlier idea of a *grammaire générale* can be dismissed. Though organic in its structure, language is not a natural phenomenon but a social one. Following the Danish classical philologist Madvig, Claëson considers the function of language to be communication. And his conclusion is thus that the speech community is the central fact. But as a good pupil of the famous idealist Boström, Claëson finally finds his definition in the words

språket är en uppenbarelse af nationalanden. Därifrån, från nationaliteten, dess liv, dess själ, dess fria utveckling, dess organiska natur
(Claëson quoted from Tarschys 1955, 74).

Claëson thus represents precisely the type of idealist particularism which inevitably latches on to some sort of nationalism since for this stance the nation is both the presupposed social reason for language and its perpetually produced result.

Tegnér agrees with Claëson (citing again Madvig and the American linguist Whitney as his authorities) in so far as he sees the power of language to be in the creation of a nation. The language determines who can understand each other, and since communication is cen-

tral, the most vital function of language is to build nations. But note that there is no national spirit or *Volksgeist* here, only function.

Tegnér offers a condensed argument leading from differences of vocabulary within the speech community to the essential role of grammar in the delimitation of the common core:

Emedan grammatiken sålunda är någonting hela folket mera allmänt omslutande än ordför-rådet, synes man hafva rätt att i språkets grammatiska bildning söka de för nationaliteten i djupaste mening kännetecknande dragen. Man synes böra antaga, så väl å ena sidan att hvarje folks grammatik trognast afspeglar dess egen-domliga skaplynne, som ock å den andra, att om språket öfver hufvud eger något inflytande på de talandes tankesätt, detta inflytande allra påtagligast måste vara förnimbart i fråga om språkets grammatiska faktorer.

Särskildt W. v. Humboldt har betonat nödvän-digheten af denna slutsats. Vi skola dock söka visa, att den ingalunda är obetingadt hållbar [...]

(Tegnér 1880, 46f.)

A long chain of arguments is presented before we reach the conclusion some twenty pages later:

Af det föregående bör hafva framgått, att man ej har rätt att i ett språks grammatik vänta synnerligen mycket "folkpsykologiskt" material. Såsom det icke beror af ett folks sätt att uppfatta världen, huruvida det kommer att tala ett isolerande eller ett agglutinerande eller ett flekterande språk, och såsom ett och samma tankeinhåll med ungefär lika grad af tyd-lighet kan återgifvas i hvilkendera af dessa språkets hufvudformer som helst, så bör man ej håller i språkets grammatiska byggnad leta efter väsentliga bidrag till folkets karakteristik. (Tegnér 1880, 66)

Here language is seen as something external to the people, and not the essential ingredient, as the romanticist would have it.

It seems to be a bit surprising, then, when we later find that Swedish is not simply at the disposal of its popular users but has a pro-nominal structure which apparently makes address forms a complicated matter. The argument is as follows: Pronouns are used for addressing people. We have in Swedish two forms which may be used, *du* and *ni* corresponding to the T and V forms of the Brown and Gilman hierarchy (1960). But in many cases this supply is not enough for speakers who must resort to using titles instead:

Om vi ock nu så vant oss vid detta missförhål-lande, att vi till och med, som någon sagt, finna *herr generalkrigskommissarien* vara ett bekvämare ord att uttala än *ni*, så kan dock ingen vara blind för det stora inflytande på våra um-gängesvanor, som denna grammatiska egenhet utöfvar. Blott genom det tvång, saknaden af ett gångbart tilltalspronomen pålägger oss, ge-stalta sig i vårt land många ej blott sällskapliga utan äfven i högre mening sociala förhållanden på annat sätt än de eljest kunnat göra. (Tegnér 1880, 87f.)

The Swedish language forces the Swedes to be formal! The naturalist Tegnér suddenly becomes an idealist when it comes to sociolin-guistic matters.

2.7. Frederik Dreier, a Danish materialist universalist

I do not doubt that the Danish philosopher and socialist Frederik Dreier would have been sympathetic to much of the critical content of Tegnér's booklet but he would have thought the retreat to idealism disturbing. His manu-script on *Sproglige Tilstande og Bestræbelser i Norden. Forsøgene til et almindeligt Sprog* was never published. Written between 1846 and 1852 (shortly before Dreier's death), it consists of more than 335 small handwritten pages and will only now be published in the planned edition of his collected writings. I have had the opportunity to read the tran-script by courtesy of the editors. Dreier's main target in the first part is N. M. Petersen as a representative of nationalist idealism which – so we are told – beguiled Dreier himself until he became able to discover its foundations. Dreier's method is akin to what would later be called *critique of ideology*, i.e. an internal critique of what is gradually disclosed as ideas which run contrary to what is taken to be the *real* world or the preferred development. The constant theme is the juxtaposition of the uni-versal idea of humankind and the particularist idea of the people.

In Conrad (1996) we may find a painstaking analysis of a somewhat later work by N. M. Petersen, viz. his history of Danish literature (1853–61). Among other things, Conrad discusses what Petersen could mean by the "people". Obviously, writing the history of Danish literature was for the benefit of the Danish people. On the other hand, the literature written within the Danish Kingdom was written by at least three different nationalities, viz. Germans, prominent in Holstein, Norwe-

gians and Danes proper. Furthermore, there is a difference between the language of the written texts which form the sole object of the history of literature and the various dialects used by the people in daily interaction. Petersen does not deal with these dialects in his history of literature, but he comments on them elsewhere. He is not impressed – the dialects cannot form the basis for any renewal of the written language and are bound to disappear as education progresses. On the other hand, it is obvious that precisely because they keep vestiges of the old they are valuable as objects of study. Petersen's most beloved pupil, Carl Säve, educated a generation of Swedish Nordic philologists – and dialectologist. He was himself a dialectologist of considerable merit.

Petersen is thus torn between his esteem for all the original virtues inherent in the old spoken languages and his conviction that only the written standard language is polished, cultivated and brought to fruition by the noblest spirits of their times, viz. the poets. This is an inherent split in the early idealist conception of language, leading to both dialect archaeology, which stresses the regular correspondences between the earliest written texts and the actual dialects of the 19th c., and to the refined critique of literature as more or less Danish and more or less valuable (cf. also Diderichsen 1968, 243, note 36).

Dreier has noted this ambivalence and makes the most of it in his attack on Petersen's idealist cultivation of the past. Dreier is emphatically a modernist and a progressivist at that – in fact he is even an optimist. Petersen was an avowed pessimist and was always tormented by imagining the doom of the Danish people who would disappear because the Danish language would be swallowed up by German. Dreier's optimism makes him discard the backward-looking Scandinavism (though he favoured any movement towards more communicative ease, he was ardently opposed to its Old Norse basis). The national researchers, notably Petersen and Martin Hammerich, disguise a social bias when they pick out the speech of the Church or the learned classes as emblematic for the language as such. The empirical basis is lacking. Whenever Petersen and Rask argue that writing has to mirror precisely the sounds of speech, Dreier agrees wholeheartedly only to reiterate his fierce attacks whenever Rask makes concessions to "usage", i. e. the writing traditions.

Dreier is an unusual type in the history of the Nordic philosophy of language – a materi-

alist universalist. Siding with Madvig, again, he connects thinking and language:

Tænkningen er ikke noget fra den indre Sprogfornemmelse Adskilleligt; jo klarere denne er, des klarere staaer Tankeprocesserne for En, og omvendt, hiin er et Moment i denne. Det er forsaavidt med Rette at man taler om at "tænke paa dansk, fransk, tydsk", eftersom den klare Tænkning foregaaer i danske, franske eller tydske Sprogformer; dette har naturligviis aldeles Intet at gjøre med Nationalisternes danske, franske, tydske Tænkning, idet Tankeproces og altsaa Resultat kan være aldeles den samme, om end forskjellige Sprog afgive Midlet.
(Dreier 1846–52, 202)

Dreier is fully aware that thinking is a complex process and notes that some day we shall know more about what goes on in the brain. But until then what we have is its manifestation in language. And language may be changed (developed) and evaluated so that it develops in the right direction:

[...] det er tydeligt at man maa kunne sammenligne forskellige Sprogs Metoder og i mange Tilfælde bestemt erklære sig for en af dem, under Forudsætning af dens Gjennemførelse med alle dens Conseqvenser; men langt vigtigere er det, at Hensynet til Begrebernes hensigtsmæssigste Udtryk paa videnskabelig Maade lader sig gennemføre, saaledes at der dannes Nomenclaturer efter almene Grundprinciper.
(Dreier 1846–52, 222)

Dreier here foreshadows the conscious development of terminology for specific areas, which is an integrated part of modern language planning efforts.

Nowhere do we see more clearly the close connection between universalism and rationalism and the materialist socialism which Dreier professed than in his suggestion that we may in fact have a better future if we construct an international common language, much as Leibniz had argued. Dreier gives various hints throughout the manuscript as to the programme he envisages for the liberation of the masses. The natural sciences must take the place of the human sciences and literature as the central matter of the educational curriculum (p. 225), and he repeatedly refers to the creation of special languages (or as we would now say languages for special purposes), in particular the terminology of mathematics, to bolster his argument. When it comes to human agency, he is insistent that it is possible and indeed preferable to influence the development of language.

He quotes with approval Rask's thoughts on the creation of a new language, foreshadowing Esperanto and Jespersen's Novial by half a century. The technical knowledge which Rask brought to the task inspired Dreier to be a linguistic engineer. Last but not least, Dreier's materialist conception of the role of language manifests itself in the hierarchy of determination. Only a "rearrangement" of the production system and a scientifically based educational system may further the new.

I have chosen to dwell on Dreier's little-known writings (but cf. Diderichsen 1968, 235 and Stybe 1959) because they seem to me to complete this ultrabrief overview of the philosophy of language by exemplifying the last of the possible stances, the materialist universalist.

55. The special case of Grundtvig: Poet, philosopher, politician, educator

1. Grundtvig and the Danish language
2. Grundtvig's own linguistic progress
3. Grundtvig's language policy
4. Grundtvig's achievement and legacy
5. Literature (a selection)

1. Grundtvig and the Danish language

N. F. S. Grundtvig (1783–1872) was one of the strongest driving forces in the 19th century to purify and cultivate the Danish language, helping to turn it into a truly cherished medium for poets, scholars, scientists, teachers, parliamentarians, popular speakers and journalists. Working in the light of the language philosophy of the German anthropological thinker J. G. Herder, who considered the mother tongue an essential part of any national identity (“*Volksgeist*”), Grundtvig was a contemporary of Herder's pupils in the romantic era such as Professor Laurits Engelseft in Copenhagen and the philosopher J. G. Fichte in Berlin. But being extraordinarily well-read, Grundtvig also included efforts supporting the vernacular by Danish humanists of the 15th–16th century, e. g. in national historiography and in collections of proverbs and popular ballads.

During his long and active life, Grundtvig constantly improved his own mastery of the Danish language along with the acquisition of other languages that were not part of the general education of the period. For a quarter of a century, Grundtvig experimented with very different types of style and literary genres, usually having written three to four times as much in rejected drafts as was published. A good deal of his writing never was printed but can be accessed in the extensive Grundtvig Archive at the Royal Library in Copenhagen, comprising 535 parcels of manuscripts, registered in a mimeographed index of 30 volumes (1957–64). Diligence and determination are indispensable factors in Grundtvig's linguistic progress. His philological work was professionally painstaking in surveying, collecting, excerpting and copying material.

2. Grundtvig's own linguistic progress

As a schoolboy (1792–1800), Grundtvig was only taught the dead languages Latin, classical Greek and Hebrew. In his adolescence he must have learned German, which was a second lan-

guage in the then-multinational Danish state. During his stay as private tutor at a manor house (1805–08), he read Friedrich Schiller and the romantic philosophers Schelling and Fichte in the original; in the 1810s he even wrote some poetry and a few other texts in German. Grundtvig did not seriously learn English until the middle of his life, when he undertook four study tours to England (1829–31 and 1843); in his youth he studied Shakespeare in German translations. Neither the French language nor Romance culture ever attracted him, and his relation to the Slavic world was even dimmer.

2.1. The vernacular

Previous, then-neglected phases of the vernacular caught Grundtvig's attention early on. He had discovered old-fashioned and downright archaic Danish, when in his childhood days he explored the library of his ageing father, vicar of the country parishes of Udby and Ørslev in southern Zealand. The youngest of five children, Grundtvig found that he could not even cope with his sister who was only one year older than him, and feeling unfit for any manual labour except turning over the leaves of a book, he threw himself into reading. He became acquainted with e. g. C. C. Lyschander's *Danske Kongers Slectebog* [Genealogy of the Danish Kings] from 1622, a comprehensive church and world history from 1706 by the Norwegian antiquarian Jonas Ramus, and historical works by Ludvig Holberg and P. F. Suhm – advanced reading for a boy not yet ten years old. In addition, at his childhood home the permanent maid, old crippled Malene Jensdatter, taught him the popular dialect and proverbial expressions of South Zealand, which he thanked her for in 1824 by calling her his language master (“*Sprogmeisterinde*”). When Grundtvig later in life was in doubt about a sentence construction, he simply asked himself: what would Malene have said here?

2.2. Studies of Old Icelandic prose

As a university student of divinity (1800–03), Grundtvig spent much of his time and energy planning a career as a writer of secular fiction. In 1801, a fellow student made him aware of the sources he would gain access to if he could read Old Icelandic. Grundtvig hesitated until

his graduation, but when his friend referred him to the then-untranslated *Jómsvíkinga Saga*, he suddenly decided to overcome the hostile genius of the Icelandic language that always seemed to be getting in his way. Staying at home in Udby as an unemployed graduate in divinity, he started an intense study of Icelandic in June 1804, producing a small grammar and dictionary for his own use by comparing and recording words in poetic samples rendered in Icelandic and Latin in an ecclesiastical history from the 1770s in his father's library. From there he proceeded to read saga texts in the original, gathering idioms and kennings, rapidly improving his skill. In his attempts to write historical fiction in modern Danish prose, he was able to take advantage of directly transferred idioms that were not found in the corresponding place of his Icelandic source, e.g. writing *faret med Seyd* [used sorcery] instead of the original *úti setit* [been sitting in the open air – the usual scene of nightly sorcery in the sagas]. His corrections are also telling, e.g. as Old Norse *vel búnir* first is given as modern Danish *klædte* [dressed], then changed to Germanizing Early Modern Danish *udstafferede* [decorated], finally to end in the archaic Danish word *udredte*. Grundtvig's linguistic sensitivity had really been sharpened. In a total of only nine summer weeks away from the libraries of Copenhagen, he made his way through 1500 quarto pages, 140 octavo columns and 42 folio columns of Old Norse printed texts and could certainly now be considered competent in Icelandic prose.

2.3. Old Icelandic poetry and mythology

The Old Icelandic Eddic poems came into the picture, when Grundtvig published three periodical articles on Nordic mythology in 1806–08, two of them discussing recent poetic use of the ancient material. In the first of these, Grundtvig translated anew 22 stanzas of the *Skírnismál* in the melodious rhymed style of contemporary romanticism (Adam Oehlenschläger), a little later turning this version into a much freer re-creation which was printed in his handbook *Nordens Mytologi* [Nordic Mythology] in 1808. Yet in this work, he also translated no less than 53 Eddic stanzas in a style much closer to Old Norse.

2.4. Poetic attempts

Living at Valkendorf's Kollegium in Copenhagen from May 1808 as a scholar and writer,

Grundtvig worked on an ambitious series of chronicle plays and saga-like stories reconstructing poetically the Nordic pagan antiquity from Odin's entrance in Scandinavia until the death of Palnatoke, the last Viking chieftain, a period spanning more than 1000 years (50 B.C. to 1002 A.D.). This romantic enterprise was interrupted in December 1810, as Grundtvig suffered a fit of insanity combined with a religious crisis (or vice versa), both probably caused by overwork and by a deteriorating relationship with Grundtvig's ageing parents who needed help in the parish from their prodigal son in Copenhagen. Two volumes of plays not designed for performance on the stage, dealing with the downfall of Palnatoke and of the Volsung dynasty, appeared 1809–11 respectively. They demonstrate a solid influence from Old Norse, along with rude expressions and clever puns clearly borrowed from Shakespeare. A short saga about Odin's arrival remained in manuscript form, whereas a story about a sword called Tírfing taken from *Hervarar Saga* was printed in December 1810. At that time, Grundtvig admitted that the huge project was stranded. The same happened to a plan for translating the Elder Edda as literally as possible which he launched in a prospectus of January 1810. His samples published subsequently in a Copenhagen newspaper announcement indeed seemed very close to the original Old Norse. The soon-to-be-famous linguist Rasmus Rask in the same newspaper violently attacked Grundtvig's style as "too packed, contrived, unnatural and partly incomprehensible". Recognizing Rask's sincere involvement in the matter, Grundtvig answered back that he wanted to demonstrate the interaction between words and ideas and therefore had to keep linguistically close to the source. However, the controversy scared subscribers away, which Grundtvig himself in 1818 considered "fortunate". He never translated the Eddic poems in their entirety.

2.5. Revival of 16th–17th century Danish

Grundtvig's break-down around Christmas 1810 meant that he changed his course from rivalling Oehlenschläger, the king of Danish romantic poetry, to fulfilling his calling as a Lutheran preacher, in church as well as in historiography. For a while, he even doubted his right as a Christian to produce literary art of any kind, but soon drawing from the examples of St. Paul and the Danish preromantic pietist

poet Johannes Ewald, he convinced himself that poetry could be allowed as long as it praised Christ and Christianity.

Grundtvig hastily abandoned his stylistic imitation of Old Norse language, at the same time shifting emphasis in contents from common Scandinavian pre-Christian history to the Danish Middle Ages and to the Reformation period. The sermons he gave in Udby church in 1811–13, deputizing for his ailing father, focused his attention on the language of the Danish Bible, for a while stopping other stylistic experiments. In 1814 he resumed his search for a suitable style, when he published a prose comment on his rhymed account of the Danish church viewed through the history of Roskilde Cathedral, *Roskilde-Rim*. He recited this lengthy poetic text at a Zealand diocesan convent in 1812 and published it in an augmented book version in 1814. The commentary carried the somewhat misleading title *Roskilde-Saga*. Actually it featured a heavy imitation of 16th–17th century Danish, e.g. Anders Sørensen Vedel's translation from 1575 of the medieval historian Saxo and Arild Huitfeldt's 10 volume chronicle of Denmark from the years around 1600. Grundtvig had now decided to write in a genuine and exclusively Danish style.

Grundtvig's real intention in this phase was, as he later revealed, to gain linguistic competence to make a Danish translation of the Bible equal to Martin Luther's German *Wittenberg Bible* from 1534. This never was to be, but Grundtvig started an in-depth study of the Danish language by gathering popular idioms and words. He attempted to exhaustively examine the dialects which still were used for oral delivery and systematically excerpted old Danish texts such as the Law of Jutland (from 1241), Vedel's Danish Saxo and Peder Syv's collection of 200 ancient heroic ballads from 1695. He also recorded both orally transmitted and printed proverbs in amazing quantities. His efforts culminated in the summer of 1816, where in two months he filled 362 quarto pages with them and additionally initiated a manuscript to be completed in 1822 with another 1200 proverbs. The appreciation of proverbs is at the same time a humanistic and a romantic feature. To Grundtvig, proverbs represented the spirit of the people and should be part of colloquial conversation.

Through all these studies, Grundtvig acquired an instinctive feeling for the roots of the Danish of the day in earlier periods of language history. His linguistic knowledge of the

vernacular was matched by few, if any, of his contemporaries. His truly professional newspaper review in 1826 of a scholarly edition of the *Old Danish Rhyming Chronicle* (1495) published in the previous year is proof of his level of scholarship.

2.6. Translation of Snorri's chronicle

Meanwhile, Grundtvig had embarked upon a translation project of far-reaching significance. In 1812, he had been contacted by The Copenhagen Royal Society for the Welfare of Norway to make a new translation of the poems from Snorri's *Heimskringla* (Norwegian Kings' Sagas). After May 1813, the commission covered the entire text. However, the loss of Norway in the peace treaty of Kiel in January 1814 put an end to the semi-official financial support for the project.

2.7. Translation of Saxo's chronicle

The following years saw an important extension of Grundtvig's obligations. While translating Snorri, in January 1815 he suddenly experienced a fit of glowing passion for his now geographically reduced native country and immediately decided to translate Saxo's Latin chronicle of Denmark too. In April he was working on both texts.

In August, Grundtvig established a Copenhagen Society for the Publication of Texts from Ancient Scandinavia, which soon was organized as a sort of nation-wide book club. Through bishops, parsons and other officials, money was collected from all over the kingdom and even from Norway. In September he published a booklet with specimens of his translations, giving arguments in the preface for why he did not aim at a literal reflection of the sources, but rather preferred to write "in the characteristic spirit of each, in a simple, intelligible and ingenuous style".

2.8. The discovery of Anglo-Saxon poetry

Grundtvig's linguistic situation was to become even more complex, as the Anglo-Saxon *Beowulf Poem* was published for the first time ever in June 1815, accompanied by an inadequate neo-Latin translation by the Copenhagen editor G.J. Thorkelin, an ageing Icelandic-born Danish official. Seeing in the ancient epic another proof of Danish grandeur in the past, but rightly suspecting Thorkelin's translation, Grundtvig quickly taught himself

Anglo-Saxon and in newspaper contributions launched harsh attacks on the edition. It was Grundtvig's distinction to be the first to identify the legend of the Danish King Skjold [Shield] in the rather impenetrable beginning of the poem along with other observations which still support his reputation as a pioneering Beowulf scholar. Thorkelin, whose scholarship was superficial and unreliable, answered sharply without being able to refute Grundtvig's arguments. Fortunately, the controversy ended in Grundtvig's undertaking to translate this old text into Danish, financed by a wealthy nobleman. Planned cooperation with Rasmus Rask on an improved edition of the original came to naught, but Grundtvig published a lively re-creation of the poem in Danish in 1820, largely in the style of current romantic ballads. This was the first version of Beowulf in any modern language. Much later, in 1861, he also published a scholarly edition of the original, though by then British-edited versions had appeared in print. Anglo-Saxon, which Grundtvig fairly easily appropriated on the basis of his knowledge of Old Norse, was to be his last linguistic conquest, to the extent that in 1820 and 1861 he actually composed a few stanzas in the extinct language. In 1840, Grundtvig published an edition of the Anglo-Saxon poem *The Phoenix* accompanied by a free translation. Until his death, Grundtvig kept up an interest in medieval Christian Anglo-Saxon poetry.

2.9. Grundtvig's servants' hall style

Yet Anglo-Saxon stylistics can hardly be accorded an important influence on Grundtvig's own language, since when he encountered Beowulf he had already come to the end of his period of close imitation of ancient languages. That is clearly demonstrated in his translations of Saxo and Snorri, published in three volumes each from 1818–23. Instead of reflecting the personal style of these very different chroniclers, Grundtvig transformed their works into a self-invented third style that he unhesitatingly imposed upon them. His idea was to try to retell the historical events the way an intelligent ideal farmer from Grundtvig's day and native district would have done it, without any marks of Latin or German-oriented education. Grundtvig took great pains to achieve his goal, maybe too great. The basic syntax was predominantly hypotactic, the sentences often long-winded and labyrinthine. However, this language

fabric was interwoven with features from spoken narration. Grundtvig dramatized the action by turning reported speech into direct speech; he added subjective touches in emotional, evaluative or even biased adjectives; he transcribed serious incidents in a jocular manner; he inserted blunt comparisons, rural proverbs and proverbial sayings; he enlivened the style by clever puns; he alluded to the Bible, Holberg's comedies and Oehlenschläger. In short, without ever defining his own part in the account, Grundtvig was omni-present as the story teller. He produced entertaining and lively prose, which might not have been as strange as his first readers and reviewers thought, but was odd enough and at that time new in print. This was the first time that anybody from the circles of fine literature had tried to capture the rhythm of Danish popular speech when dealing with such prestigious material. Thus Grundtvig anticipated Hans Christian Andersen's stylistic experiments in his fairy tales for children from 1835 onwards. The reception of this work was not favourable. Academic critics felt shocked at Grundtvig's lack of balanced literary taste and predilection for popular phrases. In 1820, Grundtvig answered that it was necessary to bridge the gap between scholars and laymen as Luther had done in his German Bible by using peasant language which was something different from boorish diction. Grundtvig further confessed that his stylistic ideal could be found in the servants' hall [Danish: Borgestue] where uneducated people speak their mother tongue with ease, as if it were the only language in the world. However, even these common readers sometimes felt that Grundtvig was making fun of the old stories, and the books did not sell well, because an agricultural crisis economically paralyzed the audience he had been aiming at. In 1834, close to 2000 of the original 3000 copies of each translated author were donated to the primary schools in the Danish kingdom. Saxo was reprinted in 1855, Snorri in 1865, for use at the now-established Grundtvigian folk highschoools. A joint edition appeared in 1865. The six volumes were to be Grundtvig's largest, boldest and last linguistic experiment.

Grundtvig's later comprehensive world and church histories (1833–69 and 1871 respectively) were not written in this pseudo-oral and pseudo-rural style, nor were his contemporary journalistic contributions. But Grundtvig himself found that a thorough Danicizing of his heart and head was the main profit of his

seven years of hard labour. By then he knew his instrument, having also learned how it should not be played.

2.10. Pragmatic and Christian simplicity

In an unfulfilled promise of a continuation of Saxo, Grundtvig in an 1823 newspaper article foresaw his future style. He hoped

that when the greatest affects me I may succeed in moderating my enthusiasm, as I allow it in a moderated form to spread all over my writing, in dissolving the language which I preferably use about days gone-by, and in concealing the core of my language in the simplest words that even babes would understand.

Grundtvig very likely was alluding to Christ's linguistic statement in Matthew 11:25. This manifesto laid the foundation for the communicative prose Grundtvig was to employ as a pedagogical thinker, as a public speaker and as a member of the Danish parliament from 1848–58. He generally held the view that in human existence things should be allowed to grow organically and cannot be forced, a conviction he also applied to language. Still now and then featuring proverbs and colloquial expressions, he considerably cut down his reliance on Danish dialects and old-fashioned idioms. Clarity and simplicity were given high priority in his theory, although he never managed to get around rather heavy sentence constructions, in principle similar to that of the languages whose influence he wanted to fight against – Latin and German. But the purpose of his leisurely rambling style was to reflect the pros and cons of his thinking, as he proceeded. Allusions from his extensive reading of history and fine literature were inserted, though not emphasized. He was time and again testing the latent possibilities in language, making puns based on etymology and sometimes also on deliberately misunderstood surface similarities. Adding popular humour to his presentations became a new and lasting element. All of this was a far cry from the polished and well-planned prose of his academic contemporaries.

2.11. Lyrical genres

As a lyrical poet, Grundtvig wrote ballads about national history or homely nature. He also wrote numerous hymns, altogether about 1600 (including originals, adaptations, translations). Alternating between stylistic and

metric patterns of the late 18th and early 19th c., he sometimes in robust rhythms didactically meted out proverbial wisdom on life, and sometimes using ambiguous symbolism conveyed inner visions of God's creation or of divine love for mankind. Quite often he avoided unnecessary pathos by resorting to good-natured jocularity.

The lack of acceptance for his historical translations made Grundtvig realize that publishing book after book cannot awaken a people – it takes more than that to change the course of national history. Increasingly his status grew from being just an individual writer to being a spokesman for Danish Christianity and for a secular Danishness. In poems such as *Paaske-Lilien* [literally: The Easter Lily, the Danish botanical term for daffodil] from 1817, and especially the great visionary autobiographic prophecy *Nyaars-Morgen* [New Year's Morn] in 1824, he interpreted his personal life as a symbol of Denmark's fate in ecclesiastical and secular history, giving the Danes hope for a happy future. Very few understood this and even fewer were able to share his self-evaluation. But this self-identification gave him energy to continue the enlightenment of his countrymen in spite of adversities. From 1825, onwards, he centered his theological thinking around the spoken words of Christ (especially in the baptismal covenant and the Eucharist), reminding his fellow Christians that the Lord had not written a single sentence of the gospels. Little by little, in secular affairs Grundtvig also came to treasure spoken words in speeches and conversations more than dead letters in a book. By this Grundtvig concluded his personal linguistic education, and now he turned to completing and realizing a language policy.

3. Grundtvig's language policy

In Grundtvig's childhood, Denmark was a bilingual monarchy with Danish and German as official languages. At his death in 1872, it had been reduced through peace treaties after lost wars in 1807–14 and 1864 to a small, purely Danish-speaking kingdom, in fact leaving close to 200,000 Danes in Prussian-conquered Schleswig.

Immediately after the loss of Norway in 1814, it became necessary to redefine the essence of being Danish. Grundtvig launched a language policy that would not be official until after 1864, when the German-speaking areas were no longer part of Denmark.

3.1. The merits of the Danish language

Grundtvig's view of the mother tongue stems from the conviction that a people first of all forms an entity, a "family" across generational gaps, because of a common language. In July 1815 in a never reprinted pamphlet called *Europe, France and Napoleon*, Grundtvig proclaimed Danish to be the closest of all languages to the human heart ("Hjertesproget"), suited to soften and melt down "the Roman iron sounds" of Latin. The proof is that throughout its history, Denmark never was inundated by foreign peoples nor violently subdued by foreign masters. He advised the rest of Europe to realize this, since it was clearly a sign that the Danish tongue was destined to become the medium of a modern revival of Christianity.

His high evaluation of the mother tongue seems typical of the prevailing mood of the day. In the same year, Grundtvig's former friend Christian Molbech spoke about the native language as "the first, earliest, most widespread and most unmistakeable sign of the existence of a people as a particular and independent nation". In 1816, the poet Jens Baggesen started a one-man periodical called *Danfana* to erect a temple for a cult of the Danish language. More down to earth, in his corresponding one-man periodical *Danne-Virke*, Grundtvig issued his manifesto in 1816 in his article "On Danish Poetry, Language and History". To him, the Danish language was the most simple and artless of all, but also was filled with the sweetest and most natural melodiousness, made to express the highest reflections as well as the deepest emotions and the wittiest jokes. Further to Grundtvig, the Danish language represented the highest possible perfection, and accordingly all living Danish poets ought to serve as its guardians in the spirit of Jesus cleansing the temple of Jerusalem from tradespeople. He named well-read scholars the true aristocracy of a people, whereas he conceived of political democrats as wilful persons.

Grundtvig often converted opinions originally given in diffuse prose to absolutely dense poetry. He did exactly that regarding the mother tongue in a stanza of his song *Langt høiere Bjerge* [Much higher Mountains throughout the Earth] from 1820, where he admitted that foreign languages may be loftier, nobler, more refined than Danish, but that in everyday discourse the Danes in their vernacular can speak with greatest truth about

grandeur and beauty. He went on to say that if foreign languages, like a hammer, beat things into hard categories, Danish instead melted categories down to a fruitful harmony.

In his introduction to the *Beowulf* translation from the same year, Grundtvig compared the vernacular to precious mortar keeping the people together with everything great, true and beautiful that has been accepted by their ancestors in the course of history. Therefore a historical study of the vernacular is the only way to achieve mastery of a language, and herein lies the demand on modern writers.

After having lost a libel suit in 1826, Grundtvig automatically incurred lifelong personal censorship (in his case it was retracted in 1837). All the same, his *Literary Testament*, which was published in 1827, showed a writer in fine spirits. He maintained that if literary style loses contact with the spoken language, it is on the wrong track, only advancing like a ghost in the desert of artificial barbarism. He still looked at the problem from the viewpoint of a writer.

3.2. The vernacular in practical life

Grundtvig's thoughts on communication were not to become useful until he adapted the viewpoint of the beneficiaries – the people. That occurred after three summer journeys to England in 1829–31 which opened his eyes to the blessings of British society with its freedom to use the vernacular and its oral and public proceedings in parliament and the law courts. The introduction in Denmark in 1831–34 of advisory provincial assemblies, functioning from 1835 onwards, again set Grundtvig reflecting upon language policy. In the beginning, he doubted that the uneducated Danish peasant representatives could hold their own against nobles and academics. Besides that, for historical reasons, he was against reducing the absolute power of the king. He felt that a truly popular literature was more important for enlightening the people than a constitution based on French political taste. Therefore in the preparatory constitutional assembly (1848–49) which preceded the regular parliament, he fought for the freedom of the press and of the spoken word and finally managed to achieve the introduction of public and oral procedure at all Danish law courts.

Acknowledging the surprisingly unimpressed common-sense reactions of the peasant delegates in the Roskilde provincial assembly, he had already in a song from 1839 grate-

fully coined the phrase that in Denmark the hand of the king [Konge-Haand] reigned after having consulted the voice of the people [Folke-Stemme]. Though the provincial assembly as an institution had been borrowed from modern Prussia, Grundtvig always conceived of it as part of a national heritage where the peasants met their king in public meetings of the *thing*.

3.3. The folk highschool project

The increasing demand for a democratic constitution prompted Grundtvig to discuss in booklets issued in 1836–47 education for citizenship intended for the non-academic part of the population. *Highschool* [Højskole] was the old Danish term for university, and Grundtvig now suggested that a state-operated national folk highschool, without examinations or degrees, be opened for this purpose, if possible located in Ludvig Holberg's old academy in Sorø fifty miles southwest of Copenhagen.

In one of his publications about such a highschool, *The Danish Four-Leaf Clover* (1836), Grundtvig mentions one of the leaves being the mother tongue, calling for courses in the vernacular and in national literature, preferably given by living Danish poets. Here and everywhere else during this period, he particularly emphasized the living, i. e. spoken, word [det levende Ord] as the medium for true interaction between teachers and participants. He pointed out that written matters always are null and void if nobody talks about them; in contrast, fiery and living speech in churches and schools, societies and circles of friends possesses unspeakably great strength and influence, even though nobody writes anything about it.

Grundtvig also included songs in Danish at the prospective folk highschool, since to him the spoken word reached a climax in song, especially when performed by girls. He made this point in his ballad *Moders Navn er en himmelsk Lyd* [This Heavenly Sound, our Mother's Name], published in February 1838. In seven introductory stanzas, he interpreted the term "mother tongue" literally as the language taught to infants by their mother, i. e. a person untainted by Latin, since Danish women could not at that time get into higher education. In thirteen following stanzas, Grundtvig through very affectionate phrases praised the Danish language as it sounds in songs sung by mothers, daughters and small girls under

the beech trees near the shore. The text seems repetitious when read silently, but when recited or sung, it features an almost ecstatic flow of images and notions. Grundtvig was not appealing to reason but confirming a belief.

In the autumn of 1838, Grundtvig had been allowed to give public lectures in Copenhagen on recent Danish history to celebrate the 50th anniversary of the peasant reforms of 1784–88. On October 17, his audience spontaneously started to sing one of his ballads, and from then his lectures and lectures delivered by his friends and pupils were framed by singing – a habit that in present-day Denmark still is sustained in connection with popular enlightenment.

In 1842, a language struggle between Danish and German broke out in the provincial assembly of Schleswig. At a mass public meeting in Jutland on July 4, 1844, Grundtvig welcomed the resistance of Schleswig inhabitants to German language dominance. As a result, a privately financed folk highschool was opened at Rødding in North Schleswig on November 7 the same year as the very first manifestation of Grundtvig's thoughts on the enlightenment of the people. Grundtvig was not directly involved in the running of the initially very modest institution and never visited the place, probably because he would rather have had a centralized folk highschool at Sorø, authorized by the king. However, more folk highschools started to appear around in the countryside through local and private initiative and funding. In a way, this was more in line with Grundtvig's general ideas of popular participation in cultural life, though for the rest of his life he seemed annoyed at his failure to establish his Sorø school. A similar plan for a centralized Common-Scandinavian folk highschool in Gothenburg in Sweden near the historical meeting point of the ancient Scandinavian kings, Kungälv, was launched by him to no immediate avail in 1839. The project was only partly realized after World War II.

In the mid-1840s, Grundtvig supported the cause of the mother tongue by publishing collections of Danish proverbs and old Danish ballads (1845 and 1847 respectively) for use in the schools, feeling that they could help sweep away pieces of foreign, i. e. Latin and German, influence and purify the taste, style and intellect of the Danes. He underlined that if a vernacular is only used to describe materialistic everyday phenomena, the populace will irrevocably lose the sense of images and symbols from their religious and spiritual life and

consequently sink down to the level of beasts. If the vernacular is threatened, the very life of the people is at stake. Grundtvig was convinced that even the most elevated emotions and the deepest philosophy could be expressed very well in the Danish language.

As a member of the newly instituted parliament, Grundtvig stresses in theory as well as in political practice the importance of defending the vernacular. In the debates leading to the democratic June 5, 1849 Constitution, he fought vehemently against technical terms taken from French parliamentary tradition, not always successfully. Regarding other foreign words and idioms, he continuously claimed that the academic members of the parliament should learn to speak Danish from the uneducated populace. He resented all linguistic barricades set up by intellectual aristocrats to prevent popular participation.

3.4. Two wars, 1848–50 and 1864

Prompted by the Three Years War from 1848–50 between Denmark and Schleswig-Holstein nationalists backed by the German Federation, Grundtvig published another one-man periodical, *Danskeren* [The Dane]. In its four volumes from 1848–51 he conducted an incessant campaign against the import and impact of anything German into Danish culture.

As early as in March 1848, Grundtvig stated that the Danish monarchy should only reach as far into Schleswig as Danish was spoken. Encouraged by Danish military victories, he later preferred the river Eider as frontier, which would mean a linguistic conversion of German-speaking southern Schleswig, in his mind to be carried out in a peaceful and non-oppressive manner. To Grundtvig, as spokesman of Danishness and tolerance, the years from 1851 onwards were largely disappointing. Under pressure from both of the non-revolutionary Great Powers in Europe, England and Russia, the official Danish policy until 1863 had to maintain the frail old bilingual state at the expense of the continuously spreading ideas of Danish identity. A new war in 1864, this time with the German Federation itself, led by Prussia, had been brought about by the ill-advised Danish incorporation of the Duchy of Schleswig into the kingdom. Denmark lost badly, with all of Schleswig becoming a Prussian province. Underrating the enemy's political resolve and military capacity, Grundtvig had supported and even been part

of provoking the outbreak of hostilities. After the war, he recommended patiently waiting for a change in the situation and never stopped hoping for the inclusion of the Danish-speaking part of Schleswig into the kingdom. Grundtvig lived to see an expanding network of local folk highschoools making up internally for what had been lost externally in 1864. Incidentally, the official boundary which was finally drawn between Denmark and Germany in 1920 after a plebiscite corresponds to Grundtvig's language criterion from 1848 and may be the most fortunate of its kind in Europe today.

4. Grundtvig's achievement and legacy

Grundtvig's tireless efforts through three quarters of the 19th c. established the vernacular in the mind of the Danes as an asset of national importance. Particularly after 1864, his endeavours were continued ardently by his followers and disciples. A small sign of this is the fact that hardly any other European nation has had so much lyric poetry written about the qualities of its language as Denmark.

As a poet or scald, Grundtvig had no successors or imitators. But his own poetry still is very much alive because of his overwhelming representation in the authorized Danish hymnbook (1953, forthcoming new edition in preparation) and the 17 editions of the *Højskolesangbog* [The Songbook for the Folk Highschools], the latter being a standard songbook used by the Danes far beyond the circles of Grundtvigians at the folk highschoools and in the Danish church. The yearly Christian holidays also serve to remind the Danes of Grundtvig, since his poetry on these occasions is presented in several ways – in churches, schools, concerts and over the electronic media.

In a historical perspective, Grundtvig's philosophy about the vernacular and his struggle against Latin and foreign languages are typical of linguistic romanticism in Napoleonic and post-Napoleonic Europe. Grundtvig's ideal that in Denmark everything should be conducted in Danish was a natural countermeasure to the Danish military and political defeats in his lifetime. In the popular Copenhagen discussion club The Danish Society, run by Grundtvig from 1839 well into his parliamentary career, he considered conquests of territory beyond nationally defined objectives

to be worthless, and instead recommended exploration of inward qualities. He seemed himself to have been suspended between, on the one hand, a specifically and mainly defensively defined idea of national identity and, on the other, a humanistic belief in the general progress of history. Not all of his followers were able to keep this balance.

In his advocacy of the importance of the mother tongue, Grundtvig was on a level with contemporary theological and humanistic academic culture in Western Europe. At the same time, his ideas in no way should be understood as signs of provincial limitation in a citizen of a small country. He knew what he was rejecting and why. Grundtvig mobilized the Danish language to serve in peace and war, and by doing that, he mobilized the Danish people in a fight for cultural survival that was rather successful then, yet is still going on.

56. Nordic language history and the history of translation I: Danish

1. Contexts, discussed and specified (the programme of Quintilianus)
2. Holy and official texts
3. Translation and shift of text-type: older translations and paraphrases
4. Case: The tradition of Saxo's *Gesta Danorum*
5. Case: The provincial and urban laws
6. Cases: School texts, drama and other dialogic texts
7. Cases: Some newer translations approaching modern standards, up to ca. 1800
8. Conclusion
9. Literature (a selection)

1. Contexts, discussed and specified (the programme of Quintilianus)

The history of translation in Denmark is part of several stories: foreign influence, the Christian Church as agent of a new faith and as bearer of classical tradition; the writing down of legislation and history; warfare, technol-

ogy; and not least the history of the book market of a small multilingual society which developed, over the centuries, into a monolingual nation state with an increasing spread of and competence in changing dominant international languages.

From a linguistic point of view, this includes orthography, loanwords, syntax, stylistics, language change, new text-types etc. and education in the liberal arts: reading and writing, i.e. literacy and text-processing. Most of these histories are told or commented on elsewhere in this handbook. But the last point, that of text-processing, will particularly be considered here. I venture to use the terms text-processing and text-type as equivalents to the Danish general terms *tekstbehandling* and *teksttype*. For the problem of terminology, cf. Adamzik (1995) and Pilegaard (1996).

The art of text-processing is described by Quintilianus in his *Institutio oratoria* (Book

10, 1st c. A.D.). In antiquity, the discipline *conversio* (i.e. ‘translation’), mostly from Greek into Latin, was produced along the same guidelines as paraphrases (Curtius 1973, 147–148) within one language, from poetry to prose and prose to poetry, from drama to prose and prose to drama, repeating the same content but in a different text-type, as an *opus geminatum* (Haastrup 2002). Paraphrases within the same text-type, carried out by change of levels of style (e.g. from “the wheel of Vergil”), were done by means of the *ratio quadripertita* (Lausberg 1998, §462, §1099–1103): addition, omission, change of place and replacement (Lat. *per immutationem*), e.g. by figurative speech, using words not *proprie* but in metaphors (Lat. *translatio*; cf. Lausberg 1998, S. 558; Curtius 1973, 128). The presentation by Quintilianus of rhetorical instruction, part of the old *trivium*, is considered the most comprehensive and reliable one because it criticized other educational practices as being less efficient. His full text was not available for centuries in the Middle Ages, but his legacy was disseminated through various elementary textbooks, *progymnasmata*, in Western grammar schools until the decline of Latin as a main subject in learned secondary education. The history of the programme in Denmark – not always glorious – can be followed in textbooks, e.g. Melanchthon’s grammar and rhetoric (cf. the *Kirkeordinans* 1537–39), and in Dal (1960); Haastrup (1991; 1997b); Tortzen (1988); Kornerup (1947); Jacobsen (1958); B. Andersen (1971) and Kr. Jensen (1982, on Thøstesen/Theophilus 1573). For use of the vernacular in teaching and text-processing, cf. Haastrup (1968; 1991) and Kr. Jensen (1982). The *ratio* was used – as the rational framework it is – in Renaissance and Baroque works on textual criticism, purism etc., and it will be the point of departure in this article, too.

Translations made on the terms of the source language are useful for historical language studies because they often represent domains not set on paper before in the target language and thus indirectly illustrate the shortcomings of the “developing language” and the limits which the translators are forced to respect, transgress or refuse to cope with; however, this kind of usefulness will not be focussed on in this article. Translations are of course also useful if they comply with modern – utopian – standards, being based (a) on a pretended equivalence in the amount of information and aesthetic impression and (b) on respect for idioms of both source and target

language, i.e. on a level with original, not translated texts, cf. Blatt (1957); Pedersen (1987); Skyum-Nielsen (1998); Kelly (1994). Using the strong definition of the two criteria (a) and (b), many texts will fall between the stools. Paraphrased texts, however, may be on a level with originals as far as respect for the idiom is concerned – often because being moved (not to say “translated”) to the target language, they change the text-type, e.g. from prose to verse, or to drama. The text-processors, freed from the exact wording in the source language, might – like “singers of tales” – benefit their new audience/readers by using the idiom of the target language and by inserting supplementary information on obsolete or presupposed knowledge. A major point of this article is, then, to give prominence to the group of hybrid texts that have been moved, thereby changing text-type, though not as full equivalents. The focus will be on a few source texts processed several times over the centuries.

2. Holy and official texts

The modern definition of translation, which pretends that equivalence is possible, applies almost only to texts produced after the middle of the 18th c. (Skautrup 1953, III, 150–153), while the historical definition applies to many older texts (Paludan 1887–1912, *passim*).

Some older translated texts, however, are even today recognized as being “faithful”, viz. standard Bible versions. The authority of these was not given by word-to-word resemblance but was explained by divine inspiration, as a new start in the target language, e.g. the Greek *Septuaginta* and the Latin *Vulgate* made by Saint Jerome who – like Cicero – is often quoted for principles resembling modern standards in order to profile the shortcomings of medieval translators. The German Luther Bible for Protestants in Germany ostensibly addressed the laity (cf. his *Sendbrief vom Dolmetschen*), using standards like the modern ones. This Bible shows Luther’s dilemma in some conclusive examples, e.g. in the translation of Romans 3:28 on “the justification by faith”. Luther ventures a bold translation, adding *allein* to the phrase *durch den Glauben*. In the Wittenberg revised edition of the *Vulgate*, however, a similar addition is not found, as is evident from the “Loeb edition” *Biblia Germanico-Latina* (1565; cf. Haastrup 1999). The first Danish full Bible version, called ‘*Christian III’s Bible*’ (1550), is by and large

a reproduction of Luther's, though one might believe it to be based directly on the Hebrew and Greek sources, since Luther's name does not occur in it (Ejrnæs 1995; Haastrup 1999).

An opposite tendency to Luther's rhetorical approach (Lindhardt 1983) is the grammatical one: *verbum e verbo*. "The Oldest Danish Bible Translation" from the end of the 15th c. is often considered an example of this and therefore is described by Haastrup (1999) as "a Latin Bible in Danish". This text is first of all notorious for its use of calque translations of the Latin inflectional system, e.g. gerunds and participles construed as compounds of the Danish infinitive and *-skullende* (Haastrup 1968; 1990; 1991; Kelly 1990). Because the use of these forms as "signa danicalia" is not fully consistent, some instances may just signal the quality "transferred from Latin", as do, presumably, similar constructions in texts not known to be translations, viz. diplomas and some Bridgettine religious texts (Haastrup 1968). Other features were Latin prefixes, e.g. *circum(-)* rendered *omkring* and, not least, glosses explaining the specific Latin wording (often homographs or possible figurative meanings) but not the meaning of difficult words, metonyms or metaphors in the Hebrew source texts of the Vulgate (Haastrup 1968; 1988 b; 1999).

Later on, Luther's happy combination of the two trends split again. Hans Poulsen Resen made his learned translation (1607, corrected to follow the Hebrew and Greek sources) to benefit students at the university (Diderichsen 1968, 130–146, with synoptic passages of various biblical translations), while Peder Jensen Wandal favoured the freer reproduction combined with commentaries, addressing his paraphrases of biblical texts (in the 1650s) directly to the laity (Skautrup 1947, II, 301). Accuracy in transcription and translation is also found in legal texts.

3. Translation and shift of text-type: older translations and paraphrases

Many medieval translations – categorized as *verbum e verbo* – are often regarded as clumsy or unprofessional in modern times. The question is: Do they represent a fully processed text or an intermediate text, a result of the grammatical reading (Lat. *lectio*) often done by the teacher as a *praelectio* (Kr. Jensen 1982, 93)? And are they supposed to be restyled later in some way (Lausberg 1998, §1100; cf.

Horace on the *fidus interpres* in his *Ars poetica* 125ff.) or just to provide ancillary help for the less trained people reading the text in the source language and in need of both explanations of "Wörter und Sachen" and theological solutions on discrete levels (Albertsen 1972) to possible contradictions in the holy text? Cf. Jacobsen (1958, 83–99) and Haastrup (1999, e.g. for nuns reading the Bible). Such a stripped text might then become the basis for the production of a new coherent text in the source or target language, a paraphrase either abridged to a summary or *argumentum* (aim: *brevitas*) or expanded (aim: *copia*) with explanations incorporated in the text or given separately in glosses.

As the focus here is on the change of text-types, legends will not be considered. We know that many of these unambitious texts were necessarily based on models in a foreign language. A fruitless quest for direct models for this kind of texts has been made by many editors, e.g. by Paulli (1936) editing old popular tales (Dan. *folkeboeger*) received in a very free, sometimes careless, reproduction (cf. Horstbøll 1999, 198f.). Texts like these are seldom edited with copious critical apparatuses showing variance in tradition. Therefore editors of translations are not well prepared to see the limits within which variations typically appear, i.e. whether or not the last variant reading they looked for in the sources might have been made in the processing of the very text they are editing. An example of ambitious Latin prose is that of the medieval mystic Suso, translated into Danish with high aspirations but not always successfully (Skautrup 1947, II, 25, 86). An example of successful metric translation from Low German is Weigere's *En Ræffue Bog* (i.e. 'Reynard the Fox'; Skautrup 1947, II, 159). In the following, a selection of examples (cases) will show the combination of change of text-type and translation.

4. Case: The tradition of Saxo's *Gesta Danorum*

This text, composed about 1200 A.D. by Saxo called Grammaticus, was edited in 1514 by Christiern Pedersen and printed in the excellent printing office of Badius Ascensius in Paris (Karker 1967, 9). We do not know how much the editor and the printer "improved" the text. Badius praised its style, as did Erasmus Roterodamus. The *Gesta Danorum* is a

wonder of text composition, so difficult that few Danes can have been its target readers and so manneristic that it seems impossible to find a way to translate it properly. It combines many antique models, demonstrating overtly the rhetorical learning and competence of its author (Johannesson 1978), who elaborates on many sources, oral and literary, including versions of sophisticated old scaldic poems in Latin metres. In the overview of his sources, Saxo mentions separately (preface 4) “the diligent work of the Icelanders” (*Tylensium industria*) which he pretends to imitate in composing his text; cf. Billeskov Jansen’s harangue in Rossel (1992, 85). An old fragment of the *Gesta Danorum* found in Angers (France), with traces of contemporary text-processing, is considered a sample of Saxo’s rhetorical work on his own text.

The full text – with a maximum of *copia* – was not as widespread in the Middle Ages as an abbreviated version of it, later called *Compendium Saxonis*. The relation between the two texts is described by Knudsen (1994, 134f.) as follows: “The text of the *Compendium* only amounts to about 23 per cent of that of the *Gesta Danorum*. A certain shortening has been achieved by jettisoning Saxo’s poems and the many stylistic variations on the same theme of which he is so fond.” Knudsen (1994, 89–123) carefully records the results of his collation: subtractions and additions, exactly the same proportions that Paulli (1936, 204–210) found in the *folkebøger* of the 16th c. The *Compendium* might be conceived as the result of an “interpretation procedure” in a grammar school: all *ornatus* sponged away, the text is ready for further rewriting, e.g. to other text-types. The *Compendium* cancels the sophisticated overall disposition (much discussed) of the *Gesta*, making the mere list of Danish kings run as a main thread through the work.

The *Compendium* became the main source for the first part of the “Rhymed Chronicle” (*Rimkroniken*) in the 15th c. (Olsen 1969). This text was the first book to be printed in Danish (1495, by Ghemen). It is normally conceived of as an original, and it is certainly so – though as a kind of paraphrase: the basic structure is the list of kings, as in the *Compendium*. The third-person narrative of the *Compendium* is changed into a row of royal narrators (still “told”, by *sermocinatio*, cf. Lausberg 1998, §820–823) presenting themselves in first-person monologues, as in a drama. The Latin prose is transformed into a metrical pattern

(Jørgensen 1989, 19–36) called *knyttelvers*, popular in the northern Germanic vernaculars, not least on the stage. This metre differs from the metres learned and taught in the grammar schools, which were unrhymed and in principle based on quantity. The *knyttelvers* metre, with coupled or crossed rhymes and syllabic accent, is very free, but the rhymes are a potential constraint on syntax and phraseology. The point is that these constraints are due not to the source language but to the vernacular target language, with features known from ballads and folk tales. In the Middle Low German metric version of the Danish *Rhymed Chronicle*, the narrator (*Broder Nigels to Sore*, i.e. Sorø in Zealand) introduces himself in this way: “I did not drink of the French wine, neither of that grown on the Rhine”, his ambition being to compose a text in the way he received his language from his father and mother. This is a plea for the mother tongue and its types of text.

Furthermore, the text of the *Compendium* is found in a Middle Low German prose version (Knudsen 1994, 37f.). It might be possible to publish the four texts (the two prose texts: in Latin and Middle Low German; and the two metric texts: in Danish and Middle Low German) side by side, as in a Loeb edition, to illustrate the concept of *opus geminatum* (Haastrup 1982; Friis-Jensen 1987, 105–110; Haastrup 2002).

The odyssey of the *Gesta Danorum* continued. The first known full translation into Danish was made by Anders Sørensen Vedel (1575), who commented on an earlier attempt by Christiern Pedersen, now lost (Karker 1967, 10): “The rendering of Saxo’s meaning was not to the point but often deviating and prolific”, and later, “he has made a paraphrase only, using ten words to render one in Latin” (my translation). Vedel’s prose version is a major work in Danish literature. A summary from his preface (fol. C1v–C2v) gives an impression of his text-processing as an editor and translator: Vedel declares that he has made no alterations as far as Saxo’s meaning is concerned, but (paradoxically) over a hundred alterations in Saxo’s Latin. Vedel, conscious of his own shortcomings, challenges his potential critics to experience themselves “how kind Saxo is to speak with – just try to translate one page!” Karker (1967, 10–12) shows that Vedel did not care much about rendering Saxo *verbum e verbo*, his own text being a new version in an ingenuous but dignified diction, characterized by the use of rhetorical devices

like alliterations, tautologies, proverbs and archaisms. Vedel normally renders Saxo's very sophisticated metrical passages in prose (Hastrup 2002) and abbreviated, maybe because they often are repetitions (*opus geminatum*) of events, even speech events, told in prose. Karker's evaluation corresponds to the more general thesis of this article: Translation was often combined with change of text-type or level of style (Hildebrandt-Günther 1966, 113–126), in this case a new *ornatus* of a more popular and national taste – as in the ballads and the *Rhymed Chronicle*. Skautrup (1947, II, 223–230) made a major point, calling Vedel the first *pasticheur* in Danish literature. He gives detailed documentation preparatory to his chapter on the literary language of the great Danish poet of the national romantic period, Adam Oehlenschläger (1953, III, 293–295, 303–309), who used Vedel's Saxo and his ballad edition (1591, facsimile 1993), viewing the ballads as literary texts.

Karker (1967, 21–27) quotes passages from a number of later editions and translations of Saxo to substantiate his evaluation (for more popular publications, cf. Horstbøll 1999, 530–545). These translations give an interesting picture of the reception of this national treasure, reflecting the changing styles. Sejer Schousbølle (1752) found the then obsolete baroque prose appropriate to Saxo's style and rendered his verses in alexandrines. In 1818–22, N. F. S. Grundtvig – a pillar of the national church – published his version, which is in principle correct but written in a very low style that he himself called *Borgestuedansk* 'servants' hall Danish'; Skautrup's appraisal (1953, III, 324–328) is that Grundtvig's style is popular but undignified. While Fr. Winkel Horn's translation (1898) is rather non-descript, the one made by Jørgen Olrik (1908–12) appears a bit old-fashioned, recalling the historical pastiches of the 19th c. described by Rubow (1923). A popular paraphrase of the older translations made by Helle Stangerup appeared in 1999, and in 2000, Peter Zeeberg launched his new scholarly version (cf. Hastrup 2002).

5. Case: The provincial and urban laws

The medieval laws form – as tokens – the greatest part of texts preserved in Danish. Among these, the Jutlandic Law – dominant for many years – has been preserved in 240

manuscripts but in different languages: 160 in Danish, 70 in Middle Low German and 10 in Latin (Skautrup 1944, I, 212). A reasonable hypothesis is that the vernacular law texts were recorded because the young Danish Church, as a societal counterpart of the Crown, conducted its administration through written laws and documents – and had to draw up concordats with laymen in the so-called "church laws" known as *Sjællandske Kirkelov* (1171) and *Skånske Kirkelov* (1174), which are interesting because they are supposed to have been issued simultaneously in Danish and Latin (Karker 1993, 63f.). The provincial laws are not translations, but the processing they had to undergo when recorded by professional scholars trained in Latin text-processing and law (Hoff 1997, 13–43; Jørgensen 1987, 95ff.) may have left some imprint of Roman and canon law on their composition and the structure of articles through protasis and apodosis, however with many subordinate clauses on syntactic levels not so easily determined as in Latin. The Danish texts were not always satisfactory to professional administrators, e.g. Anders Sunesen, Archbishop of Lund. He is renowned for two paraphrases, (a) the *Hexaëmeron*, a scholastic theological work composed in Latin hexameters instead of Latin prose (cf. Ebbesen 1985), and (b) a Latin version in prose of the provincial law of Scania, the site of his chair. In 1590, the historian Arild Huitfeldt gave (b) this mark (quoted in J. L. A. Kolderup-Rosenvinge, *Samling af gamle danske Love* I, 1846): "It is not made *verbum e verbo* but rearranges the matter under relevant headings" (my translation). This more logical and abstract construction allows for creative juridical reflection beyond the complexity presented in the casuistic articles in Danish (cf. Toulmin 1988). Sunesen adds several definitions of vernacular legal concepts, useful for students at the school of the Chapter in Lund, as well as for modern scholars. His paraphrase has the important advantage of being readable aloud, text and commentary are one text, in contrast to a text commented on in marginal glosses or even separately.

The *Jutlandic Law*, the only provincial law given assent by the king (1241), has a preface with general legal statements reflecting canon law but in later times often quoted as a symbol of the Danish sense of justice. In the Danish prose of the preface, a trained reader will not miss the Latin and canonical imprint which overshadows the large number of Middle Low

German loanwords (Karker 1993, 89f.). In the Middle Low German version, the text-type of the preface was changed into *knyttelvers*, and here the reader would hardly recognise the foreign learned model. Bishop Knud Mikkelsen, a professional jurist, *doctor utriusque juris*, studied the *Jutlandic Law* and commented in Latin on both the Latin and the Danish versions of it, comparing Danish legislation with canon as well as Roman law and using an earlier commentary by Thord Litle. Knud Mikkelsen wrote his scholarly commentary in a marginal gloss. The manuscript tradition of his work presents a layout interesting for translation studies: all the three texts in one opening, first the Danish, then the Latin text, and the glossator's Latin notes in the margin (photographs in Jexlev 1982, 51–53). A manuscript called “the notebook of Bishop Knud” is just an apograph without the basic text commented on (Jexlev 1982). Legal texts often need commentaries as language changes, articles are cancelled and new ones added. Before the new nationwide legislation in *Danske Lov* (1683), “darkened words” were listed and explained (i. e. “translated”), a necessity for judges and lawyers (Skautrup 1944, I, 244f.). Later, the old provincial laws have been translated into Modern Danish by Erik Kroman in three volumes (1945–48), the third one being a commentary.

Urban legislation was from the beginning given in Latin and later often translated into Danish prose, though influenced by the Middle Low German versions. The Latin texts use Danish words for special local purposes, like the Danish texts use Latin for special legal purposes, e. g. certain technical terms. Skautrup assumes that Danish translations were produced when the king issued or confirmed the urban charters, but little evidence is left (Skautrup 1944, I, 213).

As for guilds and artisan fraternities (Dan. *lav*), Latin also prevailed (Skautrup 1944, I, 207; 1947, II, 7f., 12f., 139f.). It is a mystery how a Latin charter (Dan. *skrå*), read aloud once a year, could possibly be effective. Since the charters regulated e. g. table manners, they must necessarily have been explained in a vernacular paraphrase, being extremely relevant for women, apprentices and servants who had no Latin.

Other texts difficult to understand and in all likelihood seldom presented to a wider public are diplomas, evidence from the court records etc. Until the late 14th c., they were normally in Latin, but the Danish original di-

plomas which replaced them reproduced the Latin models as if they were translations (cf. 1.). Texts set up in two or more languages, e. g. bilateral or even multilateral international treaties, are well known in Danish administration but seldom used for internal/domestic purposes (Haastrup 1997a). Furthermore, it should be noticed that several Danish scholars and authors wrote in foreign languages for an international public and later somehow had the text “translated” into Danish. Famous examples are Niels Hemmingsen in the 16th and Ludvig Holberg in the 18th c.

6. Cases: School texts, drama and other dialogic texts

Danish proverbs, once to a rather optimistic extent considered relics of old popular wisdom, are partly translations of Latin phrases, partly Latin translations from vernaculars. The medieval collection named Peder Låle combines Danish and Latin sentences meant for teaching grammar and presumably also text composition (“chrias”, cf. Lausberg 1998, §1117–1120). Christiern Pedersen published an annotated printed edition with criticism of the obsolete medieval Latin (Paris 1515; cf. introduction in Kjær 1979).

Drama was a central part of the curricula of grammar schools from antiquity. The metric plays of Terence (in iambic senarius) were, e. g., rewritten in prose and became the most widely chosen models of dialogues using first and second person, deixis, polite address, (drawing-room) oaths, etc. The traditional rhetorical textbooks aiming at forensic use (Lat. *contentio*) gave no guidelines for everyday dialogues, the *sermo* in a household (Lat. *in circulis familiarum* ‘in the private/intimate sphere’). The Renaissance dialogues, however, were often named after the social status of the interlocutors present in the situations (called “occasions” and “scenes” by Guazzo 1574/1614, cf. Haastrup 1994, 67–70 with plate XIII), just like in the theory of drama: the interlocutors are like characters on stage (Scaliger; cf. Lausberg 1998, §1198). In Danish schools, the plays were converted into the vernacular and into the local metre, the *knyttelvers* (cf. 4.), in a metre-to-metre translation as in an epitaph analyzed by M. S. Jensen (1997). The stage directions seem always to match a change of character with a change of line, though the original ancient drama was more like an everyday dialogue, i. e. able to

change speaker in the middle of a verse (Kr. Jensen 1982, 94). The schoolboys learned the Latin lines by heart and were trained in making variations of different speech acts and collocations, cf. a textbook from Herlufsholm, Zealand, *Phraseologia Terentiana* (1652–53) with a Danish parallel translation (Haastrup 1991, 259f.; Kr. Jensen 1982, 97–101). Another textbook (by Schletter, printed in 1667) gave sketches of the *dramatis personae*.

Even if the plays were performed in Danish, the stage directions were in Latin, the language of the schools. One example is *Ludus de sancto Kanuto duce* ('the play of Saint Canute the Duke'), based on a Latin prose legend and dramatized in Danish *knyttelvers* by a known teacher in Ringsted, Zealand, about 1500, to be performed on the medieval simultaneous stage (Nyrop-Christensen 1971). The villain, e.g., speaks *cum indignatione* and the king (with) *gaudio*.

Among later translations of dramatic texts, those of the (metrical but unrhymed) plays of Shakespeare offer an excellent example. Shakespeare was rediscovered in Germany (by Lessing, Schiller, Schlegel) and read and quoted in German by Danes. The first Danish translations in rhymed iambic pentameter were lively and more Shakespearean than the German versions but without great aesthetic ambition; they were made in 1807–16 by P.F. Foersom, an English-speaking actor who did Hamlet in the first performance of that play (1813). Although he was unable to follow Shakespeare's stylistic achievement, Foersom's texts were a revelation to Danish poets, and later many new translations were made by Lembcke, Østergaard etc., cf. the detailed descriptions with parallel texts in Rubow (1932; 1933, e.g. 103).

Phrasebooks and ready-made model dialogues for training communicative competence in foreign languages are a kind of Loeb editions with several columns in one opening, one of them for the Danish source language (often in itself a translation from German), the others for target languages, often French. Modern language studies did not become a subject of secondary education until the mid-19th c. but were carried out privately with or without the assistance of native speakers of the target language. But dialogues in Latin/Danish in the grammar schools are known, not only phrases from Terence or the *Colloquia* of Erasmus Rotterodamus, teaching good manners, but communicative routines designed to facilitate the pressure from the immersion pro-

gramme, the schoolboys being obliged to use Latin even on their way to school and back home. In Heyden (1660; cf. Haastrup 1991, 252–254), a question "Why do you whisper like that?" (Lat. *Cur tu sic mussitas?*) is answered, "Because the schoolmaster has forbidden us to speak Danish". The main subject of private instruction in the 17th and 18th c. was French, for the purpose of gaining competence in oral language use and courtesy, to master the routines of everyday encounters (for bilingual models in ready-made dialogues and manner books, cf. Haastrup 1994, 73–75) face to face with foreigners, e.g. on the Grand Tour. The grammar books were composed with great pedagogical skill, showing the importance of grammatical and pragmatic instructions; e.g., paradigms on "moves", later called "speech acts" (Austin), were combined with (a) paradigms of politeness: how to address superiors, equals and inferiors, older and younger, males and females, arranged in various ways (cf. Aristotle's Rhetoric II, 12–16), as well as with (b) paradigms of emotion for use in the household, e.g. how to reprimand severely a man- or maidservant. Other examples are conversation with shopkeepers, learned people, clergymen, physicians, attorneys, military men, aristocrats, etc. These contrastive textbooks in modern languages for Danes have been ignored for years, not considered equal to treatises which have Danish as their only subject (cf. the edition of *Danske Grammatikere* I–VI, 1915–29), although some of these contrastive grammars were based on first-class international textbooks by Des Pepliers (1759), Hilmar Curas (1760), etc. (Haastrup 1988a; 1992, 75–97; 1995).

7. Cases: Some newer translations approaching modern standards, up to ca. 1800

This article stops at the end of the 18th c. But the new utopian type of translation was already there, the one that pretends equivalence, respecting the idiom of the source as well as the target language and presenting a text of the same text-type and, if metric, even the same metre, without notes and inserted explanations. The way to the use of metres natural for the Danish tongue was long and winding, with many learned discussions (Skautrup 1947, II, 362–377). Anders Arrebo's *Hexameron* (posthumous edition 1661) portrays his struggle with Du Bartas – like Jacob's with

the Angel; it is problematic and appreciated mainly for its freer and independent passages, mostly additions. Like his predecessors, Arrebo chooses another ground to fight on, creating a different metre, a special rhymed hexameter, in order to avoid the alexandrines of Du Bartas. But after a while he gives in, changing to alexandrines but using feminine rhymes only (Simonsen 1955, 198–205). In the second half of the 17th c., Matthias Moth in his translation of Ovid's *Metamorphoses* chose the alexandrine instead of Ovid's hexameter (cf. Haastrup 1981; Hjorth 1982). Holberg, inspired by Boileau, did the same in his mock-heroic epic *Peder Paars* (1719–20), parodying Vergil's hexametric *Aeneid*. The translation of Seneca by Birgitte Thott (1658) is a really successful attempt, though her many German loanwords are a major problem for the modern reader; Skautrup (1953, III, 291) explains this as a common feature in the contemporary usage of the nobility.

The idea of translation in the late 17th and the 18th c. was dominated internationally by the French *belles infidèles* (in Denmark, the Gottsched movement coming from Germany). The main problem of Danish translation in the second half of the 18th c. seems, however, to be the language purism, under German influence as often before. The purist idea was to use no words considered "foreign", i. e. at the time French words and phrases (Skautrup 1953, III, 143–150). Texts following this trend could be just as difficult as the clumsier *verbum-e-verbo* translations of earlier times, but for quite different reasons. The trend was challenged and ridiculed by Charlotta Dorothea Biehl, the translator of *Don Quijote* (1776–77), who had an unerring instinct for oral conversation (J.E. Andersen 1997). The protagonist in her comedy *Haarkloveren* ('the hairsplitter', 1765) uses a good many purist "paper words"; the ensuing controversy made a lasting impression on public opinion (Skautrup 1953, III, 147f.).

The purist movement was part of a greater movement to cultivate the Danish language and the literary taste of the reading public, and a means to further this was – like earlier on – to compete with models from classical and modern foreign literatures, at least through translation as a practice on equal terms. A selection of translations and translators is mentioned and commented on by Skautrup (1953, III, 150–153). The number of translations of novels into Danish describes a steeply rising curve in the period 1710–1810

(Skautrup 1953, III, 106). The ambitions were supported by literary societies, the members of their boards being almost the same significant few but very enthusiastic people. Skautrup (1953, III, 107, 151) gives a survey of valuable translations following modern standards, among them translations from Latin classics representing the heaviest task of tradition.

8. Conclusion

This tradition tells us that "From Roman times to the present, Europe has been a civilisation of translations, every aspect of its culture, literature, administration, trade, religion and science having been deeply influenced by translations" (Kelly 1994, 4716). This statement applies considerably more to small language communities like the Danish one, which was multilingual for many years. The national bibliographies (cf. the outline in English by Ilsøe 1985) show that a great proportion of the books printed in Denmark stems from abroad (cf. Dal 1987), for centuries from Germany, and during the 20th c. from Anglo-Saxon countries, whether they are issued in the original language or paraphrased or translated, often second-hand. A useful guide to literature, primary and secondary, in English is Rossel (1992, 635–658).

57. Nordic language history and the history of translation II: Swedish

1. Introduction: Foreign languages and the vernacular. Translation.
2. The periods of translation in the history of the Swedish language
3. The impact of translation on the structure of the Swedish language
4. Literature (a selection)

1. Introduction: Foreign languages and the vernacular. Translation

The current conception of the history of Swedish involves the idea that the written language – as well as the modern supraregional, geographically levelled spoken language – has taken shape under a constant, partly deep-seated influence of foreign linguistic patterns. Such influence has been communicated through international cultural exchanges, where Sweden has principally played a receiving part. In the development of a national written language, the dominant examples always presented themselves in the great languages of the European continent and of

Western history. The familiarity in older times with particularly Latin, French and German, and in the last century with English, has always been widespread in – constantly growing – literate circles of Swedish society.

Of course, people's contacts with these (and a few other) foreign languages have taken place in several forms and at different levels of deliberate planning: the one extreme being a vague, general accommodation to another "linguistic world" than the one at home, unreflectingly brought about by reading, correspondence, personal contacts and travelling; the other a well-reasoned, methodical imitation of specific patterns in the lexicon, syntax and text formation.

One of the most distinctly perceivable, probably even one of the most important channels of influence from foreign languages is no doubt that of translation. In Sweden, translating activity has been going on, and is documented in literary sources, ever since the oldest epochs of the history of the written vernacular. In fact, translation, in varying pro-

portions to original writing, has contributed to production of written text in the Swedish language from the dawn of history up to the present day.

By “translation” we normally mean the rendering of a message given in one language, called the “source-language”, in another language, called the “target-language”. In today’s linguistic culture, translation in a proper sense is restricted to written language (as opposed to the oral “interpretation”) and should be based on a particular relationship of *equivalence* between the message of a source-text and that of a target-text. The equivalence, though always approximate, should be perceptible on the grammatical and lexical levels. This means either that essential single words, phrases and clauses in the source-text are rendered by reasonably recognizable units, “equivalents”, in the target-text, or, at least, that the essence of the message of a readily surveyable source-text sequence – say a sentence – is reasonably recognizable in an equally surveyable target-text sequence. It also means that the source-text is thus rendered *in its totality* in the target-text, without relevant omissions, additions or transpositions.

2. The periods of translation in the history of the Swedish language

However deeply rooted in Western civilization, translation in this modern, relatively strict sense is a cultural product of an advanced though limited age. Previous, more “primitive” periods knew no more “accurate” kind of translation than that of freely rendering the totality of a message, in a “translating paraphrase”. The ideal of formal equivalence was introduced only at a relatively advanced level of literacy. In a country like Sweden, this crucial point in history was reached at the end of the High Middle Ages, i. e. in the late 14th c. It was preceded by a phase of free paraphrase of foreign originals, closely connected with the adoption of Latin script for vernacular writing which occurred in Sweden and Scandinavia as a result of Christian missionary work and the subsequent introduction of Latin. In the case of Sweden, these events took place primarily in the 11th c. (which is about one century later than in Denmark and Norway). The main periods of Swedish translation history – still rather hypothetically delimited – are named and briefly characterized below.

2.1. The period of chivalry (early 13th to late 14th century): adaptation and paraphrase

The first “books” in Sweden, written with Latin characters in vernacular language (i. e. in “classical” Old Swedish), are records of the provincial laws, which were not produced until the early 13th c. Traditionally, this so-called Folkunga period is described as the “golden age” of medieval Swedish culture. Vernacular adaptation of inspiring achievements in continental literature, primarily in Latin, was frequent, and indeed provided the origins and starting points for domestic literature. The main genres were different kinds of legal and religious writing. The relationship to the originals was loose: most texts produced were paraphrases and free imitations. Translation in today’s strict sense of the word occurred only rarely at this early state of linguistic development.

2.2. The monastic period (late 14th to early 16th century): the introduction of lexical and grammatical equivalence

The Monastery of Vadstena dominated the production of literary texts in the 15th c. Vernacular writing there was based on translation in the modern sense of the word, i. e. transfer from a source to a target language, consisting in the substitution of equivalent linguistic material on lexical and grammatical levels. The grand Swedification of St. Bridget’s *Revelations* at the beginning of the period indicates the “birth” of a properly translating tradition in Sweden. This is indicative of the development of an effective national language.

Text production was still based on manuscripts. However, the archaic grammatical system of the East Nordic language changed dramatically during the period, from synthetic to analytic: inflexion was getting simpler. The vocabulary was interspersed with continental, particularly Low German loanwords, connected partly with the material and spiritual sides of chivalry, partly with the large expansion of trade and crafts. On the other hand, Latinized modes of expression colour syntax, which in some genres, particularly in monastic translated literature and in diplomas, became heavy and complicated. Translation acted as main channel for this influence.

2.3. The Reformational period (early 16th to early 17th century): royal Bible translation

Printing was invented and radically changed the external conditions of written language. Mass production of texts became possible and was systematically made use of by both the state and church. The dominant stylistic patterns of continental literature were still based on Latin and German – though now even on High German.

The great Bible translations of 1526 (The New Testament) and 1541 (Gustav Vasa's Bible) are powerful achievements, crucially significant to the development of the national language. In general, however, the literary culture of this period in Sweden, including text production, is poor.

2.4. The Great Power period (early 17th to early 18th century): translation in a stabilizing vernacular

The Great Power's ambitions of cultural prestige, King Gustav Adolf's and Queen Christina's fairly open-handed cultural politics, Lutheran orthodoxy, patriotic historical fantasy, and the pronounced interest during the concluding Carolinian epoch in orthography, grammar, and preservation and regulation of the national language – all these were the driving forces behind the increasing production of texts during Sweden's Great Power era, setting their distinct marks even on translator activities. Though supported by the state for ideological reasons, translation, now primarily from German, did not, however, dominate the literature in the Swedish language. The hegemony of the Latin school in the Swedish educational system reached its peak in the 17th c. Nevertheless, baroque ideals left their unmistakable mark on authors' as well as translators' writing, and old Latinate stylistic patterns were balanced by fresh ones, particularly German and French.

2.5. The academic period (early 18th century to ca. 1830): translation in a maturing vernacular

In the centuries immediately succeeding the Reformation, written Swedish slowly but steadily had strengthened its position as a civilized language of the European community. The death of King Karl XII in 1718 marks an important transition to a new era. This basically insigni-

ficant peasant country, now forced to give up its visions of being a great power, began accommodating to the modest role of a small, peaceful border state in northern Europe. In the long run, this turned out to be positively fruitful even to the interests of the national language. It was now developed and refined in peace and quiet, in all relevant types of text and in most literary genres that were cultivated in Western Europe at the time. A final layer of normalizing polish was applied in the late 18th c. The international outlook of the educated classes was getting wider and deeper, and an increasing dominance of the French language in Swedish culture reached its peak during the reign of King Gustav III (1772–92).

2.6. The industrial period (ca. 1830 up to the present): translation on the literary mass market

Far-reaching revolutions have taken place in Swedish society during this last and most extended period: industrialization, popular movements, emigration, the breakthrough of democracy, and, in recent decades, immigration from a large variety of foreign countries. Seemingly little affected by all this, translation and translating activity presents a remarkable continuity. On the other hand, it has developed forms which contrast distinctly on essential points with preceding periods. It is obvious, for instance, that literary texts in the 19th and 20th c. were translated for mass production in new genres of fiction, meeting the demands for simple entertainment directed at the broad public. Commercialism required high-speed production and a linguistic form fully adapted to the ordinary, unschooled reader. The result was a strong demand for simplicity and uniformity, not least in translation. On the other hand, it is also obvious that increasing secularization and cultural pluralism, together with a wider international outlook, gradually paved the way for translations from several new, more "exotic" literary languages.

3. The impact of translation on the structure of the Swedish language

Translation, particularly when it occurs on a large scale in a small linguistic society – as has always been the case in Sweden – is a catalyst, working with a powerful and enduring effect. The translator's endeavour to render

the message adequately gives rise to tension between the observed structure of the source-text and the given system of norms and rules in the target-language. This conflict is universal, and it is well known to any translator. Historically, it does not lack the ability to create change: in the long run, it may lead to displacement of the limits of tolerance in the grammatical system of the target-language and to restructuring semantic fields in the vocabulary; the latter involves far more than the mere influx of loanwords. Translators are intermediaries for the strong pressure exerted on language users by foreign linguistic and cultural patterns.

It is a reasonable, not to say a trivial, hypothesis that translation – together with other channels of linguistic influence – has, over the course of history, not only created cultural incentives, implicitly and explicitly, but also affected the language itself. By virtue of its central role in the very production of text, as well as its extended occurrence ever since the Middle Ages, translation is a dimension of its own in the history of written Swedish.

In the process of translation, two linguistic versions of the same message meet: one observed in the actual source-text, the other envisaged in the potential target-text. In the translator's conception, these structures are confronted immediately and sharply, at all levels. Unlike the original writer, the translator is forced to take an attitude towards a linguistic form and is called upon for deliberate solutions to specific problems concerning sentence structure and/or wording, conditioned by differences in the systems of linguistic rules and norms, sometimes even by differing textual traditions.

In the first place, this is a matter of the immediately observable structure: the set of words and phrases has to be replaced, the grammatical network normally has to be resolved and reconnected, more or less radically. But this is rarely the end of it. The translator has to take into account differences in cultural prerequisites of reception, to reinterpret an entire attitude to a given content. Normally this is not dramatic, but in some cases it may have far-reaching consequences, deeply affecting the very form of the text.

This last aspect is a crucial one, though not so frequently observed and studied. Significant traits in the external *text formation* of original documents may be taken over in translation and imitated in the composition of vernacular text. At levels within the linguis-

tic system, principally similar conditions govern the translator's relationship to the lexicon and syntax, since the translator here has the choice – more or less free – of different alternatives, relative to lexical and grammatical elements of the source language, in some cases readily transferable, in others not. But even at other levels within the same system, such as the morphological and phonological/orthographic, where the writer is subject to rules and conventions quite irrelevant to the usage of any other language, it is nonetheless possible sometimes to recognize the translator as an active mediator of more or less spectacular innovations in the target-language system.

Consequently, translation has taken part – and at the first three levels mentioned above probably a very significant, not to say a predominant part – in developing vernacular language through foreign patterns. The possible share of other channels of influence in this development is hard to judge; probably the proportions are specific at each level, in each period of time and in each particular genre.

In the following, the influence of translation will be regarded as a channel of foreign linguistic influence in general – irrespective of its possible interplay with other driving forces in the history of the language.

3.1. The chronology of influence

In medieval Sweden, the relationship between Latin and the vernacular was contradictory and complex. On the one hand Swedish took shape as a written language on the very basis of Latin. On the other hand, this occurred during a “classical” phase of its early development, when the archaic structure of the old language was still principally intact and the vocabulary reasonably genuine. Its position in relation to the dominant Latin, then, was one of a certain amount of independence. It is clear in the preserved documents that classical Old Swedish was strikingly successful in maintaining certain native forms in the lexicon and syntax; in a way it moved quite easily within the framework given by the constant paraphrasing of Latin originals. This is true at any rate with regard to writing dominated by this kind of text production, i.e. within the “literary” genres. In some kinds of judicial records, which are mainly original writing, the style is far more – and sometimes in the extreme – Latinizing.

In the late Middle Ages, during the Union period, a stricter practice of translation

emerged in the Monastery of Vadstena, and Latin's grip on the formal structure of Swedish became stronger, even in literary genres. At this time written Swedish became stiffer and heavier, in a sense less native. Moreover, there was a massive influx of Low German words; even some derivational elements and grammatical constructions of the same origin penetrated into the Swedish language during this period. This large-scale exposure to foreign influence – certainly to a significant extent conveyed by translation – for a time, it has been argued, appeared to threaten the basic Nordic identity of Swedish.

In the long run, however, the pressure from abroad had a stimulating effect upon the development of Swedish as a civilized language at a European level. Under the tight reins of Latin stylistic patterns, imposed particularly on the translators, variation decreased, and the language became more uniform. A more solid structure matured, heralding later epochs, and written Swedish gradually assumed a stability enabling it to develop a new rich variety of genres and styles. By that time – say in the late 17th c. – the numerous Low German loanwords had made themselves completely at home in the Swedish language, making an invaluable addition to its rich linguistic heritage.

The reformers' monumental Bible translation from the mid-16th c. was to become an essential element in setting a standard for the development of the national language during the New Swedish period. At this time, however, the linguistic system remained essentially unaffected. What remained was the standardization at different levels of a system that was essentially completed at the end of the Middle Ages; it was as well a question of variation in orthography. The originators of the Vasa Bible spelt, inflected, and composed phrases and clauses in a way that writers in succeeding periods, with varying degrees of consistency, either adopted or rejected, though always taking up some kind of position about it, sometimes even referring expressly to it. Discussion on questions of language and language use in Sweden was often more or less explicitly related to the Bible translated by the reformers. This biblically dominated phase in Swedish linguistic reflexion lasted from the 17th at least into the 19th c.

For the writers of non-religious genres, translators in the beginning played a less prominent part: in the early New Swedish period (late 16th and 17th c.) they were relatively few

in number, and text production in Swedish mainly consisted of original writing. This situation changed rather dramatically over the course of the 18th c. In the Gustavian era (1772–1809), new fields for using Swedish in literary writing opened up, with translators in the lead. They became the dominant suppliers of text for the expanding theatre, further, and still more important, for the rapidly growing commercial production of secular prose fiction, directed at constantly increasing strata of the population. The latter development set its mark firmly on the production of books in Swedish within literary genres during the 19th and 20th c. The share of translation in this production was never below half, though quite often, and particularly in the initial and final phases of the two-century period, considerably above it.

The role of the translators in this modern development was a dual one. On the one hand, they could act as efficient intermediaries of innovative linguistic trends in rendering more or less avantgarde literature from abroad into Swedish; to what extent they actually did this is another question. On the other hand, they could be expected to take part in adapting the written language to the particular needs of light reading, supplied by the massive import of simple fiction translated into Swedish. The actual effects on the structure of the target-language in the interplay between translators' different efforts at various levels of the literary system, as well as the relationship of the translations to the achievements of the original writers, remain on the whole unexplored.

At one level of the language system, the assessment of the effects from translators' activities is particularly obvious: the lexicon. Swedish vocabulary has been enriched during all historical epochs with loanwords from the great, dominant languages of Western civilization. The lasting contributions occur in layers still bearing witness to the continuous change in international influences:

Low German in the Middle Ages, e. g. *hövisker* 'courteous' and *æra* 'honour';

Low and High German in the Reformation period, German, French and Italian in the Great Power period, e. g. *drabant* 'bodyguard', 'satellite', *fänrik* 'second lieutenant', *gevär* 'rifle' and *artig* 'polite';

German and increasingly French in the 18th c., e. g. *bassäng* 'basin', *chiffonjé* 'escritoire', *fåtölj* 'armchair', *depå* 'depot', *kasern* 'barracks', *manöver* 'manoeuvre', *chef* 'head', 'principal', *direktör* 'manager' and *fabrik* 'factory';

German, French and increasingly English in the 19th c., e.g. *attaché* ‘attaché’, *automobil* ‘motorcar’, *blus* ‘blouse’, *cykel* ‘bicycle’, *filé* ‘fillet’, *fotboll* ‘football’, *gin* ‘gin’, *lokomotiv* ‘[railway] engine’, *match* ‘match’, *omelett* ‘omelet’, *pincené* ‘eyeglasses’, *pyjamas* ‘pyjamas’, *radikal* ‘radical’, *rekord* ‘record’, *toddy* ‘toddy’, *ulster* ‘ulster’, *velociped* ‘bicycle’; predominantly Anglo-American in the 20th c., e.g. *astronaut*, *container*, *designer*, *fight* or *fajt*, *party*, *slogan* and *status*.

Latin and Greek loanwords cover all periods from the runic inscriptions to present-day electronic media. Old Swedish forms corresponding to modern variants of high frequency include *diæful*, Mod. Sw. *djävul*, ‘devil’, *kyrkia*, Mod. Sw. *kyrka*, ‘church’, *prædika*, Mod. Sw. *predika*, ‘preach’, *tæxter*, Mod. Sw. *text*, ‘text’, ‘lesson’. Sweden’s share of the vast, relatively uniform stock of international words of Latin and Greek origin which have spread over the Western world is considerable. In the last three or four centuries, Swedish has used at least a thousand Latin and Greek lexemes to create terms used today.

To what extent translators have been the very originators of lexical innovations or have just reflected or confirmed them is as yet unexplored.

During the final phase of the 20th c., translators began to play a significant role in the complicated linguistic pattern of the European Community. The accommodation (partly imposed) to prevalent standards of conservative French officialese in particular has already left visible traces in several judicial documents produced by Swedish translators.

3.2. The levels of influence

Most easily – and most frequently – observed are certain aspects of the growth of the lexicon. This is mainly effected by a constant influx of loanwords, most obviously the direct loans, examples of which, chronologically arranged, were given in 3.1. Even loan translations and semantic loans, though less conspicuous, have deeply affected the structure of the vocabulary. Typical Old Swedish instances of the former category are words like *alzvaldugher* (Mod. Sw. *allsmäktig*, ‘almighty’, from Lat. *omnipotens*) and *upbyggia* (Mod. Sw. *upbygga*, ‘edify’, from G *aufbauen*), of the latter *hember* (lost in Mod. Sw., ‘world’, Lat. *mundus*) and *skapa* (Mod. Sw. *skapa*, ‘create’, Lat. *creare*).

Swedish syntax has developed under the constant pressure, directly and indirectly, of Latin influence in particular. This is reflected in a complex phraseology and sentence structure, and in several written genres very remote from the relative simplicity and looseness of spoken language. Setting their unmistakable mark on most genres of medieval prose, Latinate patterns have governed, often indirectly through German and French intermediaries, professional as well as literary writing throughout the history. The examples have served both as positive and as negative models – the latter particularly in the 20th c., when democratically based efforts to simplify official language constantly aimed at forcefully combatting deeply rooted traditions of complicated Latinate writing.

The imitation of Latin structures sometimes forced medieval translators to introduce innovations into the grammatical system of the vernacular, e.g. the use of the present participle governing subordinate elements: *Maria, utgangandis af huseno* ‘Mary, going out of the house’. More often, however, the translators just reinforced certain modes of expression that actually occurred even in “genuine” language, though with considerably lower frequencies. This is the case, e.g. for the general use of the present participle.

The morphological system, however native and inherited, has been directly influenced by foreign languages. Latin and Greek neuter plurals such as *centra* ‘centers’ and *temata* ‘themes’ have survived in the vernacular, often alongside adapted forms such as *centrum* and *teman*. In some individual instances this may affect the word formation: English plurals like *slips* and *rails*, borrowed in the 19th c., have been given singular Swedish forms: *en slips* ‘a tie’ (with the secondary plural *slipsar*), *en räls* ‘rails’. In Old Swedish and Early New Swedish texts, the full paradigms of Latin nouns, particularly proper names, were observed, e.g. in the Reformational Bible: *Pauli* in the genitive case, *Iesum* in the accusative and [*af*] *Pilato* in the ablative/dative.

Even indirectly, foreign influence has affected the morphological system. This is evident in a tendency – apparently reinforced by frequent contact with texts – of the writers of certain, particularly medieval genres, strictly to maintain the archaic system of the vernacular. The late medieval Vadstena language, e.g., is strikingly conservative in this respect, and was probably rather obsolete even to its contemporary public.

In a closely related sense, the impact of foreign linguistic patterns is indirectly felt even in the process of semantic elaboration and formal standardization. Strenuous efforts in these respects have, in very general terms, constantly governed the development of written Swedish throughout history. Up to, say, the reformers' great Bible translations in the early 16th c. – in a sense even up to the energetic regularization measures of the Carolinian epoch in the late 17th and early 18th c. – Swedish translators were working in a target-language which had still relatively limited means for expressing abstract levels of argument and was subject to more or less wide variation. With good reason, translators were generally influenced by continental source texts in which complex or abstract content was given precise wording based on underlying elaborated semantic systems, and in which spelling, inflexion, phraseology and sentence structure were comfortably uniform. Certainly, the inclination to transfer such qualities to the product text was always a powerful driving force in cultivating the written vernacular, probably even inspiring writers originating texts in Swedish.

The import of intact written word forms has influenced the development of Swedish orthography. It all began, of course, with the adoption of the Latin alphabet, with its given sound values, rather mechanically transferred to a vernacular system partly otherwise structured. Some of these early loanwords took part in later phonological changes, like *pawi* > *påve* 'pope', whereas a few others possibly contributed to the creation of new sounds. So, in the many nouns ending in the suffix *-tio[n]/-sio[n]*, e. g. *imitation*, *flexion*, ordinary habits of medieval and humanist Latin pronunciation ([-tsiu:n], [-siu:n] and the like) in early New Swedish may have led to confusion with fricative sounds recently developed, as we find in certain initial consonant clusters like those in *sjuk*, *sjö*, *stjärna*: in Modern Swedish the pronunciation of the consonant phoneme in question is one and the same in these cases. In a principally conservative orthography, unassimilated loanwords in several cases have, of course, made their mark on Swedish spelling traditions. There is, e. g., still a tension in French loanwords, spelt either phonetically like *butik* or "etymologically" like *boutique*: both mean 'shop', though differing in their degree of elegance or exclusiveness.

For overall text formation, some striking conventions are related to foreign languages

and indirectly to translation. Most obvious is that of typography: the medieval Gothic script was naturally continued in the printed black-letter/German type, used in texts written in Swedish (and other Germanic languages, particularly German), whereas texts in Latin and French were printed in Roman type. Not until the early 19th c. did the latter take over in (practically) all printed text in Sweden. Accordingly, the translation of printed source texts, written in Latin or Romance languages, and intended as printed target-texts in early New Swedish, normally meant a change of typography. It may be assumed, that the frequent contact with – including translation from – French in the Gustavian era hastened the adoption of the Roman type in Swedish printing.

Another important aspect of text formation, certainly related to translation, is the use of indices, headings, registers and other technical and dispositional measures for making the structure of a text clear, particularly in books. In the medieval provincial laws, the main sections (the *balkar*) in some cases (e. g. in the Östergötland law) had been arranged differently in different manuscripts, a fact which partly indicates that text formation was secondary to the original editing. In a sense, the development of clarifying strategies began in the same high medieval epoch, inspired not least by a scholastic predilection for thorough systematization. This is particularly apparent in the translation of St. Bridget's *Revelations*. Lengthy enumerations of items in a hair-splitting theological argument are rather frequent in this genre, and normally they are uncritically and meticulously taken over in the target version. Later, Renaissance culture took up another, more independent attitude to the attempts at clarity and order, though at the same time confirming such endeavours. It is significant that registers and indices appear in the Swedish Reformers' great Bible translation of 1541, later to be completed and augmented in the revisions of 1618 and 1703 and reduced or removed in the several 19th c. versions. The division of the chapters into numbered verses was introduced into the Swedish Bible in the revision of 1618 and was maintained in all subsequent Bible versions; the model came from German Bibles around 1600 (cf. Olsson 1968, 354ff.). In contrast, we may cite Swedish law texts, which stand outside this translation culture. Here the division of the *balkar* into numbered paragraphs was not introduced until in modern editions, as the work of a 19th c. scientific editor.

Translation is not merely a question of prose writing. Even poetic diction in the vernacular has been in some respects influenced by translators, particularly as regards metre. The paraphrasing “translators” of medieval chivalric poetry introduced the knittel verse and a lasting innovation conveyed by this initiative was the rhyme. Elegant Shakespearian blank verse was given a vital push into Swedish poetry by C. A. Hagberg, who carried out his classic translations of the English playwright in the mid-19th c. The ancient Greek and Latin metres, however, particularly the hexameter and the elegiac couplet (distich), were not introduced into Swedish by translators but by great original poets, such as Stiernhielm, Tegnér, Stagnelius and Runeberg, in the 17th, 18th and 19th c. Great translators followed later, though, the most brilliant being perhaps Lagerlöf in his congenial renderings of Homer in the early 20th c.

6. Literature (a selection)

1. Translation – past and present

1.1. Before the Reformation

Translation history in Norway, as in the other Scandinavian countries, begins with the introduction of Christianity. The literary language in Europe at the time was of course Latin. We assume that translation activities started in Norway in the 11th and 12th centuries. The Norwegian clergy did what the Anglo-Saxon clergy did – they mostly wrote the religious texts in their mother tongue. (In Sweden and

Denmark, fewer texts were translated into the vernacular). Also, like the Anglo-Saxon tradition, a few letters were added to the alphabet. This was necessary in order to render the spoken language better. In the churches in Norway and Iceland, the priests were loyal and read their texts in Latin, but we know that they preached in the vernacular.

The period from 1100 to 1300 saw quite important literary activity in Norway and Iceland. Significantly, it is reasonable to consider both countries as *one* literary community at the time – with Bergen as its centre (Rindal et al. 1998, 18).

The first Norwegian religious legends that we know of were translated from Latin about 1150. The book is called *Gammalnorsk homiliebok* [Old Norwegian Book of Sermons], and it is the oldest known Norwegian book. The

original text is probably an old French poem *Un samedi par nuit*. If so, this is also the oldest known example of translation from French into Norwegian (Rindal et al. 1998, 30). The translation is obviously done by a highly skilled and competent person – the text is written in a popular and oral style. It is also quite typical that this is a translation from French – French culture and language dominated European civilization in the 13th century in much the same way as it did four hundred years later, in the 17th century. In *Speculum regale (Konungs skuggsjá)*, written in the 13th century, one of the king's men tells his son to learn Latin and French, since these two languages are the most prominent ones and have “the widest influence”.

Parts of the Old Testament were translated from the Vulgate in the 13th century. The first version we know of, is called *Stjórn* [rules; ruling]. In the preface, the translator excuses himself for possible mistakes and shortcomings, and he reveals a very humble attitude towards the difficult task he is undertaking. These biblical translations were, perhaps, done in Trondheim (Nidaros), since the cathedral was located there and the archbishop of Norway and Iceland resided in Nidaros from 1152 onwards.

The first explicit “worldly” translation we know of was written in 1226, when King Håkon Håkonsson, then 22 years old, ordered the Story of Tristram and Isolde to be translated into Norwegian. The Norse title was *Tristrams saga ok Ísondar*; the translator was a certain brother Robert. Håkon Håkonsson (1204–1263) was an ambitious king – he wanted to be a good Norwegian and a good European. We might say that the king probably had a dual motive – both to offer a diversion to his court (entertainment) and to show that his court was part of the aristocratic mainstream in Europe (prestige). And we must not forget that the Norwegian kingdom in the 13th century actually had a powerful role in European politics – its realm embraced Shetland, Orkneys and Hebrides, the Faroe Islands, Iceland, Greenland, Norway and parts of (today's) Sweden.

More of the same genre followed. The novels of chivalry represented a new world of heroes and ideas, they were mostly translated from French and introduced patterns of style and language hitherto unknown in Old Norse saga prose (Beyer 1963, 63). Copies were spread to all parts of the huge Norse kingdom. King Håkon, interested in the cultural cur-

rents of his time, ordered the stories written by Marie de France to be translated into the Norse language. We know very little about this Marie, but she probably lived from around 1130 to around 1200. As her name indicates, she was probably French. Therefore we assume that the original texts were written in French. The translated collection of texts was given the title *Strengleikar* in Old Norwegian. The oldest copy of this manuscript is from 1270.

Another translation of the same genre was the saga of Pamphilus. The original text was in Latin, entitled *Pamphilus de amore*, probably written in France just before 1200 (Rindal et al. 1998, 44). The text gives pieces of advice about the art of love. The translator has followed the original text surprisingly well and the translation may have been done as a qualifying piece of work by somebody (perhaps a student) wanting to show his ability in the field.

Religion first, then worldly entertainment – that was how the history of early Norwegian translation developed in the 12th and 13th centuries. The translators are mostly unknown to us, but we do have the names of a few. As mentioned above, a certain brother Robert (an immigrant from England or Ireland?) translated Tristram and Isolde. And around 1300 we find a certain Jón Halldórs-son, obviously from a solid Norwegian family, who translated the tale of Clarus from Latin, *Klári saga*.

Later on, the first legal translations were made. In 1274, Norway, as one of the first countries in Europe, elaborated a national law for the whole kingdom. (This was actually the Norwegian common law until 1687). From around 1400 onwards, these laws, written in Old Norwegian, were hard to understand for the Norwegians and practically incomprehensible to the Danish public servants and officials, who already at that time dominated Norwegian public administration. The old Norwegian laws were therefore translated into Danish. The oldest translation we know of is from around 1530, written by a Norwegian judge, working in Oslo.

Finally, we should mention a text composed by the Catholic church in Norway (the archbishop in Nidaros) and the Norwegian king. The text is an agreement that states the rights of the church. The agreement was first written in Latin and called *compositio*. This text, intended for the Roman Catholic church, was then translated into Old Norwegian. This ver-

sion was the official version of the agreement, called *sættargerð*, intended for the Norwegian king. This agreement between king and church was signed in August 1277 (Rindal et al. 1998, 48). Thus parallel texts – legal or administrative ones – so common in modern times in Brussels and elsewhere have a long tradition.

1.2. From the Reformation to 1900

After the Reformation, contrary to the situation in many other European countries, Norway's status as a religious and political nation was weakened. From the end of the 14th century, Norway and Denmark had been a united kingdom, and in 1536 King Christian declared Norway a province of Denmark. This decision had dramatic long-term consequences for Norway. The once dominant kingdom in Scandinavia (in the 13th century) was now simply part of Denmark. The country was an extremely rural society, even compared to the other Scandinavian countries. Bergen, once the biggest city in Scandinavia, was the only city of some size, with 5000–7000 inhabitants.

After the Great Plague around 1350, most of the nobility had disappeared, and literary life was in a poor state. No books were printed in Norway until 1643 – a hundred years later than in Iceland. Norway had only four “cathedral schools”, secondary schools attached to the residences of the bishops in Oslo, Kristiansand, Bergen, Trondheim. (As late as 1787 the cathedral school in Trondheim had only 47 pupils). And Norway did not get its own university until 1811.

These are important facts to keep in mind when we consider the translation activities of the period. And the explanation for this state of affairs is, of course, the fact that Norway was part of Denmark up to 1814. Important events in Denmark became inevitably important events in Norway. This means that several of the most important cultural events for Norway during the period happened in Denmark. The main translation event, for instance, in the 16th century was undoubtedly the translation of the Bible, done by Christiern Pedersen (1480–1554). It was printed in 1550, and is known as *Christian III's Bible*.

It is important not to forget that in this early period, printed books were costly. Around 1600 a copy of the Bible cost the equivalent of a horse (Rindal et al. 1998, 55). It goes without saying that books were rare in the rural Norwegian community. The most important publications in this period – beside the Bible

– were probably the translations of the old sagas. The famous Norwegian priest Peder Claussøn (1545–1614) in Agder translated both the works of Snorre Sturluson and the kings' sagas from Old Norse into Danish – of course, since Danish was the public written language. (But, not surprisingly, certain elements in his style and vocabulary reveal the Norwegian origin of the translator, cf. Beyer 1963). If there was one worldly book on the shelf in a Norwegian farm house in those days, it was Snorre. Claussøn Friis did not live to see his translations published; the first books were printed in Copenhagen in 1633. The second edition from 1757 especially achieved quite a wide distribution in Norway (Beyer 1963).

From the Reformation onwards, there were a considerable amount of translations made from German into Danish – and what was written in Danish, was of course the current written language for educated people in Norway. Theologians had to begin to look to Wittenberg rather than to Rome in matters of guidance and spiritual questions of the day. As far as religious texts are concerned, we should not forget that several scholarly texts, originally written in Danish, were translated into Latin. From Latin such texts could then be translated into English or French. And much translation followed the same route in the opposite direction (Hjørnager Pedersen/Qvale 1998). Thus a number of texts in the 16th and 17th centuries used Latin as an intermediary language. This even happened with literary texts. Ludvig Holberg (1684–1754), who was born in Bergen and taught at the university of Copenhagen, actually wrote a novel in Latin: *Nicolai Klimii iter subterraneum*. The book was published in Leipzig in 1741, and the following year it was published in Copenhagen, translated by the Norwegian Hans Hagerup as *Niels Klims underjordiske Reise*.

Typically enough, direct translation from English into Danish did not begin until around 1700 and was quite exceptional until around 1800. Most translation from English literature was instead done via German. Translation from Romance languages, especially French, only developed towards the end of the 18th century. Early examples of French influence typically took the form of loose imitation, as in Ludvig Holberg's *Peder Paars* (1719–20), which obviously has passages from Boileau's *Le Lutrin*. On the whole, many of Holberg's comedies were influenced

by Molière. (Some of Molière's plays were translated for the theatre in Copenhagen from its opening in 1722, cf. Hjørnager Pedersen/Qvale 1998).

The most important literary event in the last part of the 18th century was the founding of the Norwegian Society (*Det Norske Selskab*) in Copenhagen in 1772. The members of this club – and club is the proper word – were Norwegian students and writers living in Copenhagen. They were active in the cultural and literary life of the capital, and several of them published translations, mostly from French (Rindal et al. 1998, 57). One of the leading members was Johan Herman Wessel (1742–1785), born in Akershus near Oslo. Among his translations from French were works by Louis Ansaume, Jacques-Marie Boutet de Monvel and Charles Simon Favart. Two other active members were Niels Krog Bredal (1732–1778) and Christen Pram (1756–1821). The latter translated a book by Voltaire, *Gengiskan i China*. Rousseau's *Confessions* was translated by M. Hagerup in 1798, and *La Nouvelle Héloïse* was translated in 1800 by J.J. Garnæs. Obviously, the Norwegians were fascinated by Rousseau's ideas and thinking.

The most popular foreign author at the beginning of the 19th century was undoubtedly Walter Scott. His novels were introduced to Norway in 1827–1832. James Fenimore Cooper's *The last of the Mohicans* (*Den sidste Mohicaner*) was also published in the 1830s. The national poet, Henrik Wergeland (1808–1845), translated some of the poems of Burns and Byron.

Two important, but quite different, translation events from the 1830s deserve a special mention. This was the era of national reawakening (as in many other European countries at that time), and in Norway this meant a renewed interest in Old Norse culture and literature. One of the well-known people in politics and humanism from 1814 onwards, Jacob Aall (1773–1844), had for years worked with the old sagas. He started with a translation of *Laxdæla saga* in 1816, and the complete works of the great Icelandic author Snorre Sturluson (1170–1241) were published in 1838–39. The translation of Snorre into Landsmål was carried out by Steinar Schiøtt (1844–1920) in 1872–79.

The other event concerns the Sami culture in the north. In 1834, Niels Stockfleth (1787–1866) published his Sami version of the New Testament.

It was during the 19th century, especially from 1840 onwards, that French literature lost its leading position as the dominant source-language. English and American literature gradually took over, and this position has been strengthened ever since (cf. article 170 on Norwegian 19th century translation).

For non-fiction literature, the situation was not quite the same. In the scientific world, German was still the most important foreign language in the 19th century. The volume of non-fiction translations, however, was modest indeed, compared to modern times. But “LSP translation” (Language for Special Purpose translation) did exist. The tradition of translating economics treatises and business documents in Denmark and Norway can be traced back to the 17th century. In 1635, King Christian IV established an official body of non-fiction translators. All ships passing through the straits of Øresund had to pay tax, and the king ordered that all tax documents were to be filed in Danish. In order to accomplish this business, a certain Frederik Urne was given the responsibility to hire and pay qualified translators (Koue 1987, 33).

The fairly strict division between literary and non-literary texts is thus deeply rooted in the Norwegian tradition. When it comes to translation norms, we have reasons to believe that the translators in the Middle Ages did not transfer scrupulously all details from the source-text. Later on, in the 17th and 18th centuries, word-by-word fidelity, sticking to the letter of the original, was the preferred method. In the translations of the Bible, the style and syntax of Greek and Hebrew are often apparent (Kvarme 1993, 240). The importance of the communicative aspect, with the focus on the audience, is obviously a concept from the 20th century.

1.3. After 1900

Norway's literary and cultural situation cannot be understood without taking into account the fact that Denmark and Norway were united politically up to 1814 – and culturally up to around 1900. The director of the national library in the 1970s, Harald Tveterås (1904–1991), who has written a history of Norwegian book stores, maintains that even in the first decades of the 20th century Norwegian book stores sold large quantities of books translated into Danish as part of their general sale of literature (Tveterås 1950–96). This explains some crucial facts: the dominant

written language for centuries – up to 1900 – was Danish. Norway had few printing offices of their own, few largescale publishers, no university until 1811 and no Bible in Norwegian – since the Danish Bible was fairly well understood by most Norwegians.

It is fair to say that the beginning of the 20th century marks a shift in Norwegian cultural history. In the years after 1900, Norwegian publishing firms finally got hold of the Norwegian book market. The first complete translation of the Bible into Norwegian (Riksmål) was published in 1904. A handful of skilled scholars were working on the translation of the Bible into Landsmål – the most prominent one being Alexander Seippel (1851–1938). The work on the Landsmål version of the Bible was finished in 1921.

The volume of translation continued to grow (see section 4.), the dominance of English and American literature continued to increase, and the variety of source languages (besides English) was no longer European – it gradually became global. The volume of non-fiction translations grew substantially, and these texts played a more important role than ever before. The non-fiction translation activity therefore received more attention and public interest. New forms of translations like subtitling and dubbing, translation for the deaf, conference interpretation etc. gradually became important communicative tools for society. Finally, the translators and interpreters have established professional organizations in order to fight for fair rates of payment. These are the features of the 20th-century translation field in Norway.

But in Norway, the cultural and linguistic rivalry between Nynorsk and Bokmål adds a special sociolinguistic perspective to all translation activity and translation criticism. It even influences the terminology discussions among the translators themselves. Especially in the field of non-fiction translation, the coining of Norwegian standardized terms is an ongoing debate among translators and linguists: do we seek one common term, or do we go for two different terms – one in Nynorsk and one in Bokmål? In Nynorsk, the tradition has been to look for words rooted in the Old Norse tradition or based on the spoken language of today, even if this leads to a situation of a lexical split with Bokmål. (Bokmål often has used established terms, coming from the Norwegian-Danish tradition). But since World War II there has been a clear tendency to unite the two concerns – when creating new terms

– first the need to have one common lexeme for both varieties of written Norwegian, and second the wish to develop an efficient and linguistically sound vocabulary.

The special status of poetry translation has been formalized in a subtle way. In the Norwegian language this is not called “translation” at all; the front page announces a “re-created version”. This indicates, of course, the impossibility and importance of the task, but according to Norwegian agreements and the actual rates for literary work, this term also entitles the “recreator” to receive a higher honorarium than a “translator” can claim. One might call this good trade union work by the translators of poetry.

The translators’ trade unions have mostly lived in peace with their employers – publishers, broadcasting, cinema, public administration, business and trade. Conflicts have been solved through negotiations – with one exception. In October 1991, the literary translators did not reach any agreement with their publishers, and more than 400 translators went on strike. The final agreement was not reached until June 1992 (Rindal et al. 1998, 216). The strike was worth while: the translators achieved a 20–30 per cent rise in their pay.

In the 20th century, Norwegian writers continued to publish translations as part of their literary activity. One of the great writers in Nynorsk, Arne Garborg (1851–1924), published translations of works like *Macbeth* (1901) and *The Odyssey* (1920). The short-story master Arthur Omre (1887–1967) translated Steinbeck’s *Grapes of Wrath* in 1940 into Bokmål. One of the greatest novelists of the century, Johan Borgen (1902–1979), wrote the Norwegian version (in Bokmål) of *Sons and Lovers* by D.H. Lawrence, which was published in 1935. (An interesting detail: *Lady Chatterley’s Lover* was translated into Norwegian in 1952 – eight years before it was legally published in England). Inger Hagerup (1905–1985), Hans Heiberg (1904–1978), André Bjerke (1918–1985), Magli Elster (1912–1993), and Helge Krog (1889–1962) were among the Bokmål authors who most actively worked as translators.

Around 1930, Norwegian Gyldendal (a publishing house) started its so-called *Yellow series* – with the aim of introducing modern international authors to the Norwegian public. The editor was Sigurd Hoel (1890–1960), who himself was one of the leading Norwegian novelists in the middle of the century. Hoel translated several of Jack London’s books,

and he also translated Joseph Conrad's *Lord Jim* in 1932. The editor and journalist Gunnar Larsen (1900–1958) translated several of Hemingway's books, and Nils Lie (1902–1978) translated Graham Greene.

It seems that fewer of the Nynorsk writers were active as translators. Several literary important translations into Nynorsk were done by university professors and other scholars. Professor Johs. A. Dale (1898–1975) translated the medieval classic *Chanson de Roland* in the 1930s. Another scholar, Olav Rytter (1903–1992), also writing in Nynorsk, was one of the prominent translators at that time. Among his translations are 55 songs from *Rigveda* (1932) in the series *Austerlandske bokverk* [Literature from the East], a series that started in 1929 on his initiative. The family Skard – father Matias (1846–1927) and the sons Sigmund (1903–1995), Eiliv (1898–1978), Bjarne (1896–1961), Vemund (1909–1994), who were all scholars (bishops and professors), made the translation of the great Greek classical texts into Nynorsk a family enterprise, Sigmund being the most prominent translator in the family. The series *Klassiske bokverk* started in 1921 with the translation of Socrates' speech of defence by Eiliv Skard, *For-svarstalen åt Sokrates*.

What are the great foreign successes in Norwegian literature? For translations from English to Norwegian, William Shakespeare is, of course, the leading author with around 50 translations published. The first play to be translated was *Macbeth* (in 1767), and this is no doubt Shakespeare's most popular play in Norway; it has been translated several times – three times after 1900. (Hartvig Kiran, 1911–1978, director in the Norwegian Radio Corporation, is considered to have written the best translation of this play in 1962).

Arthur Conan Doyle is the second most translated English author. The topseller of his work has been *The hound of the Baskervilles* (1902). Third comes Charles Dickens. His most popular book is probably *David Copperfield*. This novel was translated into both Bokmål and Nynorsk. But Dickens' popularity is a fairly recent phenomenon; it did not grow until after the turn of the century (Rindal et al. 1998, 66). The great translator of Dickens in Norway was C. J. Hambro (1885–1964), an influential politician who was for many years Speaker of the Norwegian parliament.

If we leave the Anglo-Saxon world, we find that one of the most popular foreign novels in the 20th century is Henry Sienkiewicz' *Quo*

vadis? Between 1902 and 1988, the novel has been translated 16 times(!) into Norwegian – one of them into Nynorsk (by Marta Steinsvik). But according to critics, only a few of them merit the word “translation”. Most of the Norwegian versions are translated from languages other than Polish, and – even worse – most of them are incomplete texts.

Among the great translation successes are Scandinavian books – from Swedish, the novels by Selma Lagerlöf and the books about Pippi Langstrømpe by Astrid Lindgren; from Danish, we might mention *Kongens fall* by Johs. V. Jensen, translated by Sigurd Hoel (1938). H. C. Andersen was not translated into Norwegian during his lifetime – for obvious reasons (Danish was also “Norwegian” in the 19th century). But in 1917 there were Norwegian versions on the market, translated by Inge Debes and Gabriel Scott (Rindal et al. 1998, 90).

It goes without saying that selecting a few translators among the several hundreds of Norwegian translators in the 20th century who have done an admirable job, is necessarily doing an injustice to many. In spite of this, we have picked out six different translators for special mention – Anne-Lisa Amadou (1930–), Olav Angell (1932–), Kari Risvik (1932–), Kjell Risvik (1941–), Halldis Moren Vesaas (1907–1995) and Wolfgang Fischer (1927–).

Anne-Lisa Amadou, professor of French, was chosen because of her work with a so-called “untranslatable” author, Marcel Proust. In 1962 she started with the first volume of *A la Recherche du Temps Perdu*. In 1992, after thirty years, she finished the last volume, number twelve. She never regretted it, although – or perhaps because – the transfer of Proustian syntax to Norwegian often seemed an impossible task. Among her numerous prizes is Les Palmes Académiques in 1991.

Olav Angell is famous for being the one who finally persuaded a Norwegian publisher to pay for the translation of *Ulysses* by James Joyce. Sigurd Hoel once said that if this book was translated, ten people would buy it, and nine would claim their money back (Rindal et al. 1998, 237). After three years of work, several trips to Dublin, and long questionnaires sent to Joyce-researchers, this weighty novel went on sale in February 1993 – forty years after it appeared in English. Hoel's prediction proved unfounded – around 8000 copies have been sold so far. And the Norwegian Broadcasting Corporation spent half an hour

of its prime time on television to show the translator at work – for example walking the streets of Dublin looking for the proper meaning of Joyce’s words (Rindal et al. 1998, 240).

The next two translators, Kari and Kjell Risvik, should be mentioned together, simply for the reason that they very often – though not always – work together. They are married and are the most famous translating couple in the country. The couple “covers” 14 different languages, and they have contributed especially to the translation of authors from South America and Africa in the years after 1970. Kjell Risvik translated Gabriel García Márquez as early as 1970 and Isabel Allende in 1984.

Halldis Moren Vesaas wrote in Nynorsk and was one of the most popular Norwegian poets of the 20th century. Her husband, Tarjei Vesaas (1897–1970), is one of the greatest Norwegian novelists. As a translator, however, she has worked for the theatre; she is the greatest theatre translator of the century, having translated more than 50 plays from 1940 to 1995, including Sophocles, Brecht, and Molière. Her translation of Racine’s *La Phèdre* into smooth Norwegian alexandrines is considered her most impressive work.

The last translator to be mentioned in this survey – Wolfgang Fischer – was German by birth but arrived in Norway in 1935 at the age of eight. If we take volume as a criterion, he is the most productive Norwegian translator of the 20th century. In the 1950s he worked as a journalist in Oslo but took up translating western books and other paperback books from English. During the first six years he translated around 300 paperbacks – on average one book per week. Fischer translated more than 1000 titles (Rindal et al. 1998, 164).

2. Impact of translation

From the beginning of translation around 1100 up to now, translated texts have played an essential part in Norwegian literature and society. Norwegian translation history started with religious texts, went on with secular texts (medieval ballads for the court etc.), administrative texts (the old laws), up to paperback books and the translation of mass media items in our time. In the 20th century, translation covers a wide variety of oral and written messages in different media.

Occasionally, translation activity has no doubt been a symptom of a sense of cultural inferiority, for instance in the 13th and 14th

centuries. At that time, little original literature was produced in the country. Even *Konungs skuggsjá*, one of the most important books from the 13th century, was directly inspired by and adapted from learned French books of the time.

In the 19th century, the revival of Norwegian nationalism was part of a quest for a separate national identity. The new, heroic translations of the sagas into modern language by men like Jacob Aall and Gregers Fougner Lundh (1786–1836) directly inspired the first plays written by Henrik Ibsen, for instance *Hærmændene paa Helgeland* (1858) and *Kongs-emnerne* (1863).

The history of Norwegian Bible translation also illustrates the cultural and linguistic situation of the country. The importance of Bible translation in Western civilization is well documented, and the fact is that Norway – from the Reformation up to 1900 – lacked a Norwegian version of the Bible. Therefore it was an event of great cultural importance and impact when the scholar Alexander Seippel between 1900 and 1920 singlehandedly translated 60 per cent of the Bible into Landsmål from Hebrew and Greek. The kind of stylistic and idiomatic language he created represents a landmark in the development of Nynorsk as well as in Norwegian translation history. Both the Bokmål and the Nynorsk versions of the Bible have naturally been pivotal texts in Norwegian language planning projects of the 20th century.

The greatest success for a single book, translated into Norwegian, is a children’s book translated from Swedish into Norwegian. Astrid Lindgren’s book about Pippi Langstrømpe has sold more than 70,000 copies.

There is no better way to explain the impact of translation on language development and (possible) change in modern society than to show its variety. There are the three main modes of transfer: oral, written and signs (for the deaf). There are an endless variety of domains: science, literature, conferences, politics, radio plays, film and television, international news, international business, immigration, social welfare. It is revealing of the impact of translation that when Norwegian publishers were invited to pick out the most important book in the 20th century, their choice was a translated novel, Franz Kafka’s *Prosesen*.

3. Conventions and practice

Before 1900, translation was not considered an activity of high complexity and great scientific interest (in striking opposition to current attitudes) in Norway or elsewhere. Many considered it a kind of easy work and a second-tier literary activity. No wonder that many translations were badly written, with arbitrary adaptations, serious mistakes, changes of meaning and – worst of all – substantial omissions.

This does not mean, however, that specialists today agree about translation quality. When Olav Angell finished his translation of *Ulysses*, some of the critics maintained there were faults, misunderstandings and bad language in the translation. Others asked: “What if these details were part of the translator’s strategy to create an equivalent text?” Discussions about translation quality are by no means a simple matter. But probably most Norwegian critics today agree that the notion of text is crucial, and that in principle equivalence is a matter of text, not a matter of details in grammar and vocabulary.

Some translators ask: “Are there different parameters in literary and non-fiction translation?” Others maintain that in spite of all textual and functional differences, the common notion of communicative equivalence is valid. But traditional claims about “strict fidelity” are no longer universal and absolute. The text’s function and goal (poetry, Bible translation, documents in court, etc.) have taken priority over categorical claims (Gutt 1991). It is fair to say that modern translation assessment is less concerned about linguistic form than linguistic function, and translation critics now talk about a shift of focus – from the text itself to the *use* of text.

When it comes to subtitling, the most widely read translated texts in Norway, the question of equivalence is different yet again. Here infidelity and reduction is a must (Lomheim 2000). This is a universally accepted principle of the subtitling activity. In addition, due to the special linguistic situation in Norway, with two official written standards (Bokmål and Nynorsk), the Norwegian Broadcasting Corporation (NRK) is obliged to subtitle its films either in Nynorsk or in Bokmål. (One out of four should ideally have Nynorsk subtitles). This means that after introduction of television in the 1960s, all Norwegian viewers read quite a lot of the minority standard, Nynorsk. This situation probably has had an impact on

people’s acceptance of Nynorsk as a natural written form by the majority Bokmål users.

4. The volume of translation in Norway

People visiting public libraries in Norway will find that more than half of the books (60 per cent) are translations. If we take a random year in Unesco’s *Index Translationum* (1973), the survey shows that 1006 titles had Norwegian versions. Around 70 per cent (762 titles) were literary books (Heinrich Böll, Pearl S. Buck and Marguerite Duras were on the list that year). The United Kingdom translated 682 books that year, the USA 1966, France 1935, Spain 4486 and West Germany as many as 6462. These figures are interesting in the sense that they reveal great differences on the international level when it comes to translation.

In the 1970s Norway translated around 1000 books per year (Ingo 1991, 15). In the 1980s the volume varies from 2000 to 4000 per year; in the 1990s, between 4000 and 6500. These figures illustrate the growth in volume of translations during the last twenty or thirty years. If we go back a hundred years or so, the change is even more dramatic: in the 1890s, just about 50 books were translated every year in Norway. Forty years later, in the 1930s, the annual volume had doubled, to 100 per year. The figures document that a communicative revolution has taken place – from around 50 books translated per year in 1900 to more than 5000 books in 2000.

Statistics like these are interesting indications of cultural import. We see that even nations of the same size differ a great deal. If it is true that “you are what you read”, statistics like these deserve attention. And in Norway one must not forget to ask an additional question: How many books are translated into Nynorsk, and how many into Bokmål? Nynorsk is struggling for its position as a target-language for translations; approximately nine out of ten books are translated into Bokmål.

The next important question is: what are the source-languages? From 1900 to 1950, the situation in Norway was fairly stable in this respect. Half of the titles were translated from English, whereas German and French together accounts for approximately 25–30 per cent. Swedish alone constitutes 10 per cent (Danish much less, for obvious reasons; many Danish books were sold directly in Norway).

What we may call “other languages” are clearly under-represented – about 5 per cent.

In the period from 1950 to 2000 this situation has gradually changed – not as far as English is concerned, but when it comes to “other languages”. Before 1950 the perspective was European, after 1950 it slowly becomes global. Up to 1970, we find only 9 translations from African countries (3 of them were radio plays); in the 1990s this changed completely. Black African writers like Wole Soyinka (Nigeria), Sembène Ousmane (Sénégal), Chenjerai Hove (Zimbabwe) and Emmanuel Dongala (Congo) are now in the libraries. The group “other languages” included 50 translated titles in 1979; twenty years later the number has more than doubled, to around 120.

The total number of translations in 1997 was more than 5000 titles; 2150 of these were fiction. This means that the importance of non-fiction translation has grown, and today it is the most important translation activity by quantity.

English still dominates as source language, but its part has been reduced to about 40 per cent. French and German together account for less than 5 per cent; Danish and Swedish 5–10 per cent. The rest come from all corners of the world – on the threshold of the year 2000 the translation market has finally become global. And books are no longer dominant as the translating medium – the mass media, the computer world and the news agencies represent perhaps the most important sector of translation today.

5. Translators in Norway today

Norway has three different organizations affiliated to the FIT (Fédération Internationale des Traducteurs): the sworn translators, STF (*Statsautoriserte Translatorers Forening*); the literary translators, NO (*Norsk Oversetterforening*); and the non-fiction writers and translators association, NFFO (*Norsk faglitterær forfatter- og oversetterforening*). In comparison, Denmark, Finland and USA each have only one organization in FIT, and the United Kingdom and Russia have two.

STF is the oldest, founded in 1913. Since 1923 only translators with government authorization – that is to say “sworn” translators, can be members. In 1986 the ministry delegated to the Norwegian School of Business in Bergen the administration of this prestigious examination for non-literary translators. NO, for literary translators, was established in

1948. Membership is obtained after a certain amount of literary translation has been published, for instance two books. NFFO, the association for non-fiction writers and translators, is the youngest one, founded in 1983, but it is by far the biggest organization. Scholars, technical writers, journalists and translators – with or without formal training – can be members. (The non-fiction translators actually had their own organization in the 1980s, but decided to join the NFFO in 1990). We should also add the subtitlers’ organization, NAViO (*Norsk audiovisuell oversetterforening*), established only in 1997. Its members work in the Norwegian Broadcasting Corporation, NRK, and in private subtitling firms, the latter carrying out subtitling for private television companies. Finally, there is the interpreters’ organization (*Norsk tolkeforbund*), to which both oral interpreters and sign language interpreters can belong. There are few professional conference interpreters in Norway. Since this is a highly specialized profession with few practitioners, they get their education abroad, and the few who practice are members of the international organization, the *AIIC (Association Internationale des Interprètes de Conférences)*. In sum, this gives us a picture of different groups of translators in Norway more concerned about their professional profile rather than joining together to obtain organizational strength.

Even though literary translators receive more attention from the public, the great majority of translators work on non-fiction texts. The Ministry of Foreign Affairs, for instance, has its own Office of Translation, where translators may produce 40,000 to 50,000 pages of text per year.

The main markets for non-fiction translation are, not surprisingly, in the cities – Oslo and Bergen (administrative, legal and economy texts), Stavanger (oil-industry-related texts) and Trondheim (the technological and engineering center of Norway). The non-fiction texts are quite heterogeneous; some may exist in only one or a few copies (legal documents, for instance), others may have an open, ordinary circulation (technical and political texts). In the educational system, fairly little is translated. Books are either written by Norwegian teachers and scholars or read in a foreign language, mostly English, as is often the case in higher education.

All in all, there are about 2000 professional translators in the country. (NO has around 300 members, and NFFO has around 1500

translators among its 4,200 members). According to estimates barely more than 20 per cent of these are full-time translators. In addition, there are interpreters and subtitlers. In the latter category there are probably around 150 people working as freelancers.

59. Nordic language history and the history of translation IV: Icelandic

1. Introduction
2. From the Old Norse period to the beginning of the 16th century
3. From 1540 to the early 19th century
4. From early 19th to the end of the 20th century
5. Literature (a selection)

1. Introduction

Research on the history of Icelandic translations through the centuries and their influence on the Icelandic language is only fragmentary. One can really only rely upon discussions about single works, and it is often pure chance which works have been described from a linguistic point of view. The most thorough survey of Icelandic style and foreign influence on the early Icelandic language is to be found in *Íslensk stílfræði* (Hauksson/Óskarsson 1994), which will be used in this article. In the following, the period from the oldest literary works to the Reformation in the middle of the 16th century will be discussed first. Then the

focus will be on the influence of translations of the Bible in the 16th, 17th and 18th centuries into the Icelandic language. The literature of the Baroque period will be discussed as well as aspects of the influence of the Enlightenment movement. The final section deals with the influence of the Romantic movement of literary translations on the usage of present-day language and vocabulary.

2. From the Old Norse period to the beginning of the 16th century

2.1. Different types of styles

One of the first attempts to group Nordic prose into types of style was based on syntactic features. This was done by Nygaard (1896; 1905), who divided the oldest sagas into two groups. In the first group were sagas either translated from Latin or based on a Latin original (“learned style”); in the second were those which had their roots in Nordic culture and oral narratives (“popular style”). He

looked e. g. at the use of present and past participles instead of whole sentences as a characteristic of “learned style”, but also at verbs in the middle voice used with a passive meaning and inflected pronouns used instead of relative particles. Other scholars have since refined Nygaard’s analysis (e. g. Halvorsen 1966, 119–123). Nygaard emphasized the influence of oral narrative on the oldest Icelandic literature, but Paasche (1935, 21–22) claimed instead that Latin religious works had had great influence on the development of the Icelandic written language. Turville-Petre voiced a similar opinion when he maintained that the oldest stories of the saints had taught the Icelanders how to write down biographies and wonder-tales. These had helped them to develop their own “literary style” and to express their thoughts: “In a word, the learned literature did not teach the Icelanders what to think or what to say, but it taught them how to say it” (1967, 142). Kristjánsson used Turville-Petre’s hypothesis in his studies of the style of the oldest *Lives of the Saints* (1981). He revised Nygaard’s ideas of “learned style” and claimed that it was not possible to divide the oldest sagas into two groups on the basis of style: “A truer picture can be presented: the oldest sagas in W. Norse are the saints’ lives translated from Latin and written in a style which was moulded both by the Latin of the originals and by spoken Norse” (1981, 291). Later (1985; 1986) Kristjánsson tried to explain the possible influence of the oldest translations of the *Lives of the Saints* on the style and language usage in domestic writings. He believes that the *Lives of the Saints* were composed in the so-called “saga-style” or “popular style” as opposed to the “learned style” which we “find mainly in the homilies and in later sagas or saga-versions” (1986, 195).

The “learned style” of the 13th and 14th centuries has been divided into “court style” and “florid style” after the characteristic influence in the translated works. Kristjánsson is of the opinion that “court style” is composed of “Nordic saga style”, stylistic influence from the foreign originals and clerical “learned style” (1972, 256f.). Widding (1965) was the first to define “florid style” in Icelandic and Norwegian religious works from the second half of the 13th century and the 14th century. Its characteristics are to be seen e. g. in an affected use of words, in foreign influence on words and phrases, in the use of the present participle instead of the indicative or subjunctive and in complicated syntax.

Widding and Bekker-Nielsen (1960) were also the first to point out the unusual style of translated religious works from the late Middle Ages (Hauksson/Óskarsson 1994, 178). This style creates a connection between the “court style” and “florid style” on the one hand and the style of the Reformers in the early 16th century on the other. These works were not translated from Latin but from Danish, Low German and English, which explains the great number of loanwords, loan-translations (calques) and syntactic influence in the Icelandic language noted in the texts.

2.2. The Lives of the Saints

Among the first written down in Icelandic were the translations of the *Lives of the Saints*, *Heilagra manna sögur*, composed originally in Latin. In spite of these texts being so old, scholars did not take notice of them for a long time. Nygaard e. g. did not discuss them in his abovementioned work. Turville-Petre (1967, 129) and Kristjánsson (1985, 566) have emphasized that the translations were usually faithful and accurate and that the translators had striven for linguistic purity. In spite of these intentions influence from Latin could not be avoided completely. The occurrence of Latin words e. g. is not unusual in some of the texts while others are almost free of them. Latin abbreviations are quite common and the use of the numeral *einn* (‘one’) as an indefinite pronoun has its roots in the Latin originals. In spite of these facts, most of the translators strove for a clear and simple text, written according to a Nordic tradition, and it has been maintained that most *Lives of the Saints* show a clear, probably oral, saga tradition (Hauksson/Óskarsson 1994, 196). There are translations of the *Lives of the Saints* from the 14th century which show a much more complicated and florid style under the influence of European rhetoric.

2.3. The Book of Homilies

One of the oldest religious texts from the Middle Ages is the so-called *Book of Homilies* (*Hómiljubók*), written around 1200. It contains 62 texts and parts of texts, among them sermons, prayers and explanations of several ideas concerning Christian religion and ethics. Most of the texts were composed in a Nordic language (Icelandic or Norwegian), but some of them were translated from Latin, either very faithfully or retold freely (de Leeuw van

Weenen 1993). The translator tried in part to follow the common Nordic linguistic usage in his interpretation, but several of the characteristic features of “learned style” under the influence of Latin are to be found. Among them are the use of the present participle as a gerund with the verb *vera* (‘to be’) to signify duty or something necessary; the past participle often used instead of a relative clause; verbs of the middle voice used with a passive meaning; and accusative with the infinitive (*accusativus cum infinitivo*) used instead of an independent subordinate clause (Hauksson/Óskarsson 1994, 203). Relatively few Latin words occur in the text, but several loan-translations (calques) are to be found, among them many words ending in *-leikur*, like *bjartleikur*, *dauðleikur*. The clear language used in the *Book of Homilies* has without doubt had some influence on the language used within the church and on the first translators of the Lutheran Bible in the 16th century.

2.4. Romances

The Icelanders also became acquainted with chivalric romances, *Riddarasögur*, which started to appear as Norwegian translations early in the 13th century. They themselves began to translate romances and later, in the wake of and under the influence of the translations, to compose indigenous narratives. As these narratives described the refined courtly lives of the knights and exotic surroundings unknown to the Icelanders, it was necessary to borrow words and phrases from the originals. In that way many words, mostly from OHG and MHG, but some from MLG, OE and OSx., found their way into the romances, and many such words are still used, sometimes with a new meaning. Among those used nowadays are e.g. several titles such as *barón* ‘baron’, *riddari* ‘knight’, *knapi* ‘varlet’, *lávarður* ‘lord’, *jungfrú* ‘maiden’, *herra* ‘mister’ and *frú* ‘married woman’. Others worth mentioning are *skjaldsveinn* ‘shield-boy’, *fantur* in the meaning ‘rascal’, the older meaning being ‘footman, vagabond’, *mussa* ‘loose jacket’, *burtreið* ‘tournament’, and *turna* ‘turn upside down’ (usually in modern Icelandic *umturna*). The adjective *hæverskur*, from MHG *hövesch* ‘one belonging to the court’, from *hof* ‘court’, is a common word in Icelandic used to mean ‘modest’; the noun *hæverska* ‘modesty’ is also used. Under the influence of the romances the noun *kurteis* and the adjective *kurteis*, which are regarded as loanwords from OFr. *cortois*,

sie, cortois, became a part of the Icelandic vocabulary, meaning ‘politeness’ and ‘polite’.

The romances influenced the writing of some of the sagas, especially in the second half of the 13th and in the 14th century. Traces of the “court style” are to be seen e.g. in *Laxdæla saga*, *Njáls saga*, *Grettis saga* and *Gunnlaugs saga ormstungu*. Many loanwords, derived from the romances, are used in these sagas to describe homes, weapons, and clothes as well as the hero’s appearance, manner and skill.

2.5. Exempla and younger legends

Relatively few translated works have been preserved from the late Middle Ages. Among those to be found are translations of some clerical texts from the end of the 15th and the first part of the 16th century. These were not originally written in Latin, unlike religious works already mentioned, but rather in English, Low German and Danish, and the translators sometimes used printed books as sources. Translated from English were e.g. *ævin-týri*, the word being a translation of the Latin word *exempla*, i.e. fables intended to improve the readers morally (Pétursson 1976, VII). These exempla were translated in the second half of the 15th century, and the oldest manuscript (AM 624, 4to) dates from ca. 1500. The lexicon is for the most part Icelandic, and English influence on the language is relatively small. Several loanwords and loan-translations (calques) can be found, among them some “false friends” where old Icelandic words were used in an English meaning because the translator had misunderstood them. These words have not found their way into the Icelandic vocabulary but others, originating from Low German and Danish, must have been a part of everyday speech around 1500, i.e. *kvinna* ‘woman’, *fortapast* ‘get lost’, *forgleyma* ‘forget’, *reisa* ‘travel’, *selskapur* ‘company’. English influence is also visible in the use of phrases and an unusual use of noun cases. The exempla were mostly written in a “learned style” and among the characteristic features were e.g. the use of an interrogative pronoun instead of a relative particle and the use of a present participle instead of the indicative mood. The possessive pronouns usually stand in front of the nouns instead of behind them, and the numeral *einn* ‘one’ was used instead of an indefinite article (Hauksson/Óskarsson 1994, 327–328).

The same characteristic features can be observed in *Reykjahólabók* (Stock. perg. fol.

no. 3), an Icelandic legendary containing twenty-five saints' lives and dating from around 1525. It is translated from Low German, and it has been pointed out that the scribe, Björn Þorleifsson at Reykjahólar (after 1467 – before 1552), had deliberately tried to imitate contemporary Norwegian (Loth 1969–1970, XL). The text contains many loanwords and loan-translations as well as foreign influence on syntax. The source of much of this influence is Norwegian and Danish, sometimes in Low German. It has been maintained that the translator had often tried to imitate Low German syntax (Widding/Bekker-Nielsen 1962, 258). It is obvious from the exempla and later from the legends that foreign influence on the Icelandic language was increasing, and some of the characteristics of *Reykjahólabók* can be observed in the earliest translations of the Reformers.

3. The period from 1540 to the early 19th century

3.1. Bible translations

Ten years before the Reformation in Iceland an Icelandic translation of the New Testament was published in Denmark (1540). The translator was Oddur Gottskálksson († 1556), a fervent supporter of Luther's doctrine. He was a well-educated man who had studied in Norway, Denmark and Germany. During his years abroad he became acquainted with the reformative movement and the people who proclaimed a new understanding of the doctrines of the church. The leaders of the movement wanted to have influence over the general public, and therefore they soon began to work on new translations of the Bible. In this spirit, Oddur translated the New Testament into Icelandic.

It is not known which works, domestic or foreign, Oddur used as sources during his work on the translation. Helgason (1929) pointed out in his thorough work on Oddur's translation that the main model was Luther's translation of the New Testament, probably the 1530 edition, but that he also used the *Vulgate*, a Latin translation of the Bible done by Erasmus from Rotterdam and most likely a Low German edition of the New Testament. One has to assume that Oddur also used the library of the bishopric at Skálholt, where he must have had access to the biblical texts already existing in translation, and it has even been maintained that he used a lost translation

of the Gospels as a source as well (Kirby 1986, 101).

A thorough comparison of Oddur's translation with his sources has not been done, but it is obvious that loanwords, word order, syntax and other linguistic characteristics have their roots in foreign languages, especially Low German and Norwegian. The greatest portion of the loanwords derive from the German and Latin originals. Oddur used e.g. many loanwords where, without difficulty, he could have used common Icelandic words. His translation of the New Testament has had a great influence on the Icelandic language, and some of the verses in the Bible today have not been changed since they were translated by Oddur.

Oddur and his fellow Reformers translated several religious books, and he and Gissur Einarsson (1512–1548) started on the Old Testament. Oddur is supposed to have translated e.g. the Psalms, the 5th book of Moses and the first part of the Books of Kings, but Gissur translated the Proverbs and the Book of Sirach (*Ecclesiasticus*). It became the lot of Bishop Guðbrandur Þorláksson (1541?–1627) to collect existing translations of parts of the Bible, read them through and correct them according to his taste. He himself is supposed to have translated the missing parts. Guðbrandur used Oddur's translation of the New Testament in his Bible without major changes. As far as can be seen, he never retranslated whole chapters, but he made corrections and additions, and occasionally replaced words and phrases. He often changed the tense and also the word order where he found the foreign influence too obvious. He often made corrections where he found the diction too Norwegian and put in Icelandic words instead of some of the German loanwords or loan-translations. Usually Guðbrandur's alterations were for the better. He e.g. changed the word *skurðgoðapénari* used by Oddur to *skurgoðadýrkari*, as *pénari* was a loanword from German *Diener*; also *bífalan*, German *Befehl*, to *boð*, *aflifa* to *lifláta*, *thesaur* to *fjésjóð*. But Oddur's Bible itself is often marked by the diction and style of 16th century scholars, who were under the influence of Danish and German without having always been aware of the fact that their language was marked by foreign words and syntax. The Bible was published in 1584 and had without doubt great influence on the Icelandic language and its preservation. Guðbrandur published about 80 books at the bishopric Hólar, of which a great many were religious transla-

tions, and it has been maintained that he prevented Danish influence on Icelandic written language from becoming greater than it actually did (Karlsson 1984, 55). Bandle (1956) has studied the language of Guðbrandur's Bible, and his and Helgason's work mentioned above are the most thorough studies of the Icelandic language and its development in the 16th century.

It can be maintained that, for the next two hundred years, all Icelandic translations of the Bible had their roots in *Guðbrandsbiblíja*. Guðbrandur's grandson, Bishop Þorlákur Skúlason, published a Bible during the years 1637–1644 which was mostly a reprint of his grandfather's Bible. He made some alterations, but few of them were for the better. He compared the translation to Luther's Bible and a Danish edition from 1633, and some of his alterations were influenced by these sources.

The Bible published in 1747, called the *Vajsenhúsbiblíja*, after a Danish orphanage (vajsenhus) in Copenhagen, was a reprint of *Þorlákssbiblíja*. The same can be said about the version published in 1813.

The Bible translation by Bishop Steinn Jónsson (1660–1739) in 1728 represents a diversion from an otherwise direct path from *Guðbrandsbiblíja* to the 1813 Bible. King Frederik IV ordered him to revise Þorlákur Skúlason's Bible and make it more like the Danish one translated by Hans Svane in 1647. The Bishop seems to have taken the order literally, and the language shows a great amount of Danish influence. This translation was commented on negatively when it was published and was used very little by the general public. But if it is compared with Bible translations from the 19th century, it can be noticed that the translators used it to some extent (cf. Kvaran 1994).

3.2. The Baroque period

Few books were written in the "Baroque style" in Iceland. In fact there were only two, the *Húspostilla*, written by Bishop Jón Vídalín (1666–1720) and first published in 1718–1720 (1995), and *Mendacii encomium* or *Lof lyginnar*, written by Þorleifur Halldórsson (1683–1713) in Latin in 1703 and translated by him in 1711. *Lof lyginnar* belongs to a literary genre called "fool's literature" (1988, 7). Vídalín's book of sermons had an influence on the religious life of the Icelandic people, but neither of these books influenced the spoken or written language.

3.3. The Enlightenment

Influences originating during the Enlightenment came to Iceland in the second half of the 18th century. At that time the language showed a great many signs of Danish influence, especially around the trading centres. Educated Icelanders had noticed this, and in the spirit of the Enlightenment a purposeful attempt was made to introduce and write in Icelandic about new topics, on which nothing had been written before. The policy of the Enlightenment was to write in a clear style, construct neologisms instead of using foreign, especially Danish, loanwords, and avoid all foreign influence. Among neologisms from that time are e. g. the words *farfugl* 'migratory bird', *felli-bylur* 'hurricane', *gróðurhús* 'greenhouse', *hvirfilpunktur* 'zenith', *lóðréttur* 'vertical', and *steinolia* 'kerosen'. Magnús Stephensen (1762–1833) became the central figure of the movement and took the initiative to start periodicals and publish books for the purpose of informing the Icelanders about practical matters.

The Enlightenment opened the way for further language purism in the 19th and 20th century. One of the men who, under the influence of the movement, was enthusiastic about the Icelandic language early in the 19th century was Reverend Gunnlaugur Oddsson. He wrote a Danish-Icelandic dictionary in 1819 (1991). His aim was to make it possible for less-educated people to be able to read Danish books and learn from them. It is obvious that he wanted people to make the most of what they read and be able to talk about it to others in their mother tongue. He had to use a considerable number of neologisms, and according to the Institute of Lexicography at the University of Iceland (Orðabók Háskólans), many words appear for the first time in his dictionary. Gunnlaugur did not invent them all. He found some of them in Old Icelandic, as e. g. *salerni* 'toilet'; some are verbs made from already existing nouns, like *amstra* from *amstur* 'trouble' and *klúðra* from *klúður* 'muddle, mess'. But he coined several words himself, which are still used in the everyday language, e. g. *afvopna* 'disarm', *aðskotadýr* 'intruder', *einkvæni* 'monogamy', *fjölkvæni* 'polygamy', *hagspeki* 'economics', *kvöldmat* 'dinner', *málvisindi* 'linguistics', *rakamælir* 'hydrometer', *samsvara* 'correspond to', and *skaprauna* 'annoy'.

4. From the early 19th to the end of the 20th century

The spirit of the Enlightenment was still at work in the early 19th century when Sveinbjörn Egilsson translated two epic poems of Homer, *The Iliad* and *The Odyssey*. He has been called the instigator of modern Icelandic style, his language being clear and easily understood. He avoided foreign influences in his translations, his model being the language of Old Icelandic poetry, and he invented many poetic neologisms. Even if few writers used his style in their works, he laid a foundation for the linguistic purism of the second half of the 19th century.

The growing interest in linguistic purism was also the reason for the Bible being translated again in 1841 (*Viðeyjarbiblíja*). As mentioned above, all translations of the Bible until 1813 were in fact a reprint of *Guðbrandsbiblíja* with few alterations, but in this new version the translators aimed to clear the text of all Danish and German influence. Even if they did not succeed completely, considerable changes were made. Egilsson translated the greatest portion of both Testaments from Greek and Latin, while the others used Danish or German Bibles. This translation had a considerable influence on the lexicon because the translators tried to choose new words instead of the loanwords which had been used in the Bible since the 16th century. When a new translation was made early in the 20th century (1912–1914) both *Guðbrandsbiblíja* and the 1841 Bible were used as models, as is also the case for the new translation which is currently being worked on.

During the 19th century many poets and writers translated all kinds of literature, poems, novels, short stories and plays, mostly from Danish, but these translations had little influence on the Icelandic language and style. But in 1842 the book *Stjörnufræði* ('Astronomy') by the astronomer G. F. Ursin was published in translation by the poet Jónas Hallgrímsson. Vilhjálmsón (1985) studied Jónas' language policy and his neologisms used in this work, and it is interesting to notice how many words that are now common in everyday Icelandic were used there for the first time. Examples include *aðráttarafl* 'gravitation', *sporbogur* 'ellipse', *fjaðurmagnaður* 'resilient', *hitabelti* 'tropics', *miðflótttafl* 'centrifugal force', *sjónauki* 'telescope', and *ljósvaki* 'ether'. Other words, less used, are e.g. *fleygbogi* for 'parabola', *breiðbogi* for

'hyperbola', *hringskekkja* for 'eccentricity' and *ljósfræði* 'optic'.

Some books were also translated from English. The editor Jón Ólafsson translated e.g. *On liberty* by Stuart Mill in 1886 under the title *Um frelsið*, which became very popular at that time. At the end of the translation was a list containing neologisms and rare words. Most of them now belong to the everyday Icelandic lexicon, as e.g. *dómgreind* 'judgement', *fjölbreytni* 'diversity', *frumleiki* 'originality', *hugðarefni* 'matter of interest', *misbeita* 'misapply, misuse', *neikvæður* 'negative', *raunhæfur* 'practical', *raunvísindi* 'exact sciences', *réttmætur* 'legitimate', *siðmenning* 'civilization', *siðspilla* 'demoralize' and *þverstæða* 'paradox'. At the Institute of Lexicography in Reykjavík, no older examples of these words could be found, so it is likely that Jón Ólafsson coined them for his translation.

During the 20th century much has been accomplished within the field of translation. The most influential work, however, is being carried out in the field of language policy. Within almost all scientific subjects, as well as trades, groups of e.g. mathematicians, physicists, engineers, physicians and many others work constantly and with good results to invent new words in their field and translate texts for students as well as for the general public. For example, within a relatively young branch of science, computer science, people can now communicate in Icelandic without any difficulties. These efforts will in the immediate future be the most significant for the development of the Icelandic language.

60. Nordic language history and the history of translation V: Faroese

1. Translating in the Faroes
2. Religious literature in translation
3. Recent translations
4. Literature (a selection)

1. Translating in the Faroes

Translation into Faroese is of a fairly recent date. In late medieval times, the vernacular was replaced by Danish which was used in church, in court and in writing on the whole, but never became the spoken language of the people. It is characteristic of the situation that the Faroese law amendment (*réttarbót*) of 1298, the so-called *Seyðabræv*, was ratified in 1637 by Christian the Fourth in a translation into Danish (Debes 1673, 263). The rulers no longer mastered the language of the ruled!

Quite a few short ballads have been recorded, which obviously have been taken into Faroese from Danish, their language swarming with Danicisms, and they may be looked upon as a kind of oral translation. Similarly, the Icelandic religious poem *Ljómur* from the time of the Reformation became a part of Faroese tradition, but has been handed down in a reduced version. The short history of translation into Faroese commenced with *Evangelium Sancta Matthæussa* [The Gospel according to St. Matthew] in 1823. The translator was the Reverend J.H. Schrøter (1771–1851), at that time the only Faroese clergyman born and bred. It was published by the Danish Bible Society and given to every household in the Faroes. It was popularly given the name *Føroyska bók*, being the first and for a long

time the only book in that language, but the general reception was all but positive, as Danish was generally looked upon as the “holy” language. Consequently, when Jens Davidsen (1803–78) in 1832 offered the Bible Society his translation of the Gospel according to St. Mark, the answer was in the negative.

In the *Færeyinga saga* (ed. C. C. Rafn 1832), J. H. Schrøter made the translation into Faroese which was printed alongside the Old Icelandic text and a translation into Danish. Schrøter’s orthography was based on the orthographic spelling used by J. C. Svabo (1746–1824), the orthography of the *Færeyinga saga* translation being amended by the famous Danish philologist Rasmus Rask. There are four later translations of *Færeyinga saga*.

2. Religious literature in translation

The etymologically based orthography established in 1846 by V. U. Hammershaimb and the emergence of a national movement towards the end of that century heralded a new era of Faroese language use with a growing body of literature, including translations which often gave rise to puristic neologisms, frequently inspired by Old Icelandic or Old Norse. The demand for Faroese language in church eventually led to Bible translations, the first of which was the Gospel according to St. John (1907), translated by the Reverend A. C. Evensen. In 1937 the New Testament appeared in two separate translations, one by the dean Jákup Dahl, the creator of Faroese liturgical language, the other by the free church minister Victor Danielsen; his translation of the whole Bible appeared in 1947. J. Dahl died in 1944, but the Reverend K. O. Viderø completed the translation of the Church Bible from the original languages in 1961. In 1990 the Apocrypha appeared in the translation by the Reverend Axel Tórgarð, an eminent translator of classical literature. A large number of hymns have been translated, mainly from Danish. The second edition of the church hymnbook (1990) contains 592 hymns, 225 of which are translations.

3. Recent translations

During the last century there has been a huge amount of translation activity, for prose as well as poetry, for instance Homeric poetry (J. H. O. Djurhuus), plays by Sophocles and

Euripides (Axel Tórgarð), plays by Shakespeare (Heðin Brú, Axel Tórgarð, Hanus Kamban), works by Danish-writing Faroese authors like William Heinesen (e. g. Christian Matras, Heðin Brú, Bjarni Niclasen among others). *Heimskringla* and other Icelandic sagas and poems have been translated from Old Norse (by e. g. Bjarni Niclasen, Eyðun Winther, Rasmus Rasmussen, Meinhard Djurhuus). Translations of classical and modern Scandinavian and world literature are manifold. One of the most productive translators is Jákup í Skemmuni, who has translated well over one hundred books, mainly from Swedish. Children’s books have also been translated to a large extent. The publishing house of the teachers’ union has issued more than four hundred illustrated children’s books, most of them translated, in co-print with foreign publishers. Movies in cinema are not subtitled in Faroese because of the small numbers of cinemagoers, but films are shown with Danish subtitles. The Faroese television also generally shows films with Danish subtitles, but programmes for children and youth are usually dubbed or subtitled in Faroese.

The art of translation is a difficult one which demands plenty of time, but the language of daily news often bears the mark of being produced at the last moment, and even originally produced texts may look or sound as “translated” because of the many foreign (Danish) words and phrases. There ought to be more teaching of translation in schools and institutions of higher education.

61. Nordic language history and philology: Editing earlier texts

1. Introduction
2. Areas of editing
3. Historical development
4. Preparing an edition
5. Translations
6. Text series
7. Electronic editions
8. Literature (a selection)
9. A few Internet resources

1. Introduction

The history of editing is usually traced back to the invention of printing, and in so far as editions are defined as printed texts this is obviously right. Yet editions are not confined to the transferring of handwriting to print. There are a number of medieval manuscripts which in many ways may be seen as editions, e.g. *Hauksbók*, compiled by the Icelander Haukr Erlendsson (d. 1334). This book is in effect a private library, written by Haukr for himself, and containing his edition (or “version”) of a wide variety of texts. A similar approach is found in many compilatory manuscripts, especially of the kings’ sagas, and also in a number of law manuscripts. In the latter, variant readings may occur in the margin, inserted either by the copyist himself or by a later hand, and law amendments, *réttarbætr*, were frequently added to the text. As early as in the oldest extant manuscript of the *Gulapingslög* (ca. 1250) a distinction is drawn in the text between the laws of King Óláfr Haraldsson and King Magnús Erlingsson.

As may be expected, handwritten copies made after the introduction of printed editions will reflect the approach of their printed counterparts. This particularly applies to what has been termed academic transcripts, i.e. 16th and 17th century copies of medieval manuscripts. When the Norwegian humanist Jens Nilssøn (1538–1600) copied *Jofraskinna*, an important witness to *Heimskringla*, he did so character by character, including abbreviated words he probably did not understand. In an otherwise mediocre copy of the kings’ sagas (Uppsala R: 685 fol.), the Swedish antiquarian Johan Gabriel Sparwenfeld (1655–1727) supplied his copy with a number of variant readings from another manuscript, the now lost *Kringla*. In Iceland, manuscripts were copied by hand until the end of the 19th century, and many of these late manuscripts resemble printed editions, even to the extent

of having column titles, a mix of Roman and italics, subtitles, etc. In general, the borders between the copyist and the editor were often blurred. Behind many medieval compilations there are a number of editorial decisions, though they are rarely made explicit in the text.

With these reservations in mind, the present article will focus on the history and practice of *printed* editions. In this slightly narrower sense, an edited text is characterised by being chosen from several manuscripts, and even in the case of editions based on a single manuscript, the editor will evaluate the text, and correct it or comment upon it if necessary. Like the medieval scribes, the editor presents a copy of the text, but unlike the scribes he explicitly describes the text and motivates its selection. An editor is, in a sense, a scholarly scribe.

2. Areas of editing

There are two alphabets to be considered in the context of editing early Nordic texts, the runic alphabet and the Latin one, and there are two literatures, the Latin literature, flourishing in Sweden and Denmark, and the Nordic vernaculars, most extensively developed and cultivated in Norway and Iceland.

The earliest texts – or more appropriately inscriptions – in the Nordic language were written in the runic alphabet, beginning some time in the first centuries after Christ and continuing well into the Middle Ages. A couple of medieval manuscripts are written in runes (notably *Codex Runicus* of *Skånske lov*, AM 28 8vo), but otherwise runic inscriptions are found on materials such as stone, bone, metal and wood. Runic inscriptions have so far been published in specialized editions which include photographic facsimiles of each inscription, transcriptions, translations, and often extensive comment. In general, the editing of runic inscriptions has much in common with epigraphical texts, with its focus on detailed analysis, transliteration, archaeological comments, etc. Cf. article 73 (J. Knirk). The great majority of texts – in number as well as sheer volume – were written in the Latin alphabet, which was taken into use in the Nordic countries in the 11th century. A few characters lacking in Latin were supplied, such as *þ* (from the runic alphabet) and *ð* (a modification of

the ordinary Latin letter *d*), and some diacritical marks and ligatures were added for vowel qualities not found in Latin. The system of abbreviation was adopted from English and Continental practice and extended, especially in Icelandic manuscripts. In general, the writings in the vernaculars were modelled on Latin manuscripts, and the palaeographic development reflects that of England and the European continent. Editions of texts in the Latin alphabet are naturally rendered in the same alphabet, but vernacular texts are often normalised with respect to graphemic inventory and linguistic forms. Like editions of Latin texts, Nordic vernacular texts have largely been printed in Roman (“antikva”) typefaces, not Gothic (“fraktur”). The choice of typeface probably reflects the fact that the vernacular medieval texts were seen as *classical* texts, a Nordic pendant to the Latin literature, and that the contemporary Gothic typefaces were felt to be unsuitable. They were used for the modern languages, as can be seen from several synoptic editions from the 17th and 18th centuries, in which the Old Nordic texts are printed in Roman letters and the accompanying translation into Modern Danish or Swedish in Gothic type.

3. Historical development

The first books printed in the Nordic countries were of Latin texts, such as *Breviarium Ottoniense*, printed by Johan Snell from Lübeck (Odense 1482) and, shortly afterwards, *Dialogus creaturarum optime moralizatus* (Stockholm 1483). Soon vernacular literature followed suit. The very first edition of a Danish text is *Den danske rimkronike* (København 1495), printed by Gotfred of Ghemen, a Dutchman who later took Danish citizenship. In the same year, Johannes Fabri in Stockholm printed the first book in Swedish, *Aff dyäfelens frästilse* by Johannes Gerson. Iceland and especially Norway joined at a later stage. Bishop Jón Arason established a print shop in the 1530s at Hólar in Iceland, while the first Norwegian print shop was set up as late as in 1643 (until then Copenhagen had been the place of publication for Norwegian authors).

It is often difficult to draw a distinction between printers, editors and publishers in the early history of bookmaking, and the quality of the printed editions varies considerably. The title page of one of Ghemen’s editions claims that the text has been thoroughly exam-

ined and corrected, “wel offuer seeth och rættelighe corrigeret”, but this seems to be a commonplace and does not necessarily indicate editorial intervention (cf. Skautrup 1947, 137). For better or worse, the first printed edition of a text, *editio princeps*, usually defined and authorised the text for a long time.

Printed editions soon made medieval texts accessible to a wide audience, but in some cases this was a mixed blessing. On the initiative of Archbishop Erik Valkendorf (ca. 1450–1522), two important liturgical books in Norway, *Missale Nidrosiense* and *Breviarium Nidrosiense*, were published in 1519. These editions in fact led to the destruction of a large number of liturgical Latin manuscripts which were thought to be made redundant by the printed editions. A large number of fragments are a testimony to this process (cf. section 6).

In Denmark, a number of provincial laws were published in the 16th century, beginning with an edition of *Jyske lov* by Matthæus Brandis (Ribe 1504). Noteworthy editions from the following decades include *Gesta Danorum* (early 13th century) by the Danish historian Saxo, edited by Christiern Pedersen (ca. 1480–1554) under the title *Danorum Regum Heroumque Historiæ* and published in Paris in 1514. In the next century, provincial laws were edited by Johan Hadorph (*Skånske lov*, 1676) and Peder Kofod Ancher (*Jyske lov*, 1783), and historical documents in *Scriptores rerum danicarum* by Jacob Langebek (3 vols., 1772–74).

In Sweden, four medieval law texts were published anonymously in the years 1607–1609 (*Upplandslagen*, *Östgötalagen*, *Kristoffers landslag* and *Hälsingelagen*) and in 1617 a fifth text followed suit, *Magnus Erikssons stadslag*. The latter text was edited by Jonas Bure (1575–1655), while the editorship of the four previous texts is disputed; the editor may have been the same Jonas Bure or his more famous relative, the polymath Johan Bure (1568–1652). The latter definitively entered the stage in 1634 with his edition of the 14th century didactic work *Konungastyrelsen*, entitled *En nyttigh Bok om Konnunga Styrlise och Höfdinga* (photographic reprint 1964). This is the first edition of a vernacular Nordic text that can claim to be scholarly in a modern sense (cf. Wollin 1995).

A few decades later, the first Old Icelandic texts were being edited, first in Sweden, then in Denmark. Apart from the inclusion of the poems *Hofuðlausn* and *Krákumál* in Ole Worm’s *Monumenta Danica* (Copenhagen

1643), the first book-length edition is the one of *Gautreks saga*, published by Olaus Verelius (1618–1682) under the title *Gothrici et Rolfi Westergothiæ regum historia [...] (Uppsala 1664)*. In the following year, Peder H. Resen (1625–1688) published an edition of Snorri's *Edda* and the Eddic poems *Völuspá* and *Hávamál*, containing a long introduction (Cph. 1665, facsimile reprint 1977). In Iceland, three important sources of early Icelandic history were subsequently edited and published at Skálholt in 1688, *Landnámabók*, *Kristni saga* and *Íslendingabók*. Although Norwegians participated in the editing of vernacular texts, e. g. Gerhard Schøning (1722–1780) who began, but did not complete an edition of *Konungs skuggsjá*, it was not until the beginning of the 19th century that vernacular texts were edited and published in Norway.

From the edition of *Konungastyrelsen* in 1634 until well into the second half of the 18th century, Swedish scholars, often assisted by Icelanders, were the leading force in the editing of vernacular texts. A learned society, the “Antikvitetskollegium” was founded in 1667 with the aim of collecting manuscripts and preparing editions of works on Swedish history. The most important contribution in this period was the edition of *Heimskringla* (2 vols., Stockholm 1697) by Johan Peringskiöld (1654–1720). This is the first edition of *Heimskringla* in its original tongue, and it also carries a translation into Latin (by Peringskiöld himself) and into Swedish (by the Icelander Guðmundur Ólafsson).

The early history of editing is closely connected to the collection of manuscripts. In Sweden, the above-mentioned scholars Johan Bure and Johan Gabriel Sparwenfeld collected many valuable manuscripts, and the latter donated his collection to Uppsala University Library and other libraries. In Iceland, Bishop Brynjólfur Sveinsson (1605–1675) collected Icelandic manuscripts on behalf of King Fredrik III (1648–1670), who founded The Royal Library in Copenhagen. This library still has a considerable collection of medieval Nordic manuscripts. The greatest collector of them all was the Icelander Árni Magnússon (1663–1730), professor at the University of Copenhagen and felicitously married to a wealthy Danish widow. He bequeathed his extensive collection of Old Icelandic and Old Norwegian manuscripts to the University, and since 1772 a committee of five members, The Arnamagnæan Commission, has supervised this indispensable collection.

The forefront of editing had now moved to Denmark. *Konungs skuggsjá*, the premier Old Norwegian work, was edited in Sorø (1768), and soon afterwards the newly founded Arnamagnæan Commission published a new edition of *Heimskringla* (3 vols., Cph. 1777–1783). The Commission also initiated a series of fine saga editions in which Danish historians cooperated with Icelanders, e. g. *Kristni saga* (Cph. 1773), *Landnámabók* (Cph. 1774), *Gunnlaugs saga* (Cph. 1775), *Orkneyinga saga* (Cph. 1780), *Viga-Glums saga* (Cph. 1786) and *Egils saga Skallagrímssonar* (Cph. 1809).

From the 19th century onwards, the majority of editions have been channeled through text series in each of the Nordic countries. In this period, many Norwegian scholars became actively engaged in historical studies, and from the 1840s to the 1880s, Christiania became the leading centre for editing Old Norwegian and to some extent Old Icelandic texts. The most prolific Norwegian editor was Carl Richard Unger (1817–1897), but Rudolf Keyser (1803–1864) and Peter Andreas Munch (1810–1863) also participated energetically during the first, formative decade. In Sweden, Carl Johan Schlyter (1795–1888) made a monumental contribution with his edition of Swedish laws, *Samling af Sveriges gamla lagar* (13 vols., 1827–77), and Gustaf Edvard Klemming (1823–1893) edited an impressive number of vernacular Swedish texts from the inception of *Svenska Fornskrift-Sällskapet* in 1843 until his death 50 years later. In the 20th century, Icelanders like Finnur Jónsson (1858–1934) and Jón Helgason (1899–1986) have contributed greatly to the editing of Old Icelandic and Norwegian texts, Jón Helgason also by founding the series *Editiones Arnemagnæanæ* (1958–) and its accompanying series of monographs, *Bibliotheca Arnemagnæana* (1938–). All told, several hundred scholars have edited Old Nordic texts, the majority in the Nordic countries, as may be expected, but also a fair number in Germany, England and the USA.

From a quantitative point of view, the heyday of editing was the second half of the 19th century, especially with respect to vernacular texts in Norway and Sweden, but after a decline in the first half of the 20th century, there has been a rise in the second half. The recent division of the Arnemagnæan Collection between the two Arnemagnæan institutes in Copenhagen and Reykjavík has probably contributed to a renewed interest in the editing of Old Icelandic texts. The editing of medieval

Swedish texts has also continued in the 20th century, and after a hesitant start in the 19th century, many vernacular Danish texts have been published in fairly new editions, especially law texts and charters (cf. section 6).

4. Preparing an edition

In the context of early Nordic texts, an edition is basically a representation of one or more manuscripts, organized and scrutinized by the editor in order to present the text of the manuscripts in a clear, historically correct and comprehensible format. Editors differ widely in their approach to this task.

4.1. Defining the text

The very first step is to decide which manuscripts constitute the text (or “work”) that is going to be edited. For the majority of medieval texts this has already been established through catalogues and previous editions, but in some cases the material needs to be reconsidered. There are also dynamic traditions in which several versions of the text can be isolated, and it is a matter of debate whether these versions should be edited individually or brought together in a single, critical edition.

Danish editorial history offers some illuminating examples of how this problem has been handled (cf. Kousgård Sørensen 1989). When Svend Grundtvig (1824–1883) prepared his edition of *Danmarks gamle Folkeviser* in the 1840s, he decided to edit a broad selection of versions, rather than trying to establish a single text for each ballad. The edition thus has a modest critical apparatus for each text, but there are, on the other hand, extensive supplements (“Tillæg”) throughout the edition. Grundtvig was much criticized by his contemporaries, but his edition has in fact become a model for later ballad editions. Johs. Brøndum-Nielsen (1881–1977) chose another approach when he began the editing of Danish provincial laws a century later. The corpus was indeed daunting; there are about 240 manuscripts of *Jyske lov* (including about 80 in Low German and Latin) and 192 of *Skånske lov*. After an intense debate in the early 1930s, Brøndum-Nielsen and his collaborators opted for a “best-manuscript edition” (cf. Foulet and Speer 1979, 38), in which the text would be based on a single manuscript, but supplemented with a great number of variants. For example, Peter Skautrup’s edition of *Jyske lov, Text 1 (Danmarks gamle Land-*

skabslove vol. 2, 1933) follows NKS 295 8vo (ca. 1325) closely, but gives variant readings from as many as 75 manuscripts. As a result, the critical apparatus occupies the greater part of each page, in some cases as much as 90 per cent. Once more, the editors were criticised, this time for making the secondary manuscripts inaccessible (cf. Olrik Frederiksen 1991). Anyone who has tried to piece together the text of a manuscript from a critical apparatus knows that this is difficult and tedious work, and that the result may be full of errors. However, when there are a large number of manuscripts it is not a practical option to edit each one in full. The editor is often left with the choice between suppressing textual variation or submerging the reader in numerous versions of essentially the same work.

4.2. Analysing the manuscripts

As soon as the number of versions (if more than one) and the number of manuscripts have been established, the editor must analyse the interrelationship between them. Medieval texts were transmitted through copying, and since the original is usually lost, the editor has to rely on copies, and copies of copies. The process of analysing the filiation of manuscripts is usually called “recension”. A few medieval works survive in only one manuscript, but even then there is need for an analysis of the manuscript in question, e. g. identifying corruptions. Also, a discussion of date and provenance belong to this stage; here palaeographic, linguistic and historical data are taken into consideration. Since the beginning of the 19th century, the genealogical method, developed by Karl Lachmann (1793–1851) and other classical and Biblical scholars on the Continent, has been used in the recension of manuscript traditions. The genealogical method is based on the observation that few copies are made without some errors in the transcription, and once an error has been introduced in a manuscript it usually stays on in the copies made from that manuscript. Obvious errors may be removed, however, so the errors must be of a type that is not easily identified and corrected by later copyists. This is what Paul Maas in his *Textkritik* (1960) calls “significant errors” (Leitfehler). On the basis of shared significant errors, the critic tries to establish families of manuscripts, and furthermore to subdivide these families until all manuscripts have been analysed. The genealogical method is thus a method of error

distribution, aptly and concisely termed “Methode der Fehlergemeinschaften”.

The results of the genealogical investigation are usually presented in a stemma codicum. The stemma places the original at the top and copies on branches below, one for each new generation of copies. The very first stemma was published by Carl Johan Schlyter and Hans Samuel Collin in their edition of *Vestgötalagen* (1827), but their “schema cognationis” seems to have been an isolated occurrence, and it had no impact on contemporary editions (cf. Holm 1972). The stemma as we now have it was developed by Lachmann and his contemporaries ca. 1830 and soon made its way into classical and Biblical philology, and somewhat later into medieval philology.

Among the first Nordic scholars to use the genealogical model and present the results in a stemma were Gustav Storm in his *Monumenta historica Norvegiæ* (Kristiania 1880), a collection of Latin texts, and Kristian Kålund in his edition of *Laxdæla saga* (1889–91). Today, the genealogical method is generally accepted within Old Nordic philology. Most editions contain a recension of the manuscripts and, if possible, a stemma showing how they are related. In many textual traditions, however, the genealogical method simply does not work, or it produces contradictory results. If manuscripts have been copied from more than one exemplar (“Vorlage”), errors may travel from one family to another, and their ability to define families is lost. Such “contaminated” traditions are quite common, e.g. among law manuscripts, which were frequently based on more than one exemplar.

In the 20th century, a number of quantitative approaches have been tried in the recension of manuscripts, especially in Biblical and classical philology, but the genealogical method has not yet been replaced. For a study of recension methods on Nordic material, see e.g. Haugen (1992).

4.3. Presenting the text

The recension of manuscripts gives the editor valuable information on the history and transmission of the text, but there are no hard and fast rules as to how the text of the edition should be selected. If the textual variation is limited, the edition is usually based on a single manuscript, the codex optimus. This normally belongs to an early stage of the tradition, i.e. it is placed high in the stemma. Sometimes a

later manuscript may be chosen, especially if the earlier part of the tradition is fragmented.

Variants from other manuscripts are supplied in a critical apparatus, usually placed at the bottom of the page in the printed edition. In older editions the main text is sometimes linked to the apparatus by way of footnotes, but in newer editions the reference is done by line numbers printed in the margin of the text. The main function of the apparatus is to list variants from other manuscripts, but it may also contain comments (e.g. of a palaeographic or linguistic nature) or reference to other texts.

Most editors will make a distinction between accidental and substantial variation, i.e. between those variants which do not affect the meaning and those that do. In practice, the distinction may be difficult to draw, and many editors have been accused of overlooking important variants. Even if the editor excludes accidental variation, the number of remaining variants can be very high. In such cases the editor may print only the most important variants, thus suppressing information of possible value, or several versions of the text, thereby reducing the size of the apparatus but increasing the volume of the edition.

If the editor declines from establishing a unified text, the individual versions may be printed consecutively, or even in separate volumes. However, if the versions are fairly close or perhaps overlap in certain parts, a synoptic edition is preferable and often chosen. In this kind of edition, two or more versions are printed on each page or pair of pages. This is usually done by dividing the page horizontally, so that each text may have a separate apparatus. The most important version is usually placed at the top of each page.

4.4. Reproducing the text

Once the format of the edition has been decided, the editor is ready to reproduce the text of the manuscripts. The introduction of photographic facsimiles in the second half of the 19th century made it possible to publish a manuscript as it once appeared, and the role of the editor was that of writing an appropriate introduction, usually commenting upon palaeographic and orthographic traits in the manuscript. However, photographic facsimiles are expensive to produce, and many Old Nordic manuscripts are difficult to read, even for trained scholars. Konráð Gíslason (1808–

1891) envisaged a printed type of facsimile in which the handwritten characters, including abbreviations, were copied as closely as possible by printed characters. In his *Um frumparta íslenzkrar tungu í fornöld* (Cph. 1846), he gave several examples of this kind of edition, which in recent years has been termed facsimile print. With Verner Dahlerup's edition of *Ágrip* (1880) the project was carried out in a full-length edition. Modern computer technology has facilitated the production of facsimile prints, but it is still an edition for the specialist. It has been criticized for being a hybrid between a true facsimile and a transcription, too close to the manuscript for easy reading, but too far from the manuscript for giving palaeographic insight.

One step removed from the facsimile is the diplomatic edition. The diplomatic edition follows the manuscript closely, sometimes even to the extent of marking line divisions. Usually, the graphemic inventory is copied, with allographs such as tall *s* (ſ), round *d* (ð), insular *f* (ƿ), etc. Expanded abbreviations are shown by italics, e.g. “*komungr*” for “kgr.”. Since many manuscripts are heavily abbreviated, especially Old Icelandic ones, this makes for a complicated typography and adds to the cost of the edition. The philological value of diplomatic editions is generally accepted, but the aesthetic qualities have been questioned – the early editors of *Diplomatarium Norvegicum* (1847–) thought this kind of edition looked disagreeable, and chose to expand abbreviations without marking them in any way.

One step further removed is the lightly normalized edition. Here, allographic variation is reduced (e.g. no distinction is made between ⟨s⟩ and ⟨ſ⟩ and ⟨ƿ⟩, ⟨ð⟩ etc.), and abbreviations are usually expanded without signalling this. Word divisions and interpunctuation may be regularized, and proper names capitalized. The great bulk of 19th century editions belong to this category, e.g. most of the editions by Carl Richard Unger. This type is also called the “interpretative diplomatic edition” (cf. Foulet and Speer 1979, 44).

Finally, many Old Norwegian and Icelandic editions are fully normalized, i.e. regularized according to the orthography of standard grammars and dictionaries. This is in fact a 19th century reconstruction of early 13th century Old Norwegian and Icelandic orthography, at which stage there was only minor dialectal variation between the two languages. In general, normalized editions are geared to-

wards the lay public (especially series like *Íslenzk fornrit*) and introductory courses. There is no comparable tradition of publishing medieval Danish or Swedish texts in regularized orthography, although the lexicographical works of Otto Kalkar, *Ordbog til det ældre danske sprog* (1881–1918), and especially Knut Fredrik Söderwall, *Ordbok öfver Svenska Medeltids-språket* (1884–1918), have laid a foundation for normalized editions also in these languages.

For linguistic studies, diplomatic editions are generally used, especially for studies of orthography, phonology and morphology. For literary and historical studies, which focus on the content rather than the form, normalized editions are often sufficient, and also for linguistic studies above word level, such as syntax and stylistics. Some editions cater for several needs. Finnur Jónsson's monumental edition of scaldic poems, *Den norsk-íslandske Skjaldedigtning* (Cph. 1912–15), is divided into two parallel editions, a diplomatic version (the A edition, “Tekst efter haandskrifterne”) and a normalized one (the B edition, “Rettet tekst”).

The question of how texts should be reproduced has caused much debate, with historians usually arguing for (slightly) normalized editions and linguists, especially those with diachronic interests, arguing for diplomatic editions. It is impossible to satisfy both parties within a single printed edition, but with the advent of modern technology, it is now possible to present a text at several levels of normalization, ranging from a strictly diplomatic transcription to a fully normalized version. In many cases there is already a standard edition which may be supplemented by a new edition at another level of representation. Such editions may present a more diplomatic text (e.g. Magnus Rindal's edition of *Barlaams ok Josaphats saga*, 1981) or a more normalized version (Anne Heinrichs et al., *Olafs saga hins helga*, 1982).

5. Translations

Latin and vernacular texts were translated from the 16th century onwards. In Denmark, Anders Sørensen Vedel's translation of Saxo's *Gesta Danorum* was published in 1575, and in Norway the kings' sagas were translated, first in part by Laurents Hanssøn (d. 1557/58) in the 1550s, then by Peder Claussøn Friis (1545–1614), who translated *Heimskringla* and several other sagas; the whole collection, *Snorre*

Sturlessøns Norske Kongers Chronica was published posthumously by Ole Worm (Cph. 1633). In the 17th and 18th centuries, many editions of vernacular texts contained translations, often into Danish or Swedish as well as into Latin. For example, Johan Peringskiöld's edition of *Heimskringla* (Sth. 1797) has parallel Latin and Swedish translations, and the so-called Sorø edition of *Konungs skuggsjá* (1768) has Latin and Danish translations. In the 19th and 20th centuries, translations have generally been published separately, but some examples of this type (like the well-known Loeb editions of Latin and Greek texts) are still found, e.g. the edition and translation of *Strengleikar* by Matthias Tveitane and Robert Cook (Oslo 1979).

6. Text series

The majority of Old Nordic text editions have been published under the auspices of editorial societies and channeled through series. The Arnamagnæan Commission initiated the publication of several Old Icelandic texts in the 1770s, including the Poetic *Edda* in three volumes (1787, 1818 and 1828), but did not present these editions as a series. This changed when a Royal Society for the publication of Old Nordic texts, *Det kongelige nordiske Oldskriftselskab*, was founded by Carl Christian Rafn in Copenhagen in 1825. Among other antiquarian activities, this society published a large number of Old Icelandic texts, e.g. kings' sagas in *Fornmannasögur* (12 vols., Cph. 1825–37) and *Fornaldarsögur* (3 vols., Cph. 1829–30). Another society, *Det nordiske Literatur-Samfund*, published a number of medieval texts in the period 1847–1885. In Norway, several short-lived societies were founded from the 1840s onwards, among them *Det norske Oldskriftselskab*. Their activity was ultimately taken over by *Den Norske Historiske Kildeskriftkommission* (founded in 1857), which is still active (now under the name of *Kjeldeskriftavdelinga* in the National Archive). In Sweden, *Svenska Fornskrift-Sällskapet* was founded by George Stephens and Gunnar Olof Hylltén-Cavallius in 1843 with the aim of editing medieval Swedish texts up to ca. 1600 and since then has published a large series of editions and studies. In Iceland, *Hið íslenska bókmenntafélag*, which was founded by Rasmus Rask as early as 1815–16 (in Copenhagen and Reykjavík) has initiated a large number of Old Icelandic text editions, especially under the leadership of Jón Sigurðsson in the 1850s

and the following decades. In Denmark, *Universitets-Jubilæets Danske Samfund*, founded in 1879, and especially *Det danske Sprog og Litteraturselskab*, founded in 1911 by Lis Jacobsen and Carl S. Petersen, have fostered an impressive number of editions, including Old Danish law texts and medieval writings in Latin.

Major series of Old Icelandic and Norwegian texts include *Samfund til Udgivelse af Gammel Nordisk Litteratur* (Cph. 1880–1956), *Íslenzk fornrit* (Reykjavík 1933–), *Norrøne tekster* (Oslo 1945–), *Editiones Arnamagnæanæ* (Cph. 1958–) and *Rit Stofnunar Arna Magnússonar á Íslandi* (Reykjavík 1972–). The latter three must be considered the leading scholarly series today. However, the *Íslenzk fornrit* series occupies a middle ground between strictly scholarly editions and popular ones; they are often referred to in scholarly publications, especially in literary studies, and some of them, e.g. Bjarni Aðalbjarnarson's edition of *Heimskringla* (*Íslenzk fornrit* vol. 26–28, 1941–51) have become standard editions.

With the exception of late charters (dated after 1435), almost the whole corpus of medieval Danish texts have been edited, separately or in series. In Sweden, medieval texts have been channeled through *Samlingar utgivna av Svenska Fornskrift-Sällskapet* (Sth. 1844–). There are two series, one of vernacular texts (ser. 1, *Svenska skrifter*, 1844–), and a smaller one of Latin texts (ser. 2, *Latinska skrifter*, 1924–). So far, 262 fascicules of vernacular and 14 of Latin texts have been published by this society, which can claim the honour of having the longest consecutive published series of medieval Nordic texts.

Examples of facsimiles are to be found as early as the second half of the 18th century and in several editions from the 19th century, e.g. a beautiful colour specimen in *Norges Gamle Love* (vol 4, 1885). The first complete facsimile of a manuscript was published in 1869 with the edition of *Elucidarius* by Konráð Gíslason. A few facsimiles followed suit, but the publication of whole manuscripts in facsimile only began at the turn of the century with e.g. the edition of *Codex Regius* by Finnur Jónsson and Ludvig Wimmer (Cph. 1891). The facsimiles gathered momentum with the Munksgaard series of Old Icelandic manuscripts, *Corpus codicum Islandicorum medii aevi* (20 vols., Cph. 1930–56). In addition, facsimiles have been published in national series such as *Corpus codicum Suecicorum medii aevi*

(Cph. 1943–), *Corpus codicum Norvegorum medii aevi* (Oslo 1950–), *Íslenzk handrit* (Reykjavík 1956–), *Early Icelandic Manuscripts in Facsimile* (Cph. 1958–) and *Corpus Codicum Danicorum Medii Aevi* (10 vols., Cph. 1960–73). The majority has been published in black and white, but lately some have been in colour (e.g. the two volumes in the series *Manuscripta Islandica Medii Aevi*, 1981–1982). Since printed facsimile editions are costly and cumbersome to handle, they will probably be superseded by digitized facsimiles in the not too distant future (see section 7).

Medieval charters (in Scandinavia usually referred to as *diplomas*) are being published in four national series: *Diplomatarium Suecanum* (Sth. 1829–), *Diplomatarium Norvegicum* (Christiania/Oslo 1847–), *Diplomatarium Islandicum* (Cph. 1857–), and *Diplomatarium Danicum* (Cph. 1938–). Law texts have been published in separate series as well, once more beginning in Sweden with *Samling af Sweriges gamla lagar*, (13 vols., Sth./Lund 1827–77), now supplemented with several newer editions of separate laws; *Norges Gamle Love* up to 1387 (5 vols., 1846–95) and a new series for the period 1388–1604 (1912–); the Icelandic laws by Vilhjálmur Finsen (Cph. 1852–1870); and Danish laws in *Danmarks gamle Landskabslove med Kirkelovene* (8 vols., Cph. 1933–61).

Runic inscriptions have been edited in several large series: *Norges Indskrifter med de ældre Runer* (4 vols., Oslo 1891–1924), *Norges Innskrifter med de yngre Runer* (Oslo 1941–), *Sveriges runinskrifter* (Sth. 1900–), *Danmarks runeindskrifter* (2 vols., Cph. 1941–42), and *Islands runeindskrifter* (Bibliotheca Arnamagnæana 2, Cph. 1942).

Many ballads (“*folkeviser*”) probably have a medieval origin, although the dating of this essentially oral literature has been a long-standing matter of debate. There are several national series of these genres, commencing with Svend Grundtvig’s pioneer work, *Danmarks gamle Folkeviser* (12 vols., Cph. 1853–1976), and followed by *Corpus Carminum Faeroensium* (6 vols., Cph. 1941–72), *Íslenzk fornkvæði* (8 vols., Cph. 1962–81) and *Sveriges medeltida ballader* (Sth. 1983–). A modern edition of Norwegian ballads is still lacking (cf. Solberg 1996). Denmark also has a recent edition of proverbs, *Danmarks gamle Ordsprog* (Cph. 1977–); so far 6 of the 8 planned volumes have been published.

The editing of Latin texts is largely confined to Sweden and Denmark, which had a

flourishing Latin literature from the 13th century. Both countries have seen a number of editions, in Sweden most notably the writings of St. Birgitta (cf. the Latin series of *Svenska Fornskrift-Sällskapet*), and in Denmark – in addition to the work of Saxo – the learned writings of medieval Danish scholars in the series *Corpus philosophorum Danicorum medii aevi* (Cph. 1955–); so far 12 of the 15 planned volumes have been published. The National Archive in Oslo has a collection of about 5,000 Latin fragments, mostly of liturgical texts, but they are largely uncatalogued and unpublished.

7. Electronic editions

Modern authors are now increasingly available in electronic editions, as witnessed by the ongoing projects on Henrik Ibsen in Norway, August Strindberg in Sweden and Søren Kierkegaard in Denmark. Medieval texts lag behind, and so far efforts have been concentrated on making existing editions available.

Critical editions which refer to several manuscripts, either in full or by way of selection in a critical apparatus, are well suited for the electronic format, since the limitations of the printed page no longer apply. However, uncritical use of the new technology may lead to overloaded editions in which there is simply too much information and too little guidance from the editor.

Diplomatic editions of Old Nordic texts require special fonts, sometimes quite extensive ones, and although the principles of encoding characters (“glyphs”) are described within the framework of SGML and UNICODE, the display of these characters on screen or on paper still creates problems of compatibility across computer formats. It is, after all, easier to read a word like “þá” than its SGML equivalent “þ´”. Even more challenging is the encoding of abbreviations, since these signs are commonly placed above or through one or more ordinary characters and their meaning often varies according to the context.

A prominent feature of electronic editions is the ability to link transcriptions with digitized facsimiles of the manuscript. The idea is not new, cf. e.g. the edition of Codex Regius by Finnur Jónsson and Ludvig Wimmer (Cph. 1891), in which photographic facsimiles and their corresponding transcriptions are placed on facing pages. What is new is the possibility of versatile linking between texts

and images, and the technology of storage and distribution. In an electronic edition it is possible to link several types of transcriptions (e.g. diplomatic and normalized) to one facsimile, and instead of a selective critical apparatus, the editor may include the whole or any part of the manuscript tradition. Also, the complete edition may be stored and distributed on a number of digital media (cd-rom, dvd etc.) and accessed through the Internet.

9. A few Internet resources

The Medieval Nordic Text Archive (Menota) is a collaboration between ten editorial departments and societies in the Nordic countries. The archive will include electronic texts in Latin as well as in Old Icelandic, Old Norwegian, Old Danish and Old Swedish: www.menota.org

The Arnamagnæan digitization project is presently in its infancy, but aims at making an electronic catalogue of the entire Arnamagnæan collection, with links to digitized images of each manuscript and, where possible, transcriptions and supplementary material: www.hum.ku.dk/ami/amproject.html

The Arnamagnæan Institute in Reykjavík has a survey of Icelandic editions and useful links to libraries containing Old Icelandic manuscripts etc.: www.am.hi.is

Project Runeberg is a fast-growing site which publishes all genres of Nordic literature on the Internet, including a few medieval texts: www.lysator.liu.se/runeberg

The project also has a very useful list of other digital libraries: www.lysator.liu.se/runeberg/admin/foreign.html

Språkbanken, a text archive at the University of Göteborg, offers a number of Old Swedish texts, a large concordance, Söderwall's Dictionary etc.: <http://spraakdata.gu.se/ktxt/>

VII. Nordic as a part of Old Germanic

62. Nordic, Germanic, Indo-European and the structure of the Germanic language family

1. Introduction
2. Nordic
3. Germanic
4. Indo-European
5. A critical look at the theory of Old European hydronymy
6. The homeland and structure of Germanic with emphasis on place-names and hydronyms; relations between the Continent and the North
7. Future tasks
8. Literature (a selection)

1. Introduction

In recent years, the widely accepted theories about the relationship between Gmc and the related IE languages (particularly Celtic), the structuring of Gmc, the relation between the North and the Gmc Continent and the home and expansion of the Gmc tribes have been challenged, especially from the onomastic point of view. The fact that the traditional point of view which attributed the major role in this question to the Gmc North was not essentially based on linguistic facts but on archaeological criteria (Kossinna 1896) and may not have received enough attention (see Steuer 1998 for a much more moderate modern evaluation). However, the actual meaning of the term “Germanic” and what it includes can be defined much more precisely by means of the linguistic material, though striking archaeological investigations have been fascinating for their exact dating of the objects found. In addition, the onomastic evidence reveals the region where the separation of the Gmc languages from the IE substrate had taken place. There is also evidence of a hypothetical core area of ancient Gmc settlements, its early structure and indications of the presumed separation of the Gmc languages, among them the Nordic ones.

2. Nordic

The separation of the Nordic languages from the WGmc and extinct EGmc sister dialects has been dealt with in various ways. While there is some correspondence with EGmc (e.g. “Verschärfung” etc.), the separation of WGmc is more easily understandable. Recent publications have indicated that the similarities between Old High German (OHG), Old English (OE), Old Frisian (OFris.), Old Dutch (ODu.) and Old Saxon (OSx.) are so obvious that there are nearly no doubts about our grouping these languages as “West Germanic” and contrasting them almost automatically with the NGmc languages. Even today, dialects in the area of contact between LG and Du. reveal a gradual transition; however, a similar development cannot be found in the Dan.-G area of contact. Many facts, among these the onomastic material, point to a *relatively* homogeneous NGmc. Due to the late written tradition in the North, AN (apart from runic inscriptions) cannot be described precisely; so here we are mainly dependent on conjecture.

Except for EGmc which is attested sufficiently only in Go., it is just the WGmc dialects that may serve as comparative material for NGmc, with OSx. playing a more important role than OFris. From this basis, the question is how the distinct border between the WGmc and NGmc dialects in Schleswig-Holstein and Denmark developed and how this is to be understood. It cannot be interpreted as a transition line, but rather as the result of the contact of two groups of isoglosses originating in different places. This is why the thesis that Gmc developed in Jutland, Schleswig-Holstein and other places has been undermined considerably – and the place-names and hydronyms provide the clues (see 6.).

3. Germanic

Linguists define the term “Germanic” as a group of (partly extinct) languages that differ from the related IE sister languages by a number of distinct features. It is the task of historical comparative linguistics to discover these distinctions, but so far, the important field of geographical names has not been taken into account adequately. Apart from this, the following features are traditionally regarded as characteristic of a Gmc language:

- (1) the fixing of the originally free word accent to a specific syllable;
- (2) the so-called first or Gmc consonant shift;
- (3) the development of the IE sonant nasals and liquids m, n, l, r to um, un, ul, ur ;
- (4) specific further sound laws known in Gmc languages only;
- (5) the spread of the IE ablaut e. g. to strong verbs;
- (6) the development of the weak declension of nouns;
- (7) the double system of inflection of adjectives (weak vs. strong);
- (8) the formation of a weak present perfect tense.

These very typical features of the Gmc languages must have developed from an IE dialect zone, because the connections to the IE sister languages (especially to Baltic) cannot be missed. This is related to the fact that there are geographical names in this area that *cannot* be explained from Gmc but have to be attributed to an IE language stratum.

The consistency of this reorganization also indicates that this development must have taken place over quite a long period of time in a relatively restricted area. Depending on the dialects the second or OHG consonant shift was realized to varying degrees. A comparison of these different realizations shows that the development of Gmc cannot have taken place in the area ranging from southern Scandinavia to the German low mountains, because we would have expected many more differences over such a large territory (as the HG dialects prove). Similarly, those theses based on the theory of a double origin the first between the Oder and the Vistula, the second between the Vistula and the Dnjepr have also been rejected. Again, supporting arguments could be derived from the hydronymy and toponymy.

Research into the Gmc languages has only just begun. The most important parts of the

Gmc homeland which were also the largest have so far not been investigated with regard to place-names and hydronyms. Suggestive factors have come to light that will have to be verified in the near future.

4. Indo-European

Ever since the neogrammarians (“Junggrammatiker”) linguists have tried to find similarities that allow languages and dialects to be seen as coming from one underlying language, as has been done for the IE languages. In this way, most of the languages spoken in Europe (apart from Basque, Finnish, Estonian and Hungarian) were more or less convincingly allocated to the IE language family. Similarities could be observed in the areas of phonology, morphology, lexicology, and only recently, onomastics.

But various questions concerning methodology, the structure of the IE language family datings, the supposed homeland of the parent language as well as other related questions have remained controversial. Recently, there has been a revival of the old debate about a substrate. Here, the key material was provided by place-names and hydronyms.

Hydronymy and toponymy also play a major role in the debate about the relationship between the Gmc and IE languages. The development of the Gmc dialects in the IE language area can only be successfully described – even in broad terms – if research makes use of the language material which in many cases is the oldest existing written material. The great advantage of a specific place-name is its stationary character. It is not possible to exactly define the border between the Sl. and G language areas, which arose in the Middle Ages, on the basis of common nouns (appellatives). Place-names are much more suitable for this purpose. Research results in this field, though, do not always support traditional theories.

5. A critical look at the theory of Old European hydronymy

Research has often been stimulated by the antiquity and special importance of hydronyms in pre- and early history. Hans Krahe’s investigations (e.g. Krahe 1964) were greatly influenced by the work of Leibniz, Grimm, Müllenhoff, Förstemann and many others. His in-depth studies of hydronymy started a

new era of research. Until then, hydronyms that could not be interpreted from Gmc had been attributed first to Ce. and later (due to Krahe's earlier investigations) to so-called Illyrian. But it was impossible to explain Fr. and Pol. names from Illyrian. For a description of these controversial hydronyms, linguists had to revert to Baltic roots or words for the Gmc language area, to Ce. for the Sl. area, to OInd. for the Ce. area etc. This is why Krahe himself discarded this theory after World War II. He concluded that these hydronyms could not be explained from a single IE language, not even "Illyrian". This theory had thus become untenable and was replaced by the theory of the Old European (henceforth OEur.) hydronymy.

The meaning of hydronyms which according to Krahe belonged to this group can be associated with so-called "water words", i. e. words denoting "river, flow, stream, brook, run, swamp, mire" etc. Morphologically, these words form groups that are linked through different recurrent suffixes. The most simple and most frequent form consists of one root element which is followed by *-ā* and itself serves as the basis of further derivatives like **Ara-* **Arva-* **Araros-* **Arla-* **Arant(i)a-* **Arsia-*, or **Ava-* **Avia-* **Auma-* **Avena-* **Aura-* **Avanta-* **Ausa-*. From the structure and scope of these names Krahe came to the conclusion that OEur. hydronymy was rather a West IE phenomenon which could also be supported by morphological and lexical similarities.

Schmid (1968) subjected this thesis to a rigorous examination and then redefined the theoretical basis of OEur. hydronymy. Krahe's theory, which regarded OEur. hydronymy as reflecting a West IE intermediate stage, was disproved by the fact that East IE material had to be used for the etymology of hydronyms (e. g. *Nida*, *Nidda*, *Neth*, *Nidd* etc., which can only be explained from OInd. *nédati* 'flows, runs' < IE **neideti*). And the language presupposed by this stratum of names could only have been IE. There is, though, some uncertainty as to the exact area where OEur. hydronyms would be expected.

Further research into OEur. hydronyms led Schmid (1972) to another conclusion: "No matter whether you choose an ancient name from Norway, England, France, Germany, Italy, or the Balkan peninsula, there will be a more or less precise equivalent in the present or ancient Baltic area" (e. g. *Athesis*, G *Etsch*, Ital. *Adige* with an almost corresponding

name in Lith. *Atesė*, *Atesỹs*). The Baltic area was gradually revealed as a distinct center of OEur. hydronymy which according to Schmid could be interpreted most easily as the result of a mainly uninterrupted continuity from IE to more recent times. Parallel to Schmid's investigations into hydronyms, Kuhn (1978) tried to postulate a "second Old Europe". Starting from hydronyms (and also place-names), he was convinced that he had found a "Northwest block" between the developing Ce. and Gmc languages. According to Kuhn (1978), this block had at first been largely resistant to Germanization, and as the more or less "last IE" area thus showed traces of IE and even pre-IE relics. Critics pointed out that Kuhn had not paid enough attention to eastern Europe and the special relationship between B and Gmc in his studies and had failed to incorporate a consonant change from earlier Gmc times into his theory.

A final evaluation of Kuhn's ideas will have to wait until the hydronyms of the Gmc countries and adjacent areas (especially those of eastern Europe) have been investigated completely, since eastern Europe plays a major role in the evaluation of Middle European river and place-names (as well as for early Gmc ethnogenesis). This fact did not emerge from a large study of OSl. hydronyms (Udolph 1979) – which still supported Krahe's theories that research on the early beginnings of a language family has to start with looking at the hydronyms and that the oldest hydronyms are derived from so-called "water words" – but rather from a study of the PSl. hydronyms in Poland. The latter provided even more important material in support of OEur. hydronymy. Krahe himself still excluded Sl. from the relevant hydronymic stratum, though.

According to Schmid, a hydronym has to meet the following requirements in order to count as OEur.:

- (1) It cannot be explained from the language it occurs in.
- (2) It consists of lexemes with a C¹eHC²-structure and derives its meaning from words denoting 'water, flowing' or similar.
- (3) There is no ancient suffix formation.
- (4) Inflectional elements of the name may have been adapted to the particular language.
- (5) There are strict rules of correspondence between the OEur. river-names.

- (6) Lexemes and suffixes can be explained from IE roots and word formation rules.
- (7) The names reveal the structure of IE nouns, adjectives, and participles, i.e. they are always derived from the *root*, not the *word*.

The critical evaluation of OEur. hydronymy has so far primarily focused on the following issues:

- (1) The *a*-vocalism is overly represented, which cannot be explained from IE (**Ala-* **Alara-* **Alantia* etc.).
- (2) It is interspersed with non-Gmc elements.
- (3) This kind of hydronymy is not a “system” in the strict sense of the word.
- (4) This theory is weakened by individual names that are more likely to be derived from individual languages.

None of the four above-mentioned aspects is very convincing:

- (1) The *a*-vocalism is also encountered in the appellative inventory of the IE languages, e.g. Lat. (*mare, lacus, palus, salus*); nevertheless, there is no doubt that Lat. is an IE language.
- (2) The assumption about non-IE elements has to be proven definitely; both Kuhn’s (1969–1978) and Tovar’s (1977) attempts to explain this phenomenon start from a southern European point of view, which unfortunately neglects eastern Europe. The same is true of Vennemann’s (1994) hypothesis that a “Vasconic” (Basque) substrate can be found in the IE name inventory for Europe. In addition, his etymologies suffer from grave errors. To mention just one example: as long as place names like *Bischofsheim* are linked to Basque appellatives, this kind of criticism cannot affect OEur. hydronymy.
- (3) OEur. hydronymy is not a *closed* and *limited* system, but is *open* to further IE water words and their application in hydronymy.
- (4) The revision of the derivation of individual names does not upset the theory as a whole, since a theory requires continuous verification by additional material, criticism, and counter-criticism.

Apart from these issues arising from various theoretical stages, severe criticism of Krahe and Schmid came from two European regions, namely Poland and Scandinavia. Intensive studies of the hydronyms of the eastern Euro-

pean country (*Hydronymia Europea* 1985; Udolph 1990) have contributed to a weakening of the “anti-OEur.” point of view in Poland. On the other hand, criticism in Scandinavia still persists (Andersson 1972; 1977; 1988; Strandberg 1986; Kousgård Sørensen 1972; 1982). This is especially clear in a comparative study (HSK anthology *Namenforschung. Name Studies. Les noms propres. An International Handbook of Onomastics*, 1995–1996), in which leading onomastic scholars independently express their theories of the OEur. hydronymy.

The Scandinavians rejected this theory mainly because there was no evidence of a substrate among the huge number of Gmc names. According to Scandinavian researchers there were no other languages in major parts of the Scandinavian settlement area (i.e. most of Denmark, Norway and Sweden) apart from Gmc and its pre-stages, not even as a component of geographical names. This is why the OEur. theory could not, or at least not entirely, be accepted, and a refinement was requested.

A series of contributions to the above-mentioned anthology strongly contradict to this point of view. Researchers from several countries (Germany, the Netherlands, Switzerland, Austria, Scotland, Lithuania, Bulgaria, and Poland) largely agree that difficult names – i.e. especially hydronyms – cannot be explained without studying the stratum of names preceding a particular language. In this respect, Nordic research takes quite an isolated position. It will have to be asked whether their scepticism is based on the material in exception and will lead to a new orientation for the OEur. theory, or whether it is based on a totally different thesis (see section 1) that has been established firmly for the North and applied to German conditions by Kossinna, namely that a territory of exclusively Gmc names will inevitably have to be regarded as the homeland of the Gmc language (and peoples). A substrate that could be derived from IE material would, according to Scandinavian Germanists and onomastic researchers, be in conflict with and weaken this thesis.

Again, there are striking parallels with earlier theories in Poland. The quite vehement controversy between Vasmer (1929) and Rudnicki (e.g. 1959; 1961) primarily addressed the etymology of names (largely hydronyms). Vasmer’s opinion that there were PSl. = IE relics in numerous Sl. and Pol. place-names and

hydronyms led Rudnicki and others to reject these interpretations and suggest ‘purely’ Slavic etymologies. The sense has changed in Poland, but not yet in Scandinavia.

This development is not only interesting from the point of view of the history of science, but also reveals an important issue that is decisive for the locating of the homeland and early structuring of the IE language family (regardless of whether it is Gmc, Sl., or Ce.). It is the argument that the presence of OEur. hydronyms in the oldest settlement area is *not contradictory* to this interpretation, but in itself *absolutely conclusive*. Similar to the investigations that assume a continuity from IE times of names which can be explained from Sl. (Udolph 1997) and consider it as the basis for the determination of the oldest homes of Sl. tribes. A certain continuity in naming will also have to be presupposed for determining the OGmc settlement areas. The detection of OEur. hydronyms will be part of this.

6. The homeland and structure of Germanic with emphasis on place-names and hydronyms; relations between the Continent and the North

Earlier Krahe realized that the discovery of OEur. hydronymy raised new issues about the development of the IE languages. More than once he stressed the importance of delineating the gradual splitting up of OEur. and its step-by-step evolution into individual languages more precisely.

Investigations relating to the original location and spread of names in the Gmc context as a whole are linked to this question. It proved to be essential to consider the naming of individual Gmc areas (e.g. Scandinavia, Great Britain, and the Continent) as part of a Gmc whole and to explain the place-names of the Scandinavian countries and England on the basis of the Gmc languages and vice versa, which is, however, only possible for the oldest strata of names.

In previous studies on Gmc hydronyms, the search for the oldest settlement areas of Gmc tribes aimed to discover an area where the proportion of non-Gmc relics in the name inventory was relatively small. Of course, this area would have to be the home of the Gmc tribes, as has been suggested more than once. From the point of view of pre- and early history, which was greatly influenced by Kossinna (cp.

the concise description in Hachmann 1970, 456ff.), the theory of a Nordic homeland found more and more support and finally was accepted widely. This theory fitted in with the observation that South Scandinavia and its onomastic material held a special position in Europe. Sometimes, the idea was expressed that all the onomastic material in central and southern Sweden belonged to a single language, which suggested a long and undisturbed development.

Deliberately stressing the “purely Germanic” character of Nordic hydronymy in no way supports the thesis of a Gmc homeland in the North, though. As it was often pointed out, the Gmc languages are closely linked to their IE sister languages at an older intermediate stage (yet to be reconstructed) with its distinctive characteristics, distributed equally among all Gmc languages (see sect. 3). This becomes obvious at all levels of grammar, and it may be taken for granted that this interlinkage can also be observed with place-names, which are important because of their durable and stationary character. We can expect that not only purely Gmc, but also PGmc (= OEur.-IE) hydronyms may be found that reveal the link with both the IE sister languages and the older IE naming processes. But apart from these – in a strict sense – PGmc names, we cannot expect a homogeneous stratum under a layer that may be understood as “OGmc hydronymy”. Rather, they are supposed to show distinct traces of different degrees of Germanification: here, one might think of names whose component parts (suffixes, levels of ablaut and others) disclose only minor traces of change to the individual language, whereas others reveal the Gmc influence on a broader scale. And finally, we may expect names that can be explained exclusively by the Gmc material, but at the same time (due to the term “OGmc”) consist of forms that make it difficult or even impossible for them to be attributed to an individual Gmc language or language group.

The relics which belong to the first group are especially significant in the search for the oldest Gmc settlements because they reflect a Gmc language that developed from an IE dialect group. An area with almost exclusively Gmc hydronymy and toponymy (particularly observed in Scandinavia) may of course be regarded as a territory that was settled by Gmc tribes for a long time; but due to the neighboring IE languages, it does not lend itself to answering the question of the IE homeland.

Recently, further investigations into OEur. hydronymy and the NGmc hydronyms and place-names (which is only just beginning and will require further years or even decades of studies) have provided results that are of crucial importance for the issues raised in this article.

Certain characteristics which so far have only been mentioned in passing shed a new light on the question of the homeland and early structuring of Gmc, particularly in comparison with its eastern European sister languages. And here B rather than Sl. plays the major role in hydronymy, giving rise to new ideas about the early structuring of the IE languages. The close relationship between B and Gmc was recognized as early as the 19th century. More than 125 years ago it was Förstemann's opinion (1863, 331) that amongst all languages, Lith. had the closest genealogical relation to Gmc, which is supported by modern research. It became more and more evident that the development of the typical Gmc linguistic properties must have taken place in the neighbourhood of the B and that crucial differences on the phonological and morphological level existed between the names in Scandinavia and central Europe.

These differences can be seen in the *-s-*derivatives, e. g., of the root **pel-/*pol-* 'pour' (*Vils*) and other roots (*Glems*, **Verisa*), which are found in Germany but not in Scandinavia; they appear in the *-t-*extension of the root **pel-* 'flow' found in the name *Fulda*, but not in the North, where derivatives of the IE root **ser-/*sor-* 'flow' are also missing, unlike the Continent as is proved by the names *Zorn* and *Saar*.

These examples lead to the question of what the place-names and hydronyms will have to be like in order to show a certain continuity between the IE and OEur. naming practices on the one hand and those of the individual Gmc languages on the other. Initial studies show that the following phenomena appear to be very important:

- (1) the consonant shift in the final position of the root or stem;
- (2) the similarities between B, Gmc and Sl. hydronyms and place-names;
- (3) the distribution of compounds or suffix formations of the OGmc pattern.

6.1. Consonant shift in the final position of root or stem

From the onomastic point of view, German linguists have often supported the thesis of a Scand. homeland of the Gmc tribes ("vagina gentium") because the phonetic inventory of several North German hydronyms seemed to indicate that these names had become known to the Gmc people rather late in time. Various *p,t,k* reflexes witness that these names had not been included in the first (Gmc) consonant shift, such as *Apolda*, *Lippe*, **Lupentia* (in *Lupnitz*), the numerous *apa*-names (*Ennepe*, *Honnef*, *Olpe*, *Aschaffenburg*, *Asphe*, *Hennef*, *Laasphe*, *Lennepe* etc.), *Neetze* near Lüneburg (< **Natisia*), *-wik* in place-names like *Harwich*, *Braunschweig*, *Bardowik* etc.

They were part of Kossinna's (e. g. 1896) thesis of a Scand. homeland for the Gmc tribes. Kuhn, too, used them as evidence for his idea of a late Germanification, and the interpretation that the *p,t,k*-names are unshifted has been widely supported up to the present day. Nonetheless, this is wrong.

Since the early beginnings of IE studies, we have known that there is a shift of consonants which, on the one hand, is likely to occur in final position, and on the other hand, is particularly common in Gmc. A comparison with both non-Gmc and Gmc material may help to demonstrate this phenomenon:

ON *flatr* 'flat' vs. Lith. *platus* 'wide';
 G *Nessel* < **natilon* vs. Lith. *noterė*, Latv. *nātre*, OPr. *noatis* 'nettle';
 G *weiß*, *Weizen* < Gmc **hvīta* vs. Lith. *kvietyš*, OInd. *śveta-* 'white';
 G *naß* < Gmc **nata* vs. Gr. *νότιος*, *νοτερός*;
**dheup-* in OHG *tobal* 'forest gorge' vs. **dheub* in Go. *diup-s*, G *tief*;
 OInd. *vēpa-tē* 'shaking' vs. OHG *wipf* 'fast movement', G *Wippe*, *Wimpel*, *Wipfel*.

The change will have to be assigned to the time before the first or Gmc consonant shift. Place-names and hydronyms with these properties are connecting links between the IE-OEur. stratum and the OGmc naming processes. They include:

- (a) river names with the root **nat-/*not-* like *Neetze*, *Nette*, *Netze*, *Nesse*, *Nathe* etc.;
- (b) derivations of **ueid-/*ueit-* 'bend, flex' like *Wied*, *Weidnitz*, *Weida*, *Weide*, *Vida*, *Wethau*, *Wieda* etc.;
- (c) the group consisting of *Schunter*, *Schondra*, *Schutter*, *Schossen*;

- (d) word formations from the IE root double **ueib-/*ueip-* ‘bend, flex’ like *Wipper*, *Wipfra*, *Wupper*, *Wipperau*, *Wippe* etc.
- (e) In the light of this consonant shift we can also solve the often-discussed problem of the *-apa*-names *Ennepe*, *Olpe*, *Honnef*, *Aschaffenburg*, *Horpe*, *Elsphe* etc. If we start from an IE root **ab-* (evident in Ce. appellatives and names, cp. e.g. *Avon*), then *apa* is a normal development from Grimm’s Law, whereas the OPr. *ape* ‘river’, cp. *Angerapp*, pursues the root variation **ap-*. This is all the more surprising as the distribution of *-apa*-names (Dittmaier 1955) does not reach Scand. at all.
- (f) The name of the mountain range *Harz*, whose present HG form with *-z-* goes back to LG *-t-* (especially obvious in the place-name *Bad Harzburg* [found in *Harteborg*, *Harteborch*, *Harteburg* only from 1071], is to be linked to – and here experts agree – with HG *hart* ‘mountain forest, woody range of hills’. But then the form *Harz* is a violation of Grimm’s Law (Förstemann 1863, 56). Of course, Kuhn (1959, 25) used this example as evidence of his “Northwestern block” (as a “half-Gmc” name). The early Gmc consonant shift is well known from appellatives and obvious in the parallel existence of Go. *fraþi* ‘intelligence, reason’, Go. *fraþjan*, *froþ* ‘understand’: Go. *us-fratwjan* ‘to make intelligent’; **kōt-* in OHG *hadu-* ‘fight, quarrel’, MHG *hader*: **kōd-* in Go. *hatis* ‘hate’, OIcel. *hatr*, OHG *haz* ‘hate’; **kent-* in OHG *heri-hunda* ‘war profit’: **kēnt-* in OE *hentan* ‘persecute’, *huntian* ‘hunt’, *hunta* ‘hunter’ and many more. Taking this into consideration, it is not difficult to draw a parallel between HG *hart* < Gmc **hard*: *Harz* < Gmc **hart*.
- (g) The mountain name *Süntel* which both today’s mountain range and the whole western chain of the German central mountain range from Osnabrück to the Deister (a distance of about 100 km) used to be called, presents a similar picture. The name is derived from Gmc **Sunt-ila*. The *-t-* in the final position of the root thus contrasts with the underlying word *south*, G *Süden*, which goes back to **sunþ-* and therefore to *-þ-* (OHG *sund*, MHG *sunt*, Du. *zuid*, OE *sūþ*, E *south*, OSx. *sūth*). If both forms are attributed to a Gmc (IE) form, we are able to derive Gmc **sunt-*: **sunþ-* and the older **sund-*:

**sunt-*, and thus describe this name together with the name for the Harz mountains and the already mentioned north German place-names and hydronyms in terms of the consonant shift described above.

As these examples show, consonant shift in the final position of a root or stem did take place within the Gmc languages. It has to be dated *before* the first or Gmc consonant shift and proves the relationship between IE (i.e. before the existence of individual languages) and Gmc naming practices. The centre of the relevant names is not situated in Schleswig-Holstein, Denmark, or southern Sweden, though, but north of the German central mountain range.

6.2. Similarities between Baltic, Germanic, and Slavic place-names and hydronyms

The special relationship between Gmc and the eastern languages, in particular B and Sl., has already been mentioned. We find its traces in names which can be arranged into two groups: the first one containing roots or appellatives which have left toponymic traces in all three IE language families; the second group consisting of names that are of an undoubtedly Gmc origin but whose bases positively reveal relationships with B or Sl. languages.

The first group comprises derivations of root extensions that are definitely confirmed only by an area that was inhabited by speakers of the three language families, for example, the roots **dhelbh-* ‘erode, hollow out’ in names like *Thulba* and *Delvenau*, **pers-* ‘spray, squirt’ (versus the zero grade **p̥s-* in N-Gmc *fors* ‘waterfall’) in names like *Veersee*, *Veerßen*, *Vers*, *Verse*, *Versia*, *Viersen*, and **pl̥t-* in *Fulda*. We are obviously dealing with extensions of common OEur. or IE roots of the type **C¹eC²-*, i.e. with a probably younger stratum of hydronyms compared to OEur. names. Names of this type, which again point to a close relation between the OEur. stratum and the Gmc name inventory, are definitely found in northern Germany.

The second group consists of place-names with a special relation to B or Sl. where it is not possible to explain these names completely from the Gmc language, so that B or Sl. words will have to be considered.

Undoubtedly, the Baltic language helps to explain such difficult names as *Bordenau* (near Hannover), *Bortfeld* (near Peine), *Bördel* (near

Göttingen), and *Border* (a deserted settlement near Nienburg). Here, Grimm's Law allows the derivation from a basic form **bhr̥dh-*. A convincing etymology, though, can only be derived from B *birdā* 'wet excrements', since Gmc does not provide any source.

The same applies to the place-name *Bründeln* (near Peine). In no way can this name be connected to the G word *Brunnen* 'well'. On the basis of old references (in *Brundelem*, 1100–1200, 1237 etc.), a Proto-form **bhr̥d̥l-* can be established, which can most likely be related to the IE root **bhrendh* 'swell, pregnant'. Again, B is a great help, with Lith. *brėstu*, *brėndau*, *brėsti* 'swell, ripe', *brīstu*, *brindau* 'soak' (e.g. of peas) and many more.

Dransfeld, situated west of Göttingen, represents a difficult name. *Trhenesfelde* (with the oldest reference from 960, which probably stands for **Threnesfelde*) is especially important for the interpretation of this name. There is no connection to Gmc, but rather to B: Lith. *trenėi* 'to rot, to decay', Latv. *trenēt* (*trēnu* or *trenu*) 'to rot, to decay'.

Sl. also shows a close relationship to Lower Saxon place-names. To name just a few: *Thüste* (near Hameln-Pyrmont), old *Tiuguste*, *Thiuguste*, and *Tuchtfeld* near Bodenwerder (8th/9th century [copy from the 12th century]) *Ducfelden* can be connected to the well-known pass name *Dukla* and Slovak. *dúčel*, *dúčela* 'tube', Sloven. *dukelj*, *duklja* 'high pot with narrow neck'. The little village *Dolgen*, east of Hannover, also belongs to this group and is not related to the Russ. word *dolgij*, Pomeranian-Polabian *dolg-* 'long', but goes back to IE **t̥l̥gh-* via Gmc **Tholg-un* (dative plural) and **thlg-*. It can best be related to **telgh-* 'to swell up, swollen', which is well established in Sl. **t̥l̥st̥b̥* 'swollen, big' in OChSl. *t̥l̥st̥b̥* 'big', Russ. *tolstyj* 'big' (*Tolstoy*). Nouns derived from this root refer to 'hill, elevation, growth'.

The place-name *Empelde* southeast of Hannover, 826–876 in *Amplithi* etc. is also important; it is an *-ithi*-name (Gmc suffix) whose basis cannot be explained from Gmc. **Ampl-ithi* is most likely rooted in IE **omb-l-*. From this, there is a Sl. appellative Polabian *wumbal* 'well', Bulg. *vumbel*, *vubel*, *vubel*, *vobel*, *ubel* etc. 'well or spring in a valley', 'spring in a low-positioned place where water is gathered like in a well'. It goes back to ASI. **qbl-*, a word which is not documented in Gmc. The suffix *-ithi* indicates that Germans have the name; thus *Empelde* is a reliable connecting link between an IE stratum and Gmc naming practices.

A whole group of place-names contains the element *-hude* (*Hude*, *Steinhude*, *Fischerhude* etc.), based on *-h̥y̥th*, *-h̥y̥ð* (e.g. in *Chelsea*, borough of London, 785 *Cealchyþ*, 801 as *Caelichyth*) in England, with an underlying meaning 'a port, ferry place, little harbor, landing place'. A satisfying etymology has not been found yet. But taking **-h̥y̥th-* as a starting point with the *-n-* missing (typical of Ing. languages), **-hunþ* is obtained, which has to be derived from IE **kunt-* and thus provides a connection to ChSl. **kŏt̥b̥*, which is still documented in the present Russ. word *kut* 'end of a river arm reaching far back into the country', in Ukrain. *kut* 'narrow inlet in the shape of an angle' and in Pol. *kąt* 'area of water lying between two shallows or reaching into the land from where you cannot steer a ship downstream; usually the remains of an old river bed or river arm'.

And finally, place-names in Lower Saxony and Thuringia like *Ilfeld*, *Ilten*, *Ilde*, *Ilse* need to be mentioned. With their Gmc basis forms **Il-tun-*, *Il-feld*, **Il-ithi*, **Ilis-ithi* they point to a root **il-*, which also cannot be explained from Gmc. Here, a brief glance at the Sl. languages is valuable: almost all of them have a word, e.g. Ukrain. *il* 'clay, dirt, silt', Beloruss. *il* 'thin dirt of organic origin in water, on the bottom of a water hole, swampy, gray, or white-colored land', Russ. *il* 'dirt' etc. The word is an old *-u*-stem probably related to Latv. *ils* 'very dark', but certainly to OGr. *ἰλύς* 'dirt, excrements', *εἰλύ* · *μελαν* ('black' as mentioned by Hesych).

The above-mentioned examples (which can easily be extended) are toponymically limited to a broad stretch of land north of the German central mountain range from the river Elbe to the Rhine. They are right in the middle of a dense layer of Gmc names. Together, they show that Gmc tribes have been continuously settled in this area since the formation of the Gmc languages from an IE dialect zone.

6.3. The distribution of compounds or suffix formations of an OGmc pattern

Since the beginning of scientific research on Gmc languages, linguists have recognized that throughout history there has been a change in the word formation processes, as Jacob Grimm (1826, 403) mentioned: "At a later stage it is the unmistakable direction of language to give up derivation and replace it by composition. This proves our assumption that now extinct derivations had once been alive,

and now unintelligible or ambiguous ones had once been perceptible and clear". In other words, in more recent times compounds (made up of two nouns) are predominant, while at earlier stages it was suffixation (added to a basic element). This is also true in the field of place-names (but not personal names!). Hydronyms that are attributed to OEur. hydronymy belong to the suffixed type.

If one takes a closer look at Gmc hydronymy and toponymy from this point of view, it is surprisingly easy to find a simple pattern of distribution. On the Continent, we find both compounds with ancient base words (like *-aha*, *-mar*, *-hude*, *-lar-*, *-leben*, *-loh*, *-tun*, *-lage*, *-hlaiw*) and the older suffix forms like *-ung*, *-r*, *-s-*, *-st-*, *-str-*, *-ithi-*, some of them extending as far as England (*-aha*, *-mar*, *-hude*, *-loh*, *-tun*, *-str-*) or Scandinavia (*-a(a)*, *-lev*, *-lo*, *-tun-*, *-hlaiw*, *-ung*, *-st-*, *-str-*).

For the determination of the oldest settlements of Gmc tribes, the distribution of suffix types that are exclusively or at least almost exclusively found on the continent is crucially important. These are, e.g., the *-r-*, *-s-*, *-st-*, *-ithi-* forms.

6.4. Results

The examples of Gmc hydronyms and place-names gathered so far definitely reveal that there are numerous reflexes in northern Germany (especially on the northern edge of the central mountain range in the areas of fertile loess soil) of an old IE-OEur. stratum from which a Gmc system of place-names has developed. Therefore the evidence of PIE relics in this area is no contradiction, but is necessarily conditioned by the widely known fact that Gmc as an IE language is linked to its IE sister languages in many ways.

In pre-Christian times, there was a movement away from this central area to the west (in post-Christian times as far as England) and to the north, which is clearly proved by numerous Continental names that can only be explained by referring to Scand. words, e.g. names like *Elbe*: ON *elfr*, Swed. *älv*, Norw. *elv*; *Rhön*: ON *hraun*; *Draegen* (near Gifhorn), *Drahe* and many more: Dan. *drage*, *drag* 'small promontory connecting a peninsula to the main land'; *Engensen* near Hannover, **Engisa*: Dan. *eng*, Sw. *äng*, ON *eng* 'grassland, meadow'; *Frohse*, *Frose* (Sachsen-Anhalt): OIcel. *fræs* 'blow', Norw. *frösa* 'blow, gush, bubble'; *Ohrum* (**Ör-hēm*), *Oerie* (**Ör-ithi*) require Gmc **Aur-hēm* and **Aur-ithi*: ON *aurr*

'sandy ground, gravel', Icel. *aur* 'clay, dirt; mud; scree, rubble', *Schöningen* < *Skahaningi*: ON *skagi* 'promontory'.

Thus the situation in northern Germany is in sharp contrast to Scand. hydronymy and toponymy, which have a large number of Gmc word forms but show hardly any signs of continuous development from an OEur. substrate. Maybe this is connected to the small number of OEur. names in Scandinavia. There are several indications that the lack of continuity in the development of Scand. hydronymy is due to a turning point which may have been caused by immigration, most possibly of Gmc tribes.

7. Future tasks

The investigation of Gmc place-names and hydronyms in the Gmc settlement area is still at its beginning point. Large areas of the continent (Thuringia, Sachsen-Anhalt, Lower Saxony, Northrhine-Westfalia, Hessia) have not been examined yet, while Schleswig-Holstein, Denmark, and Scandinavia have been studied much more intensively. Hence, the lack of ancient names, e.g. in Schleswig-Holstein and Denmark, is all the more remarkable. The theory that this lack is due to a gap in settlement patterns is not very convincing. It will be the task of future comparative studies of place-names and hydronyms from the North and the Continent to look into this problem.

63. Nordic-Gothic linguistic relations

1. The most important lines of research
2. Theory and practice: Criteria for subgrouping
3. The Goths and Scandinavia
4. Goths and prestige: on the history of Gothicism
5. Literature (a selection)

1. The most important lines of research

The primary reason to search for a possible connection between Gothic and Nordic is a non-linguistic one. Firstly we have Jordanes' statement (*Getica* 4, 25) that the Goths came from "*Scandza (insula)*" i.e. Scandinavia.

Secondly, we have evidence of the name of the South Scandinavian tribe *Gēatas* in the Old English epic *Beowulf* and of certain place-names such as *Götaland*, *Västergötland*, *Östergötland*, *Gotland* in Sweden. The Old English name for the southern Swedish tribe *Gēatas* is the exact equivalent of Old Nordic *Gautar* (Klaeber, 1950, xxxviii ff.). All these names seem to indicate that 'Goths' once lived in the aforementioned geographical areas.

On the basis of this evidence scholars such as Neckel have looked for linguistic features peculiar and common to Gothic and Nordic. Neckel proceeded from the assumption that "Der nordische Charakter des Gotischen und die nordische Herkunft der Goten" [The Nor-

dic character of the Gothic language and the Nordic origin of the Goths] (1927, 2f.) was an incontestable fact.

Schwarz undertook a reconstruction of the common Gotho-Nordic prototype, devoting about 100 pages to this subject. He argues: "Das Gotische [...] muß auf die Ausgangslandschaft zurückbezogen werden" (1951, 5). "Urheimat" and reconstruction of the original dialect are two aspects of one and the same reality.

In a review of Schwarz's book, Betz (1953, 309) particularly criticized it for its dependence upon the obsolete "Stammbaumtheorie", 'theory of the family tree'.

Kuhn disagreed both with Schwarz's method and with his results (1952, 45ff.). He revisited the same topic in his article *Zur Gliederung der germanischen Sprachen* (1955, 8–16). In this connection he coined the expression "das Sorgenkind Gotonordisch" (cf. also Penzl 1972 b, 1233). Kuhn concluded that East Germanic (Gothic) was neither a branch nor a cognate of Nordic but rather an early offshoot of Proto-Germanic (1955, 16).

Antonsen (1965) quotes Zhirmunskij and adheres to the theory of "a division of Proto-Germanic into a pre-North-Germanic and an East-Germanic dialect" (1965, 36, in a footnote).

Kufner (1970) examines the whole matter of grouping and separation of the Germanic languages. Leaving aside Maurer's view of a special relationship between Nordic and Alemannic (1943; 1952), Kufner (1972, 94) summarises the views prevailing in current scholarship under four headings:

- (1) Adherence to the traditional tripartite division. Examples: Krause 1953, ²1963, ³1968; Mossé ²1956.
- (2) Assumption of a first division into North(east) and South(west) Gmc. Examples: Karsten 1928; Schwarz 1951 and 1956; Rosenfeld 1956; Zhirmunskij 1964; Lehmann 1966. Rösel (1962) belongs to this group although he includes the precursor of OE within North(east) Gmc.
- (3) Assumption of a first division into EGmc and NWGmc. Examples: Kuhn 1952 and 1955; Adamus 1962; Antonsen 1965; Makaev 1965.
- (4) The view that our present knowledge and methods do not suffice to solve the problems of the Gmc Ausgliederung. Examples: van Coetsem 1970; Marchand 1970.

In the last twenty-five or thirty years, scholarly opinion about the Nordic-Gothic linguistic relationship has generally inclined to this fourth view. The absence in Germanic of something corresponding to Classical Latin and Vulgar Latin in relation to the Romance languages renders it impossible to trace the evolution of each Germanic language, language group or subgroup from its earliest stage of development. As Jasanoff states (1994, 253): The map of the Germanic languages is [...], from the beginning of the historical record, crisscrossed by dialect divisions whose interpretation and significance have traditionally been a source of controversy. The old view that North and East Germanic are more closely related to each other than to West Germanic is no longer widely held.

2. Theory and practice: Criteria for subgrouping

2.1. Theory

Fox (1995, 217f.) writes:

The basic question here is that of SUBGROUPING, that is, the intermediate relationships that may exist between the individual languages on the one hand and the single proto-language on the other. These intermediate relationships can be at several levels; although English, for example, is assumed to be an Indo-European language and therefore ultimately derived from Proto-Indo-European, it is customary to recognize at least Germanic as an intermediate grouping, which also includes German, Icelandic, Gothic, and so on. But it is also possible to recognize, for example, a West Germanic intermediate between English and Proto-Germanic, which includes German and Dutch but excludes the Scandinavian languages and Gothic, while some scholars have recognized an Anglo-Frisian group between English and West Germanic, consisting of English and Frisian. Similarly, there has long been a debate about the relationships between groups such as Slavic, Baltic, and so on, within the Indo-European family with the possibility of intermediate groupings such as "Balto-Slavic" and "Italo-Celtic", as well as the possibility of grouping together Indo-European, Semitic, Finno-Ugrian, and other language families into a larger "Nostratic" group. The furthest in this direction that we can go is to assume that *all* the languages of the world are ultimately related.

The methodological problem here is that of finding suitable criteria for such groupings, and the continuing disagreements in this area are indicative of the fact that such criteria are in practice often difficult to identify and to apply.

Here the model of the family tree (“Stamm-
baumtheorie”) can be applied (Hoenigswald
1966; Fox 1995, 218). If we have two
hypothetical languages A (e. g. Gothic) and B
(e. g. Nordic), we can postulate the following
relationship: A and B are sisters, with a non-
attested mother *X (Gotho-Nordic).

Such a hypothesis must be supported by a
multitude of basic correspondences between
the two sister-languages.

The major criterion for linguistic subgrouping
is SHARED INNOVATION [and not: SHARED RETEN-
TION]. In other words, we look not merely for
a feature that two languages have in common,
but for evidence that this feature is the result
of innovation in both languages simultaneously.
Provided that this feature is sufficiently distinc-
tive, and unlikely to have arisen by chance
in each language independently, we can be rea-
sonably confident that it is evidence that the
two languages were a single language at the
time of innovation, and therefore constitute an
independent branch of the family (Fox 1995,
220).

2.2. Practice

Schwarz (1951, 144ff., discussion 47ff.) pre-
sents a list of 26 items that appear to him to
demonstrate that there is a close relationship
between Gothic and Nordic (Old Norse). Only
6 statements from Schwarz’s list are accepted
by Kufner:

- (1) The most often cited innovation common to
Go. and the Nordic languages is the develop-
ment of a stop in geminate *j* and *w* clusters.
This development is variously called Holtz-
mann’s law, Gutturalisierung, velarization,
Verschärfung [...]. Examples for *-jj-*: Go.
twaddje, ON *tveggja* vs. OHG *zweiio* ‘of two’;
for *-ww-*: Go. *triggwa*, ON *tryggva* vs. OHG
triuwa ‘troth’.
- (2) A second innovation is the development of an
*-in-*suffix in Go. and the Scandinavian lan-
guages in the pres. part. fem. contrasting with
WGmc *-jō-*. Examples: Go. *gibandei(n)*, ON
gefandi vs. OHG *gebantiu*, OE *giefendu*, *giefen-
de* ‘giving’.
- (3) A further peculiarity of this group is the de-
velopment of a productive inchoative verb
class marked by a *-na-*suffix in the pres., a *-nō-*
suffix in the past. Examples: Go. *waknan*,
waknōda, ON *wakna*, *waknaþa* ‘awaken,
awakened’ (Annerholm 1956).
- (4) This group selected the ending *-t* (continuing
an IE perfect ending) for the 2 sg. pret. indic.,
while the WGmc dialects had an ending *-i* (con-
tinuing either an IE aorist or opt. ending) for
this form, with the exception of the preterite
presents. Examples: Go. *graipt*, ON *greipt* vs.

OHG *grifi*, OE *gripi*, OS *gripi* ‘you gripped’
[...].

- (5) In respect to the distribution of the athematic
verbs (contract verbs) illustrated by OHG *gān*
‘go’, *stān* ‘stand’, *tuon* ‘do’ it is difficult to
decide whether the northern group innovated
by expanding them [...] or whether the western
group innovated by contracting these forms
[...]. At any rate, contracted forms are lacking
in Go. and are significantly fewer in the Scan-
dinavian languages [...].
- (6) In the interrogative pronouns of the type
PGmc. *xwa-*, *xwe-*, Go. and the Scandinavian
languages have derivatives of the *-j-*type. Ex-
amples: Go. *hvarijs*, ON *hverr* ‘who?’ (Kufner
1970, 85f.).

In a theoretically advanced statement Jasanoff
writes: “The special points of resemblance are
either common retentions (Fox 1995, 220;
cf. 2.1.), like the ending *-t* in the 2 sg. preterite
[...] or structurally insignificant innovations
(Fox 1995, 220; cf. 2.1.), like the occlusion of
**-ww-* and **-jj-* to **-ggw-* and **-ddj* /*-/*-ggj*
[...].” (1994, 253).

3. The Goths and Scandinavia

The pertinent observation has often been
made that languages in fact do not exist as
independent entities, but only the people who
speak these languages. Changes do not origi-
nate in grammar books or dictionaries but
rather in the everyday use of a language. Our
sparse evidence stems from disparate eras. In
the second century B. C. the Goths may have
spoken a language which was very similar to
Proto-Germanic (Kuhn 1955). From a later
period, the end of the fourth century A. D.,
we have the written Gothic of Wulfila’s Bible.
Much later still, in the thirteenth century, we
have the evidence of Old Nordic. On the one
hand we cannot imagine how spoken Gothic
would have evolved had the Gothic kingdoms
in Italy or Spain survived and Gothic become
the dominant language in these countries. On
the other hand we cannot ascertain how simi-
lar Gothic and Nordic were, for example at
the beginning of the Christian era.

The impossibility of reaching unassailable
conclusions on linguistic grounds does not,
however, exclude the possibility of a connec-
tion between the Goths and Scandinavia. The
following sections will deal with the signifi-
cance of the Gothic presence for the North,
especially for Sweden.

Here it becomes appropriate to abandon the
romantic conception of a passive “origin of

the Goths" in favour of an active "expansion of the Goths" in northern Europe.

It is regrettable that, as indicated above, only scanty evidence remains.

3.1. Gēatas and Sweden

The connection of the Goths with Scandinavia is confined exclusively to Sweden. In other countries, such as Norway, it is certain that (poetic) tales about the Goths and their great achievements were widely known in medieval times (cf. the poem *Hamðismál* in the Poetic Edda, about the Ostrogothic king Ermanaric, at the end of the fourth century). But, as mentioned above (cf. 1.), only Sweden has preserved on its own territory up to the present day the remembrance of the tribal name Gauts (Greek Γαυτοί [Procopius, sixth century = a populous tribe in Thule, see Reichert 1987, 310], ON *Gautar*, OE *Gēatas*). The ablaut alternations of the Germanic strong verb **geutan* 'pour', **geut*, **gaut*, **gut* (see e.g. Kuhn 1954, 425) include a form which is phonologically identical with *Gaut-*. The **au* form is preserved only in place-names from central Sweden. That a relationship exists between *Gēatas*, *Götaland*, *Västergötland*, *Östergötland* and the ancient Goths can hardly be denied, but to explain it is difficult. No helpful parallel can be adduced. Perhaps the connection can be envisioned as the relationship between a colony and its motherland (Wenskus 1961, 433).

3.2. Gotland and the expansion of the Goths

The name of the island *Gutland*, *Gotland* contains in its first component the name of the ethnic group *Goths*. Hofmann (1988, 29) remarks upon the difference between names of countries which refer to a salient characteristic of the climate or geography, e.g. *Ice-land*, *Sea-land*, and those which contain the name of the inhabitants, e.g. *Fries-land* or *Ire-land*. *Gotland* belongs to the second type. Furthermore, the compound *Gut-land* 'Gothic land' is athematic, as is *Gut-* in *Gut-þiuda* (dat.) 'Gothic people' in the Gothic Calendar (Milan). There can be no doubt that the identical name for the Goths lies behind both forms. There are two possible explanations for the name of the island. Perhaps the Goths had settled there and a small tribal group emigrated, whose population later greatly increased. Conversely, the Goths could have reached the island at an early time and settled there (Wenskus, 1961,

464 ff.). In both cases these Goths were assimilated to the northern world (Hofmann 1988, 32).

4. Goths and prestige: on the history of Gothicism

This contribution on the subject of the Nordic-Gothic linguistic relationship would not be complete without a brief account of Gothicism. Nationalism (Scandinavianism) and the search for national origins was not only a prerogative of the Romantic era. The first people to evince an interest in the Goths and their kingdoms in eastern and western Europe were other Germanic tribes, namely at a very early period (by at least the fourth century A. D.) in their oral poetry.

Furthermore, authors like Augustine (354–430), Orosius (fifth century), Salvianus (fifth century), Sidonius Apollinaris (second half of the fifth century), Hydatius (395–470), Ennodius (473–521) and others increasingly revised their opinion of the Gothic "barbarians" and began to praise their virtues (Teillet, 1984, *passim*). The fame of the Goths reached its acme in Spain, where *godo* even today means 'noble' and 'rich' (Menéndez Pidal 1956, 31; Svennung 1966, 33).

Particularly important, on account of its resonance in the Western world, was the Council of Basle (1431–1449; Brough 1985, 23f.), at which the bishop of Växjö (Småland, Sweden) Nicolaus Ragvaldi (Nils Ragvaldsson) declared that his king "descenderit a rege Gothorum" (Svennung 1966, 37). The alleged descent from Gothic ancestors was, of course, a commonplace in Sweden, where the traces of the name of the Goths constituted incontrovertible evidence. Interest in the Gothic language was greatly stimulated in 1669 when "rikskanslern" Magnus Gabriel de la Gardie presented the *Codex argenteus* to the University of Uppsala. In modern times various scholars have consciously or unconsciously been influenced by Gothicism.

64. Nordic-West Germanic relations

1. Nordic and the division of the Germanic languages
2. North and West Germanic correspondences with Ancient Nordic participation
3. North and West Germanic parallels not evidenced by Ancient Nordic
4. Parallels between North Germanic and Old High German
5. The Northwest Germanic theory: a revised model
6. Literature (a selection)

1. Nordic and the division of the Germanic languages

In the numerous attempts made over the years at grouping the Germanic languages (cf. Nielsen 1989, 67–107), Nordic has been cast in three widely different roles. In Schleicher's tripartite family tree from 1860, the Proto-Germanic trunk branched out into what in Streitberg's terminology (1974 [1896]) were called, East Germanic (Gothic), West Germanic (OHG, OSx., OE, OFris., and ODu.) and North Germanic (Nordic). This model was clearly inspired by the geographical locations of the earliest attested Germanic dialects.

Another hypothesis, which took Gothic emigration from Sweden as its point of departure (cf. place-names like Götaland and Gotland), posited a Gotho-Nordic branch of Germanic more than 2000 years ago, contrasting with what in our first model was called West Germanic. Most fervent among the adherents of this "Gotho-Nordic theory" was Schwarz (1951), but obviously much in such a hypothesis comes to depend on the assump-

tion that the Goths really came from Scandinavia, which, in the view of present-day scholarship, can be demonstrated neither linguistically nor archaeologically.

A third model was proposed by Kuhn (1955) in reaction to Schwarz's theory. Kuhn thought that on their departure from northern Europe for the Black Sea region the Goths still spoke Proto-Germanic, and that the remaining Nordic-West Germanic area stayed linguistically uniform till the mid-fifth century A. D., after which a split between North Germanic and West Germanic occurred as a consequence of the departure of the Anglo-Saxons from their continental homelands and the sixth-century penetration by the Danes into Slesvig (Jutland). In the meantime, a Gothic idiom had evolved in southeastern Europe as a result of the ethnic isolation of the Goths. The linguistic arguments advanced have secured Kuhn's model (called the "Northwest Germanic theory") a large following.

However, the concept of West Germanic has not been accepted in all quarters. Thus Maurer (1952), by interpreting evidence provided by archaeology and the classical historians, replaced West Germanic with as many as three primary groups: North Sea Germanic (Ingveonic), the ancestor of Frisian, Saxon and English; Weser-Rhine Germanic (Istveonic), which developed into Franconian, etc.; and Elbe Germanic (Erminonic), which later became Upper German. For chiefly archaeological reasons, Maurer believed that there were particularly close links between the "Elbe Germanic" and "North Germanic"

groups (§ 4). Despite its dubious methodology (cf. Nielsen 1989, 74–77), Maurer's model has had considerable impact on the handbooks of German historical linguistics.

According to Kuhn, the immediate predecessor of both North Germanic and West Germanic was the language rendered by the older runic inscriptions of Scandinavia – an idiom which in art. 70 I define as a language (ca. A.D. 200–500) that antedates the inception of specifically Nordic features, but which nevertheless, in the present handbook, is designated by the term Ancient Nordic. If Kuhn is right, it is only to be expected that at least some of the linguistic parallels between Nordic and the West Germanic languages are shared also by Ancient Nordic (or Proto-Nordic).

2. North and West Germanic correspondences with Ancient Nordic participation

Since the Ancient Nordic consonants are probably identical to those reconstructed for Pre-Germanic, there would be no difficulty in deriving the consonant systems of all the other attested Germanic languages (including that of Gothic) from Ancient Nordic. However, certain innovations in the accented and unaccented vowel systems are shared only by Ancient Nordic and the North Germanic and West Germanic languages:

(a) While Gothic retained Gmc $*\bar{e}^1$ (< IE $*\bar{e}$) as a half-close, front vowel (\bar{e}), the vowel acquired a more open quality in the North Germanic and West Germanic languages, cf. ON *dād* 'deed', OE *dæd*, OHG *tāt* vs. Go. *gādēþs*. In Ancient Nordic, a similar opening is attested, cf. **makija** (Vimose chape, A.D. 250) 'sword', OSx. *māki* vs. Go. *mēkeis* and **-mariz** (Thorsberg chape, A.D. 200) 'famous', OSx./OHG *māri* vs. Go. *-mēreis*. It would appear that the early attestation of \bar{a} in Scandinavia is matched in Bavaria, where \bar{a} < \bar{e}^1 occurs perhaps as early as A.D. 170 (the last element of a Marcomannic leader's name is *-marios* according to the Greek author). For the fronting of \bar{a} to $\bar{e}(\bar{e})$ in OE (North Sea Gmc), see Nielsen 1998, 74, 97, 100–101.

The fact that Gmc $*\bar{e}^1$ is reflected as an open vowel in the North Germanic and West Germanic languages is probably due to the introduction of $*\bar{e}^2$, which pushed \bar{e}^1 into a half-open or open position. There are no reflexes of $*\bar{e}^2$ in AN, but the attestation of the open, long vowel \bar{a} in, e.g., **-mariz** is indirect evi-

dence of the integration of \bar{e}^2 in the accented long vowel system.

(b) The occurrence of **o** in Gallehus **holtjaz** (patronymic) and **horna** 'horn' and in **dohtriz** 'daughters' on the Tune stone (A.D. 400) is important because it shows that /o/ must have acquired phonemic status in Ancient Nordic (cf. below) just as it had in the North Germanic and West Germanic languages, cf. ON *goll* 'gold', OE/Ofris./OSx./OHG *gold* vs. Go. *gulþ* (Gmc $*gulþa-$). AN **holtjaz** and **dohtriz** both exhibit **o** /o/ on the analogy of forms with an unaccented *-a-* following the accented vowel, cf. $*holta-$ < $*hulta-$ and $*dohtar-$ < $*duhtar-$. The Ancient Nordic accented vowel is therefore no longer an allophone of /u/ ([o]) in complementary distribution (lowered, through *a*-umlaut, in front of unaccented /a/), but a phoneme (/o/) in its own right.

(c) The shift of final unaccented Gmc $*-\bar{o}$ (< IE $*-\bar{a}$) to *-u* in AN, cf. nom.sg.fem. (Darum 1 bracteate, etc.) **laþu** 'invitation, summons', (Opedal stone) **minu** 'my', **liubu** 'dear' is shared by all the North Germanic and West Germanic languages (Krahe I 1969, § 126.3), cf. nom.sg.fem. (\bar{o} -stem) *skqr* 'locks', OE *giefu* 'gift'; nom.pl.neut. (*a*-stem) ON *börn* (*u*-mutation) 'children', OE/OSx. *fatu* 'vats, jars' (in OE *bearn*, OSx./OHG *barn* 'children' *-u* had disappeared after a long syllable). In Gothic, the reflex of Gmc $*-\bar{o}$ was *-a*, cf. nom.sg.fem. *giba* 'gift', nom.pl.neut. *barna* 'children'.

(d) Unaccented Gmc $*ai$ and $*au$ were monophthongized to, respectively, \bar{e} and \bar{o} in AN, cf., e.g., dat.sg.masc. *a*-stem **woduride** (Tune stone) 'furious rider' and gen.sg. *u*-stem **magoz** (Vetteland stone) 'son'. Such monophthongizations are found in all the North Germanic and West Germanic languages, cf. dat.sg.masc. *a*-stem ON *degi* 'day', OE *dæge*, OSx. *dage*, OHG *tage* (< Gmc $*-ai$) and gen.sg. *u*-stem ON *sonar* 'son', OE *sunu*, OSx. *sunu*, OHG *frido* 'peace' (< Gmc $*-auz$). In Gothic, unaccented Gmc $*ai$ and $*au$ are retained, cf. 3sg.pres.subj. *baīrai* 'carries' (ON *beri*, OE/OSx./OHG *bere*) and gen.sg. *u*-stem *sunaus* 'son'.

Four additional items pertain to morphology:

(e) In comparison with nom.pl. *r*-stem AN **dohtriz** (Tune stone) 'daughters', ON *feðr* 'fathers', OE *dohtor*, OSx. *fader*, OHG *muoter* 'mothers', which regularly reflect the ending(s) inherited from Indo-European, the Go. form

dohtrjus ‘daughters’ constitutes an innovation in that the nom. pl. *u*-stem suffix (cf. *sunjus* ‘sons’) has replaced the inherited one. In view of the regular coalescence of the acc. pl. and dat. pl. *r*-stem suffixes with those pertaining to the *u*-stem (acc. pl. and dat. pl.) in Gothic, it is not surprising that the nominative plural should conform analogically to this pattern (Krahe II 1969, §23 and Brøndum-Nielsen GG, §470–71).

(f) Characteristically, the Germanic dialects possess two types of suffix in the comparison of adjectives: the vanishing grade inherited from IE **-is-* (Gmc **-izan*, **-ista-*) and the new Germanic formation with the vowel *-ō-*, cf. Go. *-ōza*, *-ōsts*. In Go., the *-iza*, *-ists* type predominates, the *ō*-comparison comprising some *a*-stem adjectives only. In Old High German both suffixes are frequent (Braune/Eggers 1975, §261, §263), but in Old Nordic and the North Sea Germanic languages, comparatives and superlatives with **-ōzan*, **-ōsta-* have the upper hand (ON *hvass* ‘sharp’, *hvassari*, *hvassastr*; OE *earm* ‘poor’, *earmra*, *earmest*; OSx. *liof* ‘dear’, *liobora*, *liobost*), although a few frequently occurring adjectives still reflect the Indo-European type of comparison. In Ancient Nordic there is only one attested adjective in the comparative or superlative; it is of some interest that the adjective (superlative) in question exhibits *ō*-vocalism, viz. Tune stone **arjostez** ‘noblest’.

The association of the *ō*-suffix with the *a*-(*ō*-) stems may account for the expansion of the suffix, seeing that it is precisely these adj. stems which gradually came to prevail (Brøndum-Nielsen, GG §530–531).

(g) An independent (formal) passive is preserved by Gothic (cf. 1/3sg. pres. *haitada* ‘am/is called’, pl. pres. *haitanda* ‘are called’) but lost in the North Germanic and West Germanic languages except for a few isolated traces, cf. ON *heiti* ‘am called’ (Noreen 1970, §542 Anm. 2), OE *hätte* ‘is/was called’ (Campbell 1959, §727), MLG/MDu. *hette* ‘was called’ (Schwarz 1951, 115). Ancient Nordic exhibits similar traces, cf. Kragehul spearshaft **haite**, Järsberg stone **h(a)ite** ‘am called’.

(h) Contrary to Gothic, which retained the reduplicated weak preterite plural endings *-dēdum*, *-dēduþ*, *dēdun* (cf. the independent OHG verb pt. pl. *tātum*, *tātut*, *tātun* ‘did’), Ancient Nordic agrees with the North Germanic and West Germanic languages in exhibiting suffix shortening, cf. 3pl.pt. Tune stone **dalidun**

‘shared’ (Krause 1971, 169–70), ON *tolðu* ‘counted’, OHG *frumitun* ‘furthered’, pl.pt. OSx. *fremidun*, OE *fremedon* vs. Go. *gawandidēdun* ‘(they) turned’.

Unlike the shared phonological innovations (a–d), the four morphological items are clearly of limited significance: one Ancient Nordic/North Germanic/West Germanic parallel results from innovation in Gothic (e) and another from common loss in comparison with Gothic (g); the increasing use of *-ō-* described in (f) may be classified as an analogical innovatory development; and finally the parallel discussed in (h) is best seen as the product of suffix simplification.

3. North and West Germanic parallels not evidenced by Ancient Nordic

A considerable portion of the 55-item corpus of correspondences between North Germanic and West Germanic compiled in Nielsen 1976 and 1985, 215–20 is attributable to loss and, especially, innovation in Gothic. Since it is not our purpose here to reconstruct Proto-Germanic, “parallels” that have come about in this way have been more or less ignored below. Similarly, the large number of shared features that result from weakening, loss, simplification or analogical developments, have been included only to a very limited extent – and in principle only where Ancient Nordic evidence is available, cf. sect. 2 (f–h) – because of the chronological factors involved. I am thinking here of the late transmission of the North Germanic and West Germanic languages in comparison with Gothic. This leaves us with a restricted inventory of shared innovations, four of which were dealt with in sect. 2 (a–d). Below, the most significant of the remaining stock of innovations will be adduced:

(a) The dat. sg. fem. nominal ending inherited from Indo-European has been preserved in the Gothic strong adjectives, cf. *blindai* ‘blind’ (Lat. *bonae* ‘good’), whereas it has been replaced by the pronominal suffix in the North Germanic and West Germanic languages, cf. dat. sg. fem. ON *langri* ‘long’, OE *hwætre* ‘sharp’, OFris. *gōdre* ‘good’, OSx. *blinderu* ‘blind’, OHG *blinteru*.

(b) The Gothic 2pl. nom. personal pronoun *jus* is a regular reflex of the Indo-European form as suggested by Av. *jūš* and Lith. *jūs* (Krahe II 1969, §33). The corresponding

NGmc and WGmc forms, ON *ér*, OE *gē*, OFris. *jī*, OSx. *gī*, *gē*, OHG *ir*, presuppose **jīz*, probably a transformation of Gmc **jūz* on the analogy of 1pl. personal pronoun **wīz* 'we', cf. Go. *weis*, runic Sw. **uiz** (Peterson 1994, 11), OHG *wir*, etc.

It is noteworthy that the 2dual nominative also shows innovated forms in North Germanic and West Germanic, cf. ON *it*, OE/OSx. *git* (Lith. *jūdu*). The Gothic form is not attested, but would undoubtedly have been **jut* (Rosenfeld 1954, 386–87).

(c) In contradistinction to Gothic, the North Germanic and West Germanic languages exhibit a reinforced demonstrative pronoun based on the normal demonstrative pronoun plus the particle *-si*, cf. Go. *sai*, OHG *se* 'see' (Brøndum-Nielsen, GG § 575A). The construction is most clearly reflected in runic Danish and Swedish, cf. nom.sg.masc. **sasi**, acc.sg.masc. **þansi** (Glavendrup, Tryggevælde), dat.sg.masc. **þaimsi**, nom.sg.fem. **susi**, acc.sg.fem. **þaisi** (Tryggevælde), nom./acc.sg.neut. **þatsi**, etc. (Brøndum-Nielsen, GG § 575; Peterson 1994, 51–54). Old High German is the West Germanic language to have deviated the most from this pattern (Braune/Eggers 1975, § 288), all case forms (with the exception of nom.sg.masc. and nom./acc.sg.neut.) being based on the uniform secondary stem form **pe(s)*- followed by inflectional endings modelled on the strong adjectival declension. Old English, Old Frisian and Old Saxon show instances of both systems, Old English being the most conservative of the three in retaining internal inflection in not just nom.sg.masc., instr.sg.masc., nom./acc.sg.neut., instr.sg.neut. and nom.sg.fem., but also in acc.sg.fem. and nom./acc.pl.neut., cf. OE *þās* vs. OSx. *thesa*, *these*. With the exception of certain case forms ending in *-a* (nom.sg.masc., gen.sg.masc., nom./acc.sg.neut., cf. Krahe II 1969, § 38) instead of *-si*, classical Old Nordic (Oícel.) only has forms with secondary stems, final inflection probably being more in accordance with Germanic linguistic instincts than internal declension.

The introduction of a reinforced demonstrative pronoun was an innovation common to all the North Germanic/West Germanic languages. When it took place and whether it occurred at the same time everywhere, is difficult to say. The loss of substance and distinctiveness and subsequent reinforcement through extended or new forms are well-known phenomena in the development of pro-

nominal and deictic systems (Samuels 1972, 84). The raw material for producing new North Germanic/West Germanic forms was available everywhere and the innovation could have come about in more than one place. Contact is likely to have accelerated the expansion of the innovation. The non-occurrence of the reinforced demonstrative pronoun in Ancient Nordic is perhaps just due to the narrow section of the sociolinguistic continuum reflected in the language of the older runic inscriptions.

(d) As has often been pointed out, Gothic is the only Germanic dialect to retain reduplicated preterites, and despite the traces that can be found in other dialects, especially in Old English, we here face a loss common to North Germanic and West Germanic.

However, the uniform way in which North Germanic and West Germanic transform the reduplicated verbs is interesting. Where the Gothic reduplicating preterite has the root vowel *ai* as in the present tense, e.g. *haihait*, infinitive *haitan* 'command, call', the vowel *ē*² seems to be the common product of contraction in North Germanic and West Germanic cf. ON/OE/OFris./OSx. *hēt* (OFris. also *hīt*), OHG *hiaʒ*. Traces of reduplication are retained in Old English/Anglian poetic language, cf. *heht* 'commanded', *leolc* 'jumped' (Campbell 1959, § 746). And where Gothic has *au* (present and preterite), the resulting North Germanic/West Germanic preterite vowel is apparently *eu*, cf. ON *jók* 'increased'; OE *bēot* 'beat' (preterite); OSx. *hliop* 'ran', OHG *liof* (OFris. *hlēp* (*hlīp*)) points rather to *ē*² as the source of origin; unfortunately preterite forms of, e.g., *āka* 'to increase' are not attested in OFris. [Steller 1928, § 97]). Old High German may have retained a few reduplicated preterites, cf. *steroz*, infinitive *stōʒan* 'push', etc. (Braune/Eggers 1975, § 354 Anm. 3; Schwarz 1951, 259; Krahe II 1969, § 75). As the third and final point, the reduplicated vowel and the graded root vowel as in the type Go. *lailōt*, infinitive *lētan* 'let, allow to', are contracted into NGmc/WGmc *ē*², cf. ON/OE/OFris./OSx. *lēt* (OFris. also *līt*), OHG *liaʒ*. ON *sera* (< **se-zō*) 'sowed' and OE *leort* 'allowed to', *reord* 'advised' are reduplicated survivals (Noreen 1970, § 506, § 317.4; Brøndum-Nielsen, GG § 646; and Campbell 1959, § 746).

Although the loss of reduplication is a common North Germanic/West Germanic loss, the further development (transformation) of Germanic reduplicated verbs in North

Germanic and West Germanic thus seems to be parallel in three respects. It is significant that neither of the new preterite vowels (\bar{e}^2 , *eu*) occurs in the nominal and verbal derivational morphology of the Germanic languages (Schwarz 1951, 107; Hirt II 1932, 144; Heusler 1913, §129 Anm.; v. Coetsem 1994, 106). This suggests that the loss of reduplication and the subsequent vocalic innovations were relatively late developments. It further suggests that the systemic origin of \bar{e}^2 had nothing to do with the transformations of Germanic reduplicated preterites in North Germanic and West Germanic, but that such forms only represented lexical additions to the new phoneme (v. Coetsem 1994, 99–102).

The next four items are all phonological correspondences:

(e) The initial Gmc consonant cluster *þl-* is retained in Gothic, but becomes *fl-* in the North Germanic and West Germanic languages, cf. ON *flýja* ‘to flee’, OE *flēon*, OFris. *fliā*, OSx./OHG *flīohan* vs. Go. *þliuhan* – in other words, a shared North Germanic/West Germanic innovation (Noreen 1970, §221,2; Luick I.2 1940, §635,1; Kuhn 1955, 15–16). For a different point of view, see Prokosch 1939, 87.

(f) While Gmc *z* (< IE *z* or *s* (Verner’s Law)) is retained in Gothic as *z*, in final position as *s*, it becomes *r* in NGmc and WGmc, in NGmc generally and in WGmc medially and in final accented position (final unaccented *-z* disappeared early in WGmc, cf. Luick I.2 1940, §629 Anm. 1 & 3), cf. Go. *maiza* ‘more’, *dīus* ‘wild beast, animal’; ON *meiri*, *dýr*, OE *māra*, *dēor*, OSx. *mēro*, *dior*, OHG *mēro*, *tior* < Gmc **maizan-*, **deuza-* (Krahe I 1969, §80; Hirt I 1931, 96; Luick I.2 1940, §629; Campbell 1959, §404; Brunner 1965, §181; Noreen 1970, §224, §265).

The shift from *z* to *r* is not easy to date. Although Schwarz (1951, 257) believes that he has evidence to show that the development had been completed by the fourth century A.D. in pre-Old High German, there are no early, unequivocal examples of the shift in early West Germanic. The chronological vagueness expressed by Braune/Eggers (1975, §168) concerning the transition to *r* in Old High German (“im Süden spätestens im 6. Jh.” [in the south no later than in the sixth century]) is typical of the caution with which the dating problem is treated in our handbooks.

In Ancient Nordic, Υz occurs rarely in medial position: nom. sg. masc. *a*-stem **hrāzaz** ‘the agile one’ (Rö stone, A.D. 400), **harāzaz** ‘the agile one’ (Eidsvåg stone, A.D. ca. 450); nom. sg. masc. *a*-stem **hrozaz** ‘the quick-moving one’, dat. sg. masc. *a*-stem **hroze** ‘for H.’ (Antonsen 1975, 80), cf. OE/OSx. *hrōr* ‘stirring, busy, active’; acc. sg. neut. *a*-stem **azina** ‘stone slab’ (By stone, A.D. ca. 550). The Hitsum bracteate, discovered in Friesland but believed by Düwel (1996, 29) and others to have been imported from Scandinavia, exhibits the form **fozo** ‘relative’ (Düwel 1983, 126–27 with further references, cf. also Krause 1971, 150). Assuming **fozo** to be a nom. sg. masc. *n*-stem name, Seebold (1996, 197–98) sees the form as Low Franconian (Continental West Germanic) rather than a name deriving from Friesland or Scandinavia (Jutland), where the ending would have been *-a*. See also Nielsen 1997, 10–11.

It seems safe to conclude that the change of *z* to *r* had not been implemented in Scandinavia by the end of the Ancient Nordic period. There are no inverted spellings (no confusion of the runes Υ and \mathfrak{k}) in medial position. In West Germanic territory, the shift may well have occurred earlier than in Scandinavia, but precise chronological clues are not available.

(g) The West Germanic gemination (consonant doubling) before *j* is well-known, every consonant except *r* being affected after short syllables, cf. the Class I weak infinitives, *ja-||jō*-stem nouns, etc: Go. *satjan* ‘to set’, *kuni* ‘kin’; OE *settan*, *cynn*, OFris. *setta*, *kenn*, OSx. *set-tian*, *kunni*, OHG *setzen*, *chunni*. Less familiar is the Nordic consonant gemination after a short vowel before *j*, with *g* and *k* being doubled in such cases, cf. *hyggja* ‘to think’ (Go. *hugjan*; OE *hycgan*), *leggja* ‘to lay’ (Go. *lagjan*; OE *lecgan*), *bekkr* ‘brook’ (< **bakja-*), *lykkja* ‘loop, knot’ (cf. *lúka* ‘to finish’), cf. Brøndum-Nielsen, GG §274,1; GG §344; and Noreen 1970, §279,1.

Very likely, West Germanic consonant gemination is an innovation which spread to Nordic, although on a reduced scale; there certainly seem to be no chronological objections to such a conclusion. The Weser runes from ca. A.D. 400 (Antonsen 1993, 15) exhibit the geminated form **kunni** ‘kin’, identical to its OSx. counterpart, cf. above. This does not run counter to Luick’s assessment (I.2 1940, §631 Anm. 7) that West Germanic gemination took place after the second but not later than in

the fifth century A. D., cf. also Schwarz 1951, 262. In reaction to Noreen's vague assignment of Nordic consonant doubling (1970, § 279.1) to before 900, Brøndum-Nielsen (GG § 274 Anm. 3) remarks that the consonant lengthening is undoubtedly a good deal older.

(h) As in all other positions, IE *o* preceding a single nasal in a medial unaccented syllable develops into Go. *a*, cf. dat. pl. masc. *a*-stem *dagam* 'days' and 1pl. pres. ind. *baíram* 'carry' (< IE **bheromes*), whereas the vowel is retained as *o* (> *u*) in NGmc and WGmc because of the following nasal, cf. ON *dǫggum*, OE/OSx. *dagum*, OHG *tagum* and ON *berum*, OHG *berumēs*, cf. Krahe I 1969, § 45; Luick I.1 1921, § 294.3; Brøndum-Nielsen, GG § 119 Anm. 2; and Streitberg 1974 [1896], § 54.

Ancient Nordic has no comparable forms, but the Stentofte inscription exhibits two dat. pl. masc. *a*-stem forms in **-u-**, **hAborumz** 'he-goats' and **hagestumz** 'stallions' (Santesson 1989, 226–27).

From this we may conclude that unaccented *o* remained before a nasal in Proto-Germanic, that it became *a* only in Gothic, and that *o* in this position was eventually incorporated as *u* in the unaccented systems of the North Germanic and West Germanic languages.

In the absence of Ancient Nordic and other direct or indirect evidence, the eight parallels adduced raise some very serious questions to which, at best, only tentative answers can be provided:

- When precisely were the various innovations (parallels) introduced?
- Did they come into being before, during or after the Ancient Nordic period (A. D. 200–500)?
- Did they all occur at the same time in North Germanic and West Germanic? In other words, to what extent could the shared innovations have arisen independently, and to what extent did they spread through contact?

4. Parallels between North Germanic and Old High German

Until the publication of Maurer's *Nordgermanen und Alemannen*, no attempt had been made to compile lists of features shared by Old Nordic and Old High German (Maurer 1952, 80). Our Ancient Nordic material actually exhibits one item with parallels in the

two later languages, cf. dat. sg. masc. ON *syni* 'son', early OHG *suniu* whose endings, like that of the Ancient Nordic personal name dat. sg. masc. **kunimu(n)diu** (Tjurkö bracteate), reflect the IE locative suffix **-ēu*.

Maurer himself (1952, 80–84) posits four "grammatical" correspondences between Nordic and Upper German (southern German), drawing attention at the same time to the relevance in this context of his inventory of six parallels that, in addition to Nordic and Upper German, comprises also Gothic (1952, 70–72). Both lists will be evaluated below.

Despite the title of his book and his lists of correspondences, Maurer seeks not so much to establish a primary Nordic-Upper German dialect group as to weaken the traditional theory of a West Germanic linguistic unity (1952, 84). Maurer took inspiration from the archaeological literature dealing with the period under investigation, thinking that the later speakers of Nordic and Upper German sprang from, respectively, the "North Germanic" and "Elbe Germanic" culture groups posited on the strength of material finds dated archaeologically to between the first century B. C. and ca. A. D. 300 (1952, 132). The Nordic-Upper German parallels had arisen, fully or in part, at a time of early "North-Germanic"/"Elbe Germanic" proximity in northern Europe. Here the links between the "Elbe Germanen" and the "Nord Germanen" were closer than those between the "Elbe Germanen" and the Anglo-Saxons or than the ties linking the Anglo-Saxons to the "Nord Germanen" (1952, 84).

The publication of Maurer's book in the 1940s stimulated Eduard Kolb (1957, vii, 1) to undertake an investigation of the lexical material shared solely by Alemannic and North Germanic. In the first two editions of his book (1942; 1943), Maurer had himself posited a list of such words, but in reaction to heavy criticism Maurer (1952, 6) decided not to include it in the third edition. Nevertheless, Kolb continued with his plans and was able to identify a total of 170 lexical parallels, 36 of which were treated in considerable detail (1957, 23–124). In a review of Kolb's book, Kuhn (1957–58, 145–48) offered important arguments for assuming that Kolb's lexical inventory should be reduced, while Kolb's findings met with Senn's approval (1958, 302).

Since the present article is concerned only with phonology and morphology and not with the lexicon (for the drawbacks to setting up prehistoric dialect groups by means of lexical

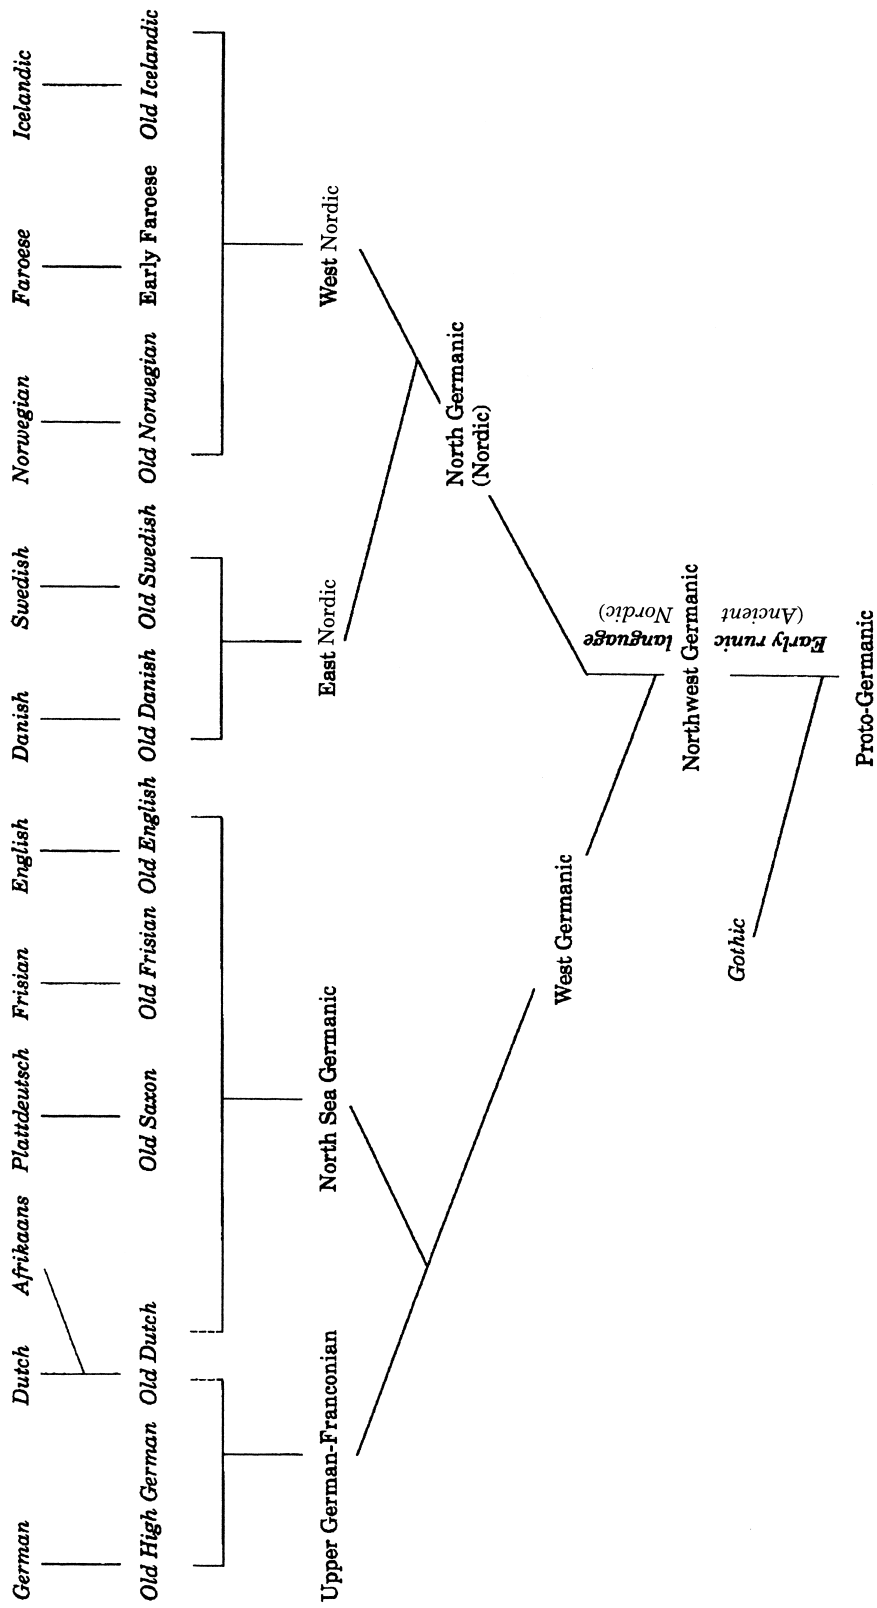

Fig. 64.1: Attested languages have been rendered in italics.

criteria, see Nielsen 1989, 146–47), we shall confine ourselves to considering how far Maurer's points are borne out by the two inventories (§ 4.1–2) examined below.

4.1. Maurer's Nordic-Upper German (Alemannic) correspondences

(a) The *i*-umlaut of *a* to *e* is a feature which Maurer (1952, 81–82) sees as an innovation subjected to various restrictions in both Nordic and Upper German, and which he thinks was brought to southern Germany as an inherent linguistic tendency by the “Elbe Germanen”. To adduce the *i*-mutation of *a* as a shared innovation is, in my view, not immediately comprehensible. In Upper German the shift was prevented by certain consonant groups, whereas in Nordic *i*-umlaut of back vowels was absent in short syllables, unaccented *i* disappearing without causing mutation. Chronologically, the change was recorded relatively late: in the eighth century in southern Germany (cf. Braune/Eggers 1975, § 51 Anm. 1), and slightly earlier in Nordic, cf. (pre-)ODan. *Ongendus* (ca. 700) < **-gandiz* (Brøndum-Nielsen I 1950, § 78 Anm. 1). Finally, I am hesitant about attaching too great importance to shared features which result from conditioned phonetic change (the principle of least effort). I have discussed this problem in detail elsewhere, cf. Nielsen 1985, 89–96, esp. 89–93.

(b) Another common development governed by the principle of least effort is consonant cluster simplification of the combinations *wl*- and *wr*- seen in, e.g., ON *líta* ‘to gaze, look’, OHG *antlizzi* ‘face’ vs. OE *wlitan*, *andwlita* and OIcel. *reiðr* ‘angry’, OHG *reid* ‘frizzy, curly’ vs. OE *wrāþ* ‘angry’, OSx. *wrēð*, OFris. *wrēth*. The weight carried by this parallel must be regarded as insignificant, cf. Nielsen 1985, 94–95.

(c) Maurer (1952, 82–83) sees a correspondence between Nordic and Upper German in the pronunciation of Gmc *g* < IE *gh* (and vernerized *k*) as a stop consonant in contradistinction to the fricative pronunciation prevailing in the North Sea Germanic languages. The major difference between Ancient Nordic and Old Nordic, on the one hand, and the North Sea Germanic languages on the other is that the originally palatal allophones of /*g*/ merged with /*j*/ in the latter group. Otherwise, the allophones of /*g*/ would appear to have come out as stops initially and as fricatives

intervocally. Because of the second consonant shift the situation was somewhat different in Upper German, which probably only had stop allophones, cf. Braune/Eggers 1975, § 149 and § 88 Anm. 3.

The fact that Ancient Nordic, Old Nordic and Upper German did not, like the North Sea Germanic languages, undergo a “split plus merger” process has little bearing on Germanic dialect grouping. Not only is this “parallel” a common retention, but the merger of some /*g*/ allophones with /*j*/ “shows phonemicisation at its minimum relevance” (cf. Samuels 1972, 39): allophones from one phoneme join another existing phoneme to which their distinctive features have become more similar owing to conditioned phonetic change.

(d) Finally, the open reflexes of Gmc \bar{e}^1 on ON (\acute{a}) and OHG (\bar{a}) are set apart from the mid-front vowels thought to have been preserved by OE (WSx. $-\bar{x}$) and OFris. (\bar{e}). We believe that Gmc \bar{e}^1 must also have become \bar{a} in the North Sea Germanic languages before being fronted. See Nielsen 1994, 118–21, 124–25 and above, § 2 (a).

4.2. Maurer's Nordic-Gothic-Upper German correspondences

Four of the six parallels listed by Maurer (1952, 71) in this category echo some of Frings' “Ingveonic” (i.e. North Sea Germanic) innovations, the latter being matched by features shared by the remaining Germanic languages (Frings 1932, 32 Anm.).

Not surprisingly, the Gothic, Nordic and Upper German correspondences tend to be common retentions. This holds true of the distinction between the accusative and the dative preserved in the 1/2 sg. personal pronouns, e.g. Go. *mik*, *mis* ‘me’, ON *mik*, *mér*, OHG *mih*, *mir* (cf. also AN dat. sg. *mez* ‘me’ [Opedal stone]) vs. acc./dat. sg. OE $m\ddot{e}$, OSx./OFris. $m\ddot{i}$.

The reflexive pronoun is retained in Go. (acc. *sik*, dat. *sis*), ON (*sik*, *sér*) and OHG (*sih*), but not in the North Sea Germanic languages.

Further, Go. nom. sg. fem. *si* ‘she’ is considered an inherited feature along with OHG (Bavarian) *si*, which contrasts with the “innovatory form” *sio*, *siu*. Maurer (1952, 71) brackets the latter forms as Old English, Old Saxon and “partly Old High German”. As far as Old English is concerned, Maurer is wrong: this language has no nom. sg. fem. forms of the 3 personal pronoun in *s*- (Nielsen 1985, 165,

227). For the Old High German forms, see Braune/Eggers 1975, § 283 Anm. 1f.

And finally, the pronominal declension of the strong adjective in the nominative singular neuter, cf. Go. *blindata* ‘blind’, ON *blint(t)*, OHG *blintaz*, has no counterpart in the North Sea Germanic languages, cf. OE/Ofris./OSx. *blind*. In Nielsen 1985, 108–9 it is suggested that variation between pronominal and nominal (cf. the North Sea Germanic languages) endings may have been a feature of the early Germanic adjective in the nom./acc.sg. neuter. If the Gothic, Old Nordic and Old High German forms are innovations, (independent) interparadigmatic analogy may be held responsible, pronominal models for the introduction of the endings being present everywhere.

Maurer (1952, 72) adds a fifth item borrowed from Frings, viz. the variant forms denoting the interrogative adverb ‘how’, cf. Go. *hwaiwa*, ON *hvé*, OHG *hwē* (< the adverb **hwaiw-* [Braune/Eggers 1975, § 291 Anm. 1]) vs. OSx. *hwō*, OE/Ofris. *hū* (< interrogative pronoun instrumental **hwō* [Nielsen 1985, 116–17]). The two groups of languages have, of course, made common selections of alternative forms. Since it has been a choice between an adverb and the instrumental case of an interrogative pronoun, the parallel is close to being a lexical one, its significance diminishing accordingly.

The only one of the six parallels adduced independently by Maurer (1952, 70–71) is the reflection of Gmc *eu* as *iu* in Gothic, Old Nordic and Upper German (Alemannic), where Old English, Old Saxon and Old Franconian show greater tendency towards introducing a more open second element (*eo*, *io*) before *a*, *e*, *o* in the following syllable. By way of illustration, I would like to offer the following examples: Go. *liufs* ‘dear’, ON *liúfr*, Upper German *liuf* vs. OE *lēof*, OFris. *liāf*, OSx. *liof*, OFranc. *liob*. In AN *eu* is retained in **-leubaz** ‘dear’ (Skärkind stone) and has become *iu* before *u* in **liubu** (Opedal stone). Limited weight should be attached to this item, seeing that it has to do partly with conditioned phonetic change and partly with diphthongs whose quality is dependent on the way in which the diphthongs are integrated in the respective vowel systems.

The linguistic ‘‘facts’’ compiled by Maurer to underpin the original geographical proximity of the ‘‘North Germanic’’ and ‘‘Elbe Germanic’’ culture groups in northern Europe prior to the southward expansion of the ‘‘Elbe

Germanen’’ have proved to be founded on extremely weak evidence. Personally, I would hesitate to label a single one of Maurer’s ten parallels (§ 4.1–2) as being of any real value.

There is one item which links Ancient Nordic to Old High German. As was pointed out in § 4, the dat.sg.masc. *u*-stem ending *-iu* occurs in the Ancient Nordic personal name **kunimu(n)diu** as well as in early OHG *suniu* ‘son’. The instances of Ancient Nordic conservatism seen in § 4.2, viz. the retention of a specific dat. sg. form in the lsg. personal pronoun, **mez**, and of the diphthong *eu* as **eu** or **iu** (before *u*), is hardly surprising in view of the age of the older runic inscriptions of Scandinavia.

5. The North-West Germanic theory: a revised model

While Maurer’s scenario for explaining the correspondences between North Germanic and West Germanic (Alemannic) must be described as a dialect-geographical cul-de-sac, the same conclusion cannot be drawn with regard to Kuhn’s theory (§ 1, cf. also § 2–3), even if, on closer inspection, the latter model would seem to require modification.

According to Kuhn, the split between Nordic and West Germanic took place close to A. D. 500. In art. 70, where I list some of the major isoglosses separating Ancient Nordic from Pre-Germanic, on the one hand, and from Old Nordic, on the other, it is pointed out that the earliest Nordic innovations were attested in the runic inscriptions of the sixth century.

However, the most spectacular West Germanic divergences from the purported North-west Germanic successor language to Pre-Germanic are likely to have come into being in the third and fourth centuries A. D., cases in point being the loss of unaccented **-z* and the gemination of consonants before *j*, which are both attested in the Weser runes from ca. A. D. 400 (Antonsen 1993, 15), cf. the personal name nom.sg.masc. **ulu:hari** (vs. AN **swabaharjaz**) and **kunni** ‘kin’ (cf. OSx. *kunni* and ON gen.pl.neut. *kynja*).

In a recent book I have posited the following tree diagram illustrating the development of the Germanic languages (1998, 57):

It will be noted that the early runic language (Ancient Nordic) is equated with Northwest Germanic, at least until the time when West Germanic branched off, an event which may

have preceded the inception of the earliest Nordic innovations by two centuries or more. The early runic language (Ancient Nordic) was gradually succeeded by North Germanic (Old Nordic).

It should not be overlooked that the interrelations illustrated by means of this Germanic family tree give a somewhat simplified picture of the linguistic developments: the diagram does not provide any information on, e. g., the linguistic parallels linking North Germanic to the North Sea Germanic languages, cf. Nielsen 1985, 187–215 and article 65. And the model does not envisage the possibility that the early runic language (Ancient Nordic) could be interpreted as the predecessor of Old Nordic and West Germanic minus Old High German (i. e. the North Sea Germanic languages), cf. Antonsen 1975, 26; Nielsen 1998a, 542–52; and article 70 in this volume.

It is outside the scope of the present article to pursue this line of enquiry any further, but the relationship between Nordic and North Sea Germanic is among the problems that have been taken up for discussion in a monograph devoted to the question of the dialect-geographical position of Ancient Nordic within Germanic (Nielsen 2000). Needless to say, much of what has been put forward here on the relation between Nordic and West Germanic is contained also in my recent monograph.

65. Nordic and North Sea Germanic relations

1. Introduction
2. North Sea Germanic and Nordic parallels
3. Frisian loanwords in Nordic
4. Nordic loans in Frisian
5. Conclusion
6. Literature (a selection)

1. Introduction

The grouping of the Northwestern Germanic dialects is still a hotly discussed topic (see article 64). Arguments have been advanced that originally there was a North-West-Germanic group which split up in the first centuries A. D. The oldest runic inscriptions from Jutland would then be relics of this early more or less uniform dialect (e. g. Antonsen 1975; Andersson 1995, 33). These dialects have common developments which separate them from East Germanic. Taking this view, West Germanic separated from North Germanic (Nielsen 1998, 56–57) by developing special features like the gemination of consonants before /j/ and less regularly before /r/ and /l/; loss of final -z, cf. OE *dæg*, OFris. *deg*, OSx. *dag*, OHG *tag* vs. ON *dagr* ‘day’; differences in the treatment of -i and -u after long and short roots; the development of *ð* to *d*; and special developments of -s-stems, cf. Nielsen 1998.

Ca. 100–450 A.D., North Sea Germanic developed as a separate group and comprised the later Old English and Old Frisian dialects, and probably also the dialects in the coastal areas of Belgium (Flanders), the Netherlands and Northern Germany. In these last areas, southern influences, Low Franconian and Old High German, partly superseded the earlier

North Sea Germanic character, so that we have only remnants of the original language in place-names and modern dialects (Schönfeld 1970, § 29).

2. North Sea Germanic and Nordic parallels

Since the speakers of the later OE dialects originated from Northern Germany and Denmark according to historical sources, it is no surprise that the Nordic languages have some features in common with North Sea Germanic. On the other hand, it also seems quite clear that there are later connections, too, e.g. in the contacts between North Frisian and the neighbouring Danish dialects. But even the commercial trade between Frisia and Scandinavia may have left some traces. Influences between Nordic and North Sea Germanic thus went both ways.

Just as the West Germanic innovations have some parallels in Nordic (art. 64), so also have a few of the specific North Sea Germanic peculiarities a parallel there.

(1) A very specific characteristic of North Sea Germanic is the disappearance of nasals before /f, þ, s/ as in OFris./OE/OSx. *fīf* ‘five’, OE *tōþ* ‘tooth’, OE/Ofris. *ūs* ‘us’. The same development appears in Old Norse, but only before /s/: ON *óss, áss* ‘Ase’, cp. OFris./OE *ōs-* in personal names (< Gmc **ansu-*).

(2) The monophthongization of Germanic /ai/ in OE and OFris., e. g. OE *stān*, OFris. *stēn* < Gmc **staina-* ‘stone’, seems to have spread from the North Sea area to Northern Ger-

many and in the 10th and 11th century to Denmark and Sweden (Feitsma 1962, 99). Most striking is that OE had /a:/ but OFris. seems to have preferred /e:/. This latter form is also the one that spread to the east and to the north. In the same way, Gmc /au/ became /a:/ in OFris. and /o:/ in OSx.: OFris. *bām*, OSx. *bōm* 'tree'. It seems likely that there is a connection with the spread of the monophthongization of Gmc /au/ to /ø:/ in East Nordic since about 900 (Skautrup 1944).

(3) OE and OFris. both show palatalization of initial /k/ and /g/: OE *cirice*, OFris. *szurke* 'church'. A similar development also appears in the Nordic languages, but several centuries later. The beginnings of this phenomenon in Old English and Old Frisian lie in prehistorical times. The same development in some of the Nordic languages appears in the late Middle Ages. Here we have to assume that there is no direct connection, but more likely a common tendency between related languages.

(4) Final *-n* disappears in OFris., ON (and ME): OFris. *kāpa*, ON *kaupa* 'to buy'. An exact dating is not possible in the case of Old Frisian and Old Nordic, as the disappearance of *-n* happened in the centuries before the start of the manuscript tradition. But in view of the runic inscriptions, it seems probable that this development occurred earlier in Old Nordic than in Old Frisian. In this case we also should reckon with parallel developments, even more so when it is taken into consideration that this tendency is still going on. In Modern Dutch *-n* is written in infinitives and plural forms, but is generally not pronounced in everyday speech.

(5) In the case of nom. acc. pl. OFris. *āgen* and ODan./OSw. *oghon* 'eyes', Hammerich (1937) includes this among the Frisian-Nordic parallels. As *-n* also appears in OHG and OE, it is more probable that the West Germanic languages and ODan./OSw. retained a Germanic form, independently from each other. The younger and longer forms OFris. *āgene* and ODan. *ogh(e)næ* may be due to influence from the genitive and/or may have come into being as an ending that was clearer to perceive.

3. Frisian loanwords in Nordic

A much discussed topic is the question whether Frisian linguistic traits and loanwords spread to Scandinavia in the period from the 5th to the 11th century A.D. There is no doubt that commercial connections between Frisia and the Scandinavian countries

existed, cf. Lebecq 1994. Through these commercial ties, Old Frisian words could have spread to Scandinavia; the difficulty is that there also was strong Middle Low German influence in the later Middle Ages. The literary documents from Scandinavia begin in the 12th century, and the linguistic differences between Old Frisian and Middle Low German are normally not so very great as to be able to distinguish between loans from the one language to the other in the case of separate words. Therefore it is very difficult to say whether a specific word is a loan from Frisian or from Low German. Elis Wadstein (1932) has proposed many Frisian loans, but his ideas have not been generally accepted. Löfstedt (1963–65) mentions about 40 words that are paralleled in North Sea Germanic and ON. A part of them can be attributed to the common ancestor, NwGermanic, see also Lerchner (1965). Only a few words can be attributed to OFris. on linguistic grounds:

(1) OFris. *bāken* 'beacon' with Frisian /a:/ from Gmc /au/ (< **baukana-*). The word must be a loan from the period before the 12th century (Feitsma 1962, 108–9). Since the same word in its Frisian form also appears in Dutch and Low German, it can be assumed that it was an important and much used word in the coastal areas of the North Sea.

(2) Also *bāt* 'boat' has been mentioned as a Frisian loan into Nordic. The word, however, does not appear in Old Frisian texts, and the modern Frisian form *boat* must be a loan from Dutch or English. Relics of an OFris. form with /a/ can, however, be found in North Frisian dialects. But as Feitsma (1962, 109) points out, it is uncertain, whether the loan came from OE or OFris.

(3) *Fredag* 'Friday' is often considered a loan from Frisian, as the Norse form should be *Friggjar-dagr* 'dies Veneris' (Feitsma 1962, 110).

(4) ON *klæði* 'clothes' may also be an early loan from OFris. *klath* or *kleth*, although it is difficult to explain it (Feitsma 1962, 111–12).

A number of other words have been explained as loans from OFris., cf. Feitsma 1962, 112–20: e. g. ON *blek*, *kerra*, *penning*, *sekkr*, ODan. *mættæł*, *strætæ*, *skræde*, *skrædder*, *gældkære*, *læst*, *mærsk*, *pæl*, and *stæfn*. As some of them do not appear in Old Frisian texts, their provenance is rather uncertain. Old English and in some cases even Middle Low German could be the origin. The question should be asked

in which word-field we have to place the separate words. If the historical background is considered, it is to be expected that loans from Old Frisian should be restricted to the following areas: shipping, trade (products, money) and maybe even Christian missions. The examples mentioned above all belong to one of these fields.

4. Nordic loans in Frisian

On the other hand, it is sometimes assumed that the Vikings might have spread Nordic linguistic traits in the North Sea area. For the British Isles, there is no doubt that they did. How far they influenced the language in the Frisian area is unknown. The Vikings had occupied some territories in the Netherlands during the 9th century, where they got the task to keep their countrymen away. Some scholars have therefore assumed that there were Viking settlements in the area and as a consequence some ON influence on semantic and juridical fields (Gosses, Miedema). But according to Blok (1978) it is rather unlikely that the Vikings colonized these lands to the extent that they did in the Danelaw. And, more important, the Viking fiefdoms that are mentioned in sources from the 9th century lay in the southwestern and central parts of the Netherlands. That means that they at the closest lay at the edge of the Old Frisian area.

Until recently, archaeologists had not found any definite remnants of Viking settlements or even traces of Vikings who lived in the Frisian area. Only isolated finds show that they really had been in the Netherlands at all (Working Paper 1971). A few years ago archaeologists discovered a Viking treasure on the former island of Wieringen in the Dutch province of North Holland (Besteman 1997). Since some of the golden objects found there originated from Denmark, it is now assumed that this is proof that at least some Norsemen had settled in the northern parts of the Netherlands. This is corroborated by the mention of a Viking in Friesland in the *Annals of Fulda*. This Norse emigrant led the Frisians in their attempt to beat off a Viking attack in the year 873. The wording in these annals, however, seems to suggest that he was an exception. In general it is quite improbable that large numbers of Scandinavians settled there. So a strong Scandinavian influence on the Frisian language is not very likely, especially not when it concerns phonetic or morphological features.

Among the linguistic phenomena that have been attributed to a possible Viking influence are:

(1) the plural in *-ar*, *-er* in the masculine *a*-stems in Frisian, as in OFris. *dagar* 'days'. This plural form existed beside *daga* and *dagan*. Recent research has come to the conclusion that this plural form appears in eastern texts. Em-singo seems to have been the central area (Meijering 1989, 27). The appearance of forms like *eckerar* 'fields' as vernacular words in Latin charters suggests that it is a dialectal Old Frisian morphological element. This may be confirmed by the plural form *rutforstar* in a charter from the first half of the 9th century, i.e. before a possible Viking influence could have taken place. But the manuscript of this charter from Fulda is notorious for scribal errors, and in addition *forst* 'forest' is probably a loan from Old Low Franconian and ultimately derives from Romance.

As Feitsma and others already mentioned, it is rather unlikely that the plural form in *-ar* is a loan from ON, especially as morphological elements rarely are taken over. The neighbouring ON dialect Old Danish shows a tendency to lose *-r* in masculine *a*-stems and to keep it in feminine nouns (Skautrup 1944, 135, 267; GG §430,5). This is exactly the opposite of the Old Frisian situation. It is far more probable that the ending *-ar* is an internal Frisian development and a remnant of Gmc *-ōz* or even of a rather hypothetical *-ōziz*. This ending possibly did not develop according to the sound laws for morphological reasons (Meijering 1989). The need for clear plural endings in Old Frisian led to the spread of the ending *-(a)n* in the western areas and *-(a)r* in the eastern areas. In the latter case, the developments in Low German, where *-r* also appears in some dialects, may have influenced its use in Old Frisian. In the western parts the *-n* may be connected with the spread of the same element in Old and Middle Dutch as a plural ending.

(2) The numeral *tweer* 'two' is often seen as a loan from ON *tveir*. The difficulty is that this form does not appear in eastern manuscripts, only in western ones. This means that the form originated in areas where ON influence is rather unlikely. Therefore a connection with the genitive is far more probable.

(3) The rising character of Old Frisian diphthongs as in *biada* 'to offer', *sia* 'to see' has a parallel in ON *bjóða*, *sjá*. In this case it is rather likely to have been a parallel develop-

ment, especially as the Nordic dialects neighbouring Old Frisian do not have this feature in all cases: e.g. ODan. and OSw. *sē(a)* ‘to see’ but ON *sjá*.

(4) Breaking in OFris. *siunga* ‘to sing’, *siunka* ‘to sink’, *siugun* ‘seven’ has a parallel in Old Swedish and Old Danish: *siunga/siungæ*, *siu/syu* (GG §182). Especially in this case it must be assumed that it is a parallel development. If there was a direct connection between these breakings, then one should expect more phonetic development of this kind. But in precisely the East Nordic languages that have the same kind of breaking, the rising diphthong of Old Frisian and Old West Nordic (no. 2 above) is not a general phenomenon. Feitsma comments: “At most we can say that Frisian shows a, not very strong, tendency to *r*-breaking and that East Nordic has an *r*-breaking of another type” (1962, 103).

(5) Some traces of vowel balance have also been spotted in Old Frisian: *binna houi* and *binna hūse* ‘in the court and in the house’ and are seen as parallel to Nordic (Hammerich 1937). But as Feitsma writes (1962, 104), borrowing such an accent would be a sign of intensive contact. It is, however, unlikely that such contact existed between Scandinavia and Friesland.

5. Conclusion

There is no doubt that there are old connections between North Sea Germanic and Old Nordic, but it is also quite clear that these originated in the common ancestor of both dialect groups, NwGmc. Most of the apparently common features can be explained as younger parallel developments that possibly originated in Northwest Germanic. It is quite probable that the spread of umlaut and breaking in both North Sea Germanic and Nordic also had its origin in this common tendency. These parallel developments would have taken place in the first centuries A.D. In later centuries, there was certainly an influx of loanwords from the North Sea Germanic languages into Old Nordic in connection with the Old Frisian trade and with the missionaries who tried to convert Scandinavia to Christianity. There are hardly any indications of influence the other way around, at least as far as Old Frisian is concerned.

66. Contact with non-Germanic languages I: Relations to the West

1. Unknown peoples in northwestern Europe
2. Partially known peoples in northwestern Europe
3. Known peoples in northwestern Europe: The Celts
4. Well-known peoples in Europe: The Romans
5. Literature (a selection)

1. Unknown peoples in northwestern Europe

The geographical areas affected by the Indo-European expansion c. 3000–1500 B.C. were not uninhabited ones. On the contrary, the development of the Indo-European family of languages, which includes most of the languages spoken in Europe and certain languages spoken in western Asia (esp. India and Persia), is the result of the commingling of a great number of peoples and languages. Details of this process are, however, unknown. The only thing we know is that the Indo-European civilization prevailed over a widespread area in the Late Stone Age and the following Bronze Age. These epochs are so named because of the prehistoric flint and bronze implements used during the respective periods. It is regrettable that in prehistoric Europe, oral tradition played the role later assumed by written records. The invention of the alphabet was in fact the greatest accomplishment of the ancient Near East. In the absence of written records it is impossible, among other

things, to observe how languages develop. Archaeologists have established that Europe has been inhabited by human beings since the Middle Pleistocene Epoch, c. 600,000 years B.C. During more than a century of research in human evolution and prehistory of man, much additional information has been gathered about the Neanderthal peoples, their distribution in space and time, their origin and disappearance and their way of life. (The name Neanderthal derives from the gorge-like Neander Valley above the Düsseldorf river, a small tributary of the Rhine, seven miles east of Düsseldorf, Germany).

Anthropologists are convinced that Stone Age man was able to speak. Under these circumstances it must be assumed that a great number of very ancient languages existed in Europe and that these overlapped with and were gradually supplanted by the Indo-European languages. Etruscan and Basque, for example, can be regarded as relics of the very early civilization of Europe.

Hachmann, Kossack and Kuhn undertook a concerted effort in 1962 to present evidence for the otherwise unknown *Völker zwischen Germanen und Kelten* 'peoples between the Germani and the Celts' (see Scardigli 1995, 558f.).

One must bear in mind that the climate in northern Europe impeded the rapid and easy development of civilization. Of particular relevance is obviously the division of the year

into a short, warm summer period which permitted activity and a long, cold, icy winter period of enforced inactivity.

2. Partially known peoples in northwestern Europe

The expansion of the Celtic and later of the Germanic peoples after 800 B.C. is typical of the Iron Age in western Europe. The period of about half a million years of the Stone Age and the Bronze Age, i.e. between the pre-Indo-European and the Celtic Ages, can be investigated only with the aid of archaeology and, to a certain extent, by means of linguistic reconstruction (Indo-European, Fox 1995).

The Hallstatt culture (named after Hallstatt in Salzkammergut, Austria) is associated with the Celts. It extended throughout a large area of southern Germany and included southern France and northern Spain in the West, as well as Austria and Yugoslavia in the East. The original homeland ("Urheimat") seems to be the region of the Upper Rhine and the Upper Danube. The Celts reached the height of their migratory potential in the La Tène period (named after the site La Tène in the canton of Neuchâtel, western Switzerland), which began about 450 B.C. The archaeological map of the Celtic world at that time reveals a major trajectory of influence in the western part of Central Europe. The Celts also arrived in Italy about 400 B.C.

3. Known peoples in northwestern Europe: The Celts

According to Caesar (100–44 B.C.), who led the famous campaign in Gaul: "[...] Fuit antea tempus, cum Germanos Galli virtute superarent, ultro bella inferrent, propter hominum multitudinem agrisque inopiam trans Rhenum colonias mitterent" [now there was a time when the Gauls were superior in valour to the Germani and made aggressive wars upon them, and because of the number of their people and the lack of land they sent colonies across the Rhine] (*Bellum Gallicum* 6, 24, 1; echoed by Tacitus *Germania* 28).

The Celts – moving from east to west – and the Germani – moving from north to south – immediately came into direct contact with one another. For several centuries they must have coexisted peacefully in proximity to one another.

Caesar also described (and implicitly condemned) a different kind of non-contact: "Civitatibus maxima laus est quam latissime circum se vastatis finibus solitudines habere" [their tribes account it the highest praise by devastating their borders to have areas of wilderness as wide as possible around them] (*Bell. Gall.* 6, 23).

"There is no doubt that the relationship between Germani and Celts was often one of military antagonism, but equally that, on the basis of trade and exchange, there was in large measure a shared Celto-Germanic unity in material culture and social organisation" (Green 1998, 146). The Germani admired the Celts and emulated their way of life, especially their skill in the employment of *iron* (see 3.5.) in making utensils and weapons.

The culture of Jastorf (in the district of Uelzen, Lower Saxony, Germany), which followed the Bronze Age culture of the so-called "Nordischer Kreis" [Nordic Circle] from the fourth century B.C. onwards, has been ascribed to the Germani (Schwantes 1960). It is a civilization similar to the Celtic one (La Tène, see 2.) and immediately to the north of it.

"The cultural flow, as revealed by archaeological finds, is clearly from the Celtic South to the Germanic North" (Green 1998, 146). The Celts were more advanced than the Germani in particular with respect to settlements, household organization, implements, tools (iron, see 3.5.) and the raising and use of horses. The Celts owed their superior expertise in horse and chariot technology in part to their contact with equestrian nomadic peoples of the southern Russian steppes, namely the Scythians or the Sarmatians. The organization of Celtic communal life and rites served as a model for the Germanic tribes and thus exerted a major influence upon their rising power (Scardigli 1994 b passim).

Judging from what we know about the Continental Celts (Galli), there were, however, important differences between the Celts and the Germani in matters such as language and religion.

With regard to language, Untermann (1989, 212) points out that Celtic and Germanic, as subfamilies of the Indo-European family of languages, are the result of developments which took divergent forms in central and northern Europe respectively. No trace of Celtic *r*-endings in verbs, *-ī*-genitive, nor loss of *p* can be found in Germanic. No trace of Germanic strong verbs, adjectival inflexion, nor the Germanic First Sound Shift can be

found in Celtic. The structures of the two languages differ considerably.

The specific lexical correspondences between Celtic and Germanic are therefore highly significant as evidence of (more than) linguistic contact. An examination and evaluation of them yields illuminating results, as will emerge below.

With regard to religion, our information about this for both the Celts and the Germani derives principally from Greek and Latin (sometimes Christian) authors and occasionally from inscriptions and carved images. A major portion of the surviving relics and artefacts relates to myths.

Caesar's statement about the religious differences between the Celts and the Germani no doubt primarily represents his own point of view, but it at least permits one to raise the question of whether such differences existed: "Germani multum ab hac consuetudine differunt", [Germani differ much from this [Celtic] religious practice] (*Bell. Gall.* 6, 21). On the contrary, the identical statement "*deum* [Tac.: *deorum*] *maxime Mercurium colunt*, [the most worshipped god is Mercury], which Caesar makes about the Galli (*Bell. Gall.* 6, 17) and Tacitus about the Germani (*Germ.* 9), seems to indicate a close connexion between the two religions from the standpoint of the Roman observer. It must, however, be borne in mind that the information provided in classical antiquity about the "barbarians" was superficial, since these peoples were not regarded as worthy of serious attention. The silver cauldron of Gundestrup (first century B.C.?), now in Copenhagen, is a Danish archaeological find which surely comes from a southern Celtic area. Its surfaces are decorated with motifs whose background is to be sought in Celtic myths and religious belief, and this in turn awakened the interest of the Germani too (Haussig 1973, 106f.). Hachmann (1990) regards the Gundestrup cauldron as a late Celtic model for early Germanic art.

The cult of the *matres* or *matronae* in the Upper Rhine area at the time of the Roman emperors represents a form of Germano-Celtic religious syncretism. The images and the extraordinary appellations applied to these goddesses indicate their Celtic provenance and at the same time demonstrate the Germanic adoption of this cult (Kienle 1938; Landucci Gattinoni 1986; Scardigli 1989; 1994b, 163ff.).

An accurate evaluation of the contact and differences between the Celts and the Germani

in religious matters is fraught with difficulty. In establishing how they diverge (Haussig 1973), one must at the same time emphasize the great curiosity which the Germani exhibited about external aspects of the Celtic divinities and keep in mind the scarcity of the surviving Continental Celtic remains.

3.1. Personal names

In order to shed further light upon the connexions between the Celts and the Germani, it is useful to examine briefly the evidence provided by personal names. The chieftains of the Germani emerge into the light of history bearing Celtic names or names whose form and meaning were very similar to the Celtic ones. The king of the Cimbri, who invaded Italy at the end of the second century B.C., was named *Boiorix*. The Celtic tribal name *Boii* (Birkhan-Callies 1976, 205ff.), "true to the wide extent of the Celtic migrations [...] is attested from different parts of Europe and it also occurs in personal names" (Green 1998, 161). The "Germanized" (Green) form of *Boii* (see also 3.2.) appears in German *Bayern* (the change $o > a$ is a regular one).

The same phenomenon can be observed in connexion with the name *Ariovistus*, a king of the Suebi in the first century B.C. The exact etymology of this name is obscure, but the Gaulish tribe of the *Insubri* (see 3.2.) also had a chieftain called Ariovistus (Scardigli 1994 b, 88).

In the first century A.D. a seeress of the Bructeri, a Germanic tribe, bore a Celtic name, *Veleda* < **welet-*, cf. Old Irish *fili* 'seer, vates' from the IE root **wel-* 'see' (Scardigli 1994 a, 73ff.; 1994 b, 162).

Boiorix moreover contains the element *-rix*, which is very common among the Celtic rulers at the time of Caesar, e.g. *Adiatorix*, *Ambiorix*, *Andebrocirix*, *Bituriges* (pl.), *Cantorix*, *Caturix*, *Cingetorix*, *Docirix*, *Dumnorix*, *Elvorig*, *Eporedorix*, *Lugotorix*, *Magiatorix*, *Orgetorix*, *Togirix*, *Toutiorix*, *Vassorix* and the well-known *Vercingetorix*. The numerous Latinized *-ricus*-forms (Reichert 2, 595ff.), such as *Ermanaricus*, *Alaricus*, *Theudericus* etc., frequent for example in the Gothic family of the Amali, are probably derived from these *-rig*-forms (see the discussion on the Celtic loanword **rika-* in Gmc in 3.3.). Incidentally, note that in *Kratylos* 407 d, Plato has Socrates state that his interlocutor Hermogenes, contrary to his name, was not a son of the god Hermes at all. We should always take this as

a warning when we are dealing with proper names.

3.2. *Brācae*

The combination of linguistic evidence with that provided by archaeology and the written historical sources constitutes a fruitful approach to the question of the relations between the Celts and the Germani. To this end it is necessary to examine certain selected documents. The Romans encountered the Galli *Insubri* and *Boii* (see 3.1.) as invaders τὰς ἀναξυρίδας ἔχοντες i. e. “wearing *bracae*, breeches” as early as the battle of Telamon in Etruria in the year 225 B.C. (Polybius, *Hist.* 2, 28, 7). At this point the Germani still were living far away in their northern homelands. *Gallia bracata* ‘Gaul in breeches’ (as opposed to *Gallia comata* ‘Gaul with long hair’, which does not exclude the possibility that long hair and breeches were concomitant) was the part of Gaul subsequently called *Gallia Narbonensis* (Mela 2, 74), cf. also Cicero, *Epistolae ad familiares* 9, 15, 2 “bracatis et Transalpinis nationibus”, [peoples in breeches on the other side of the Alps]. Though applied by the Romans to other “barbarians” as well, the word *bracae* ‘breeches, trousers’ seems to be of Celtic origin (Stokes/Bezzenger 1894⁴, 181). Tacitus tells us (*Historiae* 2, 20) about A. Caecina Alienus, who was present in northern Italy in 69 A. D. and who received Romans of high rank clad in togas but himself was “bracas [, barbarum tegmen,] indutus” [wearing breeches [, a barbaric garment]]. This garment of varying length had three functions: (1) decency, cf. Isidore, *Etymologies* 19, 22, 29: “bracae quod sint breves et verecunda corporis his velentur”, [*bracae* because they are short and cover the private parts of the body]; (2) protection from the cold, cf. Ovid, *Tristia* 3, 10, 19: “arcent mala frigora braxis” [they protect themselves with *bracae* from the harsh cold]; (3) last but not least as riding attire to prevent wounds from chafing when in the saddle or on horseback (Hachmann 1990, 786–803). The garment which the fine citizens of Rome regarded as an object of ridicule was of course an advantage for the Germani and they adopted it. ON *brók* fem., OE *brōc* fem., MLG *brōk*, OHG *bruoh* fem., OFris. *brōk* are all to be traced back to the reconstructed Gmc form **brōk-* ‘breeches’. This form is in turn derived regularly from Celt. **brāk-* (Celt. [IE] *ā* > Gmc *ō*, cf. also Lat. *Rōmāni* versus Go. *Rumoneis*). In view of the evidence presented

above, the hypothesis that **brāk* is a Germanic loanword in Celtic, as Green (1998, 146) and others suggest, is extremely unlikely. Furthermore, Tacitus does not mention anything about *bracae* in his account of Germanic garments (*Germania* 17). Wenskus (1961, 426) adduces this alteration in the mode of attire by the Germani, namely the adoption of the breeches, as the external manifestation of the altered relationship between leader and followers (see also 3.3.). The hypothesis that **brāk* is a Celtic loanword from a third, unknown language of the East European steppes is, conversely, a tenable one.

3.3. *-rix*

As observed above in 3.1., there was a word for ‘ruler’, current among the Celts, which was borrowed by the Germani. It corresponds to the Lat. word *rex* and OInd. *rājan* and derives from the IE root **reg-* ‘hold’, ‘keep’, ‘retain’. The Celtic forms are Gaul. *rīx*, Ir. *rí*, gen. *rig* etc. ‘ruler’ and its cognates. IE *ē* becomes *ī* in Celt., but not in Gmc, where *ē* is retained (in Go.). Therefore, the Gmc forms **rīka-*, **rīkia-* sb. ‘ruler’ and adj. ‘mighty’ must have been borrowed before the First Sound Shift from Celt. *rīg-* ‘a ruler’, nom. *rīks*, gen. *rīgos*. These borrowings are represented in Gmc by Go. *reiks* adj. ‘mighty’ and sb. ‘ruler’ (the Go. word for ‘king’ is *þiudans*), ON *ríkr* ‘mighty’, OSx. *rīki* ‘mighty’, OFris. *rīk(e)* ‘rich’, OE *rice* ‘mighty’, ‘rich’ and *rica* ‘ruler’, OHG *rīhhi* ‘mighty’, ‘rich’. A derivative also belongs to this group, namely Gmc **rīkia-* n. ‘might’, ‘kingdom’, Go. *reiki*, ON *rīki*, OSx. *rīki*, OE *rice* ‘kingdom’, OHG *rīhhi* ‘Reich’, ‘kingdom’. Verbal derivatives are Go. *reikinōn*, ON *rikja*, OE *ricsian* ‘rule’.

There may be a correlation between this loanword and the so-called “Gaulish-West Germanic revolution” and with its concomitant restoration tendency (Wenskus 1961, 409ff.). Wenskus observes and illustrates by means of a map that around the first century B.C. a relatively organic group of Celtic and Germanic tribes in the west deposed the kings who reigned over them at an earlier period, see for example Caesar, *Bell. Gall.* 5, 25, 1: “cuius maiores in sua civitate regnum obtenerant” [whose ancestors reigned over his people]. Tacitus (*Agricola* 12) made the following statement about some tribes in Britannia: “olim regibus parebant, nunc per principes factionibus et studiis distrahuntur” [they once obeyed kings, now chiefs lacerate them with

factions and partisans' behaviour]. Orgetorix e.g. (Wenskus 1961, 416) found himself in the role of a failed king. Caesar (*Bell. Gall.* 1, 2, 1ff.) introduced him as follows:

Apud Helvetios longe nobilissimus et ditissimus Orgetorix. Is [... = a. 61 B.C.] regni cupiditate inductus coniurationem nobilitatis fecit [among the Helvetii the noblest man by far and the most wealthy was Orgetorix. In the year 61 B.C. his desire for kingship led him to form a conspiracy of the nobility].

But the end was tragic:

Moribus suis Orgetorigem ex vinculis causam dicere coegerunt. Damnum sequi oportebat ut igni cremaretur. Die constituta causae ditionis Orgetorix ad iudicium omnem suam familiam, ad hominum milia decem, undique coegit et omnes clientes obaeratosque suos, quorum magnum numerum habebat, eodem conduxit: per eos, ne causam diceret, se eripuit. Cum civitas ob eam rem incitata armis ius suum exsequi conaretur, multitudinemque hominum ex agris magistratus cogerent, Orgetorix mortuus est; neque abest suspicio, ut Helvetii arbitrantur, quin ipse sibi mortem consciverit [In accordance with their custom they compelled Orgetorix to take his trial in bonds. If he were condemned, the penalty of being burnt was the consequence. On the day appointed for his trial Orgetorix gathered from every quarter to the place of judgement all his retainers, to the number of some ten thousand men, and also assembled there all his clients and debtors, of whom he had a great number, and through their means escaped from taking his trial. The state, being incensed at this, essayed to secure its due rights by force of arms, and the magistrates were bringing together a number of men from the country parts, when Orgetorix died, not without suspicion, as the Helvetii think, of suicide].

The conclusion would seem to be that a personal name containing the element *-rix* and regal position are not dissociated from one another (cf. Socrates' statement 3.1.). In passing one can note the increasing importance of clients and retainers. The Orgetorix episode has several aspects in common with the vicissitudes of Arminius, who was also of stirps regia, of 'royal descent' (Callies 1973, 417ff.).

3.4. *ambacti*

The role of the *clientes* in Celtic society is occasionally mentioned by Caesar, e.g. in connexion with the Aedui: "magnae erant eorum clientelae" [their clients were very numerous] (*Bell. Gall.* 6, 12, 2); also in connexion with

Litavicus "cum suis clientibus" [with his dependents] (*Bell. Gall.* 7, 40, 7).

Clients and retainers in great number are explicitly attributed to the class of the *equites* 'knights', the second class after the *druides*. Caesar *Bell. Gall.* 6, 15, 2 wrote on this subject:

Eorum ut quisque est genere copiisque amplissimus, ita plurimos circum se ambactos clientesque habet. Hanc unam gratiam potentiamque noverunt [according to the importance of each of them in birth and resources, so is the number of liegemen and dependents [followers] that he has about him. This is the sole form of influence and power they know].

The *ambacti* seemed to enjoy a somewhat higher position in relation to their lords than the *clientes* (Wenskus 1982, 20ff.) and this perhaps explains why they are named first in the passage quoted above. However, it is conceivable that *ambactos clientesque* is merely an example of a hendiadys whose purpose was to show the meaning of a foreign word by adding a second word which was current among the Romans.

Gaulish *amb-act-us* means 'a person who goes around', *amb(i)* being a Celt. preposition with the sense of 'around'. The only sources of information about this noun are Latin ones. The word occurs already in the *Annales* of Ennius, in the second c. B.C.

The word and its derivatives are well-represented in the Germanic languages: Go. *andbahts* often renders Gr. δῆκονος 'dean', cf. OE *ambiht*, OHG *ambaht* 'minister' and so on. In ON only the fem. form survives: *ambátt* 'woman servant', cf. also *konungsambátt* 'a royal concubine'. Another substantive and a verb designating 'office' and 'officiate' respectively also belong to this group. They are Go. *andbahti* neut. 'service' and *andbahtjan* 'serve', ON *embætti* 'service', also 'holy service', *embætta* 'attend', in the ecclesiastical sense 'celebrate', 'officiate', OSx. *ambaht* neut., OE *ambahti* neut. and *ambihtian*, OHG *ambahti* neut. 'Amt', 'office' and *ambahten* 'attend'. This group of words brings us to the institution of the *comitatus*, in German *Gefolgschaft*, the 'followers', which is well attested among the Germani. Regarding the possibility of its derivation from the Celtic institution of the *ambacti*, see Timpe 1998, 537ff. According to Caesar: "[...] clientibus, quibus more Gallorum nefas est etiam in extrema fortuna deserere patronos" [for according to Gallic custom it is a crime in dependents to desert their patrons, even in desperate cases] (Caesar,

Bell. Gall. 7, 40, 7). Tacitus asserts the same in *Germ.* 14. Certainly *andbahts* and *reiks* together represent “converse positions in a power relationship (a follower and someone in authority)” (Green 1998, 150).

3.5. *iron*

The best exposition on this subject is that of Green (1998, 153f.), which is quoted here nearly in full length:

Under metallurgy, where Celtic influence on the north made itself particularly felt in the Iron Age, pride of place belongs unsurprisingly to the word ‘iron’. Geographical access to supplies and command of the technology of iron-making such as the Celts enjoyed, constituted a revolution in warmaking and underlay their expansion, military and political, in the La Tène period as well as the reaction of the Germanic tribes to it. The result was that whereas the Germanic north had been largely independent in the Bronze Age it came increasingly under the sway of the south during the Iron Age, with perceptible Celtic influence in iron-making and its products. Chronologically the beginnings of iron-making in the Germania cannot be earlier than the fourth/third century B.C.; traces of the earliest furnaces for this purpose have been found in the north-east of the area then occupied by the Celts (Bohemia, Moravia, south-western Poland). Although Tacitus could still speak much later of a general paucity of iron amongst the Germani (it was in high demand for weapons largely monopolised by leaders) he explicitly refers to a Celtic tribe, the Cotini, dwelling in what was now Germanic territory (Moravia), mining iron and paying tribute with it. Ptolemy also knew that the neighbouring Germanic tribe of the Quadi were in possession of iron-works [...]. The secondary position of Germanic within this web of isoglosses has been stressed on purely phonological grounds by Lehmann (1987, 79ff.) who, in considering Go. *eisam* within the framework of Gothic word formation, has pointed to the extreme anomaly of a word beginning with *ei-*, the rarity of native words ending in *-m* and the suspicious variation of forms in the different Germanic languages. From all this he has concluded that the Germanic word for ‘iron’ is unlikely to be native, but rather borrowed from a non-Germanic language. The closeness of the Celtic isoglosses and the absence of any other counterparts suggest that this source was Celtic, a conclusion borne out by the significant fact of accent doublets in both Celtic and Germanic, as well as by the non-linguistic evidence for the dominance of Celtic iron-working over Germania.

3.6. Conclusions

Scholars mention many other words which illustrate in various ways the influence of the Celts on the Germani and their mutual relations over the course of five centuries, namely from the third century B.C. to the second century A.D. Thus the selection presented here provides only a general impression. For a more detailed discussion see Green 1998, 145ff. part II, “Contact with the non-Germanic world, Contact with the Celts”. Other contributions on this topic are listed in the bibliography. Incidentally, all the loanwords are examined here in accordance with the etymological method, which requires the most accurate investigation of the borrowed words in their original milieu immediately prior to the point at which borrowing occurred (Scardigli/Breschi 1981, 469ff.).

4. Well-known peoples in Europe: The Romans

“In their gradual expansion they [i.e. the Germanic tribes] came into contact with a great variety of different peoples and cultures, ranging for example from the Celts in the west to the Romans in the south [...]. By far the most important of these contacts (not merely because it also involved an encounter with Christianity [see 4.3.]) was that with the Roman world” (Green 1998, 143).

Swedish and German scholars in particular distinguish between two periods in the prehistory of central and northern Europe immediately prior to the “barbarian invasions” (“Völkerwanderungszeit”, 374–568 A.D.): “the pre-Roman Iron Age” (“vorrömische Eisenzeit”) and “the Roman Iron Age” (“römische Eisenzeit”, often called simply “römische Kaiserzeit” i.e. “the Roman Imperial Age”). The purpose of the distinction (see Chronologie 1981, 607ff.) is clear: there was a time when the Germanic tribes lived in their (to us) relatively obscure original homelands, undisturbed or only occasionally disturbed by the Celts, and gradually expanded in a southerly direction. Thereafter followed a period when the Roman emperors decided to conquer and subjugate the Celtic and Germanic north (Wheeler 1954, 21 ff.). In any case the Romans were first present in the Germanic world in a moral way and later in a material way. The latter also involved a remarkable Germanization of the Roman world, chiefly in the military.

The imperial frontier along which the two worlds met should be seen not so much separating them as constituting a zone in which they could interact. Military encounters there may have been, but also long periods of peaceful exchange, especially in the border-zone along the Rhine and the Danube. Even the military encounters provided the means [...] for the Germani to learn from their opponents and adopt some of their ways. This also worked the other way, however, for just as the Roman army had been the main agent of Romanisation in the Empire, so did it also become the main agent of barbarisation. The Romans came more and more to depend on recruiting from Germanic tribes on or near the frontier, sometimes settling whole groups of barbarians within the confines of the Empire and even appointing Germanic leaders to posts of military commanders (*magistri militum*) within their own ranks (Green 1998, 143f.).

The fame of Rome was widespread after the end of the Third Punic War and the conquest of Corinth (146 B.C.). The honour, glory and respect won by means of the Roman achievements in vying for supremacy in the Mediterranean allow us to postulate that the great power in the south caught the attention of the Germani and exerted an attraction on them. The first information and impressions, however, were mediated by the (Romanized) Celts, and thus the Celts constituted an indispensable link to the Roman world at the very inception of the peaceful or warlike contacts of the Germani with the Romans.

4.1. *Volcae*

A fossilized survival of the encounter of Germani with Celts and Romans has been preserved up until the present day. In the memory of the Germani it assumed ever increasing weight as time progressed: viz. the Germanic word **walhōz* 'very important neighbours'. Behind the Germanic form it is easy to recognize the Celtic tribal name known by its Latinized form *Volcae*. No scholar has thus far cast doubt upon this identification (Much 1919, 423ff.). It is less easy, however, to determine why and when this contact became a relevant reality for the expanding Germanic tribes and how long it remained so. Furthermore, it is difficult to explain the ending *-ae* of the name *Volcae*, given that all the Latinized Celtic tribal names have either the ending *-i* as in *Atuatuc-i* and *Arvern-i* or *-es* as in *Suession-es* and *Allobrog-es*. The Greek form *Οἰόλκαι* may have been influenced by the Latin one. Let us explore the material: the eth-

nic group *Volcae* is mentioned first by Cicero (106–43 B.C.) in his oration *Pro Fonteio* 12, 26, together with the Allobroges. In the same passage both groups are referred to as *Galli*. Livy (*Ab urbe condita* 21, 26, 6) mentions the *Volcae* in connexion with Hannibal, who encountered *Volcae* on both sides of the Rhône in 218 B.C. Caesar (quoting Eratosthenes) locates the *Volcae Tectosages* in the *Hercynia silva*, the 'Hercynian forest' (the Mittelgebirge?), to which they supposedly had migrated from southern France (*Bell. Gall.* 6, 24, 2). Contrary to this statement, it is likely that southern Germany was the original homeland of the *Volcae*, and in this area the Germani first encountered them (Norden 1922², 359). We are unfortunately in the dark as to the number of Celtic tribes to which the name *Volcae* was applied. In any case during Caesar's lifetime they were classified as *Volcae Tectosages* (*Bell. Gall.* 6, 24, 2) and *Volcae Arecomici* (*Bell. Gall.* 7, 7, 4; 7, 64, 6). The *Volcae Tectosages* inhabited the region from the Pyrenees to Narbo (the main stronghold was Tolosa, now Toulouse) and the *Volcae Arecomici* lived farther to the east (their chief town being Nemausus, now Nîmes). Unfortunately, analysis of the term *Volcae* from the standpoint of Celtic etymology yields no useful information. The (Lat.) proper names *Volcatus*, *Volcius*, *Catuvolcus* are plausibly related to *Volcae*. Caesar (*Bell. Gall.* 5, 24, 4; 5, 26, 1; 6, 31, 5) names *Catu-volcus* (presumably 'Volcus of battle') together with *Ambiorix* as a chieftain of the *Eburones*, a tribe of the Germani *cisrhenani* (Neumann 1986, 348ff.).

Germanic **walh-* must be a very old loanword (dating from the fourth century B.C.), since it exhibits the First Sound Shift ($k > h$) and the Proto-Gmc phonetic change $o > a$. The Gmc forms are as follows: Runic *WALHA-*, cf. 4.1.1.; OE *Wealh*, mostly in pl. *Wealas* 'the British, the Welsh (of Wales)', sometimes as opposed to 'the English'; adj. *wilisc* 'Welsh'.

The word is found in many proper names and place-names. OE *wealh*, variants *wilhe*, *wiel* also means 'a slave, servant'. The word even occasionally designates 'a Roman'. Of the many compounds the following merit mention: *wealh-hnutu* 'a foreign nut, walnut' (*Juglans regia* L., see Weisgerber 1955, 33ff.; Marzell 1972, 1052ff.); *Wealh-land* 'Normandy' (cf. ON *Val-land*); *wealh-stod* 'an interpreter'. OHG has *Walaha* 'Romans', *Walaho lant* 'Gaul', *wal(hah)isc* 'Romanic', 'welsch' (cf. *Walchensee* in Bavaria, *Walensee* in Switzerland 'the *welsch* lake'). Also note-

worthy is *walahiskiu bira* ‘Italian pear’ (cf. Polish *Wlochy* ‘Italy’). In modern German *welsch* is, except in Switzerland, a pejorative term, cf. *kauder-welsch*, *rot-welsch*.

In ON we have *Valir* ‘the Welsh esp. in France’ (cf. *Walloons*), *Valland* ‘Normandy’. In the prose text that precedes the Eddic poem *Vǫlundarkviða*, a mysterious woman is referred to as *Qlrun Kjár’s dóttir af Vallandi*. In the *Karlamagnús saga*, *Valirnir* are ‘the French’. In a kenning appearing in the Eddic poem *Hyndluljóð* (9, 2) ‘gold’ is designated as *valamálmr* ‘Welsh ore’ (cf. 4.1.1.). *Valska* fem. or *vǫlsk tunga* is ‘the Welsh tongue’, esp. ‘the French language’. The Gmc form **walh-* was also borrowed by the Slavs (cf. *vlachū*) and the Greeks. None of these words refers directly to Celts with the exception of *Wales* and *Welsh*. The supposition that the Gmc form **walh-* underwent a gradual change of meaning from ‘Celtic’ to ‘Romanic’ esp. ‘French’ is supported by the fact that the Celts were Romanized everywhere on the continent. **Walh-* thus represents a keyword for the understanding of the progress of the Germani in their acquaintance with the rest of western Europe (Weisgerber 1943, 87ff.).

4.1.1. Anwalhakurne

A runic inscription on a gold bracteate found in Tjurkö, in the district of Blekinge (Sweden) and dated to about 500 A.D. (Krause 1966, 136) has a sequence of runic signs transcribed here as follows:

[...]**jurterunoRanwalhakurne** ...
[...]**heldaRkunimundiu** ...

and translated literally as: ‘(he) wrote (the) runes on (the) Welsh corn, Held for Cuni-mund’. This is the only attestation of the form *WALHA-*, in conjunction with *KURNE* ‘corn’. What is ‘Welsh corn’? Scholars are of the opinion that it must be a kenning for the ‘Roman gold’ which of course was used to coin the bracteate. It is certain that the two words **wurte** and **walha** alliterate. In this connexion it is appropriate to mention again the Nordic *valamálmr* ‘Welsh ore’ as a kenning for ‘gold’ (cf. 4.1.). For reasons of space it is not possible to discuss here the background of this inscription (Celtic treasures, etc.).

4.2. Imperium Romanum

Virgil (70–19 B. C.; *Aeneid* 6, 851) pronounced the admonishing words: “Tu regere [cf. 3.3.

-rix] imperio populos, Romane, memento” [Roman, remember that you must subjugate all peoples to your rule].

For the Roman period in the Germanic area we must of course distinguish between expansion and migration. As Goffart (1982) shows, the Germanic peoples migrated in search of lands for settlements. The Roman political leadership, in contrast, sought new dominions to plunder. But it would be a mistake to expect a great number of Lat. loanwords in the Germanic languages, testifying to Roman power and conquest. The most frequent examples of the Roman lexical invasion of the secular sphere concern trade and traffic. “Caesar makes it clear that for the Romans trade and warfare supported one another when he sent a legion to safeguard a route across the Alps which Roman traders travelled only at great risk and cost in tolls exacted” (*B.G.* 3, 1, 2; Green 1998, 219; Scardigli 1995, 560f.).

Fields of interest to the Germanic tribes were, in addition to travel (e.g. Lat. *(via) strata*, English *street*), horticulture, esp. viticulture and viniculture (e.g. Lat. *caulis*, English *cauli* (-flower), Lat. *vinum*, English *wine*); and architecture, with special reference to the kitchen and its utensils (e.g. Lat. *tegula*, English *tile*, Lat. *cocina*, English *kitchen*, Lat. *catillus*, English *kettle*, Lat. *patina*, English *pan*). Particularly noteworthy is the adoption by Germanic speakers of the Lat. suffix *-arius*, English *-er*, since it involves the “deep structures” of the language. An example is Lat. *molinarium*: English *miller* (Lat. *molinus* from Lat. *mola* ‘mill-stone’, in pl. ‘mill’, English *mill*). (The loanword for ‘ass, donkey’, OE *esol*, OHG *esil*, NHG *esel*, from Lat. *asillus*, should be included in this context, cf. Lat. *molae asinariae* in Cato, 234–149 B.C., *De agri cultura* 10, 4 and Go. *Asiluqairnus*, in the Vulgate *mola asinaria* Matth. 18. 6; Mc. 9. 41, cf. Luke 17. 2).

Caesar (*Bell. Gall.* 4, 2) comments that the Germani allowed merchants into their territory more because they wanted to sell them their war-booty than to buy from them, but by the time of Tacitus the position was different: whilst the tribes in the interior still practised barter, those near the imperial frontier made use of Roman coins in order to buy wine (Tacitus, *Germ.* 5). The use of Roman coins points to the first transition from a coinless barter society to a monetary one under Roman influence.

That Roman trade went far beyond the wine explicitly mentioned by Tacitus is clear from other evidence. He himself refers to silver vessels as gifts to Germanic chieftains and we

should not underestimate the role of gift-giving in primitive societies and the Romans' ability to adapt it to their own political ends. Archaeological pointers include coins, silver vessels and wine sets of Roman origin used in imitation in Germania, but also vessels in bronze, glass and terra sigillata, brooches and ornaments, even weapons and statuettes. Such objects are attested far into the interior, through Germany to Scandinavia, Pomerania and northern Poland [...]. To a large extent the acquisition of Roman goods served as the status symbol of an élite, they could be used as gifts to strengthen ties between kindreds, as objects for further exchange with more distant tribes, or simply to provide raw material (Green 1998, 219f.; cf. 4.1.1.).

We may conclude that loanwords from the period of the Roman empire do not confirm the expectations of those who postulate a far-reaching Latinization of the Germani. The words reflect the actual course of historical events: the *imperium Romanum* failed to subdue the Germani, and consequently contact between the two cultures in the secular sphere remained superficial.

4.2.1. The defeat of Varus (*clades Variana*)

After the conquest of Gaul the Roman emperors planned the conquest of Germania. At first they appear to have met with success, until an unexpected disaster occurred in the year 9 A.D. P. Quinctilius Varus, commander-in-chief of the Roman army in Germany naively allowed himself to be trapped in an ambush organized by Arminius and his comrades. Three legions and some auxiliary troops were destroyed. This defeat put an end to the Roman ambitions of conquering and subduing the north as far as the river Elbe. This event explains to a great extent the failure to Romanize the Germani, in contrast to the successful Romanization of the Gauls. To be sure, thanks to the transmission through (poetic) oral tradition and transmission between the Germanic tribes, the momentous news even became known to the Scandinavians (Petrikovits 1982, 14ff.).

4.3. The Church of Rome

In his well-organized *Etymological Dictionary of Old Norse*, Jan de Vries (1962, xxxiv) lists all the loanwords from Latin in the Old Norse language he encountered. In view of the purpose of the present handbook it appears suitable to mention them here:

(1) *annáll* (2) *biflia* (3) *buzel* (4) *dalmatika* (5) *dekan* (6) *dispensera* (7) *disponera* (8) *disputera* (9) *divisera* (10) *emend(er)a* (11) *eximi* (12) *eyrir* (13) *figúra* (14) *fitonsandi* (15) *gafi* (16) *gladel* (17) *hrókr* 2 (18) *jacinctus* (19) *justa* (20) *kaldel* (21) *kantiki* (22) *kantilena* (23) *kapituli* (24) *kapp* (25) *kardinali* (26) *karina* (27) *kastr* (28) *kaupa* (29) *ketill* (30) *klausu* (31) *klúss* (32) *kolorr* (33) *kómeta* (34) *kommún* (35) *kampona* (36) *konfirmera* (37) *konkordera* (38) *koróna* (39) *kredo* (40) *krúss* (41) *kussari* (42) *kvaterni* (43) *latína* (44) *leena* (45) *legáti* (46) *lenz* (47) *lepra* (48) *linja* (49) *manna* (50) *marmari* (51) *metr* 1 (52) *mitr* (53) *momenta* (54) *muskat* (55) *múta* (56) *mútari* (57) *nátúra* (58) *nóna* (59) *notera* (60) *nóti* (61) *obláta* (62) *olifa* (63) *orða* 1 (64) *organ* (65) *pakti* (66) *palma* (67) *past* 2 (68) *pati* 1 (69) *patina* (70) *peð* (71) *pella* (72) *persóna* (73) *petallum* (74) *pikturr* (75) *planéta* (76) *portari* (77) *praefatio* (78) *prim* (79) *processia* (80) *pulkrokirkja* (81) *purpuri* (82) *regula* (83) *samvit* ? (84) *signa* 1 (85) *simfon* (86) *skapular* (87) *skript* 2 (88) *smaragdr* (89) *sóna* (90) *sómn* (91) *spá* 1 (92) *still* (93) *stóla* (94) *stóll* 3 (95) *súrna* 1 (96) *Sýrland* (97) *tabla* (98) *tesaurr* (99) *titull* (100) *trakt* (101) *traktera* (102) *traktr* (103) *turturi* (104) *unian* (105) *vínflaki* (106) *ymni* (107) *ortog* (108) *qrk*. The following items are in de Vries' opinion uncertain: (109) *bullu* (110) *karp* (111) *kjárr* (112) *kǫttr* (113) *pungr* (114) *purka* (115) *sallaðr* (116) *salselaðr* (117) *serfr* (118) *sikul-gjǫrð*.

Everyone with a smattering of Latin can identify in the lexemes quoted above which stem from the secular and which from the Christian sphere.

If we take into consideration that the conversion to Christianity of the Germanic peoples who remained in their homeland began in the south and moved northwards, reaching Iceland only in the year 1000 A. D., it cannot be expected that Latin loanwords of Christian content reached northern Europe very early or directly. Frank Fischer (1909) devoted a whole book to this subject. In his work he draws a distinction between: (1) OE-Lat. loanwords, (2) OLG-Lat. loanwords, (3) MLat. loanwords in ON, which he calls "Altwestnordisch". There are also prehistoric (pre-Viking) loanwords (i.e. those borrowed before c. 800), such as ON *ketill* and *vin* (Fischer 1909, 13ff.; see also 4.2.).

The mode of penetration of religious (Christian) loanwords into the Germanic languages is entirely different from that of the secular ones. Whilst the secular Latin loanwords are

occasional, the religious loanwords are the result of a planned and purposeful activity: the foreign mission. The history of Germanic Christianization begins with the Goths in Moesia (now northern Bulgaria) in the fourth c. and ends six centuries later with the Icelanders. Missionaries were active in Europe during the entire period, under the direction of the Church of Rome. The Irish and the Anglo-Saxon missions on the Continent with their protagonists such as Columban (543?–615) and Boniface (675–754) merit a mention in this connexion (Gschwantler-Schäferdiek 1973, 175ff.; Schottmann 1980, 557ff.).

This second wave of Roman influence upon the peoples of the North had an incomparably deeper effect on the behaviour and spiritual development of the Germani than did the orders of imperial rulers (cf. art. 45).

4.3.1. The Germanization of Early Medieval Christianity

In his book *The Germanization of Early Medieval Christianity*, James C. Russell calls attention to some effects of the Christianization of the Germani which led paradoxically to what he calls ‘Germanization’ of Christianity. He argues:

In perceiving the centrality of divine power in Germanic religiosity, the missionaries sought to prove that the power of Christ surpassed that of the local deities, as St. Boniface sought to demonstrate when he chopped down an oak tree dedicated to Thor at Geismar in Hessen. Such emphasis on the superior intercessory power of the Christian God in earthly affairs, and particularly military conflicts, appears to have contributed toward a perception of Christianity as a powerful magico-religious cult, and thus advanced the Germanization of Christianity. Given the substantial inherent disparity between Germanic and Christian world-views, a missionary policy that encouraged the temporary accommodation of Christianity to a heroic religio-political, magico-religious, world-accepting Germanic world-view appears to have been developed as a more effective approach than straightforward preaching or coercion. Although the accommodation of the Germanic world-view was originally intended to have been a temporary measure, the general lack of post-baptismal religious instruction, complemented by the vitality of Germanic religiosity, resulted in the Germanization of Christianity (Russell 1994, 7).

67. Contact with non-Germanic languages II: Relations to the East

1. Contact with Finno-Ugric languages
2. Contact with Baltic
3. Literature (a selection)

1. Contact with Finno-Ugric languages

1.1. Lexical loans

Loanwords constitute the most important source material when studying contact with Finno-Ugric (FU) languages. Their essential advantage is that they allow (relative) dating, i.e. classification in chronologically different layers.

In the Baltic Region and in Scandinavia, there was IE–FU contact long before the Germanic period proper – since early IE times. If we are to assess and to locate contact between Germanic (Gmc)/Proto-Nordic (PN) and Finnic (F)/Sami (S, Sami = indigenous name for Lapp), and to establish a chronological order, we are obliged to begin at the very beginning. Because of the great time depth, the etymologies of the earliest loanword layers (cf. 1.1.1.–1.1.2.) need more comment than the younger loans.

1.1.1. Contact between Northwest Indo-European and Finno-Ugric (mainly Pre-Finnic and Pre-Sami)

The contacting IE language may be called Northwest Indo-European, i.e. approximately the proto (P)-language of the later Germanic, Baltic (B) and Slavic (Sl.) branches, because this contact, with a high degree of probability, must have taken place in a rather westerly region which can be approximately equated with the Baltic Sea region.

The contacting FU language stage was largely Pre-Finnic (PreF) or, alternatively, Pre-Sami (PreS). PreF, also called Finno-Samic protolanguage (Sammallahti 1998, 2) or Early Proto-Finnic, is the reconstructed common proto-language of Finnic and Sami. PreS is phonologically the same as PreF, but applies here to lexical items (loanwords) which are attested exclusively in S.

Finnic (F) itself is a group of languages east of the Baltic Sea, which are closely related to each other (also called Baltic-Finnic), i.e. Finn(ish), Ingrian, Karel(ian) proper, Olonets, Lude, Veps, Vote, Est(onian), Livonian. Vote and Livonian are almost extinct today.

The IE stage of the source language or dialects is based on phonological facts. Firstly, the reconstructed source words must reflect IE phonology. Secondly, the alleged borrowings from these IE source words must represent a sufficiently early stage, i.e. they must be phonologically identified as PreF or PreS forms. This can be shown also by internal FU sound correspondences. Of course, not every word has a structure that can be judged on phonological criteria. But there are a sufficient number of features to allow us to establish the language stage on both sides.

The clearest IE features which can be seen in PreF loans are: (1) reflexes of IE laryngeals, (2) reflexes of IE palatal stops, (3) reflexes of IE vocalic resonants (differing from the reflexes of Gmc vocalization with /u/), (4) reflexes of IE /o/ as F /o/. The last feature alone does not always point to an IE stage, because Gmc /a/ sometimes also has F /o/ as its reflex. In such cases, however, there may be internal PreF criteria, i.e. FU phonology and/or distribution of the word, from which an early borrowing can be inferred (cf. ex. 3 below).

Some examples of loanwords in F or/and S which fulfill the criteria are given below. – The present S words are written according to the present North Sami orthography, except for ['] for quantity III in certain cases (according to the practice in Sammallahti 1998, see esp. 48).

(a) Words attested in Finnic and also in Sami and/or in Volga-Finnic (Mordvin, Cheremis) and/or Permic (Votyak, Zyryen):

(1) Finn. *kasa* 'sharp point, edge', Karel. *kaža*, *kadža*, South Est. *kadza*, S *geahči* 'end, point' < PreF **kaća* ← IE **h₂akyā* > Gmc **agjō* > OHG *ekka* 'point, edge' > G *Ecke* 'corner'. – A later, Gmc loan from the same IE word is F **akja* > Karel. *agja* etc. 'end, brim, edge' (Koivulehto 1991, 23–25).

(2) Finn. *kyrsä* 'unleavened, thin bread; crust; something small, insignificant', Est. *kürss* 'first cut slice of bread, crust', Mordvin *kše*, *kši* 'bread' < PreF (Finno-Volgaic) **kürsä* ← IE **krusā* > PSl. **krūchā* > Russ. *kročá* 'crumb', dim. *kroška* 'crumb (of bread), tiny bit, a little one'; the full grade variant IE **krowso-* > SrCr. *krūh* 'bread', Sloven. *krūh* id., Russ. *kruch* 'slice, piece, splinter'. For semantics cf. also Modern Gr. *psomi* 'bread' < *psōmion* 'morsel, piece of bread'. Metathesis

of a liquid and an obstruent in initial position and the palatal vowel (*ü*) for a corresponding velar vowel (*u*) of the source word are not rare in loanwords. Old words with *-rs-* are normally loanwords (*-rs-* is not attested in FU; Koivulehto 1999b, 121). Finn. *leipä* ‘bread’ is a later loan from Gmc.

(3) Finn. *lansi* ‘lowland; low’ (< **lante* < **lonta/*lomta*), Votyak, Zyryen *lud* ‘field, meadow, pasture’ < PreF (Finno-Permic) **lonta/*lomta* ← IE/PreGmc **lond^ho-/*lomd^ho-* > Gmc **landa-* > Go. etc. *land* ‘land’. As to the phonetic development cf. Finno-Permic **komta* ‘lid, cover’ > Votyak, Zyryen *kud*; > F *kante* > Finn. *kansi* (Koivulehto 1994, 139).

(4) Finn. *lehti* ‘leaf (blade)’, the same in S and Cheremis < PreF (Finno-Volgaic) **lešte* ← IE **b^hl₆h₁-tó-* > Gmc **blada-* > ON *blað* ‘leaf’ (or alternatively ← IE **b^hleh₁-tó-* > Gmc **blēda-* [*>* OE *blæd* ‘blossom, sprout, fruit’] → S *lieddi* ‘blossom, flower; oar blade’) (Koivulehto 1995, 122–125).

(b) Words attested only in Finnic:

(5) Finn. *kalja* ‘(weak) beer’ < PreF **kale* (+ suffix *-ja*) or **kaleta* or **kaleja* ← IE **h₂al-u-* (> B/Sl. **alu-* > OPr. *alu* ‘mead’, Lith. *alūs* ‘beer’, Sl. *olū* id.) or ← IE **h₂al-u-t-* (> Gmc **alup-* > ON *ǫl* etc. ‘ale, beer’) or ← IE **h₂al-ew-yo-* (> PS. **alauja-* > ORuss. *oluj* ‘beer’). The F word was borrowed in Zyryen: *kal’ja* ‘weak beer’. As to the ending in **kale* cf. FU **mete* (> Finn. *mesi* ‘mead, honey’) ← IE **med^hu-* (Kallio 1998). Finn. *olut* ‘beer’ is a later, Gmc or B loan.

(6) Finn. *kaski* ‘burnt-over clearing’ (the seed was thrown in the ashes) < PreF **kaskē* or **kaške* ← IE **h₂azgV-* > Gmc **askōn-* > ON *aska*, OHG *aska* etc. ‘ashes’; ← IE root **h₂as-* ‘to burn; to dry’; cf. Finn. *palo* ‘burnt-over clearing’: a nominal derivative of Finn. *pala-* ‘to burn’. – Scand. *aska* denotes burnt clearings in many field-names (Koivulehto 1991, 28–32).

(7) Finn. *pohta-* ‘to winnow’ etc. (*-ta-* is a normal verbal suffix) < PreF **po(w)š-ta-* ← IE **powH-eye/o-* > Gmc **fauja-* > OHG *fewen* (*fouwen*), MHG *vöuwen* ‘to screen, to sift, clean (corn)’, G (dial.) *fäen* ‘to screen; to sprinkle; to clean flour/meal by throwing it up in the air’, OInd. *pavāyati* ‘cleanses, purifies’. On the other hand:

(7.a) Mordvin *ponžavtoms* ‘to winnow’ ← IE **puneH-/*punH-* > OInd. *punāti/punānti* ‘cleans, winnows/they clean, winnow’; *u* > *o* is regular in Mordvin.

(7.b) Votyak *puž*, Zyryen *pož*, ‘sieve’, Votyak *pužni-*, Zyryen *požn-al-* ‘to sieve’ < PreF = Pre-Permic **pe(w)šenV* ‘sieve’ ← IE **pew-Heno-* > OInd. *pāvana-* ‘purification, winnowing of corn; sieve, strainer’ (Koivulehto 1991, 87–96).

(8) Finn. *rohto* (dial. also *rohtu*) ‘medicine, (medicinal) plant; weed; green herb; cattle feed’, Est. *roht*, gen. *rohu* ‘grass, herb, plant; spice, medicine’ < PreF **rošto* ← IE/PreGmc **g^hróH-to-(n)-/*g^hróH-tu-* > Gmc **grōpa(n)-/*grōpu-* > ON *grōð-r*, *grōði* ‘herb, plant; growth’/Sw. *grodd* ‘germ’; **g^hroH-ti-* > Gmc **grōði-* > MHG *gruot* ‘green growth’ etc. The words are nominal derivatives from the IE verbal root **g^hroH-* > Gmc **grō-(ja-)* ‘to grow (esp. of green growth)’ > Sw. *gro* ‘to germinate, to grow (of plants)’, E *grow* etc. (Koivulehto 1999b, 213).

(9) Finn. *tahdas*, gen. *tahtaan* ‘dough, paste’, other F languages: ‘dough’ < PreF **taštas* ← IE **tah₂i-s-to-(s)* > Celtic, OIr. *tōis*, *tāis*, Cymric *toes*, Breton *tōaz* ‘dough’, Ch Sl. *těsto*, Russ. *testo* ‘dough’ etc. To the same root belongs the Gmc *m*-derivation OHG *deismo* ‘sour dough’ (= IE **tah₂i-s-mo(n)-*). The IE root is **tah₂y-* ‘to dissolve’, nominal ‘soft mass’. In the F word the *-i-* was dropped in order to get a normal base stem of two syllables, cf. also: PreF **rišma* > Finn. *rihma* ‘thread, snare’ ~ B **rišima-* ‘binding’, Finn. *vehma-ro* ‘pole of a team of draught oxen’ ~ B **vežima-* ‘drawing; waggon’ (L. Posti). Finn. *taikina* ‘dough’ is a later, Gmc loan from a different word (cf. G *Teig* ‘dough’) (Koivulehto 1999b, 213–214).

(c) Words attested only in Sami:

(10) S *arvi* ‘rain’ (in conservative dialects *-br-*) < Proto-S (PS) **eprē* < PreS **üprä* (**iprä*) ← IE **ṃb^h-ro-* > OInd. *abhrá-* ‘cloud, rain cloud’, Av. *aβra* ‘rain, rain cloud’, Lat. *imber* ‘(heavy) rain, shower’. The PreS loss of the nasal before two consonants is regular (Koivulehto; Sammallahti 1998, 126).

(11) S *čuoŋji* (gen. *čuoŋjágá*) ‘goose’ < PS **čōñēk* < PreS **čaŋak* ← IE **g^han-/*g^hanad-/*g^hanud-* > Gmc **ganat-/*ganut-* > OHG *ganazzo*, *ganizo*, *ganezo*, *ganzo* ‘gander (= male goose)’, MLG *gante* id. etc. – Finn. *hanhi* ‘goose’ is a later, Baltic loan (Koivulehto 1983, 143–144; Sammallahti 1998, 126).

(12) S *čuorpmas* ‘hail, (also collectively)’ < PreS **čormeš* ← IE **kor-mo-/*kor-mā* (< **kor-mah₂* < **kor-meh₂*) > PB **šarma-* > Lith. *šařmas/šarmà* ‘white frost’. As to the se-

mantics cf. Modern Persian *zāla* ‘hail, white frost’ or Kashub. *żlodz* ‘white frost’ = Polab. *zlod* ‘hail’. – A later B loan is Finn. *härmä* ‘white frost’ (Koivulehto 2001; Sammallahti 1998, 126).

(13) S *gožu* (nom., weak grade) : *gohččo* (gen., strong grade) ‘soot, layer of soot, deposit of smoke or soot on things near a fireplace’ < PS **kočsāj* < **kučo-j* < **kušo-j* ← IE **h₁usyō-* or **h₁usyā-* > PGmc **usjō(n)-/*uzjō(n)-* > ON *ysja* ‘fire’? (as a name for fire), Mod.Icel. *ysja* ‘quicksand; fine rain; loose fresh snow’/PGmc **uzjōn-* > ON *-yrja*, attested in the compound Gmc **aim(a)-uzjōn-* > ON *eimyrja* (f.) ‘embers’, OHG *eimuria* id., E *ember(s)* (Gmc **aima-* > ON *eimr* ‘smoke, steam’). Also belonging to the same word family is Gmc **us-ilan-* > ON *usli* ‘embers, sparks’, Mod.Norw. *usle* ‘black smoke, coal-dust, embers’; the IE verbal root is **h₁ews-* approx. ‘to burn’ > OInd. *ōṣati* ‘singes’, Lat. *ūrō* ‘to burn (trans.)’. As to the semantics cf. also Finn. dial. *nuoha* ‘soot; layer of dust; flying dust; snowstorm’. The other old S words for ‘(various kinds of) soot’ are also borrowings: *giehpa* ‘soot’ (a B loan), *ruohhti* ‘coarse soot’ (a Gmc loan), *suohtti* ‘soot’ (a Gmc loan). FU palatal *ś* > PS *ć* was substituted for IE *-sy-* = *-sī-*, because there was no FU *-sj-*. The suffix *-j* is attested in several ancient borrowings; cf. also ex. 15 (Koivulehto 2001).

(14) S *guolbba* (gen. *guolbana*) ‘heath, dry level plain with reindeer moss or heath plants, sandy plain without stones’ < PS **kōlpen* < PreS **kalpen* ← IE **h₂alb^h-(en)-* > G dial. *Alben* ‘chalky sand underneath the top soil’, ON *alfr* ‘aur, möl’ = ‘gravel’ (only in ONorw. place names, Magnússon 11), Sw. (dial.) *alv* ‘subsoil’, a derivative from this is Sw. dial. (e.g. Gotl.) *alvar* (f.) ‘useless, barren, treeless, open field, bare mountain field, level heath on a shore’ (a new etymology, Koivulehto 2001). The adjectival form is IE **h₂alb^h-o-* ‘white’ (> Gmc **albā-*, Lat. *albus* ‘white, pale’). Finn. *kalvas*, *kalpea* ‘pale’ is obviously a parallel borrowing (a new etymology, together with Petri Kallio). As to the semantics cf. Sw. *blek* ‘pale’ ~ (dial.) *bleke* (n.), *bleka* (f.) meaning the same as Gotl. *alvar*: “*Bleket eller Allvarmoen, som det här kallas, var de mästa ställen brundt*” (*mo* ‘moor, heath’) (Linné).

(15) S *guovssu* (nom., weak grade): *gukso* (gen., strong grade) ‘dawn’ < PS **kōksāj* < PreS **kawso-j* or **kaṃso-j* ← IE **h₂aws-ōs-* > Proto-Gr. **auhōs* > Lesb. *auōs* (with a secondary long *ā*: Att. *hēōs*) ‘dawn’, Iran. **aušah-* (attested in later Iranian languages) id., fur-

ther derivatives in Lat. *aurōra* id., Lith. *aušrà* id. = Gmc **aus(t)ra-* > ON *austr* ‘east’; zero grade in OInd. *uṣ-ās* ‘dawn’; verbal stem **h₂ews-/*h₂wes-* ‘to shine, to glow’. The sequence **-ws-* was originally unknown in FU, so it was probably replaced by the existing FU *-ṃs-*: cf. S *juoksa* : *juovsa* ‘bow’ ~ Finn. *jousi* id. < **jōṃse* (a new etymology, Koivulehto 2001; Sammallahti 1998, 126).

1.1.2. Contact between Pre-Germanic and Pre-Finnic/Pre-Sami

It seems possible to discern layers of loanwords which are later than the layers of IE borrowings discussed in the preceding section (1.1.1.) but earlier than the Gmc layers proper discussed in the following sections (1.1.3.–1.1.6.). It is appropriate to call them Pre-Germanic loanwords. Pre-Germanic (PreGmc) is understood here as a language stage that followed the depalatalization of IE palatals (e.g. IE *k̑* > PreGmc *k*) but preceded the Gmc sound shift (“Lautverschiebung”, “Grimm’s Law”, e.g. *k* > PGmc *χ*). The IE movable stress still existed and caused the lenition of the unvoiced stops in unstressed position, so that they gradually merged with the reflexes of the IE aspirated voiced stops: i.e. Verner’s Law is assumed to have acted before the Gmc sound shift (cf. Koivulehto/Vennemann 1996, esp. 170–174; Ramat 1981, 38–40).

The characteristics of these Pre-Gmc loans are among others: (a) In contrast to the oldest layers, (1) there are no immediate reflexes of IE laryngeals (cf. exs. 18 and 19), (2) the depalatalization (“centumization”) of the IE palatal stops has already taken place (cf. ex. 17), (3) the lenition of the IE unvoiced stops (“Verner’s Law”) has already taken place (cf. ex. 17); (b) in contrast to the Gmc loans proper, (4) the IE vocalic (syllabic) resonants have not yet undergone the typical PGmc vocalization with *u* (*um, un, ur, ul*, in Gmc loans appropriately reflected by F *um, un, ur, ul*), but are obviously either still preserved as such, or, at least, have a phonetic shape that differs from that of PGmc; cf. exs. 18 and 19), (5) the merger of IE /o/ and /a/ in Gmc /a/ has not yet taken place (cf. ex. 17). Additionally, *per definitionem*, (6) the Gmc sound shift (“Lautverschiebung”) had not yet taken place. This criterium is, however, hardly applicable, because of the lack of a suitable corresponding distinction in the FU/PreF consonant system (cf. ex. 16).

(16) S *gahčča-* ‘to fall’ < PS **kećće-* < PreS **kićće-* (or **kećće-*) ← PreGmc **kidye/o-* (or **keydye-?*) > PGmc *χit(t)ja-/χitatja-* > PN **hittja-* > ON *hitta* ‘to hit upon, to meet with, to hit or light upon; to find, to find one’s way’, *hitta á, í* ‘to hit upon, to get into’, Mod.Icel. *hitta* ‘to meet, to hit’, Sw. *hitta* ‘to find’. Original sense *‘to fall, to light upon’: cf. Cymric *cwyddo, di-gwyddo* ‘to fall, to happen’ (‘fallen, sich ereignen’) < either (1) Pre-Proto-Celtic **kei-* + a vocalic verbal suffix, or (2) Pre-Proto-Celtic **kid-ye/o-* (according to Peter Schrijver); IE (Gmc-Celtic) **keyd-* ‘to fall’. As to the semantics cf. Gmc **falla-* ‘to fall’ ~ OPr. *au-pallai* [-l-] ‘to find’ ~ Lith. *pulti, puolu* ‘to fall’ etc., Lat. *cadere* ‘to fall; to happen; to turn out; to occur’, *in-cidere* ‘to fall into; to chance to meet or find, happen on; to happen to’. A new etymology (Koivulehto 2001; Sammallahti 1998, 242).

(17) S *doarvi* ‘so much as is needed, a sufficient amount’ (attested in every S dialect/language) < PS **tārvē* < PreS **torva* ← PreGmc **torβā* > PGmc **parbō* > ON *þorǫf* ‘need’ (*vinna þorǫf* ‘to be sufficient’), OSw. *þarf* ‘need; what is needed, necessary’, OE *þearf* ‘need’, = Go. *þarba* ‘want, need’ (formally = Lith. *tarpā* ‘thriving, growth’); IE root **terp-* approx. ‘to get satisfied’. A later, Gmc/PN loan from the same noun is S *dárbu* ‘need’; Finn. *tarve(h)* (gen. *tarpe(h)en*) ‘need, want’, pl. ‘materials, utensils’ is a parallel Gmc/PN loan, probably from the same noun, too (the ending *-eh* is frequent in loanwords and need not reflect a similar ending in the source word: cf. ex. 18). As to the phoneme substitution cf. also Finn. *arvo* ‘value, price’, an Aryan loanword: cf. OInd. *arghá-* ‘price, value’. A new etymology.

(18) Finn. *kone*, gen. *kone(h)en* ‘machine’; (older, dial.) ‘magical cure; (magical) trick, cunning; strange’, Karel. *koneh* ‘magic’; a verbal derivation: Finn. (dial.) *konehtia* ‘to conjure, to practice witchcraft’, Karel. *konehtie* ‘to conjure, to practice witchcraft; to plot’; < PreF **koneš* ← PreGmc **gñ(H)yo-* (= IE **ǵñh₃-yo-*) > PGmc **kunja-* > ON, Mod.Icel. *kyn* (n.) ‘wonder, something strange’. To this group also belong: ON *kynsl* (n., pl.) ‘wonders, strange things’, (Mod.)Icel. *kynngi* (f.) ‘magic, witchcraft’ (derived from ON *kunnr* ‘well-known, learned’), *kynnga* ‘to conjure, to practice witchcraft’; cf. Lith. *žinià* ‘news, information; knowledge; art, skill; witchcraft’ (= IE **ǵñh₃-yā-*); IE verbal root **ǵneh₃-* (in Gmc also **ǵenh₃-*) ‘to know, recognize’. Cf. also IE **ǵñh₃-mV-* (> Lith. *žymė* ‘sign, mark’) > PreF **imeš* > Finn. *ihme* ‘miracle, wonder’.

For the Germanic significance of this IE word family (‘secret knowledge’) see Seebold s.v. *König*. The basic stems ending in an *-eš* are normally loanwords. The IE laryngeal seems to have no reflex. It may already have disappeared or there was an assimilation IE **-nH-* > **-ñ-*, and the long syllabic nasal was later shortened before *j* (as for the gemination see Seebold 331, 471). The geminate was replaced by a single nasal in PreF, as a geminate nasal was still non-existent; the oldest word with it is Finn. *onni*: see the next example. A new etymology (Koivulehto 2001).

(19) Finn. *onni*, gen. *onnen* ‘happiness, bliss, delight; luck, fortune’ = (or rather >) S *vuodna* ‘good fortune, luck’ < PreF **vonne* ← PreGmc **wñ(H)-* > PGmc **wun(n)-* in: **wuna(n)-/wunōn-* > ON *Uni*, a man’s name (probably also *Unr*), *Una*, a woman’s name, and in **wunjō* > WGmc **wunnjō* > OHG *wunna*, *wunnia* ‘delight; happiness, bliss, pleasure’, OLG *wunn(i)a*, OE *wynn*, MHG *wünne* id. The corresponding verb is Gmc **wunē-* > ON *una* ‘to feel happy’, OHG *wonēn* ‘to stay, live’; the IE verbal root is **wenH-* approx. ‘to strive; to want, wish’. Initial PreF *v-* disappeared regularly before labial vowels in F and S; in S it has arisen again regularly before a PS long *ō*. The word is the only *e*-stem with a geminate dental nasal and obviously also the oldest F word with *-nn-* in a basic stem in general. The F geminate can be explained by a PreGmc geminate **-ñ-* < IE **-ñH-*, which was later shortened (cf. ex. 18). But it can not be excluded that it reflects the original sequence **-ñH-*, at a stage when the laryngeal was already hardly audible (for an analogous case see ex. 52 below). A new etymology (Koivulehto 2001). A younger word for ‘luck’ is a loan, too: S *lihkku*, Finn. *lykky* (cf. Sw. *lycka* id.); and S *oassi* ‘share; luck’ is a loan from Finn. *osa* ‘part, share’, which itself is an old Aryan loan.

1.1.3. Early contact between early Proto-Germanic/North Germanic and Pre-Finnic

Proto-Germanic (PGmc) is understood here in the traditional sense as a stage after the stress was fixed on the first syllable and after the Gmc sound shift (‘Lautverschiebung’). The term North Germanic (NGmc) applies to phonetic and lexical features which are attested (early) in the north of the Gmc speech area. Chronologically, it refers to items older than the traditional Proto-Nordic period.

Here and below it is used for forms with an early long /ā/ (< PGmc /ē/ or rather /æ/). The preceding early PGmc stage /æ/ is attested, too: see ex. 24).

Gmc loanwords that have undergone the typical phonetic changes that took place between PreF and (Late) Proto-Finnic (PF) must have been adopted during a more or less PreF period. The phonetic changes in question are numerous and shall not be enumerated here (for these see e.g. Itkonen 1983, 203–204; Hofstra 1985, 55–57). The most important ones can be inferred from the examples below, where the PreF original forms are given. Several of the loans that fulfill the criteria are attested also in S. In these cases it is theoretically possible to reckon with one and the same loan into a common proto-language (Finnic-Sami), but, more probably, the S word is a very old borrowing from PreF proper into PreS. Of course, not all early loans have a phonetic shape that could supply appropriate criteria.

(20) Finn. *apaja* ‘fishing ground; (dial.) recess of a river’ (in Vepsian, Vote, Est. ‘narrow bay’, Est. also ‘muddy ground’) = S *vuohppi* ‘deep narrow bay, recess of a river or lake’ < PreF **apa-ja* (-*ja* is a suffix denoting a place’) ← early PGmc **aban-* > Sw. (dial.) *ave* ‘shallow, narrow bay of a lake’; cf. also PGmc **abhōn-* > ON *efja* ‘bay of a river; muddy ground, mire’ (Nikkilä 1988, 145–148; LÄGLOS I, 29–30).

(21) Finn. *arpa* ‘lot, share, portion; destiny’ = S *vuorbi* ‘lot, destiny’ < PreF **arpa* ← early PGmc **arba-* (m. or n.) > OSw. *arf* (n.) ‘inheritance, landholding’, ON *arfr* ‘inheritance, portion of an inheritance’, OSw. *arver* ‘inheritance’. S *árbi* ‘inheritance’ is a later, PN loan (LÄGLOS I 37).

(22) Finn. *hauta* ‘pit, tar-burning pit, cooking pit, pit for catching wild animals (for wolves etc.), hole; grave’ (= apparently S *suovdi* ‘gill; mouth, gullet’) < PreF **šavta* (or rather ← **šavða*, which is required by the S form, dialectally showing the dental fricative) early ← PGmc **saupā-* > OE *sēap* ‘pit, hole; well, pool’, *sand-sēap* ‘sand-pit’, *wulf-sēap* ‘wolf-pit’, MLG *sōt* ‘well’; cf. Gotl. *sāide* ‘tar-burning pit’ < Gmc **saupja-*; S (dial., obsol.) *saude* ‘tar-burning pit’ is a later borrowing into PS. As to PreF *š-* cf. ex. 67: Lith. *šarvas* (LÄGLOS I, 90).

(23) Finn. *kansa* ‘people’ (Karel. *kanža* ‘company; comrade’) = S *guos’si* ‘guest, stranger’ < PreF **kansa* ← early PGmc **χansā* > PGmc **hansō* > Go., OHG *hansa*, OE *hōs*

‘crowd, host’, MHG *hanse* ‘commercial company’ (LÄGLOS II, 38–39).

(24) Finn. *käve-* ‘to go, walk’ (-*v-* preserved as such in the past tense *kävin* ‘I went’ and in the derivative *käve-le-* ‘to walk around’) < PreF **käve-* ← PGmc **skæwja-* > Go. *skewjan* ‘to go, walk’, ON *skæva* ‘to go, to hasten’. Note that long open vowels did not originally exist in PreF (LÄGLOS II, 141–142).

(25) Finn. *liesi* (stem *liete-*) ‘hearth’ < PreF **lēte* (or **lēde*) ← early PGmc **slēda-* or **slēdi-* > OHG *slāt* ‘chimney hood, chimney’, G *Schlot* ‘chimney, smokestack’; as to the semantics, cf. G *Esse* ‘hearth; chimney’. Old loanwords with a heavy (long) first syllable have often become F *e-*stems (cf. LÄGLOS II, 201).

(26) Finn. *maltša* ‘*Stellaria media* (chickweed); *Atriplex* (orache)’, Est. *malts* ‘*Atriplex*’, (adj.) ‘soft’ < PreF **malčca* (? < **maltja*) ← early PGmc **malčja-* ‘soft, tender’ > OHG *melta*, OLG *maldia*, OE *melde* ‘*Atriplex*’ (LÄGLOS II, 248–249).

(27) Finn. *paha* ‘bad, evil; difficult, hard, rough’ < PreF **paša* ← NGmc **bāga-* > ON *bág-r* ‘difficult, hard’, *bág-lundr* ‘ill-disposed, bad-tempered’; the PreF *š* is proved by S *buoš-ši* ‘ill-tempered’ (with a new S phoneme *š*), which was apparently borrowed from a late PreF form before PreF *š* > PF *h*, but after PreS *š* > PS *s*. A long *ā* was not possible (Koivulehto 1981, 339–341).

(28) Finn. *sata-ma* ‘boat-shore, harbour’ (-*ma* is a suffix) ← early PGmc **stapa-* (> OHG *stad*, *stado*, MHG *stade* ‘strand, shore’; cf. E dial. *staith[e]* ‘quay’). As to the suffix, cf. Finn. *ranta-ma* ‘bank (of a lake, river)’ from the Gmc loan Finn. *ranta* ‘shore’ (Nikkilä 1988, 153–158; also O. Nuutinen). A later borrowing would have given Finn. **tata(ma)*; cf. ex. 29.

(29) Finn. *suota* ‘(obsol.) herd of mares in heat, (dial.) horse herd, reindeer herd’ < PreF **sōta* (or **sōða*) ← early PGmc **stōda-* > OHG, MHG *stuot* ‘horse herd’, OSw. *stop* ‘herd of mares, horse herd’ etc. (Koivulehto 1997, 19).

1.1.4. Contact between Proto-Germanic/early Proto-Nordic and Finnic

The younger layers of old Gmc loanwords were borrowed into the (Late) Proto-Finnic (PF). This can be proved by the fact that they have not undergone the typical phonetic changes which transformed the PreF phonemic/phonetic system into that of (Late) PF. Because the Late PF forms do not consider-

ably differ from Modern Finnish forms phonetically, only the latter forms are given below. The equivalents from other F languages are also omitted, for the sake of brevity.

In most cases it is not possible to distinguish between PGmc and early PN loans; so the source word forms are mostly labelled as Gmc. Only the forms with NGmc long /ā/ (< PGmc /ē/) are given expressly as NGmc.

(30) Finn. *autio* ‘desert, deserted’ ← Gmc **aub(i)ja-* > OSw. *öþe* ‘desert’, OHG *ōdi* id. (LÄGLOS I, 47).

(31) Finn. *hartia* ‘shoulder’ ← Gmc **hard(i)jō* > ON (pl.) *herðar* ‘shoulders’ (LÄGLOS I, 84).

(32) Finn. *havas*, gen. *hapa(h)an* ‘depth of a fishing net, netting’ ← NGmc **hābaz* (= PGmc. **χēbaz*) > ON *háfr* ‘pochet net, hoop net’, Mod.Norw. (dial.) *haav* (= *håv*) id.; see ex. 48 (LÄGLOS I, 91–92).

(33) Finn. *laho* ‘rotten; a rotten tree’, Lude/Veps ‘rotten, lying tree’ ← NGmc **lāgō* > ON *lāg* ‘lying tree’, Sw. *låg*, *låga* ‘lying tree’, dial. ‘lying, rotten tree’; cf. Finn. *lieko*, ex. 35 (LÄGLOS II, 150–151).

(34) Finn. *lantio* ‘pelvis’, *lanne(h)*, (pl.) *lante(h)et* ‘loins’ ← Gmc **landī(n)-* > OHG *lentū(n)* ‘loin’, ON *lend* id. (LÄGLOS II, 170).

(35) Finn. *lieko* ‘a lying tree trunk in water, snag’ (only in WFin!) ← Gmc **lēgō* > ON *lāg* ‘a lying tree trunk’ (LÄGLOS II, 200).

(36) Finn. *malja* ‘bowl; cup’ ← NGmc **mālja-* (= PGmc. **mēlja-*) > OE *mæle* ‘bowl, cup, basin’, ON *mælir* ‘measure’, *qrva-mælir* ‘quiver’ (LÄGLOS II, 2469).

(37) Finn. *patja* ‘mattress, bed’ ← Gmc **baðja-* > ON *beð-r* ‘bed, bolster’, OHG *betti* ‘bed’.

(38) Finn. *ruokkia* ‘to feed, (dial.) to keep up, to care for’ ← Gmc **rōk(i)ja-* > ON *rækja* to take care of’, OHG *ruohhen* id.

(39) Finn. *ruokko* ‘upkeep, care’ ← Gmc **rōkō* > OHG *ruohha* ‘care, concern’.

(40) Finn. *sairas* ‘sick, ill’ ← Gmc **saira-z* > ON *sár-r* ‘sore, wounded’.

(41) Finn. *sakko* ‘fine, penalty’ ← Gmc **sakō* > ON *søk* ‘charge, offence, suit in court; cause’ (= Sw. *sak* ‘thing’).

(42) Finn. *tanko* ‘pole, rod’ ← Gmc **stangō* > ON *stong* ‘pole’.

1.1.5. Contact between Proto-Germanic/early North Germanic and Pre-Sami

In this group borrowings of different ages are combined. The earliest of them could theoretically go back even to a PreGmc period: cf.

exs. 43, 45, 46. S *lieddi* ‘blossom, flower’ (ex. 44) still reflects the PGmc long /ē/ (= *e*¹), but it is hardly a PreGmc loan, because of the S vowel combination *ē-a*, which is an innovation (non-existent in FU), and because of the initial *pl-* attested in a few dialects.

Perhaps the most interesting examples are 47 and 48, which show PreS /a/ (> PS /ō/ > *uo*) as a reflex of the long North Germanic /ā/ that already had developed from PGmc long /ē/, the phonetic value of which was rather [æ:] in PGmc. Since the examples must be considered most convincing (note that NGmc **hābaz*, ex. 48, was adopted in parallel in F, the meaning being exactly the same: cf. ex. 32), they show that the phonetic development [æ:] > [a:] was rather early in Scandinavia; obviously it was finished several centuries B.C., at the latest. It is not reasonable – in view of the whole (even if relative) chronology of western FU – to assume that the PreS vowel system would have lasted any longer. On the other hand, since the S word for ‘blossom, flower’ (ex. 44, with /ē/) is hardly any older, we are led to assume an early dialectal division in Gmc: in a certain NGmc dialect the phonetic change [æ:] > [a:] took place very early, while some other Gmc dialect in the north retained the front character of the same phoneme, even raising it early to a rather closed [e:], attested later in Gothic. The same division can be observed also in Gmc loanwords in F: cf. Finn. *paha* (ex. 27), *laho* (ex. 33) and *malja* (ex. 36) versus Finn. *liesi* (ex. 25) and *lieko* (ex. 35). Note also that probably the earliest Gmc value, long [æ:], is also attested in loanwords (see ex. 24 above, and Hofstra 1985, 35–37, 139–142). The etymologies 47–49 are new ones (presented in two papers read by Koivulehto), but are already listed in Sammallahti 1998.

(43) S *buoidi* ‘fat’ < PS **pōjtē* < PreS **pajta* ← early PGmc. **faita-* > ON *feit-r* ‘fat’ (Sammallahti 1998, 128).

(44) S *lieddi* ‘flower, blossom; (oar, shoulder) blade’ < PS **lēdē* = PreS **lēða* ← PGmc **blēda-/ā* (< PreGmc **b^hlē-t-* < **b^hleH-t-*) > NGmc **blād* (cf. OE *blād* (f.) ‘flower, blossom; fruit’), Old Low Franconian **blād* (→ French *blé* ‘corn’) > MDutch *blat* ‘yield (crop); return, interest’. Cf. Finn. *lehti* ‘leaf, blade’ (ex. 4) (cf. Sköld 1961, 139–140; Sammallahti 1998, 128).

(45) S *luoika-* ‘to lend, to hire out (for a single occasion)’ < PS **lōjkkē-* < PreS **lajkke-* or **lojkke-* ← early PGmc **laig^weje/a-* or **laig^wē-*

(or ← PreGmc **loiŋ*^w *éje/a-*; hardly ← IE **loik*^w-*éye/o-*) > ON *leigja*, *leiga* ‘to hire’, Mod.Icel. *leigja* ‘to rent, hire; to hire out’, Mod.Norw. *leie*, *leiga* ‘to rent, hire; to hire out’, OSw. *leghia* id.; IE root **leyk*^w- ‘to let’. Since PreS *-*kw-* (for PGmc -*gw-*) was non-existent, the geminate -*kk-* might have been substituted for it. S *laigu* ‘hire, rent’ is a later loan from PN **laigō* > ON *leiga* ‘hire, rent’ (Koivulehto; cf. Sammallahti 1998, 128).

(46) S *ruovda* (LuleS *ruob’da*) ‘rim, side (of the bottom piece of a Sami brogue, of a boat or bed)’ < PS **rōmtę* < PreS **ramte* or **romte* ← early PGmc **ramd-* (< IE **rom-t-*) > Gmc **randa-ō* > ON *rōnd* ‘edge, rim, border’, OHG *rant* id. The S form unambiguously reflects PreS -*mt-* (cf. Sköld 1960, 64–74; Sammallahti 1998, 128).

(47) S *vuohčču* ‘narrow bog (collecting water)’ < PS **vōččō* < PreS **vaččo* ← NGmc **wātjō* (fem.) (< PGmc **wētjō*) > Gotl. (Sw. dial.) *vāt* (fem.) ‘bog, a boggy place where there is water in autumn and in spring’. Cf. also Sw. etc. *vāta* ‘moisture’ < NGmc **wātjōn-* < PGmc **wētjōn-*. As for the replacement of Gmc -*tj-* by (Pre)S -*čč-* cf. S *fiščču* ‘seal’s flipper’ ← PN **fitjō* > ON *fit* id. The same replacement has taken place in PreF proper (see ex. 26, Finn. *maltsa*). A new etymology (Koivulehto 1999c, 14; Sammallahti 1998, 128).

(48) S *vuoksa* ‘depth of a fishing net, netting’ (LuleS *vuopsa*) < PS **vōpse* < PreS **apse* < **apas(e)* ← NGmc **hābaz* (= PGmc. **χēbaz*) > ON *háfr* ‘pocket net, hoop net’. In S syncope took place early: nom. **apas(e)* : gen. **ap(a)sen* > **apse* : **apsen* (other examples: S *gáica* ‘goat’, *sávza* ‘sheep’, see exs. 53, 59). In S, there was no substitute for Gmc **h-*: cf. S *ávji* ‘hay’ ← Gmc **hauja-* and ex. 49. Finn. *havas*, gen. *hapa(h)an* ‘depth of a fishing net, netting’ is a parallel loan from the same NGmc word (ex. 32) (Koivulehto 1999a, 12–13; Sammallahti 1998, 128).

(49) S *vuopman* ‘hunting fence with two long, converging arms ending in a pit or a pen’ < PS **vōmēn-* < PreS **amene* ← Gmc **hamen-* (*n*-stem, masc.) > OHG *hamo* ‘hunting net; fish weir net’, MHG *ham(e)* ‘sack-like hunting net’, G *Hamen* ‘landing net; a long, tapering hunting net’. As for the semantics, cf. Finn. *siula* ‘side net of a seine; side fence leading reindeers to an enclosure’. (Koivulehto, a new etymology; Sammallahti 1998, 128).

1.1.6. Contact between early Proto-Nordic and Proto-Sami

There are hundreds of PN loanwords in S. As early PN does not considerably differ from PGmc, it is, in most cases, impossible to choose between the alternatives PGmc and PN by purely Germanic criteria. The difference from the earlier PGmc and PreGmc loans into PreS (1.1.2. and 1.1.5.) can, however, be established on several criteria based on the phonetic development (“Lautgeschichte”) of S itself: (1) Gmc/PN /*a/* yields S *a* (i.e. the front *a*, written *á* < PS /*ā/* < PreS /*ä/*), whereas the older PreS layers in such cases have S *uo* (< PS /*ō/* < PreS /*a/*); (2) NGmc/PN long /*ā/* likewise yields the same reflexions, respectively; (3) Gmc/PN /*e/* gives S *ie* (< PS /*ē/*), whereas in the older PreS layers we would expect the reflex of PreS /*e/* > S *ea* (also written *æ*); (4) Gmc/PN long /*ū/* normally becomes S *uv*; the oldest Gmc loans, however, have S *u* (< PS /*u/* < early PS/PreS /*ū/*): see ex. 57 ‘cow’); (5) G/PN initial /*f/* yields S *f*, a phoneme which was adopted from PN, whereas the older layers have initial S *p* (written with *b*: see ex. 43). The following examples are all (except ex. 51) listed also in Sammallahti (1998, 128–129, 243).

(50) S *biergu* ‘meat, flesh-food’ < PS **pērķō* ← PN **bergō* > ON *björg* ‘aid, rescue; food’.

(51) S *buvri* ‘storehouse, shed’ < PS **puvrē* < early PS **puvrā* ← PN **būra-* > ON *búr* ‘store house’.

(52) S *fiel’lu* ‘board’ < PS **fēllō* ← PN **felhō* > ON *fjǫl* ‘board’. The Gmc/PN sequence -*lh-* was replaced by geminate -*ll-*, because there was no *h* in PS.

(53) S *gáica* ‘goat’ < PS *kājce* ← PN **gaitiz* > ON *geit* ‘goat’. In S syncope **-ttis(e)* > **-ttse* = -*cce* took place early (cf. ex. 59).

(54) S *gárdi* ‘corral’ < PS **kārtē* (< early PS **kārtā*) ← PN **garda-* > ON *garðr* ‘fence, yard’.

(55) S *gávdna-* ‘to find, come upon, meet’ < PS **kāvne-* ← PN **gagnija-/gaganja-* > ON *gegna* ‘to go against, meet, encounter’.

(56) S *gávdni* ‘(useful) thing; use(fulness)’ < PS **kāvnē* (< early PS **kāvnā*) ← PN **gagna-* > PN *gagn* ‘gain, use, utensils’.

(57) S *gussa* ‘cow’ < PS **kuse* < early PS **kūse* ← PGmc/early PN **kūz* > ON *kýr* ‘cow’.

(58) S *mánnu* ‘moon’ < PS **mānō* ← PN **mānan-* (or rather **mānōn-*) > ON *máni*, *mána-* ‘moon’.

(59) S *sávza* ‘sheep’ < PS **sāvce* ← PN **saudiz* > ON *sauðr* ‘sheep’. In S syncope

*-tis(e) > *-tse = -ce took place early (cf. ex. 53).

1.2. Phonetic/phonological Germanic influence on Finnic

It has been suggested that Gmc had a deep impact on F phonetic development. Most of the phonetic changes which occurred between PreF and (Late) PF can be explained by assuming a Gmc speaking superstrate in regions originally populated by speakers of F (Posti 1953). According to this theory the changes came about as phonetically incorrect F spoken by a Gmc superstrate and were subsequently carried through by the F substrate which imitated this incorrect pronunciation. The theory, in its essential core, has gradually been accepted by most linguists engaged in F language history (cf. Itkonen 1983, 203–204), but see Fromm (1958, 211–240). For a new critical evaluation see now Kallio (2000).

The explanation of the F consonant gradation (lenition of *p, t, k, s* under certain circumstances) encounters particular phonetic difficulties if attributed to a “Verner’s Law” that would have arisen only in PGmc. It has recently been shown (Koivulehto/Vennemann 1996) that these difficulties can be explained away if we start from a Verner’s Law which had operated already before the Gmc sound shift (in PreGmc or “Paläogermanisch”, see 1.1.2.).

On the other hand, since consonant gradation is found in two Samoyed languages (Selkup dialects and Nganasan) – in one of them, Nganasan, the resemblance to the F phenomenon is rather striking – it has been argued that gradation was already a Proto-Uralic phenomenon (Helimski 1995, 28). However, if that were the case, it would be a little surprising that (1) gradation became phonological only after the PF period, (2) there is also gradation in S, which has a rather different look: it is based on strengthening and all consonants and consonant clusters are involved (Sammallahti 1998, 3), and (3) this kind of gradation is, again, found in Selkup. Thus it would seem a better solution – provided that gradation was essentially an autochthonic phenomenon – to explain its Finnic, Sami, Nganasan, and Selkup manifestations as secondary convergent (parallel) developments that arose from a similar phonotactic prerequisite in Uralic (Sammallahti 1998, 3). If this is accepted, then the question of an opposite direction of phonetic influence – Pre-Finnic → Pre-Germanic – does not seem very

probable. As to F gradation, a compromise could be reached by assuming an indigenous predisposition which was enhanced by foreign influence (Verner’s Law).

1.3. Syntactic influence

An early Germanic and, more generally, Indo-European influence on F syntax is obvious, even if it is difficult to date and describe it, as well as its source language, exactly. It is, however, generally accepted that the development of subordination, i.e. of subordinate clauses, is due to IE influence; Uralic, originally, made extensive use of infinitive and participial constructions. Moreover, the coordination of words or whole sentences using the conjunction ‘and’ is apparently adopted from Gmc, since Finn. *ja* ‘and’ is also an old Gmc loan (cf. Go. *jah* ‘and’). Another syntactic feature adopted from Indo-European is the agreement of attributive adjectives in number and case; originally, the attribute had neither number nor case markers, a state that is still preserved in Hungarian.

1.4. Conclusions

At least the following conclusions can be reached from the material presented and discussed above.

(1) Contact between an Indo-European idiom which, in its later stages, we call (Proto-)Germanic and Proto-Nordic, and the Finno-Ugric language family – especially the Finnic and Sami branches – started at a time when the contacting IE language still was, in its phonetic/phonological shape, as good as identical with reconstructed Proto-Indo-European; we choose to call this language Northwest Indo-European.

(2) The contact continued, apparently without noticeable interruptions, through Pre- and Proto-Germanic stages to the Proto-Nordic period – and was to continue until the present time.

(3) This contact manifested itself most clearly, as a steady flow of lexical borrowings from Indo-European/Germanic to Finnic/Sami. Several cultural loanwords from the oldest IE period bear witness that the Pre-Finns became acquainted with a primitive type of agriculture along with some kind of cattle breeding: words for ‘burned clearing’ (the slash-and-burn method, or just burning woods to get pasture land for the livestock), ‘bread’, ‘leaf’ (leaves

as fodder!), ‘pasture’, ‘to winnow’, ‘herb, grass’, ‘dough’, ‘a kind of fermented beverage’. The list includes the names of the two oldest cereals, ‘millet’ (cf. Koivulehto 1983, 144) and ‘wheat’, which were not discussed above (but see ex. 66 below). Actually, the old names of these cereals do not necessarily indicate that they were – on a larger scale – cultivated in Finland. It is noteworthy that also Finn. *porsas* ‘(little) pig’ could belong to this western IE layer (cf. OE *feorh* ‘pig’ < IE **por-kos*; alternatively, but not very probably, it is an Aryan loan, Koivulehto 2001); Finn. *uuhi* ‘ewe’ seems to be a still older IE loan which has spread from the east (cf. Lat. *ovis*; Koivulehto 1991, 108–109).

But the later loans are by no means limited to “cultural” words only – such as Finn. *leipä* ‘bread’, *taikina* ‘dough’, *kaura* ‘oats’, *ruis* ‘rye’, *lammas* ‘sheep’, *kauris* ‘he-goat’ (which could also be an older loan): on the contrary, masses of everyday words were adopted, words for body parts, verbs carrying core meanings, adjectives etc. A deep Germanic phonetic/phonological impact on Finnic has also been suggested.

(4) Such massive influence can only be explained by assuming a close and permanent connection between the speakers of the respective languages. It is not sufficient to assume an adstrate influence only. The close connections can only be understood by assuming a stratification of linguistic communities: i.e. at least a temporary coexistence of both languages in the same geographical area, with the newcomers, i.e. the speakers of Germanic, forming a superstrate and the original population, the speakers of Finnic, forming a substrate.

(5) The Germanic superstrate people, however, were not numerous enough to maintain their language for a longer time. They gradually assimilated to the native population. So the only traces of the foreign superstrate(s) consist of its linguistic, above all lexical, impact on Pre-Finnic and Proto-Finnic.

(6) According to the evidence of lexical loans of Proto-Germanic age, an early dialectal diversification can be discerned: there was an early North Germanic dialect, where the Proto-Germanic long /*ē*/ = /*ǣ*/ had attained the phonetic value of a long *ā*, long before the onset of what is traditionally considered the Proto-Nordic period proper. In another dialect the original front vowel was retained and even raised to a closed *ē*. On the other hand, the early PGmc long *ǣ* is also attested in loanwords (see ex. 24 above).

(7) In the light of the evidence discussed above, the so-called Jastorf theory, which is currently largely adhered to by German historical linguists, is untenable. According to this theory the Proto-Germanic primary homeland would have been situated in the northern part of the present-day Germany (within the Jastorf Culture territory, approximately 600–0 B.C.) and Scandinavia would have acquired its Germanic language only by a secondary linguistic expansion from south to north (for opinions about the Jastorf theory, see Fromm 1997). The old loanwords which are exclusively attested in Sami indicate that the respective contact areas were situated in middle/south Scandinavia and/or in Finland, apparently since Proto-Indo-European times. On the other hand, loanwords of equal antiquity in Finnic – sometimes even including areas east of it – point to contact areas in Finland and/or in the Baltic. It is, therefore, in Scandinavia and Denmark that the primary Germanic homeland must be sought, within the area of the Nordic Bronze Age Culture as defined by archaeology.

2. Contact with Baltic

2.1. Lexical loans

The only evidence of the contact between Germanic and Baltic (B) are the Gmc loanwords adopted by Baltic populations. In contrast to the hundreds of loans adopted by Pre- and Proto-Finns and Pre- and Proto-Sami there seem to be just 10–20 old Gmc loans in B; and several of these are considered to have passed into B through Slavic (Sl.) mediation (see e.g. Stender-Petersen 1927, 134; Otrębski 1966). In Slavic there are, in fact, considerably more Gmc loans than in B (cf. Stender-Petersen 1927; Kiparsky 1934). The loanwords are nearly all cultural ones.

Some of the most interesting examples are discussed below.

(60) Lith. *gātvė* ‘street, lane; (obs.) cattle track’, Latv. *gatve*, dial. *gatva* ‘avenue; cattle track’ ← Go. (or older) *gatwo* (f.) ‘street’; or from a corresponding PN word: cf. ON *gata* ‘way, path, road’. There have been attempts to explain the word as a genuine B formation (Otrębski 1966, 62–63; Karulis I 294–295); the explanations, however, do not seem plausible (and Finn. *katu* ‘street’ is by no means borrowed from an alleged B **gatu-*, as Karulis claims, but from Sw. dial. *gatu* = standard Sw. *gata*!). The difference in the endings of

the Gmc and the B word does not, of course, endanger the loan etymology (Fraenkel 139–140).

(61) Latv. (dial.) *glīsis*, *glīse* ‘amber’ ← Go. **glēs* (= PGmc **glēza-* > **glāza-* > OE *glær* ‘resin, amber’, MHG *glār* ‘resin’). The Gmc word appears as *glaesum* in Tacitus. The source word is most probably an early Gothic form. Endzelin (ME I 627) explains the Latv. *ī* as a secondary development: the Gothic word was first adopted in Old Prussian (OPr), from where it passed through Courland (where *ē* > *ī*) into Latvian (ME I 627). The long *ī* could be, at least theoretically, also the original value, as the closed Go. long *ē* could have been replaced by B long *ī*: the B long *ē* was, at an earlier time, a rather open vowel (Stang 1966, 46). Cf. ex. 62.

(62) Lith. *ýla*, OPr. *ylo* (Latv. *īlens* m.) ‘awl’ (*y* = *ī*) ← apparently Go. **ēla* (= PGmc **ēlō* > OHG *āla*, OE *æl* ‘awl’). As for the vowel correspondence cf. ex. 61. The B loanword proves the long vowel of the Gmc word, which has been questioned (Fraenkel 183; Mažiulis II 24–25).

(63) OPr. *ilmis* ‘shelter for corn or hay’ < **ilmas* (see Mažiulis II 24) ← Early Go. **hilm(a)s* > (Wulfila) *hilms* ‘helmet’ (= ON *hjalmr* ‘helmet’ = Sw. [old, dial.] *hjäl* also ‘shelter for corn etc.’). In this later borrowing the Go. *h-* has no reflex any longer. An older borrowing from the same Gmc word is OPr. *kelmis* < **kelmas* (see ex. 64).

(64) OPr. *kelmis* ‘cap, hat’ < **kelmas* (see Mažiulis II 160–161) ← PGmc **χelmaz* > Go. *hilms*, ON *hjalmr*, OHG *helm* etc. ‘helmet’. The replacement of Gmc **χ* by B *k* proves an old borrowing (in contrast to OPr. *ilmis*: ex. 63).

(65) Latv. *klāips* ‘loaf, bread’ < **klaipas* ← (P)Gmc **χlaibaz* (hardly from [later] Go.) > Go. *hlaiψs* ‘bread’, ON *hleifr*, OE *hlāf*, OHG (*h*)*leib* ‘bread, loaf’ (Fraenkel 271). Lith. *kliēpas* ‘loaf’ is often considered a later Slavic loan, but Skardžius (1931, 19) sees in it an early Gmc loanword. Since it is true that a Proto-Baltic *ai* also can give a later *ie* (Stang 1966, 54–55; several B loanwords in Finnic prove this irrefutably), there is no reason why the Lith. word should not be a reflex of Gmc *ai* (see also ‘wheat’, ex. 66). The Gmc word was also borrowed to Slavic, Finnic (Finn. *leipä*, obviously < **laipa*: *ai* > *ei* is attested in several old loanwords), and Sami (*láibi*). That the Lith. word should be a later borrowing from ON *hleifr* (see Fraenkel 271) seems thus improbable. (Unacceptable root etymo-

logies in Karulis I 398: IE **k^wel-* ‘to turn, rotate’ or *(*s*)*kel-* ‘to cut’.)

(66) Lith. (pl.) *kviečiai* ‘wheat’, (sg.) *kvietys* ‘a single grain of wheat’, Latv. (pl.) *kvieši* ‘wheat’ ← PGmc **χwaitja-* > Go. *hwaiteis* ‘wheat’, ON *hveiti*, OHG (*h*)*weizi*. An early borrowing is proved by the initial *k* for Gmc *χ* and by the B development *ai* > *ie* (the latter is proved by several B borrowings into Finnic: cf. Finn. *paimen* ‘shepherd’ ~ Lith. *piemuō* ‘shepherd boy’). Thus, an alleged later borrowing from ON *hveiti* (Fraenkel 326) is improbable; cf. also ex. 65: Lith. *kliēpas*. Note that Votyak *vad’z*, *važ* ‘wheat’ can be explained as coming from Gmc **hwaitja-*, but not from ON *hveiti*. Also Finn. *vehnä* ‘wheat’ < **vešnä* (attested also in Mordvin and Cheremis) is highly suspected of being a borrowing, and the only possible source word seems to be IE **k^weytnō-* ‘white’ > PGmc **χwīta(n)-* > **χwīta(n)-* > G dial. *Weiß* ‘wheat’, a substantivized form of ‘white’ (cf. Seebold s.v. *Weizen*; this ablaut grade is given also for Sw. dial. *vīte* in Hellquist II 1335; in Finnic we must reckon with a peculiar phonetic substitution for IE *-ym-* caused by phonotactic constraints).

(67) Lith. *šarvas*, pl. *šarvai* ‘armour, weapons’, OPr. *sarwis* ‘weapon(s)’ (< **sarvas*, Mažiulis IV, 65–66) ← (early) Go. or PGmc **sarwa-* > Go. (pl., n.) *sarva* ‘weapons, armour’, OHG *saro*, gen. *sar(a)wes* (n.) ‘weapons, armour’; cf. ON *sorvi* (m.) ‘necklace; (pl.) warrior’ < *(*ga*)*sarwia-* (Magnússon 1020). The substitution of B *š* for Gmc *s* is the same as in Gmc borrowings into Pre-Finnic (see 1.2.3., ex. 22: Finn. *hauta*), and the explanation is, obviously, the same, too: Germanic had only one sibilant phoneme /s/, while Pre-Finnic and Baltic had /s/ and /š/; thus, this Gmc phoneme could have a phonetic value that was not “sharp”, i.e. it lay somewhere between the phonetic values of /s/ and /š/ of the borrowing languages, and could also be replaced by /š/ (see Koivulehto 1997, 15–18). A bold attempt to explain **šarvas* as a genuine B formation (Mažiulis IV 65–66) must be rejected, as well as a connection with Gr. *kóryς* ‘helmet’ (Fraenkel 965).

2.2. Conclusions

(1) The old Gmc lexical loans in B belong to different layers. There is a later layer, as shown by OPr. *ilmis* (ex. 63), and there is an earlier layer, as shown by OPr. *kelmis* (ex. 64), an earlier borrowing from the same Gmc word (cf. also Stender-Petersen 1927, 132).

(2) Since the later layer must be a Gothic one, it seems probable that the earlier layer also originates in an idiom that could be called early Gothic or Pre-Gothic (cf. Stender-Petersen 1927, 134: “Ur[ost]germanisch”); at least Latv. *glīsis* (ex. 61) and Lith. *ýla* (ex. 62) are clearly Gothic, even if they cannot be dated more closely. A Gothic origin is also suggested by the fact that the scanty lexical material preserved in Old Prussian, a West Baltic language, has relatively the most loanwords.

(3) The earliest direct contact with (Pre-)Goths arose, obviously, in the Baltic coastal region: a word like Latv. *glīsis* ‘amber’ can hardly have been adopted elsewhere. Clear indications of direct Scandinavian lexical influence (in the Christian Era) do not seem to exist; it is worth noting that the common Slavic word for ‘eye’, Russ. *glaz*, goes back to the same Gmc origin as Latv. dial. *glīsis*, but instead of the (Pre-)Goth *ē* it reflects the NGmc and WGmc long *ā*.

68. Scandinavia in the light of ancient tradition

1. Ancient geography of the North
2. Ancient ethnography of Scandinavia
3. Literature (a selection)

1. Ancient geography of the North

1.1. The image of the North up to Pytheas

The Greeks not only developed geography as a systematic discipline; Greek tradition also provides us with the earliest mythical reports on the European North. As early as Homer, the long Nordic summer's day was already known, beginning and ending at the same hour: In the *Odyssey*, the poet recounts how among the race of giants known as the *Λαιστρυγόνες*, a shepherd setting out for the pasture greets the returning one (Od. 10,81–86). The Nordic winter's day also appears to have been known, since Homer mentions the "cruel" length of the night for the Cimmerians (Od. 11,19). Other myths speak of the northern mountain range *Ῥιπαία ὄρη* behind which the sun returns from the West to the East each night. It was allegedly here that the land of the Hyperboreans was to be found, warmed by the returning sun, unreachable by ship or on foot and inaccessible to mortals (Pindar Pyth. 10,29f.). However, it is no lon-

ger possible to identify the northern areas of the ancient world from which this semi-mythical knowledge originated. In preclassical times this strange world was said to be located immediately behind the *μεγάλη θάλασσα*, the Mediterranean Sea. But as the scope of interest expanded through trade and exploration as well as colonization, the mythical North shifted as well. The foundation of the city *Μασσαλία* (Lat. *Massilia*; ca. 600 B.C.) was of importance in several respects. First of all, it was here that the Greeks came into contact with the "northern barbarians", i.e. Celts, who subsequently lost much of their mythical status. Furthermore, the Celts served as a vehicle for new information from areas which were later referred to as *Britannia*, *Germania* and *Scadinavia*, but which were initially located beyond the geographical horizon. And finally, of major importance for the later history of discovery, the western supply center *Μασσαλία* pointed the way to the gates of Gibraltar and to the Atlantic Ocean.

Initially, the land from which amber came was thought to be located in the vicinity of the *Ῥιπαία ὄρη*. Some have regarded the name *Ῥιπαία* as Gmc and compared it with ON *riþ(r)* 'rocky cliff', a highly speculative etymology which can not be proven. Accord-

ing to myth, the river Eridanos (Ἐριδανός) originates in the Rhipaeon mountains and was associated with amber as early as Hesiod (fr. 150,23f.). Phaeton, son of the sun god Helios, is said to have drowned in Eridanos, after which the Heliades, Phaeton's sisters, turned into poplars on the banks of the river and wept tears of amber into the river (Apollonios Arg. 4,595ff.). This myth is the basis for the belief in an amber river Eridanos in northern Europe. Geographic science was of course already skeptical about such traditions at an early stage. Thus Herodotus (3,115) doubts the existence of a river which the barbarians call Eridanos, since he saw the name as Greek and consequently as the invention of a poet. But he cast no doubt on the fact that amber must come from the remotest extremes of the inhabited world.

In Herodotus' times, Phoenician mariners controlled trade in the western Mediterranean and through the straits of Gibraltar. But the Greeks steadily increased their influence after the establishment of Massilia: At first this affected westerly overland trade (for example via the Rhone route), which was comparatively complicated and expensive due to the intermediate trade with Celtic tribes. In the second half of the 4th century B.C., a man named Pytheas left Massilia for the North by sea. Sources indicate that he was searching for a direct trade route to the tin and amber islands (Κασσιτερίδες, Ἐλεκτρίδες). It has even been suggested that he was searching for the northern sea route to southeastern Europe and Asia in the service of Alexander (Dion 1977, 180ff.). With his journey, the Greek horizon was suddenly extended to the North Sea and Scandinavia. Pytheas of Massilia is thus the key figure in the discovery of northern Europe. He was presumably the first Greek to travel the Atlantic to the North. But as early as the 6th century B.C., a Carthaginian explorer by the name of Himilco appears to have come as far as the British Isles and perhaps even to the North Sea. His reports have been preserved in an old Greek periplus, a description of the seacoast between Britain and the Black Sea. This periplus was translated by the Roman civil servant Rufius Festus Avienus in the 4th century A.D.; however, only the first book (Britain to Massilia) has survived. Of particular importance for later tradition is a phenomenon reported by Himilco in the northern ocean (Avienus Ora 120ff.): the "sluggish ocean" in which no wind drives the ships and where the seaweed in the shallow

water keeps the ships from preceding. This poetic text does not indicate whether or not Himilco views these two phenomena, the "sluggish ocean" and the seaweed, as being connected.

1.2. The discovery of the North after Pytheas

1.2.1. The record of Pytheas' voyage is not attested directly, either, but rather is known only as excerpted by other authors, in particular Strabo and Pliny. Nevertheless, the citations from Pytheas provided by these authors constitute not only the earliest concrete geographic descriptions, but also contain a variety of names, admittedly only a few of which are historically attested and prove to be autochthonous. Pytheas' travels took him through the straits of Gibraltar and via Tartessos, located at the mouth of the Guadalquivir, to Britain ("tin island" *Ictis*). After six days' journey to the north of Britain (the exact procession of the journey is unclear) Pytheas reports reaching a large island, *Thule* (Θούλη), in the North Sea, which subsequently played an important role in geographic literature. The short summer nights and long winter nights are mentioned in connection with Thule (e.g. Pliny Nat. 2,186f.) and the descriptions also grow more precise. When Pytheas (in Geminus and Kosmas) reports that the barbarians had shown him the resting place of the sun which is always with them in the night, he confirms the mythic idea that the sun travels back from the West to the East each night, to the north of the Rhipaeon mountains. Most of all, however, this report seems to indicate that Pytheas himself had seen the bright summer's night, perhaps even the midnight sun, and had thus traveled far to the north. It is significant that precisely this report is the only attested verbatim citation from Pytheas (cf. Mette 1952, 10).

1.2.2. Ancient authors following Pytheas mention a natural phenomenon within about a day's journey at Thule, which has been the subject of much controversy – the so-called "curdled, viscous, frozen sea" (*mare pigrum, concretum, congelatum; πεπηγυῖα θάλαττα*). Reports of the "sluggish ocean" could have been in circulation before Pytheas (cf. 1.1.). Several pieces of evidence make it unlikely that only the Arctic ocean is being referred to: Pliny for example differentiates between a *mare con-*

cretum (4,104; 37,35) and a *mare congelatum* (4,94). This needs not be significant, since multiple designations are frequent in Pliny, resulting from the incorrect interpretation of his sources. Pliny does, however, cite Pytheas when remarking that amber is the “flotsam of the viscous ocean” (cf. 1.2.3.) – an additional reason not to consider the Arctic ocean. Finally, the sources frequently mention a phenomenon which obtained its vernacular name, *lebermer* or *libersee*, in the Middle Ages, which even presume a natural explanation for this phenomenon: “. . . that the sea around the Orkneys is so viscous and thickened by salt (*circa Orchadas mare sit concretum et ita spissum a sale*), that ships would barely be able to move through it without the help of a storm; therefore this sea is also called in our tongue *libersee*” (Scholion 144 on Adam 4,34). Although *libermere* is glossed in Isidors Summarium Heinrici as *mare mortuum* ‘Dead Sea’, this could represent a later interpretation of existing evidence. Medieval literature continues the myth of the *lebermer* in which ships make no progress, for example in the OHG poem *Merigarto* (38ff.), speaking of the *mere giliberōt* in the *wentilmere westerōt*. A sea to the north of Britain (in the vicinity of the Orcades and Thule) is mentioned as early as Tacitus (Agricola 10,6), said to be sluggish and almost impossible to row through, and stirred by no wind (*mare pigrum et grave remigantibus perhibent ne ventis quidem perinde attolli*). This description calls to mind again the report of Himilco in Avienus (cf. 1.1.); it would seem as if Tacitus relied here more on his own library than on eyewitness accounts. But regardless of whether his remark is taken seriously or as a learned aside, it appears necessary to differentiate in ancient tradition between a “frozen” sea and a “curdled” sea. Pliny also mentions “native” names for the northern ocean which reflect the natural phenomena described above. According to Hekataios, the ocean on the other side of the river *Parapanisus* is called *Amalcus*, “the name which means ‘frozen’ in the language of this people” (4,94). On the other hand, according to Philemon, the northern ocean from the region of the Cimbrians to the foothills of *Rubaea* bears the name *Morimarusa*, “which means ‘dead sea’”, but behind that point is called *mare Cronium* (4,95). The “name” *Amalcus* appears to represent a misunderstanding, based probably on the Greek μάλκιος ‘still, frozen’. On the other hand, *Morimarusa* is Celtic and indeed means ‘dead

sea’. It is a matter of opinion as to whether this ‘dead sea’ is to be posited in the vicinity of the Celts or whether one should assume that the name has been transmitted from afar by Celtic-speaking peoples. It is interesting that Philemon (ibid.) attributes this designation to the Cimbrians, who are usually regarded as Germanic. The name *Cronium*, finally, has been subject to some rather absurd interpretations: Thus Much (1898, 322 A. 1) compares the name as a Celtic cognate with OE *hran* ‘whale’, which he construes as ‘whale-sea’, an interpretation frequently adopted by later scholars (cf. for example Svennung 1974, 28f.). Müllenhoff (1870–1908 I, 415ff.) is correct in refusing to recognize an autochthonous name here. It will be necessary to explain *mare Cronium* in terms of classical tradition (cf. Rubekeil 1992, 105). In opposition to Müllenhoff’s attempt to discard the natural occurrence of a “dead sea” as pure fantasy, Much (1898, 322f.) presents a report from Fridtjof Nansen, who encountered so-called “dead-water” (*dodvand*) in the North Sea in which his ship could no longer move. Nansen explained the dead-water phenomenon as a result of a fresh water layer lying on top of the salt water below. It is possible that the ancient accounts are based on observations of a similar phenomenon. Pytheas again (transmitted by Polybios) is the source of an account provided by Strabo (2,4,1), according to which in the vicinity of Thule the earth and the sea combine to form a mixture resembling a “sea-lung” (πλεύμων θαλαττίω εοικός) which can be traversed neither by ship nor by foot; land and sea and all things float there. Here again the question of whether the “sea-lung” can be identified with the accounts of the “curdled ocean” must be addressed. It has been noted that jellyfish are sometimes referred to on the German North Sea coast as “Seelungen”, and in the Mediterranean other marine mollusks have names like Gr. πλεύμων (θαλάττιος) or Lat. *pulmo* (Müllenhoff 1870–1908 I, 418ff.; Mette 1952, 7; Svennung 1974, 22f.). When positing such associative explanations, one must not forget that Pytheas allegedly describes the phenomenon of the “sea-lung” based on his own eyewitness impressions. Thus we are dealing either with a very expressive description of a natural phenomenon which was foreign to Mediterranean experience of the time, e.g. a tidal mud flat (which admittedly does not exist at the latitudes in question), seaweed beds (Jordanes Get. 1; cf. also Avienus in 1.1.) or a semi-frozen con-

glomeration of ice floes and freezing water (Nansen 1911 I, 69; further explanations in Macdonald in PWRE II.11, 628). Otherwise one would have to agree with Polybios, Strabo and others in surmising that Pytheas was a “fraud”.

1.2.3. Pliny (Nat. 37,42) preserves for us the first attestation of an autochthonous name for amber which of course was also one of the main interests on Pytheas’ journey: It is referred to by the Germanic tribes as *glaesum*, later confirmed by Tacitus (Germ. 45,4 *glesum*). It is even conceivable that the Romans borrowed the word *glesum*: The name of the island *Glaesaria* attested by Pliny (ibid.; also 4,103 *Glesiae*) shows Latin morphology and was coined, as Pliny himself states, by soldiers of Germanicus. The underlying Gmc common noun is continued in Mod.E *glass*, Mod.HG *Glas* and retains in OE *glær* (with Verner’s law) the meaning ‘amber’. Pliny tells of two different transport routes for amber – and implies at the same time two distinct areas of origin: On the one hand, he reports (37, 45) on the eastward overland trading journey of a Roman nobleman to sites “600 miles distant from Carnuntum of Pannonia” (presumably the coast of Samland). On the other hand, the amber island *Glaesaria* – which the Germanic tribes referred to as *Austeravia* or ‘Eastern Island’ – is to be sought in the North Sea. Information relating to North Sea amber stems by and large from Pytheas.

In the vicinity of an oceanic bay called *Metuonis* ‘with a space of 6000 stadia’ (*aestuarium oceani Metuonidis nomine spatiorum sex milium*) Pytheas found the island *Abalus*. Here allegedly the spring ocean currents washed up the amber as the “flotsam of the viscous ocean” (Pliny Nat. 37,35: *concreti maris purgamentum*). The meaning of the puzzling words concerning “6000 stadia space” remains unclear: If this refers to the physical extent of the ocean bay *Metuonis*, then the designation would have to apply to the entire length of the Frisian North Sea coast (Gutenbrunner 1939, 69). This would support Detlefsen’s etymology (1904, 10), comparing *Metuonis* (= Gmc **mēdwan-*) with Mod.HG *Matte*, Mod.E *meadow*. It could however also be the specification of a distance from a fixed reference point not explicitly cited. Some have identified this point with the peninsula *Tastris* (Pliny Nat. 4, 97; presumably Cape Skagen) and seen *Metuonis* as the Courland Lagoon (Aly 1957, 473f.). This however makes the

localization of the island *Abalus* problematic, supposedly a day’s journey away. Stichtenoth (1959, 91) assumes this island to be in the Baltic Sea and incidentally links the *aestuarium* with the name of the *Aestii* – an opinion based purely on speculation. A much more likely possibility is that the *aestuarium Metuonis* actually refers to the mouth of the Elbe, which is indeed approximately 6000 stadia (1110 km) away from the supply settlement at Οὐξισάμμη (the Breton island of Ouessant), where Pytheas was required to pause during his journey to Britain (Wenskus 1985, 97). When referring to the island which Pytheas called *Abalus*, Timaios uses the name *Basilis*, as Pliny notes in the same paragraph. This fact has led to some confusion, since Pliny says elsewhere (4,95) that Xenophon mentions an island called *Balcia* (manuscript also *Baltia*), which is then referred to by Pytheas as *Basilis*. The relationship among these three names and their referents is still a matter of controversy today. However, the attempt made by Solinus (19,6) to conflate *Abalus* and *Balcia* to a single name *Abalcia* can not be regarded as acceptable. *Abalus* and *Basilis* must be treated as two names for the same island; there can hardly be any doubt that the island in question is Heligoland. *Balcia* should be handled separately from *Abalus-Basilis*, primarily because of two observations made by Xenophon: first its “enormous size” (*insulam esse immensae magnitudinis*), but also because of the distance to the “Scythian coast” of three days’ journey compared with a journey of only one day for *Abalus*. Since *Baltia* is nothing more than a scribal error, it can not be connected with *Belt*, the name for a strait (Svennung 1953, 13). The facts seem to indicate that *Balcia* is another name for the later *Scandinavia* (cf. 1.3.3.). The epithet *Basilis* for *Abalus*-Heligoland is of particular interest. It is not necessary to posit an underlying autochthonous Gmc name **Baswa-lajjō* ‘red cliff’ for *Basilis* (Krogmann 1963, 211 f.). The name appears in Greek tradition and must be reconstructed as Βασιλεία (vῆσος), which could be interpreted as something like ‘king-island’. Wenskus (1985, 99 ff.) has demonstrated that this name, like others in this context, originates with Pytheas; he assumes that this remarkable designation is based on the name of the Teutons, which itself can be understood *pars pro toto* as ‘kings’ (cf. Go. *þiudans* ‘king’). Greek has simply adopted the name from the Gmc in an historical framework which can be reconstructed as follows: Heligoland, which in spite of the statements

made by ancient authors never had significant amounts of native amber (cf. also Gutenbunner 1939, 71), was primarily a center of trade for amber from Jutland and presumably also was home to a Greek trading settlement since Pytheas' journey. But the amber was supplied by Teutons from northern Jutland (cf. 2.1.1.). A startling counterpart to this designation in the Gr./Gmc contact area is found in a later Gmc name for Heligoland, i.e. *Fositesland*, an island in *confinio Fresonum et Danorum* (Alkuin Vita Will. 10). The compound *Fositesland* contains the god's name *Fosite*, which has turned out to be a Gmc borrowing from the Gr. Ποσειδῶν. The short *o* in the first syllable was presumably lengthened via folk etymology (Kuhn 1978, 285); similarly, the name was reinterpreted in ON as *Forseti* 'president' (Grímnismál 15). Adam von Bremen (4,3) knew that the island *Fosite* was *Heiligland* (Heligoland). Adam also bears witness to the fact that a type of sacred peace still existed on the island in the Middle Ages; he adds that none of the islands is thus as remarkable as *Heiligland*. This special status reminds us that Apollonios (Arg. 4,504f.) had already referred to the amber island Ελέκτρις as "sacred" land, a fact that is more than likely to be due to Pytheas in one way or another. Thus since Pytheas' times, Heligoland had been the location of *Poseidon-Fosite* worship; the temples to Poseidon, the god of islands and sea travels, served primarily to invoke peaceful trading.

1.2.4. At about the time of Christ, Germanic territory became the focus of geographical and historical interest. After Pytheas' exploratory voyage, the scope of interest of Mediterranean civilization moved significantly to the north: Gaul had become a part of the Roman Empire, and Drusus, Tiberius and Germanicus were in the process of extending the Empire's borders to the Elbe. Roman excursions even reached the edge of Scandinavia to Cape Skagen in northern Jutland –, where they located the *Cimbrorum promunturium*, the "Cimbrian foothills" (Mon. Anc. 26; Pliny Nat. 2,167). The knowledge which had survived from Pytheas' times was now mixed with newer information. Pomponius Mela mentions an "enormous gulf *Codanus* above the Elbe" (3,31: *super Albim Codanus ingens sinus*) full of large and small islands, the largest of which, the island *Condannovia*, "has now been inhabited by the Teutons" (3,54). According to Pliny (Nat. 4,96), the same *sinus Codanus* starts at *mons Saevo* and runs to the *Cim-*

brorum promunturium. Pliny also mentions various islands in the *sinus Codanus*, *quarum clarissima est Scatinavia*. Scholars have sometimes equated the "bay" *Codanus* with Skagerrak or Kattegat (Noreen 1920, 23) and sometimes with the Baltic Sea (Svennung 1974, 50). However, statements with this degree of exactness become misleading as soon as they presume that Mela and Pliny operated with the modern understanding of Scandinavian geography rather than that which was typical of ancient Rome. In any case, it is evident that when Mela uses "above the Elbe" he does not mean the same North Sea bay which appears as *Metuonis* in Pliny-Pytheas (incorrect in Horst Roseman 1994, 98). Furthermore, the assertion that the gulf *Codanus* is full of large and small islands suggests a localization "on the other side of" the Cimbrian foothills, i.e. to the east. If one keeps in mind the fact that in ancient times Scandinavia was regarded as an island – regardless of what its name was – extending the coastline of Jutland, then the Baltic Sea would also have to have been seen as a gigantic ocean bay.

A number of questions are raised by the *mons Saevo*, a mountain range *nec Rhipais iugis minor*. It is assumed that Pliny and Mela obtained their information from a lost document by Varro (Kroll in PWRE I.41, 304ff.; Gisinger in PWRE I.42, 2401; Sallmann 1971, 265ff.). Here Pliny's comparison of the *mons Saevo* with the *Rhipais iugis* also suggests interference from a Greek source, since a Roman would have chosen the Alps as an object of comparison (Detlefsen 1904, 29). Furthermore, the comparison with the Rhipaeen mountains shows that Pliny or his source imagined a large mountain range, and not simply a single mountain. Here we are clearly dealing with a nebulous depiction of the Norwegian highlands, and not (as posited by Svensson 1921, 63f.) with the Baltic plateau. Pliny's comparison could well also have been partially responsible for the fact that in the Middle Ages Adam does not hesitate to refer to the Norwegian mountains as *Riphei*. The name *Codanus* is presumably Gmc, although the preciously proposed etymologies are hardly convincing (cf. Svennung 1974, 49f.). We can not accept the attempt to emend *Codanus* to †*Scodanus* (Svensson 1921, 64ff.) and thus to connect it with the name *Scadinavia*. A different question is the island name *Codannovia*, also mentioned by Mela: Müllenhoff (1870–1908 I, 490) had already recognized that Mela had adapted the name written correctly by

Pliny as *Scatinavia* to *sinus Codanus*. Subsequent attempts to refute this opinion (Kuhn 1941, 114; Neumann and Wenskus in Reall. V, 37f.) base their argumentation on Mela's localization of the Teutons on this island: Accordingly, the Teutons were not to be found to the north, but rather to the south of the Baltic Sea. *Codannovia* would then be the portion of Jutland located to the north of the Limfjord (cf. 1.3.2. on the *Alociae*). Even if this view of the Teutonic homelands is well founded (cf. 2.1.1.), it still can not serve as an argument for a separate *Codannovia*. Pomponius Mela did not engage in critical studies; what is more, he compiled a variety of sources and maps in an unstructured manner which resulted in several misconceptions on his part. Although the like may be said of Pliny, his designation *Scatinavia* is easier to justify (cf. 1.3.3.f.). The assumption of an autochthonous *Codan-ovia* (= **Kodana-aujo*, which would mean 'Codanus-island') is problematic most of all due to the form in which it is attested. In addition, if *sinus Codanus* does indeed refer to the Baltic Sea, the northern tip of Jutland would hardly be called a "Baltic Sea island", at least not from the local perspective.

1.3. Ancient names for Scandinavia

1.3.1. In the reception of Pytheas, *Thule* is seen as the northernmost of the British Isles, with the distance to the main island consistently specified as a journey of 6 days. All additional information is, however, of widely varied content. According to Pliny (Nat. 4,104), it is only a day's journey to the "curdled sea", similarly in Strabo (1,4,2) to the "still sea". Because of the difficulties in associating these names with locations, as mentioned above, such specifications can not bear great meaning. At least we do have more precise information concerning the geographic latitude: All authors concur in the description of the bright summer nights and dark winter nights. Even more exact information is provided by Strabo (2,5,8) and Pliny (4,104), according to whom Pytheas places Thule in the vicinity of the Arctic Circle. Similar information can also be found in other fragments. The journey to Thule begins at the island *Berrice*, which Pliny (4,104; cf. 1.3.2.) places in the vicinity of the *Scandiae* and which Müllenhoff (1870–1908 I, 387) takes to mean the Shetland island Mainland. Since Tacitus (Agricola 10), several authors (such as Ptolemy 2,3,14) have relocated Thule

in the Shetland and Orkney Islands, a position also adopted by some of the older scholars (Müllenhoff 1870–1908 I, 408). However, as early as the Middle Ages, Thule was considered identical with Iceland (Adam 4,35: *Thyle nunc Island appellatur*; and similarly, with reference to Beda Venerabilis, in the Prologue of the *Landnámabók*: "till þess ætla vitrir menn þat haft, at Ísland sé Thile kallat" [for that reason learned men believe that Iceland was called Thule]. Although some scholars still maintain this position today, Thule is now considered most likely to be middle or northern Norway (Nansen 1911 I, 62f.), since Thule according to Pytheas and in contrast to prehistoric Iceland was said to be inhabited. Grain was also cultivated, as was honey and fruit (Strabo 4,5,5; Solinus 22,9), meaning that neither the Shetland Islands nor Iceland can be intended. Furthermore, Mela's statement that Thule is "located off the coast of the Belcae" (3,57: "Thyle Belcarum litori adposita") remains puzzling, and it is not clear whether *Belcae* is to be associated with the controversial island name *Balcia* (cf. 1.2.3.) in Pliny. The authorship of the name *Thule* is, however, beyond all doubt: Strabo refers consistently to Pytheas, and Pliny does so in part. The dominant Greek influence in the Thule tradition is demonstrated by the fact that as late as the Middle Ages, Latin authors write mostly *Thyle* or *Tyle* and often even use Greek inflectional forms. The variant with *y* makes a Greek origin all the more apparent, since the early Greek sources – e.g. Strabo – tend to write Θούλη (with [u:]) more often than Θύλη (with [y]). Thus the literature does not indicate that an autochthonous name *Thule* was ever observed by the Romans. In later classical literature the notion of Thule does not become clearer, but rather more vague. Since Virgil (Georg. 1,30 *ultima Thule*) Thule has meant the edge of the world. The island is treated as "foreign" (Silius Italicus Pun. 3,597 *ignotam Thylen*) or even "sinister" Thule (Stattius Silv. 4,4,62 *nigrae litora Thylen*), i.e. Thule was affected by history at an early stage and became a poetic stereotype for the unknown. In the 6th century A.D. in his treatise on Scandinavia, Prokopios (Goth. 2,15) calls both the northern and southern inhabitants of the Scandinavian mainland (Γαυτοί, Σκριθίφιννοι) Thulites and their country Thule (Θουλίται, Θούλη). This means that the well-known name received new meaning in classical literature. Prokopios still associates Thule with the midnight sun: There, the longest day

and the longest night each last 40 days. Otherwise Prokopios' Θούλη is identical with that which Ptolemy still referred to as Σκανδία 'the real Scandia' (cf. 1.3.2.; 1.3.4.).

1.3.2. Pliny (Nat. 4,104) learns from older sources that there are other islands in the vicinity of Britain, *Scandias*, *Dumniam*, *Bergos* (manuscript also *Vergos*) *maximamque omnium Berricen* (manuscript also *Ver(i)gon*), *ex qua in Tylene navigetur*. *Berrice* has already been mentioned; Pliny writes that the other islands are less significant. Since *Scandiae* is written in the plural, it appears to function as a collective designation for the following names (Detlefsen 1904,63). Among these, not only the island *Berrice* – “from which one sails to Thule” – is to be assumed in the vicinity of Britain (cf. 1.2.1.), but also *Dumna*, which Ptolemy (2,3,14; 8,3,10: Δούμνα), too, places to the north of Albion near the Orcades. It can not be conclusively shown that the names in Pliny originate in Pytheas. In the preceding paragraphs, Pliny's text is based on Timaios. His sources for the *Scandiae* remain anonymous (“sunt qui et alias produnt”), although the form of the names suggests a Greek origin. A century after Pliny, the island group Σκανδία νῆσοι is also mentioned by Ptolemy (2,11,16), who however specifies their location as east of the “Cimbrian peninsula”, i.e. east of Jutland. In the same chapter Ptolemy mentions three unnamed “Saxon islands” near the mouth of the Elbe, and the three νῆσοι Ἀλοκία “above the Cimbrian peninsula”. The latter name is apparently autochthonous. Previous scholars (cf. Detlefsen 1904, 61f.) associated the name with *Halligen*; Gutenbrunner (1939, 16) interpreted Ἀλοκία as “Alkinseln”. Svennung (1974, 199) takes great liberty with the geographic information in Ptolemy: He reads Ἀλοκία as **Alogiae*, which reminds him of the Norwegian Hålogaland, whose fjords could create the impression of a group of islands (in fact, Adam 4,37 also describes *Halagland* as an island in the vicinity of the Cimbrian peninsula, Ἀλοκία presumably refers to the land north of the Limfjord, which Adam (4,16) still describes as an archipelago and which several scholars (e.g. Kuhn 1941, 114) have identified as Mela's *Codannovia* (cf. 1.2.4.). Ptolemy differentiates three smaller and one large island among the Σκανδία; the latter is located to the east, opposite the mouth of the Vistula and is also in the “actual sense” called *Scandia* (καλεῖται δὲ ἰδίως καὶ αὐτὴ Σκανδία). Elsewhere (8,6,4) he

speaks of this island alone, where the longest day is 18 hours long. Since Ptolemy also cites the coordinates and the names of various inhabitants (cf. 2.1.3.), there can be no doubt as to the fact that he means the Danish islands and most of all southern Sweden (Scania). After Ptolemy, *Scandiae* was no longer used to refer to any island group. Only a single island is mentioned, which apparently was based on Ptolemy's conception of the “actual Scandia” (αὐτὴ Σκανδία). Jordanes (Get. 3 with the vulgate Lat. form *Scandza*) explicitly cites Ptolemy as a source; according to him, the Goths were originally from the island *Scandza*. The usage of *Scandia-Scandza* in the Gothic emigration saga by Jordanes is primarily responsible for the frequent presence of the name as late as in medieval texts (cf. examples in Svennung 1963, 26f.).

1.3.3. Pliny was not only the first to mention the *Scandiae insulae*, but also an island called *Scatinavia* or *Scadinavia* (4,96; 8,39). Probably the island attested earlier in Mela, *Codannovia*, is identical with this island (cf. 1.2.4.). *Scadinavia* is the source of the corrupt form *Gangavia* in Solinus (20,7f.). The name *Scadinavia* together with its written variants can be seen as the predominant name for Scandinavia in the early Latin texts, taking into account the poor nature of the evidence available. Authors writing in Greek do not use the name. More precisely, in the light of ethnographic data, *Scadinavia* refers to southern Sweden. This name continued its tradition into the Germanic Middle Ages and has ultimately resulted in the modern name *Scandinavia* (cf. 1.3.4.). *Scadinavia* is the only name possessing an undeniably Gmc etymology, as a compound combining **skapan-* ‘damage’ and **-aujō* ‘island’. This etymology is also frequently cited in texts from the early Middle Ages. For example, a manuscript version of the *Origo gentis Langobardorum* states that the island name *Scadan* is to be interpreted as ‘damage’ (*excidia*). The transparency and viability of the compound is further supported by the new formation of *Scedelandum* in ‘in the damage-lands’ in Beowulf (v. 19, varied 1686 *on Scedenigge*). And the unwieldy attempts in several sources to reinterpret the vernacular form as ‘Schön-Au’ confirm the “damage” etymology and the autochthonous character of the name (Rübekeil 1992, 100).

Immediately after mentioning *Scatinavia* for the first time, Pliny (4,96) mentions an

island *Aeningia* which is “not smaller”. Svennung (1974, 67 ff.) is probably correct in pointing out that the initial *A-* has to be emended to *F-*, and that **Feningia*, which due to its morphology also appears to be Gmc, should be regarded as an old name for Finland. This conception of Sweden and Finland as enormous islands is necessary in order to consider the Baltic Sea as an ocean bay lying between them (cf. 1.2.4.). The isolated attestation of the name **Feningia* also provides an additional piece of evidence for the fact that the information from Nat. 4,96 must stem from a younger source which is fully independent of the Pytheas tradition. This is probably what Pliny means with the introductory sentence to 4,96: “Incipit deinde clarior aperiri fama”.

1.3.4. Three important names have been considered as old designations for Scandinavia: *Thule*, *Scandia* and *Scadinavia*. Of these apparently only *Thule* and *Scandia* are to be attributed to Pytheas; *Scadinavia* originates in a newer source and may have made its way into Latin literature through Varro. Pliny is the only ancient author to mention all three names. *Scandia* and *Scadinavia* have been treated by the great majority of scholars as variants of the same name, the former as an actual short form (Müllenhoff 1870–1908 II, 360; Kretschmer 1929, 148 f.) or adjectival formation **Skadni* (Much in Hoops 1911–1919 IV, 88). However, this sort of variation is without corroboration in the history of language (Rübekeil 1992, 102 f.). The associative resemblance of these names has once again – as so often in the past – led scholars down the wrong path. The same mistake led medieval scribes to replace the *Scadinavia* of the Pliny originals in their copies with the combination form *Scandinavia* (Müllenhoff 1970–1908 II, 359). This error manifests itself in the modern form *Scandinavia*. It is of crucial importance to note that *Scandia* is as clearly a product of the Greek tradition as *Scadinavia* is always limited to the Latin tradition. No Greek source even uses the latter name. If one turns to the earliest attestations, a new picture emerges: There the *Scandiae* appear as an island group. In Pliny, the earliest surviving attestation, they are also far away from Scandinavia; here they are placed more to the north of Britain. Ptolemy (2,11,16) also knew the group of islands, but placed them in the neighborhood of other islands near the Cimbrian peninsula. These are the anonymous Saxon islands and his Ἰαλοκίαι; both groups consist

of three islands each. In addition, the Σκανδία also consist of three islands, if one excludes the largest, the “actual Skandia”, whose wide variety of ethnica lends it more of a continental character. Ptolemy appears to be the first to regard *Scandia* and *Scadinavia* simply as naming variants, since his “actual Skandia” is conceptually the same as Pliny’s *Scadinavia*. Nevertheless he avoids the barbarian name. Writing in Latin, Jordanes brings this development to its conclusion: He calls the island from which he believes the Goths to have emigrated, not *Scadinavia*, but – with reference to Ptolemy – now *Scandza*. Jordanes mentions the island *Thyle* only once on the “most extreme edge of the West” (Get. 1 *in ultima plagae occidentalis*), again only as a literary reminiscence to Virgil. Ptolemy admittedly appears to be the last ancient author who consciously distinguishes *Thule* and *Scandia*. The Greek Prokopios, who wrote at almost the same time as Jordanes, not only avoids *Scadinavia*, but also *Scandia*. Instead he uses the name *Thule* (Θούλη), which for him embodies the characteristics of the Ptolemaic *Scandia* as well as Pytheas’ *Thule*, and in doing so describes Norway and Sweden as the same island. Prokopios’ reason for taking this position has not been identified. The fact that the names *Thule* and *Scandia* have no living equivalent for the Germanic peoples of the post-classical period became evident as the Barbarians learned to write: Their historical authors used the name *Scadinavia* and subjected it to written variations which can be explained as a consequence of their own linguistic competence (cf. 1.3.3.). *Thule* and *Scandia*, however, also occur as island names in the Mediterranean. We must therefore consider the possibility that these names were coined by Greeks, perhaps in analogy to the southern islands (Rübekeil 1992, 106 f.). The *Thylae* located directly off Carthage (Mela 2,105) even makes it plausible that Himilco applied the name to the northern island (cf. 1.1.).

2. Ancient ethnography of Scandinavia

2.1. Chronological outline

2.1.1. In Pliny (Nat. 37,35) we find two crucial ethnographic remarks from Pytheas: The first is that the edge of the ocean bay *Metuonis* is inhabited by a Gmc folk named the *Guiones* (dat.pl. *Guionibus*, *Germaniae genti*); the

manuscript sources also show *Gutonibus* instead of *Guionibus*. Of course, the classification as *gens Germaniae* can not originate with Pytheas, who could not yet have known of a *Germania*. The second remark, which follows immediately, states that the inhabitants of *Abalus* sell amber to the neighboring *Teutonibus*. Here the attestation of the name is unambiguous. In the context of the first remark, one must either take the *Guiones* to be *Gutones* and consequently place the *aestuarium Metuonis* in the Baltic Sea, or one must offer a plausible correction of the manuscript evidence. The eastern localization has not found much acceptance (cf. 1.2.3.); for this reason Müllenhoff (1870–1908 I, 479) conjectured that *Guionibus* was *Teutonibus*. Thus the name of the Teutons would appear in the same chapter in two different inflectional forms, namely, as *Teutonis* and as *Teutonibus*. Detlefsen (1904, 7) therefore cites *Inguionibus*, a name which Pliny has elsewhere placed in the vicinity of *mons Saevo*, *sinus Codanus* and *Scatinavia* and which he also attributes to Cimbrians and Teutons (Nat. 4,96.99: *Inguaeones*). If Detlefsen's suggestion is correct, it would no longer be possible to regard the three cultic communities *Ingaevones*, *Herminones* and *Istaevones* in Tacitus as inventions of later times. In any case, however, the Pytheas-Pliny citation proves that before the Great Migration (ca. 120 B.C.) the Teutons were indeed settled in the northwestern portion of Jutland, the location of the *Thythæsýsæl* in the Middle Ages and of the modern region of *Thy*.

2.1.2. As mentioned above, the information in Mela 3,54f. and Pliny 4,96f. originates in a younger source (cf. 1.3.3.). Both authors mention the Teutons. Mela's placement of the Teutons on the island *Codannovia-Scadinavia* must however also be regarded as a mistake (cf. 1.2.4.), as is the case for his location of the Sarmates on the Frisian tidal mud flats (3,55). It is therefore not possible to justify the proposition of Teutonic colonies in *Scadinavia* (Melin 1960, 39f.). A more interesting name appears in the same Pliny quotation: The "tribe of the Hilleviones inhabiting 500 districts" (*Hillevionum gente quingentis incolente pagis*), apparently a substantial people with an admittedly otherwise unknown name. Schütte (1929, I, 407) and Grienberger (1902, 152) have read here *Hillevionum gens* as **illa Suionum gens* and drawn a comparison with *Suionum civitates*, described in detail by Tacitus (Germ. 44,2). If one chooses not to recon-

struct their name in Ptolemy (cf. 2.1.3.), there is no further mention of this tribe until Jordanes. However, their significance becomes evident in the Middle Ages: The *Suehans* and *Suetidi* mentioned by Jordanes (Get. 3, the former from Go. **Sweans*) now appear as *Sviar* (*Svéar*) and *Sví-þjóð* and their name also appears in the new term for royalty *Sviaríki* (*Své-ríke*), ModSw. *Sverige*.

Stronger than the evidence for the name *Suiones* is that for the *Fenni* (Tacitus Germ. 46,1), mentioned again by Ptolemy (with the early Gmc sound change *e > i*: 2,11,16 Φίννοι; 3,5,8 Φίννοι). This ethnicon already appears to be the basis for the derivation of the "island name" **Feningia* in Pliny (cf. 1.3.3.). The name of the *Aestii* (Tacitus Germ. 45,2) is most likely continued today in the name of the modern *Estonians*; Tacitus' claim that their language was close to that of the Britons remains puzzling. Their name (and also *Fenni*) is presumably a Gmc exonym. It is therefore questionable whether the peoples bearing these names can already be identified with particular tribes in the prehistoric period. *Fenni* may have referred to all nomadic inhabitants of the North who did not speak Gmc languages; *Aestii* on the other hand could have been used to describe the Balto-Finnic or Baltic peoples.

2.1.3. Ptolemy (2,11,16; cf. 1.3.2.) mentions several new names in his αὐτῆ Σκανδία. According to him, the West is inhabited by Χαίδεινοί, the East by Φαύοναι and Φιραῖσοι, the North by Φίννοι, the South by Γούται and Δαυκίονες, and the middle by Λεώνοι. The most salient comparison is that of the Φίννοι with the *Fenni* in Tacitus and of the Γούται with the Γούτοι in Prokopios (cf. 2.1.2. and 2.2.). The majority of the other names remains, however, unexplained, either because the tradition has significantly corrupted the original forms or because the names are not attested anywhere else. The *Suiones* mentioned by Tacitus have been occasionally identified as the Φαύοναι (Schütte 1926, 44: **Σουιόναι*) or the Λεώνοι (Bremer 1900, 830: **Συεώνοι*). The latter seem to be the most likely candidates for this association, due to their localization in the middle. The Χαίδεινοί are probably identical with the medieval *Heinir* (< **Heiðnir*), the inhabitants of the Norwegian Hedmark, ON *Heiðmørk* (Zeuss 1837, 159; cf. however Svensson 1919, 11f.: *Hedemora* in Dalarna, OSw. *Henamora*). The Φιραῖσοι have been linked to the *Finnaithae*

in Jordanes (cf. 2.1.4.), and it has often been suggested that the Δαυκίονες are the ancestors of the Danes (cf. however Zeuss 1837, 158f.: Σκανδιώνες). The many attempts at interpreting the Ptolemaic names really prove only one thing, namely the uncertainty of present research.

2.1.4. The Scandinavian ethnography in Jordanes is based primarily on Ptolemy's Σκανδία chapter. It faced the same problem as Ptolemy, i.e. that many of the names have been corrupted through transmission and are therefore difficult to analyze properly. In addition, his ethnography contains several artificial formations such as *Gautigoth* (cf. 2.2.). However, it also includes what appears to be a new, autochthonous source: According to Get. 3, a Scandinavian king *Rudvulf* sought refuge with Theoderich, and we can assume that his reports of "tribes surpassing the Germanic peoples in bodily size and spirit" (*gentes Germanis corpore et animo grandiores*) have come into the Getica. Names such as Fervir, Ahelmil, Taetel or Vinoviloth have received a variety of contradictory interpretations. In the case of Mixi Evagre Otingis, for example, there are even difficulties with the text segmentation. However, several of the names can be more clearly interpreted: We have already discussed the *Suehans* and *Suetidi*. We also find a name *Screrefennae*, which Prokopios (Goth. 2,15) wrote as Σκριθίφιννοι, a compound consisting of the Finn-name and a verb meaning 'glide' (perhaps 'ski'). Raumaricii and Ragnaricii are also based on compounds, here based on the Gmc noun **rīkja-* 'ruling power' and referring to the inhabitants of Romerike and Ranrike. *Finnithae* could also represent a more correct form of the name for the Φιραῖσοι in Ptolemy (cf. Zeuss 1837, 159). Presumably this name can be compared with OSw. *Finnadhe*, attested in inscriptions as *Finhiþi* (Forsheda, Småland) and with the *Finnedi* in Adam (4,25). That Jordanes' *Scandza* is identical with Prokopios' Θούλη (cf. 1.3.4.) can also be seen in his ethnography: Prokopios' Θουλίται include in the North the Σκριθίφιννοι and in the South the "populous tribe" (ἔθνος πολυάνθρωπον) of the Γαυτοί.

2.2. Gutones and Gautar

The *Gautar* (OE *Geatas*) are of particular importance in the study of Germanic ethnography, since common opinion holds that their

name provides linguistic evidence for the Scandinavian origin of the Goths. In the present text it is only possible to briefly outline the problems involved in this complex topic. The first reliable attestation of *Gutones* is found in Pliny (Nat. 4,99). Earlier knowledge of the name in Pytheas (cf. 2.1.1.) and Strabo (7,1,3: *Γούτωνας read as Βούτωνας) is possible, but not certain. All evidence points to the region south of the Baltic Sea. After Ptolemy (cf. 2.3.) we also hear of a tribe called OWN *Gautar*, OEN *Gotar* in the Middle Ages. Ptolemy (Γούται), Prokopios (Γαυτοί) and, indirectly, Jordanes (*Gautigoth*) place this tribe on the Scandinavian "island". The etymological kinship between the name stems **Gutan-* and **Gauta-* is as much beyond doubt as is their relation to the Gmc verb **geuta-* 'pour' (OWN *gióta*, OHG *giozan*). This relationship is supported by information in Jordanes, according to which the original ancestor of the Goths bears the name Gaut (Get. 14; manuscript *Gapt*). According to Jordanes (Get. 4) the Goths originated on the island *Scandza* as from "a workshop of the tribes or womb of the peoples (quasi officina gentium aut certe velut vagina nationum)". It has therefore been assumed that the Scandinavian *Gautar* were the original tribe and the *Gutones* split off from them, meaning that the name *Gutones* must be secondary. In the meantime, however, confidence in the origin saga in Jordanes has been shaken (cf. Hachmann 1970); furthermore, the island name *Scandza*, crux of the emigration saga, is not autochthonous (cf. 1.3.4.). The linguistic data must therefore be interpreted with some caution. **Gutan-* can not be derived from **Gauta-*. **Gutan-* is a primary (deverbal) agentive formation, probably meaning '(sperm-) pourer' = 'men'. Theoretically **Gauta-* could have the same meaning. In this case, however, we would be dealing with semantic competitors, not with lexical variants (Rübekeil 1992, 126f.; similarly Grønvik 1995, 82). Wessén (1924, 116; slightly different Andersson 1996, 13ff.) proposes that **gauta-* is the simplex form and **gutan-* its *n*-stem compositional variant (cf. for example OE *léadgota*). Not only is this assumption unprovable (Andersson *ibid.*), it conflicts most importantly with the fact that only the stem suffix alternates in such variants, and not the root ablaut. It is even debatable whether these compositional variants actually originated in composition at all. On the other hand, from a morphological point of view, the underlying relationship could be one similar to that be-

tween ON *hiti* 'heat' and its derived secondary adjective *heitr* 'hot'. **Gauta-* would then be the adjective from the noun **gutan-* and the god **Gauta-* would be 'the Gothic one' (Rübekeil 1992, 132f.). However, it is not possible to conclusively prove this solution either; **Gutan-* as a primary formation does not necessarily imply that **Gauta-* must be secondary. Since the name of the island Gotland also plays a role here, one will probably have to assume a polycentric ethnogenesis, located in the region of the Baltic Sea, whose "Traditionskern" was located in a social class. The most probable candidate here is the "merchant-warriors" (Rübekeil 1992, 153), who referred to themselves with the appellative form 'men' and so produced an ethnocentric tribal name.

1. Departure

What does it mean to write a “historical survey” of the period before Christianity in Scandinavia? Certainly, there are written sources that tell us about this period, but they originate from a much later period, or from individuals with a quite different cultural background and conception of the world. In the early days of archaeology, Montelius established the fact that, for the Nordic Iron Age, we are practically totally dependent on Roman sources, but that these have little or nothing to tell about the conditions in the north (Montelius 1919, 195). Nor do the rather few runic inscriptions from this time support any to wide-ranging interpretations. Consequently, a historical survey of Iron Age Scandinavia is necessarily dependent on the archaeological material, where the interplay between archaeology and history could deepen our understanding of the past. It is, however, important that one is aware of the pitfalls and dangers of arguing in circles, as for example if the archaeological evidence is used only when it can support the written texts.

One issue that is often brought up is the validity of texts written by Roman historians or authors from the Middle Ages. The Icelandic sagas are often used not only to understand the religion but also the society which existed hundreds of years earlier than the texts’ time of origin. How much did these authors know about heathen times, and how much did they alter this so that the history could serve their own purposes? Not least, one has to take into consideration the fact that they had a quite different religious world view and that they were Christians who tried to describe a pagan

society. Similar concerns surround the Romans’ narratives about the barbarians. What were their intentions with regard to these texts, and what did they really know about the conditions of life in the north?

It is essential to be aware of the fact that the approach to writing history in antiquity was fundamentally different from our own. There were stringent rules on how the text should be written: the history had to be presented aesthetically and the depicted events were above all included for a moral and rhetorical effect. To us, it also appears as a shortcoming that the realism in antiquity does not extend to a description of the history of indigenous people and changes in their social and economic structures, but instead portrays them as static societies (Auerbach 1999, 47 ff.; Wells 1999, 32).

A rhetorical device used by many writers in antiquity was to choose a subject that illustrated a high degree of depravity in Roman society and contrast this with an ideal of naturalness, purity and virtue. Sometimes the Germanic people were to embody this ideal of an unspoiled society. Thus, we find that the Germani have an ambiguous role in Roman texts: on the one hand they are uncivilized, ferocious primitives who were used as a warning to the Roman people; on the other hand, they were idealized as unspoiled people who knew nothing about luxury, secrecy, property, sensuality and slavery all of which had corrupted Rome (Schama 1995, 76f.). But even if the descriptions of the barbarians sometimes are contradictory, there is one thing that is always the same – they are essentially different from the Romans themselves (Wells 1999, 100). In this sense Tacitus’ writings, for instance, have the character of political texts and have to be used with caution (Lillehammer 1994, 151).

This is also the case with somewhat later historical writers who wrote their own peoples’ histories. Their view of a historical text differs from ours, and in our opinion they

mix facts with stories so that the result is more like a myth. Jordanes' texts about the Gothic people's past, for example, played an important part in the transformation of the Gothic identity from barbarians to a classic people (Harrison 1999, 32 f.).

Another problem is that the Roman sources depict "Germanic people" on a high and general level. But there are no reasons to believe that they had a uniform settlement practice, economy or social organization. On the contrary, what is called "Germanic" was in reality a heterogeneous mix of societies. This is evident if we compare the archaeological material with the written records. Caesar writes that the Germani did not have permanent settlements and did not practise agriculture, something which is obviously wrong if we take a closer look at the archaeological record (Hedeager/Tvornø 1991, 113).

The archaeologist Ulf Näsman is one of the scholars who raised and renewed the discussion about how to use written sources. He believes that archaeologists hesitate to make use of written sources because of the way the historical records were misused before and during the Second World War. He argues in favour of reading historical texts to find adequate analogies as a supplement to the archaeological records (Näsman 1988). Instead of using texts as historical truths, we can consider them as sources of analogies and ideas for interpretations, as we do with, for example, anthropological knowledge. But there is no doubt that the question of the reliability of the written sources, and how one is to use them, is a provocative one. The current tendency is for an increased usage of them, but the last word has not been heard yet on this issue.

In earlier archaeological research, written sources were used in a relatively uncritical way. The texts were taken as a point of departure, whereupon the archaeological material was searched for evidence that could "fit" the texts. Archaeology often became a question of finding out the names of individuals who were buried in great monuments, or discovering a tribe's or a people's origin, their *Urheimat*. One of the most famous examples is perhaps the speculation about who are supposed to be buried in the mounds at Gamla Uppsala in Sweden. From reading *Ynglingatal*, it has been suggested that the mounds should be connected with the rulers Aun, Egil and Adils (e.g. Nerman 1923 b). Such historical or "biblical" archaeology

(Brink 1999) was toned down after Weibull's methodological criticism of the sources, and when archaeologists' ambitions were to be more "scientific", this kind of speculation was put aside. But in later years it seems like there is a growing interest in "giving names" to archaeological material (Gräslund 1993; Hyenstrand 1996).

One should, however, keep in mind that many names and places in the narratives barely correspond to a reality, and despite the large amount of work which has been done, it is still uncertain how trustworthy they are. If they are to be used, it is important to be conscious that they characteristically include second-hand information and that they often have travelled a long way before they were written down. Rökstenen, a runic stone from Östergötland in Sweden, could be taken as an example of how difficult it can be to use written sources as a historical account. The person Tjodrik who is mentioned on the stone is often considered to be Teoderik, king of the Ostrogoths in the fifth century (Gustavson 2000, 26 f.), and it seems that people during the Iron Age knew that Charlemagne had transferred the statue of Teoderik from Ravenna to Aachen (Zachrisson 2000, 343). On the stone it is also mentioned that Teoderik should have been king of "the sea-warriors", something that could not be correct (Hyenstrand 1996, 46). Consequently, there can be a great deal of uncertainty about the historical value of the texts, not least because the writers refer to and are dependent on each other. However, this does not imply that they cannot tell us a great deal about their time – on the contrary, many texts certainly illustrate how important heroic deeds and myths of origin were – and there is no doubt that the texts are valued today in this respect.

It is quite clear that earlier research on sagas were often inspired by national romanticism, and therefore to a high degree concentrated on their Nordic or Germanic character. The elements representing Middle Age Christian motives, drawn from legends of saints and knights or Latin chronicles, were therefore disregarded. When these influences were recognized, they were usually thought of as stemming from decadent foreign elements which had distorted the original meaning of the text. In later years, the situation has been rather the reverse – the sagas are regarded as part of a common European tradition, and perhaps to too high a degree (Lönnroth 1993, 89).

One classical dispute is about the relationship between oral and written authorship. One side sees the written sagas as having emanated from oral tradition, principally from the Viking Age, while the other side considers them to be creations of an author, i.e. originating in the 13th century or later. The literary historian Lars Lönnroth's opinion is that we cannot find knowledge about specific political events in the sagas, but that they can tell us about beliefs, social norms and institutions which existed in the milieu where they originated. Consequently, the texts could be of more help when the interest is shifted towards social history and history of mentality. But then we will have to stop reading these texts as sources from the past which can tell us about Scandinavian history, and instead regard them as literary texts or remnants of a Middle Age mentality and culture (Lönnroth 1993). No doubt, this is also the prevalent opinion today.

Consequently, this could paradoxically mean that mythical and poetic texts can increase our knowledge more than "realistic" dynastic stories can. Aspects of heroic poems, which describe an ideal picture of e.g. the great halls, can be traced back in time by archaeological means, and it is in this way possible to reconstruct the prevailing mentality and ideals of the past (Lönnroth 1997). The "chieftain's hall" is a good example of how textual or historical archaeology have had an increasing impact on the discipline recently (Callmer/Rosengren 1997; Herschend 1997). For the elite, it was of great importance to have feasts and ceremonies with an abundance of food and drink. Different drinking vessels, both of local and Roman origin, are often found in rich burials. These finds could therefore be associated with feasts, where social relations were established and reinforced. Archaeological excavations in recent years have revealed structures which have been interpreted as halls where such ceremonies are thought to have taken place. Milieus like this are often connected with male activities, but this has not been proved at all. Drinking implements are in many cases found in female burials, and one interpretation is that women took an active part in creating alliances at feasts which were held to maintain unity within the community (Andrén 1991 b; Cassel 1998, 47f.).

2. The relationship between pictures and texts

If the texts are difficult to interpret, the combination of text and picture will perhaps provide a more fruitful basis for interpretation. Picture stones (Sw. *bildstenar*), which occur on the Swedish island of Gotland, are excellent material if we want to get closer to the mythical world (Nylén/Lamm 1987). Picture stones are dated to A.D. 400–1100, and it is mainly later stones, from about A.D. 700, which can be connected with the myths we know from written sources. Here, we can follow stories that are recognizable from the sagas. The illustrations on these stones are of two types – those with clearly demarcated pictorial motifs and compositions with motifs which run into each other – and these different compositions have been compared with different kinds of poetry (Andrén 1991 a, 24). Andrén shows that it is possible to follow a tradition from the Swedish boat burials in 6th and 7th century, through the boat motifs on the picture stones, and continuing with the Icelandic sagas from the 13th century, i.e. linking artefacts, pictures and text together (Andrén 1991 a, 27).

The picture stones have a lot to tell us about people in the past and their world view, and among other things, we can understand that the myths which we know from the written sources were familiar to the Gotlandic society in the 8th and 9th century. One example is a picture stone from Ardre parish, where among other things it is possible to identify a scene from the song of *Völund* in the poetic *Edda*. *Völund* was a famous smith who was captured on an island, where he was supposed to make precious items for the king. However, he took revenge on the king by decapitating the king's two sons and turning their skulls into gold vessels. When he left the island as a bird, he also left the king's daughter pregnant (Nylén/Lamm 1987, 52, 71). In several cases it is possible to identify such themes from the sagas on the picture stones. The picture stones of this type were located along roads or erected in public places, and we have to assume that the myths were so well known that it was possible for people to recognize them from the sequences that were depicted.

The earliest runes are known from the first century A.D., but it is not until the third century they become more common. We find these early runes principally on jewellery and weapons, for instance on the weapons in the

large deposits of war booty in Danish bogs (Lund Hansen 1998). Several studies have revealed that it is predominantly exclusive objects that are decorated with runes (Hines 1998; Lund Hansen 1998). The usage of runes could therefore be associated with the elite, and one can imagine that these strange signs must have aroused much amazement and awe (Thrane 1998, 222).

In Scandinavia, runes are first and foremost associated with rune stones, but this use of runes is secondary to placing them on objects (Zachrisson 2000, 340). It has been suggested that the runes had utilitarian function, and Hedeager connects them with the development of a central power which “encouraged a system of writing so that important reports, agreements, decisions and the like could be written down and circulated” (Hedeager 1992, 249). There is, however, no archaeological material which supports this hypothesis, and the archaeological material rather seems to suggest that runes were linked to magical concepts. Hedeager has also later considered such a relationship between runes and magical beliefs. On the gold bracteates from the Migration Period, we find both runes and motifs from the Icelandic sagas. From such illustrations it is, for instance, possible to connect runes with the shamanistic Óðinn (Hedeager 1997).

It also seems as if the runes often were for private consumption and not for display. The position of fibulas shows that the runes were turned towards the wearer’s body, and stones in burials are concealed in the ground, as was the case with the famous Eggjastone from Norway and the Kylværstone from Gotland (Zachrisson 2000). A frequent phenomenon is that the runes are difficult to interpret and that we cannot understand their message. But perhaps it was not the legibility that was of importance, and we should be cautious about interpreting these inscriptions as a sign of ignorance of the “right” way to use runes. Consequently, it is probably wrong to understand the early runes as text in our modern sense, and we have to be open to the possibility that they had meaning at quite different levels.

3. People and tribes

It is impossible to ignore the concept “Germanic” in a discussion about the Nordic Iron Age, but the term has often been used without an explicit definition, and there is every reason to question its relevance. Most scholars today

agree that it is problematic to correlate language with material culture and “people”. Despite this, it is obvious that a large number of the works on Germanic culture are based on such a supposed correspondence between language and culture (Chapman 1992, 21 f.).

Caesar is the earliest writer of whom we know who used the word *Germani*, and his usage influenced the subsequent writers, including Tacitus (Wells 1995, 169). “Germanic”, as well as “Celtic”, is a term which was coined by the Romans and not by the “barbarians” themselves, and there is no reason to believe that these people saw themselves as Germanic (Chapman 1992, 34; Wells 1995, 170). This already creates a problem: if they did not see themselves as a defined group, there is no reason at all that we should do so. There are other problems as well with the usage of the term “Germanic”. Besides the fact that the relationship between language, material culture and ethnicity is problematic, the word could be associated with the Nazis’ racial biology and the glorification of Aryans and Germans. Therefore it is also reasonable to question whether Germanic really is an appropriate category, and it is suggested that archaeologists should search for other terms to use (Näsman 1999).

It should not surprise us that earlier archaeological researchers used labels such as Germanic in a relatively uncritical way, because the term “culture” was used in an unproblematic and one-dimensional way. This could be described as an essentialist view, where one conceived of culture as a phenomenon for which some aspects can be specified, with a core made up of a number of selected elements (Bolin 1999, 25 ff., 100). In classical ethnography it was presupposed that language, material culture and ideas were interconnected, something which is not accepted today. Therefore, one usually talks about cultural identities instead of people in the current debate. But even if the focus has shifted from a picture of Germani as a people to a discussion about their identity, there are still many problems to solve. One of them is that the idea of a Germanic identity or society presupposes a similarity over great distances. There has, for example, been a discussion about a “Pan-Germanic” myth of origin common to the people in the north of Europe, where a Germanic identity was supposed to have been created after the fall of Rome (Hedeager 1993). But the fact that there are similarities in the material culture and in the symbolic world does

not imply that the organization of society was the same. Quite the contrary, we can expect to find different types of societies, which change and develop differently (cf. Hill 1995 about the supposed “Celtic” Europe).

A number of different tribes are also mentioned in the sources from antiquity, and several attempts have been made to locate them geographically. It is, however, often necessary to “adjust” part of the information to make it fit. The Roman writers themselves had seldom experienced the regions and tribes they wrote about, a fact which of course made their descriptions of the tribes and where they were located unreliable. We also have to see the Romans’ naming of the tribes in its context – to name and categorize is a way of obtaining power over something which was partly unknown and unpredictable. In many cases a tribe’s name emerges and then suddenly disappears into oblivion, and this could imply that the group really had ceased to exist or simply that the Romans had lost their interest in them. Recent research emphasizes the Romans’ role in the creation of what could be called the “ethnic discourse”, which seems to be of growing importance during the Roman Iron Age (Pohl 1998).

The classical writers divided the indigenous people into discrete, well-defined groups, a division that is referred to as “tribes” in modern literature. But the archaeological evidence shows that these tribes probably represented divisions that were formed in response to the Roman incursions, that is, the entities were creations generated by the Romans themselves (Wells 1999, 33).

One group which has received a great deal of attention is the Goths. It is above all Jordanes’ *Getica*, written in the middle of the 6th century, which is of interest. Jordanes’ work is built on Cassiodorus’ work on the history of the Goths, and the text is a mixture where it is possible to distinguish parts of different origin (Svennung 1964). The description of the Goths’ migrations from south of the Baltic Sea via the Black Sea and westward again has attracted much interest, as well as their supposed origin or *Urheimat* in Scandinavia. According to Jordanes, the Goths had left the island of Scandza under their king Berig. Down to the late 19th century this story was accepted as a historical fact, but today this is more uncertain. The story is instead a typical example of the way a myth of origin is constructed – a people’s origin is linked to a hazy past and often located on an island (Heather 1998, 28f.).

An interesting but problematic question is also what the tribes in the written sources really represent. It has been suggested that they should not be understood as a unified group of people, but that they instead consisted of war alliances of different groups which were held together and given their identity by their heroic achievements (Harrison 1999). Looked at in this light, the Gothic identity had an attractive reputation, and the “Goths” need not have had a common language or history. The important thing was to refer to a shared origin, something which is a recurrent phenomenon in ethnic discourse. We should also be aware of the fact that the constitution of the groups varied: sometimes only a minority of the population identified with the group, for instance the freemen (Heather 1998, 300) or the warriors, while in other cases the identity was shared by a majority of the society.

It is also clear that it is difficult to identify different tribes by means of archaeological methods, and this is true not only for the Scandinavian but also the continental material, which is described in written sources. The question is therefore if it is possible to go any further along this path. When it comes to the Scandinavian Iron Age, we can almost certainly be sure that people identified with different groups, but it is quite another matter to give these groups names.

4. Migrations

Closely related to the question about tribes is the matter of migrations that the written sources tell us about. What is included in the concept “tribe” is fundamental for the interpretation of the migrations. Who was actually moving over such a large area – entire peoples, men in active service, or the elite? A frequent opinion among those who study the Great Migrations is that this did not involve an entire tribe driving off another people and in this way created a chain reaction. Instead it is suggested that it was warriors or armies who were on the move. Other interpretations maintain that substantial numbers of the population were migrating. But it is probably a mistake to seek a uniform course of events behind the narratives, and most likely there are different processes that are described as migrations.

It is interesting that traces of cultivation and abandoned settlements were noticed and interpreted before modern research began. In *Gesta Danorum*, Saxo Grammaticus comments on the fact that the Danish woods show

traces of deserted cultivated fields. The reason for their abandonment was thought to be serious crop failure with emigration as a consequence, and according to Saxo this involved the Langobardi, who later settled in Italy (Skovgaard-Petersen 1977, 17). We often find such migration myths in the written sources – it seems to be archetypical in people's stories about their past – but their historical reliability is questionable.

In Scandinavian research it is also evident that most of the work describes emigrations, in contrast to, for instance, British archaeology, which tells about recurrent immigrations. The interpretation of emigrations southwards from Scandinavia builds on an ancient tradition from Jordanes. He describes Scandza as an “*officina gentium aut certe velut vagina nationum*” – [a factory of tribes and surely a womb of nations] (Wolfram 1988, 2). The few cases where immigration is thought to have occurred are described as the result of the return of an old Scandinavian people, e.g. the Heruli. According to the narratives, they were driven away from Sweden in the 3rd century, and wandered through Europe for 300 years before they returned to the north.

In the early days of archaeology, the written sources were given great credence compared to the way they are viewed today. One example is Nerman's work on Gotland. His point of departure is the *Gutasaga*, which was written down in the middle of the 14th century. Nerman admits that a large part of the saga is fiction, but he claims that the part which tells about the emigration of one third of Gotland's population corresponds to a historical reality. The question is only when this large emigration took place, and now the archaeological material is taken into consideration. It is argued that the number of graves decreases in the 5th century, and Nerman's conclusion is that this is evidence for the event which was written down almost a thousand years later (Nerman 1923 a). The method involves finding archaeological material that fits the written sources and thereby date the events. The explanation for the changes is characteristic as well – different kinds of catastrophes, e.g. war or a bad harvest and famine, which gave rise to migration.

If one, in the early days of archaeology, saw migrations as an unproblematic and natural part of the appearance and change of a culture, this was radically changed after the Second World War. As a reaction to earlier re-

search, it was argued that migrations were not a sufficient explanation for material change, and for many years migrations were more or less absent in the archaeological discourse. Today it is possible to notice a renewed interest in the question, something that most likely is related to many archaeologists' interest in ethnicity and cultural identity. No doubt, there are similarities in the archaeological material, for instance, similar types of artefacts or styles over large areas, although it is certainly more difficult to answer why there are such similarities. Are they caused by internal developments, diffusion of ideas, or does it mean that people of a different origin had moved to the place?

There are many examples in the archaeological material that can tell us about contacts from far away. The findings of horse equipment in an offering from Sösdala in Scania, for instance, resemble continental finds, because the artefacts were taken apart and deliberately destroyed. There were, however, no traces of fire, and neither were there any bones. This could be associated with the Huns and their rituals connected to funerals, and the conclusion drawn is that those who made these offerings must have had a thorough knowledge of ceremonies of the Huns (Fabech 1991). The offerings thus support the theory about the Scandinavians' great mobility during this period, with deep-level contacts in East and Central Europe.

Hines has studied the Scandinavian character of the East Anglian archaeological material. He claims that the introduction of a Scandinavian style of dress is due to immigration, but that this represented a long-term process and that the initial migration was followed by long-distance contacts. The result was not a simple imitation of Scandinavian culture but a hybridization of different traditions and heritages (Hines 1992).

There are also studies today which try to link the written and archaeological sources. Jordanes and Prokopios write about the Danes, who are supposed to have come from Sweden to Denmark around 200 A.D., where they “pushed” away the Herules. The Herules moved around on the European continent for several hundreds of years before they returned to the north. This story is connected to the archaeological material, and it is suggested that the rich grave finds in large mounds at Himlingøje in Zealand, which seem to represent a foreign element, could be traces of the Danes (Hedeager 1988, 221).

But, as mentioned before, it is hard to determine whether it is migration or contacts that result in such similarities in the material culture between different areas, and it is difficult to define what should be called a migration as well. We know that people from the northern countries went south and did military service on the continent and in the Roman army (e.g. Lund Hansen 1998). Some people perhaps settled for good, whilst others returned with foreign objects and new ideas after a couple of years. Maybe the best we can do is to recognize that encounters between different cultures did happen all the time: some of them ended in a permanent move, others in the altering of ideas and other influences or even conflicts. One thing can at least be made clear – migration is a well-known phenomenon in all human history, and there is no reason to deny that migrations took place because of criticisms of earlier research (Heather 1998, 17).

5. Social organization

Within Scandinavian Iron Age research it is possible to distinguish two main directions. One is characterized by an evolutionary view of history, which argues in favour of a general development, often thought to involve a rapid transformation from a tribal society to a state in large parts of northern Europe. The other direction argues that development varied considerably between different areas, and that more solid central powers were a relatively late phenomenon in the north.

Earlier literature often describes the Scandinavian societies as patrilineal (Sw. *ättesamhälle*). This comes from a reading of the laws from the Middle Ages, where the ownership of land follows earlier patterns when the society was supposed to have been organized around lineage (Harrison 1999, 227f.). This hypothesis has, however, been questioned (Lindkvist 1997, 22; Gaunt 1983; Murray 1983). The disagreement is not about the significance of the family, but how these relationships were organized. It is argued that there is no trace of unilineal groups involved in e.g. landholding, and that the kinship relations were bilateral. However, it is essential to acknowledge that this does not mean that the family was unimportant.

The link between the individual, the family and the farm have been recognized in various contexts. In the written sources it seems like both people and deities were closely associated

with a farm (Burström 1995), and the farm or the village could be understood almost as synonymous with the family. How settlements were structured during the Iron Age is a controversial issue, and in Sweden at least, large rescue excavations in recent years have altered the picture. It has often been assumed that the establishment of villages was a late phenomenon, but today there are indications that villages existed at least in the Early Iron Age. Here as well, there seems to have been great variation, both within and between different regions. The discussion has also concerned the definition of a village, and it is interesting that there are different ways of linking farms together in addition to them being located close to each other. On the Baltic islands of Gotland and Öland, the settlements are linked to each other through enclosures built of stones. Like the villages, this was perhaps a way of linking families together and emphasizing their kinship relations.

The description of the Iron Age in south Scandinavia is often built on an evolutionist approach, where the society is supposed to have developed from a tribal organization into a state. The organization around the family and the tribe is thought to have broken down when the retinue (where loyalty was attached to a leader rather than to a relative) became more important. A surplus was required to maintain a retinue, and this could be obtained through raids or tributes. Such an expansive system caused conflicts, and the society was transformed into an archaic state. One who has argued in favour of this model of development is Hedeager, and she dates the changes relatively early. She suggests that the retinue was established as early as the Pre-Roman and Early Roman Iron Age, and that the states were founded in Late Roman Iron Age and consolidated during the Migration Period (Hedeager 1992). Other researchers, who in fact describe a similar development, date the establishment of the state considerably later (cf. Randsborg 1994). One problem with this model is that the development is seen as more or less predestined and that it does not allow deviation from the progression tribe – retinue – state. It is, for instance, assumed that the family and tribe lost their importance for the organization of society when the retinue formed. It is probable, however, that the family was of great significance even afterwards, that different kinds of group formations existed at the same time, and that there were both vertical and horizontal systems of alliances.

It is of course easy to look at historical time as a kind of “key” to previous times. It is, however, important that such a retrospective approach is not allowed to predominate so that all we see in earlier times is a straight line with events that lead to the foundation of the state. It has been pointed out that research tends to concentrate on the successful examples of the foundation of states and that there have been several “dead ends” as well (Lindkvist 1997, 20). We must understand that what we see as a development towards the state was not perceived in this way at the time of the events.

To facilitate interpretation of the Nordic Iron Age it is also possible to draw on analogies with societies for which we have historical evidence (e.g. Näsman 1988, 1998). In the material from contemporary Europe there are above all two models that could be used and compared with Scandinavia (following Näsman 1998):

(1) The first model starts with a number of small societies that coalesce into larger communities. This is a lengthy process and it leads towards more or less well integrated societies. Such societies, which were not stable enough to be called “kingdoms”, could be labelled “tribal confederations”. After a couple of hundred years they develop into kingdoms. This process is usually dated from the Roman Iron Age to the Early Middle Ages. The model is based on material from the continent, and principally the rise of the Merovingian kingdom.

(2) The second model supposes that there are many small and unstable societies which struggle for supremacy. But after periods of conflict and instability, one of the communities wins control over the others, a process that is relatively short and a kingdom is built. This usually is thought to have happened in the Viking Age. The model is based on similarities with the foundation of England. Näsman further maintains that interpretations of archaeological material from south Scandinavia show that there was a larger number of regions in the Early Roman Iron Age than in the Migration Period. Later on the regional cultures were less numerous and distinctions became more blurred, and in the early Viking Age the different societies were integrated into a kingdom. It is also during this period that centres of regional significance were urbanized (Näsman 1998).

To use such analogies and models as a basis could be fruitful, above all if regional variation is allowed and the material is not forced into a “pan-European” or Germanic model of development. The material culture differs between areas in Scandinavia, for instance in the structure of the cultural landscape, and these variations indicate different economic and political development during the first millennium A.D. (Widgren 1988).

A study of central places and regional divisions could also give us a picture of the society’s complexity (Fabech 1997). Today, when the amount of archaeological material is increasing, there are a growing number of places which seem to have had some kind of specific function. That these are important places is perhaps obvious, but it is necessary to examine the level on which they functioned: locally, regionally or inter-regionally. It is clear that locations which are called “central places” represented quite different levels, and we can get a better picture of the Iron Age societies if we understand these places better. For instance, Gudme in Funen and on Helgö in Lake Mälaren could be characterized as central places in the region, while Slöinge in Halland and Dankirke, Denmark, could be examples of “manor houses” (Fabech 1997).

In Uppåkra, Scania, there are thick cultural layers, and recent research has made it apparent that this is not an ordinary settlement. From the first century A.D. to the 10th, there are abundant traces of handicrafts, trade and religious activities (Hårdh 2000). Uppåkra’s interpretation as a central place is also of importance for the discussion about the societies in southern Scandinavia. Several central places have been identified in Scania, which indicates that Uppåkra principally had its significance on a local level in south-west Scania. This corresponds to the interpretation of Jordanes’ *Getica* and the location of four different tribes (*gentes*) to this area (Andrén 1998). According to this, there were a number of small political units in Scania during the Migration Period, something which is radically different from the larger units in the Viking Age, when Scania is supposed to have been a part of the Danish kingdom.

The archaeological material from Gotland also support the hypothesis that a central power did not exist during the Roman Iron Age. Graves, richly furnished with gold and Roman artefacts, are dispersed over the island, and often in connection with the forts on flat ground from the Pre-Roman Iron Age.

These have probably been central places of local importance. In the Late Roman Iron Age and Migration Period, the cultural landscape altered, because houses and enclosures were built in stone. The stone enclosures not only structured the farm's land, but they also seem to link farms with each other as well as with the grave monuments – and thereby linking the living with their dead ancestors. The material evidence does not, however, support the opinion that the organization of society was changing radically – contrary to this, using stones could have been a way of preventing change (Cassel 1998). A change in society could not be seen until the late Migration Period, when wood was used as building material once again.

In southern and western Norway, it has been argued that it is possible to distinguish several economic and political units in the Late Roman and Migration Periods. This interpretation is founded on the distribution of richly furnished graves. During the early phase it seems that most of the centres existed contemporaneously, while power seems to have been centralized in the Migration Period. The earliest historical documents from the late Viking Age and the early Middle Ages show resemblances with these early units, something which could imply that the later county organization was based on the earlier units (Myhre 1987).

To sum up, it can be established that the Nordic Iron Age is a period during which there were large changes in the organization of society, with for example the emergence of a more stable centralized power. But it would be a mistake if we only saw this period as a route to the establishment of the state and Christianity. The people in the past did not know “the end of the story”, and if we want to understand their world, we must admit the possibility of variations among the regions. It is also of great importance that we recognize that sacrifices and burial rituals were not only a matter of prestige, and religion was not only an ideology, but something that people believed in.

7. Literature (a selection)

1. Introduction

The runic inscriptions written in Ancient Nordic stem from, roughly, 200 to 500 A.D. The runic evidence occurs within a geographical area comprising Norway and Sweden as far north as, respectively, Trøndelag and Uppland, the island of Gotland and Denmark (with Scania and Slesvig), the medieval Danish territory exhibiting the largest concentration of early runic monuments. In addition to being the earliest recorded language in Scandinavia, Ancient Nordic was the first Germanic language to emerge, antedating Bishop Wulfila's Gothic translation of the Bible by about a century and a half. It is therefore pertinent to consider how far the early runic idiom differs from its reconstructed Proto-Germanic predecessor. This will be the topic of sect. 2.

The runic script employed for carving the early inscriptions was the 24-letter older futhark. The total number of older futhark inscriptions recorded is about 350, but 70 of these derive from the Continent, dating back chiefly to the sixth and seventh centuries (Neumann et al. 1995, ii). The remaining 280 are of Scandinavian provenance, but a limited number of inscriptions postdate the AN period proper by up to two centuries. In sect. 3., we shall examine the extent to which ON linguistic features began to make their presence felt in the older futhark inscriptions of the pre-Viking period in Scandinavia.

This article does not challenge the assumption that Ancient Nordic was indeed one language. But the question of the uniformity of the early runic idiom will be taken up for consideration in sect. 4, the subject of which is periodization within Ancient Nordic.

Traditionally, "urnordisk" ('Proto-Nordic') has been the term preferred by Scandinavian philologists for denoting what in this work is called Ancient Nordic. But was the language of the older runic inscriptions in fact

a specifically Nordic brand of Germanic or could it have been the ancestor of, e.g., some of the West Germanic languages as well? This problem will be surveyed from a research history perspective in sect. 5.

2. From Proto-Germanic to Ancient Nordic

Whereas the older runic language of Scandinavia retained the consonant system inherited from Proto-Germanic, significant changes occurred in the accented and unaccented vowel systems. Early runic forms like **makija** (Vimose chape, 250 A.D.) 'sword' and **mariz** (Thorsberg chape, 200 A.D.) 'famous' (cf. Go. *mēkeis* and *mēreis*) suggest that Gmc \bar{e}^1 must have been lowered to \bar{a} prior to the runic era. This development was probably due to the introduction of \bar{e}^2 , which pushed \bar{e}^1 into a half-open or open position (van Coetsem 1994, 98–113).

The occurrence of **o** in the nom.sg.masc. name **holtijaz** (Gallehus gold horn, 400 A.D.) and in the nom.pl.fem. **dohtriz** 'daughters' (Tune stone, 400 A.D.) is important because it shows that /o/ was not an allophone of /u/ as in Proto-Germanic. **holtijaz** and **dohtriz** both have **o** /o/ on the analogy of forms with an unaccented *-a-* following the accented vowel, cf. **holta* < *hulta-* and **dohtar-* < **duhtar-*. The runic accented vowel was therefore no longer an allophone of /u/ ([o]) in complementary distribution (lowered, through *a*-umlaut, in front of unaccented /a/), but a phoneme (/o/) in its own right.

Compared to Proto-Germanic, the following vowel reductions and simplifications took place in unaccented positions: **-ō* > (*-ū* >) *-u* (cf. **lapu** 'invitation, summons' (Darum 1 bracteate, etc.), **minu** 'my', **liubu** 'dear' (Opedal stone), and **-ai*, **-au* > *-ē*, *-ō* (cf. dat.sg.masc. *a*-stem **woduride** 'furious rider' (Tune stone), gen.sg. *u*-stem **magoz** 'son' (Vettelund stone)). All the vocalic changes described here were paralleled by developments in the later North and West Germanic languages (see article 64).

But how close was the idiom represented by the older runic inscriptions to Proto-Germanic in relative terms? If as our point of departure we take the legend on the famous Gallehus gold horn: **ek hlewagastiz holtijaz horna**

tawido [I, Hlewagastiz, son of Holt, made the horn], an illustration may be provided by translating this into Proto-Germanic (cf. Antonsen 1986, 322–24): **ek hlewagastiz hultijaz hurnan tawidōn*; *a*-umlaut has taken place in **holtijaz** and acc.sg.neut. **horna** ‘horn’, and in unaccented position the final nasals have disappeared in **horna** and in 1pret.sg.ind. **tawido** ‘(I) made’. But it is highly significant that the number of syllables (thirteen) in the Gallehus inscription corresponds exactly to that of Proto-Germanic, the morphological endings having been retained better in the runic idiom than in any of the other early Germanic languages including Gothic, its chronologically closest of kin. A Gothic rendering of our text: **ik hliugasts hulteis hairn tawida* has only nine syllables. The three middle words have been considerably shortened, and the final syllable of the last word has been shortened to *-a*.

The level of attrition in Gothic is comparable to that of Old Nordic (Old Icelandic), the successor language of Ancient Nordic, cf. *ek hlēgestr hyltir horn gorða* [táða]. But unlike Gothic, which has devoiced the Gmc nom.sg. masc. case-suffix **-z*, ON has rhotacized the ending to *-r*. ON has *i*-mutated vowels in *-gestr* and *hyltir*. ON has no reflexes of the verb *taujan* ‘to make’.

Linguistically, the Gallehus legend comes closer to its Proto-Germanic predecessor than to its ON counterpart. In sect. 3 we shall have a closer look at the transition from Ancient Nordic to Old Nordic.

3. The beginnings of Old Nordic

The syllable reduction in the ON translation of the Gallehus legend mentioned in the preceding section was due to the syncope (loss) of unaccented *a* and *i*. The syncope of *a* must have begun by the end of the sixth century, seeing that it occurs in, e.g., **haukz** ‘hawk’ (< Gmc **habukaz*) on the Vallentuna dice, which on archaeological grounds is datable to ca. 600 A.D. (Gustavsson 1989). Another instance of *a*-loss is acc.sg.masc. **stain** on the Eggja stone from ca. 700 A.D., cf. AN acc.sg. masc. **staina** (Tune and Vettelund stones). An example of *i*-syncope is the seventh-century Björketorp form, 3pres.sg.ind. **barutz** ‘breaks’, but note that *-i-* is retained in its slightly earlier parallel, **bariutiþ** ‘breaks’, on the Stentoft stone.

Very early examples of *a*- and *u*-breaking are seen in Björketorp **haerama-** ‘rest’ and Istaby **haeru-** ‘sword’, cf. ON **hjärm-* and

hjár-. The forms show that breaking must have begun prior to the syncope of *-a-* and *-u-*.

Morphologically, the beginnings of a specifically Nordic masc. *a*-stem declension were closely linked to *a*-syncope, cf. acc.sg.masc. Eggja **stain** ‘stone’ (AN **staina**), nom.pl.masc. Räväl **stainaz**, acc.pl.masc. Gummarp **staba** ‘staves’ and ON acc.sg.masc. *stein*, nom.pl. masc. *steinar*, acc.pl.masc. *steina*. And the use of the 2pres.sg.ind. ending *-z* for the third person as in Björketorp **barutz** ‘breaks’, where *-z* has replaced *-iþ*, cf. Stentoft **bariutiþ**, was a direct consequence of *i*-syncope, which brought the fricative of the ending in direct contact with the final consonant of the verbal stem. The fricative would have been exposed to (assimilatory) changes involving manner and place of articulation as well as phonation in accordance with the consonant cluster rules applicable to the Germanic languages. Although syncope of *-i-* did not at first occur after short syllables in Nordic (cf. Rök **sitiz** ‘sits’), the uncertainty ensuing from the first wave of *i*-syncope must have created a sufficient need for a new ending to replace what had become an alveolar stop or zero ending alternating with the fricative as markers of 3pres.sg.ind. forms.

Two other innovations can be dated to roughly the same time as syncope: the loss of initial *j-* as shown by the use of the **jāra*-rune (✻) for *a* (A) in, e.g., **haukz** ‘hawk’ on the Vallentuna dice from ca. 600 A.D.; and the loss of *w-* before rounded back vowels, cf. By stone **orte** ‘(he) wrought’ vs. the Tjurkö bracteate form **wurte** with retention of *w-*.

Philologists have tended to bracket all the older-futhark inscriptions as “urnordisk” (‘Proto-Nordic’), operating mostly with an early period and a late one, cf. “Früh- und Spätturnordisch” (Krause 1971, 15), “ældre og yngre urnordisk” (Skautrup 1944, 16–80), “(eldre) urnordisk og synkopetid” (Seip 1955, 6–30), etc.

Linguistically, there is no disagreement that from the sixth century A.D. the runic inscriptions show evidence of important innovations. As Skautrup (1944, 80) puts it, “Sproget er i periodens sidste århundreder undergået ændringer i karakter og omfang som aldrig siden ...” [During the last centuries of the period the language underwent changes of a nature and on a scale without later parallel]. The logical linguistic conclusion to be drawn from such an observation would be to distinguish terminologically between the runic language prior and subsequent to, say, 500 A.D. In

accordance with our terminology, Ancient Nordic was gradually superseded by Old Nordic from the sixth century.

The question of whether it is at all warranted to label the runic language recorded before 500 A.D. as “Nordic”, will be considered in sect. 5. First, we shall discuss the linguistic homogeneity of the runic language belonging to the early period.

4. Periodization within Ancient Nordic

Throughout the time span encompassed by Ancient Nordic (ca. 200 to 500 A.D.) the language of the inscriptions stayed conservative, remaining, on the whole, closer to Proto-Germanic than to Old Nordic (or the WGmc languages). Nevertheless we must acknowledge the existence of an *early* period, with runic grave and bog finds from around or just after 200 A.D. whose most significant linguistic features were the variation between **-o** and **-a** as nom.sg.masc. *n*-stem markers in the runic material deposited at Illerup and Vimose (cf. the personal names **wagnijo**, **nijijo**; **laguþewa**, **swarta**) and the emergence of **-a** in the runic legend on the Skovgårde clasp (**talgida** ‘carved’) as a weak 3pret.sg.ind. ending along with **-ai** (Nøvling **talgidai**) and **-e** (Illerup, Garbølle **tawide** ‘made’), cf. Stoklund 1995.

Similarly, the divergent forms exhibited by runic legends inscribed on bracteates entitle us to posit a *late* period within Ancient Nordic (from 450 A.D. at the earliest). Especially important are progressive developments such as *ai* > *ā* (Halskov bracteate **fahide** ‘(he) painted’, cf. Einang stone **faihido** ‘(I) painted’) and *ht* > *tt* (Tjurkö 1 bracteate **wurte** ‘(he) wrought’, cf. Tune stone **worahto** ‘(I) wrought’), which are portents, as it were, of the transition into Old Nordic, cf. Antonsen 1975, 17, 26; 1994, 52. But it must be stressed that the bracteate language is *Ancient* and not Old Nordic. Nor is it West Germanic, for that matter, the WGmc element in the bracteate idiom being of limited significance.

However, there is no evidence for assuming that Ancient Nordic was not a uniform language during the middle part of its attested life span, between, say, 250 and 450 A.D. Non-datable stone monuments like Möjbro, Nordhuglo, Opedal, Tune, Einang and Vettelund would fit in here along with, e.g., the Gallehus gold horn. Despite all difficulties in dating the stone inscriptions in absolute chronological

terms (cf. Haavaldsen 1991, 89–90), we shall not hesitate to call this the *central* (or classical) period within Ancient Nordic.

5. The dialectal position of Ancient Nordic: research history

The dialectal provenance of the early runic inscriptions of Scandinavia and especially those from Jutland and Slesvig (e.g. the Gallehus inscription) became a hotly debated issue in the wake of the Dano-German conflict over Slesvig around the middle of the nineteenth century. By that time the Υ rune had not yet been identified as the nominal nom.sg.masc. marker, and it was only when Bugge (1865, 317–18) and Wimmer (1867, 50–51) began to transliterate this rune as, respectively, **-r** and **-R** that Scandinavian philologists believed that they had a strong argument for the Nordic provenance of the inscriptions, (**r** and) **R** in final position being identified with ON nom.sg.masc. *-r*. Bugge (1866–67, 223–24) and Wimmer (1867, 57–58) both followed Bredsdorff (1839, 161–62) in also regarding **ek** as evidence of the Nordic character of, e.g., the Gallehus gold horn, cf. ON *ek*. Scandinavian philologists stuck to the views advanced by Wimmer, and as late as in 1951 Bjerrum (1951, 205) used the same arguments as Wimmer, viz. the form **ek** ‘I’ and the retention of Υ **R** as the nominative suffix, to show that the Gallehus inscription was Scandinavian. The most recent scholar to argue in favour of the Nordic provenance of the early runic idiom is Grønvik (1981, ch. 3), who (probably wrongly, cf. Nielsen 1994) believes that the divergent reflexes of Gmc \bar{e}^1 in the early inscriptions of Scandinavia and in Ingveonic West Germanic can be used as criteria for positing a primary split within the Germanic of North-Western Europe.

German scholars mostly rejected the classification of the early runic inscriptions of Scandinavia as Nordic, questioning the diagnostic value of both Υ , which they preferred to transliterate as **-z** instead of **-r**, and **ek** which, in addition to *ik*, was paralleled by *e*-forms in Old Saxon and Old Low Franconian. Bremer (1900, 836), e.g., thought that owing to the late westward expansion of the Danes, at least some of the early inscriptions should be ascribed to the *West Germanen*, i.e. the Anglo-Frisians. De Boor (1928, 189) found it safest to regard the runic language of the fourth century A.D. as Proto-Germanic (“urger-

manisch”), and Arntz (1935, 187) questioned the Scandinavian character of the Jutland inscriptions, saying for instance – in the absence of an ON equivalent of **tawido** ‘(I) made’ – that the Gallehus legend could have been Anglian or Saxon. Most recently, Vennemann (1989) has assigned the Gallehus inscription to West Germanic, indeed to pre-Old English, provenance, a classification which should be seen in close connection with Vennemann’s controversial (cf. Nielsen 2001) views on early Germanic dialect grouping.

A fairly comprehensive view of the dialectal position of the runic language prior to the sixth century is taken by Antonsen, who labels it as “Northwest Germanic” (“NwGmc”):

From the phonological, morphological, and syntactic points of view, NwGmc can be considered the parent language not only of the later Scand., but also of the Ingv. WGmc dialects. There are no features attested in the inscriptions which would contradict this assumption (Antonsen 1975, 26).

The spiritual father of this model is Kuhn (1955) who, in reaction to the Gotho-Nordic macrogroup set up by Schwarz in a book from 1951, was able to demonstrate that the linguistic parallels between North and West Germanic were much more numerous and significant than those between Gothic and Nordic (NGmc). According to Kuhn, a shared Nordic-West Germanic language stage was reflected in the early runic inscriptions of Scandinavia, and the eventual split into separate North and West Germanic branches supposedly took place around 500 A.D. Kuhn’s North-West Germanic theory found many adherents (especially outside Scandinavia), among them Haugen 1970, Markey 1976 and, most recently, Penzl in a number of articles (e.g., 1989). Originally, Antonsen also came out in support of Kuhn (cf. Antonsen 1967), but as we saw above, Antonsen in his runic grammar left out Old High German from his version of “Northwest Germanic”, basing this restriction entirely on morphological points (1975, 26; 1994, 60). For arguments in support of Antonsen 1975, see Nielsen 1998, 542–52.

6. Conclusion

Traditionally, the term “urnordisk” (‘Proto-Nordic’) has been used with reference to the period during which the older runic futhork was employed (ca. 200–700 A.D.). From a strictly linguistic viewpoint, however, this period must be divided up into two: one which

antedates the inception of specifically Nordic features and which (nevertheless) in this work is called Ancient Nordic, and one which, from the sixth century, through syncope, breaking, loss of initial semi-vowels, morphological innovations, etc. inaugurates the ON era. A clear illustration of the greater resemblance of Ancient Nordic to Proto-Germanic than to Old Nordic was provided by the translations of the Gallehus legend. But it is important to note that neither the Gallehus idiom nor Ancient Nordic in general was identical to Proto-Germanic.

The research history showed the increasing tendency (outside Scandinavia) to regard the language of the older runic inscriptions (Ancient Nordic) as the ancestor of not only Old Nordic but also (some of) the West Germanic languages. Finally, Ancient Nordic was described as a fairly uniform language with variation only at the beginning and at the end of the period.

Hans Frede Nielsen, Odense (Denmark)

71. A survey of ancient Nordic sources

1. Introductory remarks
2. Place- and tribe-names in the works of Greek and Latin authors
3. Loanwords in the Balto-Finnic languages
4. Runic inscriptions
5. Literature (a selection)

1. Introductory remarks

The essential direct and indirect sources of Ancient Nordic (AN) are of the following three types: place-, tribe- and personal names in the work of Gr. and Lat. authors; loanwords in the Balto-Finnic (BF) languages, principally in Finn. and Lappic; and finally, and most importantly, those oldest runic inscriptions whose NGmc origin may be regarded as secure. Furthermore, certain conclusions can be drawn from mod. place-names

whose roots, in part, reach as far back as pre-Christian times (on place- and personal names cf. articles 76 and 77).

2. Place- and tribe names in the works of Greek and Latin authors

The oldest names are recorded by the Gr. Pytheas of Marseille, who travelled through Britain and parts of Scandinavia ca. 325 B.C., but Pliny's transmission of his accounts is so uncertain and corrupt that it is impossible to identify precisely the places and regions that Pytheas visited. In his work *Naturalis historia* (written before 79 A.D.), Pliny himself mentions the tribe names *Vandali*, *Gutones*, *Burgundiones*, as well as the place-names *Scattinavia*, designating the largest of the islands of

Sinus Codanus, and *Scandiae*, designating the archipelago surrounding the tin-island *Ictis*, which lies en route to *Tyle*. According to common opinion, these two names originally denoted two different referents, from which by secondary contamination the modern name *Scandinavia* has emerged. In the Gr. tradition, *Skatinavia* goes back to Gmc **skaði/an-aujō*, whose meaning ‘scathe-island’ can only be interpreted as nautical terminology. Thus the name would have been conferred externally, by visitors from outside, which possibility corresponds to the idea of an island. Undoubtedly, the generally most important source of Gmc is *Germania* (98 A.D.), written by Tacitus, who mentions the “NGmc” tribes *Suiones*, *Fenni*, *Rugii*, *Anglii* (the latter probably being WGmc, in any case belonging to the Nerthus-worshippers’ cultural group; the Rugians’ linguistic affiliation remains open, but it is presumably EGmc). In his work *Geographika* (ca. 150 A.D.), the Gr. astronomer and geographer Ptolemy provides not only several names, such as *Gutai* and *Chaideinoi*, but also their geographic arrangement. He defines *Skandia* proper as the largest of four islands located at the mouth of the Vistula. (In the later vulgar Lat. tradition *Skandia* becomes *Skandza*.) Ptolemy’s famous map, however, stems from a 13th-c. manuscript. Finally, the Archbishop of Ravenna, Jordanes, who was a Goth, wrote a history of his people called *De origine actibusque Getarum* in about 550 A.D. In essence, it is a summary of the lost history of the Goths, written by the Roman Cassiodor, a contemporary of Theodoric the Great. In his work, Jordanes names and describes the island *Scandza*. He also mentions the *Dani* for the first time, as well as the *Ostrogothæ*, *Ragnaricii* and *Raumariciae* names we can now for certain assign to AN. Like Cassiodor before him, Jordanes hands down the cliché of Scandinavia as *officina nationum* ‘workshop of nations’ and *vagina gentium* ‘womb of the tribes/peoples’. The Gr. historian Prokop describes an incident from the beginning of the 6th c. (512, according to him): after their defeat in Pannonia, the Heruleans return home, already having obtained a new king from Scandinavia to replace their previous ruler, whom they had killed. This account has led to the quite justifiable conclusion that the Heruleans were for legitimate rulers dependent on their Scand. home. The “tribe” of the Eruleans/Heruleans (H- is presumably the Lat. spelling, as in the case of *Herminones* for *Irmin-*; the original name was supposedly

**eruloz*) has always been of great interest to Scand. philologists. Bugge (1891–1903) interpreted the Eruleans not as a tribe, but as a class of Scand. rulers who formed a tribe only outside Scandinavia, in a foreign ethnic environment. In the second half of the 3rd c. they emerged from the darkness of history and attacked almost simultaneously Greece (267 A.D.) and Northern Gallia (269 A.D.) with fleets of 500 and even 2000 ships, respectively. In 286 they raided Gallia again. Hydatius reports assaults in the northwest (456) and even in the south (459) of Spain. According to Jordanes, the Eruleans were driven out of Scandinavia by the Danes, but this may rather hide the fact that “einige Heruler [sich] einem uns unbekanntem gesellschaftlich-politischen Druck entzogen haben” (Rübekeil 1992, 117). As for their phenotype, there are striking parallels between the Eruleans and the later Vikings. Both employed smaller or larger fleets, both appear seemingly at random in the east and the west, and both are groups with non-locatable homes in the north. Even the myth of the Heruleans’ expulsion is possibly paralleled by the topos of the Jarls being expelled from Norway by King Harald Finehair: “Die völkerwanderungszeitlichen Heruler sind die Vorläufer der Wikinger in linearer Filiation, und sie sind wie diese ein soziologisches, kein ethnographisches Phänomen – Letzteres werden sie nur für kurze Dauer in ihrer südöstlichen Heimat und lediglich in den Angaben der Historiographen” (Rübekeil 1992, 118). A question of particular interest to runologists as well as to historians of civilization and of the (H)Eruleans could be connected to the word *e/irilaR*, a term with which the runemasters referred to themselves, or to the ON word *jarl*, denoting ‘prince, chieftain’. The name consists of a root **er-* + a suffix, which, however, appears not to retain the so-called IE suffix-ablaut. The people’s name is probably identical with the lexeme *jarl* (< **erloz*), and the spellings with -u- might be cases of substitution within an independent ancient tradition (cf. Rübekeil 1992, 111). The relation to the runemasters’ self-referential *e/irilaR* remains controversial and open (svarabhakti -i- is unlikely). The root **er-* does not correspond to the homonymic IE lexemes for ‘earth’ or ‘man’, but rather to ‘to jump up, to rush off, to be moved by rage’, in which case **er(i)lo-* designates some kind of berserker. Later, this meaning developed into ‘man taking on fighting as this task’, i.e. a warrior aristocracy, from which the class of the jarls evolved. The

question of whether the Eruli in the late AN period can be said to have been the main upholders of both the runic culture and a ritualistic association strongly tied to Odin – as Höfler (1971) and Klingenberg (1973) assumed – has to remain open.

3. Loanwords in the Balto-Finnic languages

Over a period of ca. 5000 years (counted up to the present), the speakers of the so-called Uralic languages must have had sufficiently close contact with the Scand., Gmc and IE peoples so that time and again borrowing occurred, in which process Gmc/IE was the donor almost every time. Practically all aspects of life, even the most elementary ones, feature borrowings (cf. the survey of research in Hofstra 1985 and the numerous works by Koivulehto since 1971 concerning this topic). The exact time and place of particular instances of contact during the early period is hidden in the depths of history. Although it is often taken for granted that there was migration, there is no reliable archaeological evidence for the Finns' immigration to Finland, for example, or the Gmc peoples' immigration to southern Scandinavia and North Germany. Even the issue of the original homes of the Indo-Europeans (and the Uralic people) remains completely open. It is certain, however, that within the Uralic family of languages there are various layers of borrowings whose approximate age can only be determined by internal reconstruction. Various stages and intermeditate proto-languages have been distinguished, but these are „nicht immer als hierarchisch-chronologisch voneinander getrennte Ebenen, sondern auch als areal zusammenhängende Sprachgebiete aufzufassen“ (Koivulehto 1991, 13). Early PF (“Frühurfinnisch”) forms a reconstructed source language of BF = “Ostseefinnisch” (Finn., Est., Livian) and Lappish (the language of the Saami living in the north of Scandinavia). All of these stages can be proved to contain borrowings; loanwords that exist exclusively in Finn. or Lappish may date from the early PF or BF period, or may have been borrowed later by each language separately. Therefore, possible donor languages would be Pre-Gmc, NGmc, Pre-AN, “Old EGmc” or Go., AN, or later language stages. Departing from previous research, which was inclined to assume the Baltic area to be where the borrowing occur-

red, primarily Koivulehto and others now tend to work from the assumption that the borrowings came via Scandinavia. They also date the borrowings as well as the Gmc sound laws much earlier. Accordingly, the transition from /e₁/ > /a:/ would have happened as early as the Bronze Age, since early PF already has borrowings with reflections of both of these Gmc phonemes (cf. Koivulehto 1981). This theory has justifiably been criticized, because the dating of early PF to the Bronze Age is based on arbitrary assumptions about the ethnic classification of archaeological “Sachkulturen” on the southwestern coast of Finland. With the evident intention of assigning the oldest runic inscriptions to AN, Grønvik dates the change from /e₁/ > /a:/ at the 2nd c. A.D. in all of his publications, and has it begin in NGmc. If one accepts this chronology, the Finn. loanwords with reflections of Gmc */e₁/ could either have been borrowed before the sound change or originated in EGmc (“Goths” in the Vistula region) peoples, as traditional research has assumed. The often mentioned PGmc words, including *rengas* ‘ring’, *kuningas* ‘king’, *keihäs* ‘spear’ (< **gaizaz*), *juusto* ‘cheese’, *teljo* ‘ship’s beam’ (~ OIcel. *þilja* ‘rower’s seat’), *juko/jukka* ‘yoke’, and *pleto* ‘field’ (> OIcel. *þjall*), were probably borrowed in the time B.C. Presumably from the AN period, however, come words like *kulta* ‘gold’, *hartio* ‘shoulder’ (~ OIcel. *herðar*), *kaltio* ‘source’ (~ OIcel. *kelda*), *juhla* ‘feast’ (~ OIcel. *jól*), *terva* ‘tar’ (~ OIcel. *tjara*), *valta* ‘power/might’, and *havukka* ‘stroke’ (OIcel. *högg*) and many others, but the precise time of borrowing remains uncertain in individual cases; the same goes for many of the Lappic loanwords, e. g. the often mentioned *miel’ke* ‘milk’. Therefore, these sources contribute little to our understanding of the evolution of AN. The extent of borrowings in both languages during the AN period should be estimated at 100–1000 lexemes. Due to phonetic (reflections of Gmc */e¹/) or lexical arguments (one word occurs only in the Go. Bible translation), it is believed that there is a group of borrowings (around the birth of Christ or in the 1st c. A. D.) from Go. or other EGmc languages of the Wielbark culture, located south of the Baltic Sea or in the Oder-Vistula area. The most pertinent instances are the following: *paita* ‘shirt’ for Go. *þaida* ‘frock coat’, *äiti* ‘mother’ for Go. *aiþei* ‘mother’, the conjunction *jah* ‘and’ (which Grønvik, reading the Stentofen stone in 1987, took for late AN as well, an interpretation he

withdrew himself in 1996), further *mitta* ‘measure’ for Go. *mitan* ‘to measure’, *miekka* ‘sword’ (for *mekeis*), *neula* ‘needle’ (for *nepla*) and others. It seems to be obvious that these words were borrowed before the Goths’ and other EGmc peoples’ migration, starting in 200 A. D. (yet even this conclusion is not really certain). The period of time cannot be specified further with certainty, but time and again (the latest in Grønvik 1998, 147ff.) the 1st or 2nd c. A. D. is cited as the most probable. Whether or not at this point of time, however, there was a dialect-geographical contrast between EGmc and AN instead of a unified NGmc, (or whether some of the other models of the splitting up of the Gmc dialects apply) depends not least on the linguistic interpretation of the oldest runic inscriptions.

4. Runic inscriptions

Provided their North Gmc origin may be regarded as certain or at least probable, the oldest runic inscriptions are our most important sources of AN, because they are the only direct ones. It is still disputed when and where the Gmc peoples adopted the runes. At present, the Latin thesis prevails among Scandinavian runologists, whereas in Germany the North Italian thesis is still popular. Morris (1988), who re-postulated the Greek thesis and presumed the adoption to have happened very early, was refuted with good arguments. The two earliest potential finds of runic material are the fibula from Meldorf with the inscription **hiwi** or **ipih** (cf. e.g. Moltke 1985), and the two possible runes **ea** on a shard from Osterrönfeld (cf. Dietz/Marold/Jöns 1996), both of which are archaeologically dated to the first half of the 1st c. A. D. These finds, however, are controversial, and their being runic is not completely assured. Therefore, the earliest definite inscriptions still date from a time between the end of the 2nd c. A. D. (spearblade from Øvre Stabu) and the beginning of the 3rd c. (weapons from the bogs of Illerup and Thorsberg, fibulae from women’s graves of the Late Roman period in present-day Denmark). Thus the adoption of the runes probably took place in the centuries bordering the birth of Christ. Each new find might challenge this view, however. Another moot point is the crucial question of which language stage these inscriptions, at least the earliest ones, represent. Numerous linguists (e.g. Kufner 1972; Antonson 1975; Haugen 1976; Penzl 1989 and others) believe the language of the oldest runic inscrip-

tions to represent a NWGmc stage (which most likely was a union of later AN and Ing. WGmc). In the north, this stage would be retained in its archaic shape, whereas WGmc would have seceded from this union through a string of innovations (e.g. loss of final *-z*), beginning in about 200 A. D. Grønvik, however, repeatedly argues “daß die Runensprache viele spezifisch nordische Züge aufweist und somit keine nordwestgermanische, sondern eine jüngere Sprachstufe vertritt” (1996, 119). He calls this language stage “Ur-nordisch” or “Nordisch I”. Putting the purely terminological question aside, we can certainly assume the existence of an AN language in Norway and Sweden in the 3rd c. and afterwards (as in the inscription on the Tune stone), but the inscriptions from Denmark before the exodus of the Angles, Saxons and Jutes and the immigration of the Danes cannot be classified as unequivocally. This reservation holds, for instance, for the fibulae from women’s graves. In the case of the finds from bogs, the attackers’ origin is relevant, as is the question of whether the inscription was made before or after the battle. According to archaeological indications, the finds from Illerup stem from the area around the Oslo Fjord: they are therefore clearly AN. The finds from Thorsberg on the other hand stem from the region of the Weser-Rhine-Teutons; thus they cannot be proclaimed AN a priori. The finds from the Nydam bog are assigned to the Baltic area possibly Gotland (hardly EGmc). Grønvik’s main criteria for a dialectal separation of WGmc and AN are the loss of the final *-z* in WGmc, which in AN evolved to *-R*, and the change from Gmc. */e_i/ > /a:/. The latter change is supposed to have occurred first in AN (in the 2nd c.), whereas in about 200 A. D. the WGmc languages divided into South Gmc, featuring the development to /a:/, and Ing. (Franconian and PAS), which retained /æ:/ (Grønvik 1998, 121). Of all forms, **niwajemariR** on Thorsberg, serves as evidence for this development, next to **makija** on the chape from Vimose, Funen. That the loss of the *-z* in WGmc occurred in any case before the birth of Christ is indicated by the two names *Chariovalda* and *Catualda* in Tacitus’ Annals (II, 11; II, 62) (we do not even know whether their bearers were actually WGmc), and the name **Harigasti** on helmet B from Negau, which is dated to around 100 B. C., and in which Grønvik (1996, 159f.) would like to recognize an appellative ‘der Heergast’ in WGmc form. Nevertheless, the previous proposal that it is

a genitive of the Latinized Gmc name *Hari-gastus* cannot be ruled out, and in addition, the reference is unique. Finally, there are runic indications in this matter. On Thorsberg, -R is preserved in **pewar** and **marir**; the Illerup mount for a shield-handle 3 (found in 1983), however, features the inscription **lagupewa** (probably for 'sea servant'), which lacks the final -R. One could think of this as a banal misspelling; otherwise, one must ad hoc imagine a WGmc writer in Funen (or at the Oslo Fjord?). In this case, though, next to anything is possible. For criticism of Grønvik's view cf. also Nielsen (1998, 551f.), who, in accordance with Antonsen, classifies the earliest inscriptions as "NWGmc". This classification, however, raises the question of whether or not a distinct space and time for AN exists at all. Perhaps Klein's (1992, 224) assessment will prove itself most convincing:

Inschriften von Sprachtypus und Entstehungszeit der Gallehus-Inschrift sind [...] nicht westgermanisch, sondern gehören eher ins Vorfeld des Nordgermanischen – nicht weil sie bereits kennzeichnend nordgermanische Züge trügen, sondern weil sie eine Sprachform bewahren, welche die westgermanischen, und hier besonders die nordseegermanischen, Dialekte längst verlassen hatten.

Since the issue of linguistic affiliation is deliberately left open here, all runic inscriptions that are not clearly EGmc or SGmc are presented as (potential) sources of AN.

4.1. Runic inscriptions from the early AN period; ca. 2nd/3rd-5th century

In the past 20 years numerous new finds, which are not taken into account in most of the older handbooks of linguistic and cultural history, have increased the corpus of AN inscriptions considerably. Nevertheless, the fundamental categories of artefacts bearing inscriptions remain practically unchanged. Runes are found on jewellery, on weapons, seldom on stone, and in a few cases on profane objects of daily use. On the basis of archaeological evidence or the shape of the *e*-rune the following inscriptions, which form a homogeneous group, can be dated to the period of time before 400 A.D.: The fibulae Himlingøje I (*hariso*), Himlingøje II (...*widuhudar*), Værløse (*alugod*), Næsbjerg (*warafnis?*), Nøvling (*bidawarijar talgidai*), Gårdlösa (*ekunwodr?*), Udby/Skovgårde (*omal/lamo talgida*, new find 1988, cf. Stoklund 1991). For

lack of a better explanation, these inscriptions are interpreted as manufacturers' inscriptions (name + 'I carved/am the carver'). Furthermore, we have weapon finds, some of which bear identical inscriptions, from the bogs of Thorsberg, Nydam, Vimose and Illerup: *wagnijo* on a lance-blade from Vimose and on two lance-blades from Illerup, in the one case carved, in the other stamped. Due to this fact, it appears justifiable to question the previous interpretation that inscriptions on lance-blades denote weapons' name (e.g. *tilarids* on Kowel, *ranja* on Dahmsdorf, *raunijar* on Øvre Stabu, among others). One would think that placing name magic on a weapon is an individual act, not a piece of manual work that can be repeated trivially by means of a stamp. There are names on other parts of weapons which strengthen this critical view: On the fitting of a shield-handle from Illerup the inscription *swarta* is found, which probably is the bearer's or the maker's name. Presumably, the wooden handle of a firesteel from Illerup names its owner (*gauþR*, with faulty omission of the thematic vowel?), as does the chape from Thorsberg (*owlþupewar niwajemariR*). The bronze fitting of a drinking horn from Illerup features two inscriptions (*fu??R fra*), the first of which might be a name. The chape from Vimose is dated to about 200 A. D., as is the buckle from Vimose. The wooden item from Vimose which is most often referred to as a plane belongs rather at the end of the AN period than at its beginning (Grønvik 1996 offers new interpretations of all three inscriptions). A new find in 1995 from the Nydam bog, the bronze strapholder of a hazel scabbard, is dendrochronologically dated to ca. 300 and typologically to 250/60–310/20. The inscription runs right-to-left and reads *harkilar ahti* (perhaps 'Harkilar owned (this)', but this is justly criticized by Stoklund 1998, 63). The inscription on an axe handle from the Nydam bog is perhaps one of the most important finds from the last years (Stoklund 1998, 61). Apart from the formula-word *alu*, it appears to contain three masculine nominative forms (*wagagastiR*, *sikijar*, *aipalatar*), perhaps the 1sg.pres.ind. of 'to consecrate'. On the archaeological evaluation and classification of all these early runic finds cf. Lund Hansen 1998. Some inscriptions on wood (such as the casket of Garbølle with the rune maker's text *hagiradar (i) tawide*) can be dated to the 4th c., as can the oldest rune stones. Among these stones are certainly the Opedal stone (*birginguboro swestarmiliu-*

bumer wage) (Grønvik 1996, 81–96, even dates it to about 200 A. D.), the Einang stone (*[ekgo]dagastirrunofaihido*), the Vetteland stone (... *flagda faikinarist... magorminastaina... darfaihido*) and the Rø stone (*ek hrarar satido stain... swabaharjar ana... sxirawidar ... stainawarijar fahido*), all from Norway. Another new find from the Nydam bog is a piece of wood, provisionally dated to around 400 by means of archaeology, whose inscription seems however to make no sense whatsoever, such that a pseudo-inscription is presumed (cf. *Nytt om Runer* 12, 1997, 4f.). Two arrows from Nydam bear the inscriptions **la** and **lua**, respectively, which probably stand for *alu*. The Tune stone dates from the end of the 4th c. or the beginning of the 5th c. (Grønvik 1981). Its long text constitutes the most extensive inscription from the AN period. Due to the shapes of its runes, the inscription on the stone slab from Kylver in Gotland belongs in the second half of the 4th c. It comprises the oldest Futhark inscription we have as well as a tree-like sign and a side inscription (most likely *sueus*, a doubled ‘horse’ in the service of grave magic). The two gold horns from Gallehus, which are now lost, are dated to around 400 or shortly thereafter. The text of the shorter horn (*ek hlewagastir holtijar horna tawido*) constitutes the earliest secure example of a Gmc “Langzeile” with alliteration. The Myklebostad stone (with a svarabhakti in the name *worumalaiba/e*), the Rosseland stone bearing an eril-inscription (*ek wagigar irilar agilamudon*), the Årstad stone (*hiwigar saralu ekwinar*) and the Reistad stone (*iupingar ekwakraRunnam wraitha*), all from Norway, belong perhaps at the end of this period, namely, towards 500 (on the first three cf. the new interpretations in Grønvik 1996, 97–124; on Reistad cf. Bammesberger 1996). From their rune forms and language, two further bog finds belong clearly at the end of the AN period. The first is a collection of wood pieces from Kragehul in Funen, which are taken to be a spearshaft, bearing an eril-inscription. The second is a piece of bone referred to as an amulet from Lindholm in Scania (both newly interpreted in Grønvik 1996, 50–74; on previous interpretations cf. Krause/Jankuhn 1966 and Birkmann 1995). The oldest Sw. rune stone, the Möjbro stone (*frawaradaranahaislaginar*), stems from sometime in the AN period (the date cannot be further specified). The end of the AN period is marked by the bracteate inscriptions, which show numerous peculiarities: most of the texts

consist of so-called formula words like *laukar*, *alu*, *lapu*, *ota*, *ehwu*, *gakar*. Elaborate texts are offered by the Skodborg bracteate (*auja alawin auja alawin auja alawin j alawid*), the Zealand II bracteate (*hariuhahaitika farauisa gibu auja* + a tree-rune, as a triple invocation of the god Tyr??), the Väsby and Åskatorp bracteates, which were made with the same stamp (*uigar eerilar fahidu uuilald*, newly interpreted in Grønvik 1996, 220–229), the Åsum bracteate (*eikakarfahi*), and the Tjurkö I bracteate (*wurte runor an walhakurne heldar kunimudiu*; the traditional interpretation in Krause/Jankuhn 1966 is more convincing than the suggestion in Grønvik 1987, 150ff.). Regarding the bracteate from Ågedal in Vest-Agder, Grønvik offered various interpretations in 1987 and 1996, but none of them appears convincing. Moltke (1985) deemed the bracteate inscriptions in general to be the product of illiterate goldsmiths, devoid of any linguistic meaning whatsoever. The other extreme is represented by Seebold (1991), who assumes they are unique runes which, far from being corrupt forms, constitute intentional new creations meant to describe new phonemes. Each view might be right, depending on the particular instance. In any case, the latest bracteates may well belong at the beginning of the late AN period.

4.2. Runic inscriptions from the late AN period; ca. 6th-7th century

Meanwhile, the runic inscriptions from these two centuries convey to us a fairly precise idea of the evolution of language within this period of time. Their chronological classification is partly absolute and partly relative (on this aspect cf. article 82). It should be taken into account that, due to new finds as well as new interpretations, there have been quite a lot of changes and new perspectives since the standard works on Scand. language history based on Krause/Jankuhn (1966) or even older runological works were published. This reservation concerns particularly the following inscriptions, which can be safely assigned to the late AN period: the comb from Setre, the dice from Vallentuna, the whetstone from Strøm, the piece of bone from Ødemotland, the fibulae from Eikeland, Fonnås and Skabersjö, the Blekinge stones from Istaby, Gummarp, Sten-toften and Björketorp, and the Eggja, Järsberg and Noleby stones. The fibula from Bratsberg, the By stone, the spearshaft from Kragehul and the so-called amulet from Lindholm all date from the beginning of the transitional

period. Finally, there are new readings and a large number of new interpretations of bracteate inscriptions (above all, Grønvik 1987; 1996; Santesson 1989 and Seebold 1991 are important; Birkmann 1995 provides a survey up to 1994). All of these inscriptions provide in any case clear evidence for the transition to the period of syncope.

72. The Ancient Nordic period: An archaeological survey

1. Overview
2. General background
3. Geographical and climatic conditions
4. Regionality
5. Subsistence and settlements
6. Defence
7. Social and political structures
8. Glimpses of the spiritual life
9. Literature (a selection)

1. Overview

The Nordic Iron Age societies were agrarian and socially stratified, and had elites with far-reaching contacts competing to consolidate or increase their power. Settlements comprised both villages and single farmsteads, with large “central places” as well as possible chieftains’ farms standing out in the general picture. The elite was able to organize substantial territories, as testified by defence structures and sacrifices of weapon. Roman influence is evident in the material culture, in the emergence of runes, and in the pictorial art.

2. General background

The present survey is intended as an archaeological outline of the first 7 centuries A. D., paying special attention to aspects important to the emergence and use of runes.

In most cases, attaching linguistic labels or historically known tribe-names to archaeological finds is most problematic. It seems, however, reasonable to interpret the agrarian Iron Age culture of Scandinavia as representing an AN speaking population, in contrast to the hunter-gatherer culture of the inland forest and mountain areas of Norway and Sweden which in historical times were populated by Sami-speaking peoples (Zachrisson et al. 1997). It must, however, be borne in mind that farmers and hunter-gatherers influenced and were dependent on each other, e. g. with regard to fur trading and iron production. It should also be mentioned that “Germanic” influences/contacts are evident in southern and southwestern Finland from the Late Roman Period onwards (Schaumann-Lönnqvist 1991).

3. Geographical and climatic conditions

The agrarian societies of Scandinavia faced varied environmental conditions. The mo-

raine deposits in Denmark and Scania were rather densely populated, with only a few kilometres between settlements. Similar conditions could be found on fertile plains like Västergötland, or Jæren in Rogaland, while the mountainous areas of Norway and Sweden were more sparsely settled along the coasts and in the valleys.

A notable natural factor is the rising land levels which has taken place since the end of the Ice Age. For the period in question, the relationship between sea and land in southern Scandinavia will have been mostly like it is today, while the gradual retreat of the sea becomes ever more marked towards the north and east. In Ångermanland/Västerbotten, the sea at the beginning of the Christian era was about 20 m higher than its present level, retreating about 10 m during the first millennium. In central Sweden the sea level during the Migration Period was 5–8 m higher than today, and the present Lake Mälaren had open access from the Baltic Sea. In Norway the land seems to have risen ca. 4 m in the Oslofjord area since the beginning of the Late Roman Period, in western Norway less than 3 m while in Trøndelag the sea level during the Vendel Period was ca. 4 m higher than today. The steady increase in the landmass would have been of great importance with regard to the area available for cultivation and grazing, both for individual farms in the coastal zone and for the society as a whole, as well as by changing the possibilities for communication by sea.

The climate during the Roman Iron Age was rather mild and dry, even a little warmer than today, and warmer than in the preceding period. Around the 5th century, however, the weather became cooler again.

4. Regionality

Basically, Iron Age Scandinavia can be regarded as one cultural area, apart from the Sami areas already mentioned. Agrarian settlement was found in Denmark, southern and central Sweden, the coastal zone of northern Sweden and some inland areas, such as Dalarna and Jämtland, the coastal zone and arable valleys of southern Norway and Trøndelag, and the coastal zone of northern Norway up to the Tromsø area. The area can be subdivided if one looks closer at the finds

Tab. 72.1 Divisions of the Scandinavian Iron Age, with approximate dates and the period names in Danish, Norwegian and Swedish. Besides the period names, the labels A–D and I–VIII are used, the latter mostly in Swedish archaeology. Each of the periods can be subdivided; both the absolute dates and the subdivisions are currently being discussed and revised. In Denmark and Sweden the transition from “Early” to “Late Iron Age” is placed at the end of the Late Roman Iron Age; in Norway, however, at the end of the Migration period.

	Viking Period	Vikingetid Vikingtid Vikingatid		VIII
A. D. 775/800	Vendel Period	Yngre germansk jernalder Merovingertid Vendeltid		VII
530/550	Migration Period	Ældre germansk jernalder Folkevandringstid Folkvandringstid	D	VI
375/400	Late Roman Iron Age	Yngre romersk jernalder Yngre romertid Yngre romersk järnålder	C	V
150/160	Early Roman Iron Age	Ældre romersk jernalder Eldre romertid Äldre romersk järnålder	B	IV
0	Pre-Roman Iron Age	Førromersk jernalder Førromersk jernalder Førromersk järnålder	A	III II I

(Näsman 1998, 5f.), but the possible subdivisions vary according to the material considered (pottery, jewellery, grave types, settlement types), and there is a general drift towards fewer and larger regions through time.

One obvious region is southern Scandinavia, i. e. the area comprising present-day Denmark, Scania, Halland, Blekinge and Schleswig, corresponding to the medieval Danish kingdom. For the Roman Iron Age this can be subdivided, on the basis of the pottery amongst other things, and Jutland in the Late Roman/Early Migration Period still can be divided roughly into three cultural areas. Another region is central eastern Sweden, with strong connections to the coastal areas of northern Sweden. During most periods the Baltic Islands – Gotland, Öland and Bornholm – display distinctive characteristics separating them from each other as well as from mainland Scandinavia. In Norway the picture is more varied, due to the natural environment, but generally southwestern Norway forms one region and eastern Norway another.

These regions are based on the archaeological material. They should not, however, be interpreted in ethnic or political terms – as tribal areas, chiefdoms or petty kingdoms – without additional evidence.

5. Subsistence and settlements

5.1. Farming

The basis of the Scandinavian societies was agriculture, and in most areas it had been so for millennia. Growing grain was combined with cattle breeding, the emphasis depending on local conditions.

In southern Scandinavia this meant that access to meadows or even heaths was important for ensuring winter fodder. Villages have been found from the Pre-Roman Iron Age onwards, but single farmsteads existed too throughout the Iron Age. Each farm consisted of a long-house with a dwelling in one end and a byre with stalls for varying numbers of cattle in the other; in addition there may have been one or more small buildings. The

buildings had two rows of posts supporting the roof and walls of wattle-and-daub between smaller posts, all set into the ground. In some parts of Jutland, buildings could have massive turf walls too. During the Late Roman Period, long-houses became elongated and were subdivided into several rooms, and sunken huts appeared. Some fences have been preserved, allowing us to determine the number of farmsteads and the structure of the village, in some cases with one farm markedly larger than the rest. A classic site is Vorbasse in central Jutland, where the evolution of the village can be followed from the first century B.C. into the Viking Age (Hvass 1983, 1988). Both here and at other settlements, the village was repeatedly moved after some generations and rebuilt a few hundred metres away. Each village seems to have been surrounded by an infield, manured with dung from the byres.

In Norway, settlements appear to have consisted mostly of single farmsteads, but a village-like conglomeration of farms relocating within a restricted area and including one larger farm has been excavated at Forsandmoen in Rogaland (Løken 1987). Here and at some other places, buildings with wattle-and-daub walls have been found (cf. Lillehammer 1994, 170f.; Skre 1998, 140–156), but the “classic” Norwegian house in the Late Roman and Migration Period otherwise had plank walls protected by outer stone walls. Each farm consisted of 1–3 long-houses and optional huts and was surrounded by a fenced, manured infield. In some cases 2–4 farms shared a common infield. The period after ca. 300 A.D. witnessed a vigorous expansion in which many new farms were founded, partly in marginal areas. Mountain pastures were also utilized in the summer (*seterdrift*), and in contrast to southern Scandinavia, hunting and fishing appears to have been of some importance. During the 6th century many farms were deserted, perhaps due to a decrease in population, but from the middle of the 7th century settlement expanded again.

Only during the last decade have traces of buildings been discovered in mainland Sweden. Long-houses, possibly with wattle-and-daub walls, and smaller huts have now been found in many parts of the country, but no villages have yet been discovered outside of Scania (e.g. Andersson (ed.) 1998; Lamm/Åqvist 1997; Ramqvist 1983). On Öland and Gotland, the picture has been dominated by the many remains of long-houses with stone foundations (*stengrunder, kämpagravar*) along

with adjacent stone field enclosures (*stensträngar, vastar*. Stenberger 1964, 454–466; Burenhult 1984, 97–112; Cassel 1998). The stone settings permit us to reconstruct farms with up to 5 houses and fenced fields. Most farms are single farms, but they may be grouped loosely together. The stone foundations all belong to the Late Roman and Migration periods, and their abandonment has led to the creation of theories about devastating attacks on the islands which now are being doubted.

Generally the agrarian settlement evidence seems to indicate a stable economic system with the potential for expansion during the Late Roman Iron Age. In spite of obvious continuity in many areas, a 6th-century “crisis” may to some degree have been real, e.g. for marginal settlements in Norway, although the evidence may also indicate a reorganization of farmlands and farming methods. Social inequalities are indicated by the varying sizes of farms, even within a single village.

5.2. Iron production and other crafts

Iron production from bog ore was carried out in Denmark from the 2nd century B.C. onwards, and large-scale production took place in western and southern Jutland ca. 100–700 A.D. (Voss in Hvass/Storgaard 1993, 206–9). In Norway and Sweden too, iron was produced from bog ore for most of the first millennium A.D. – in Småland even during the 5th century B.C. – often in mountain valleys and in quantities far beyond the local demand (Magnusson 1991; Lillehammer 1994, 143ff., 178; Stenvik 1997). Iron was traded in the form of standardized bars, and both production and distribution must have been organized by local magnates.

Within the local communities, iron smithing would have been a specialized trade (e.g. found only at 1–2 farms in the Vorbasse village). Pottery, cloth and bone combs would also have been the work of specialists, at least for the better quality grades, as would ships and objects from bronze and precious metals. We have no means of telling whether such specialists will have been full- or part-time. Migration Period clay moulds for ornamented jewellery have been found in settlements which otherwise show no “special” features (Ramqvist 1983, 177ff.), perhaps as an indication of itinerant craftsmen.

5.3. “Central places” and other specialized settlements

Some settlements, however, stand out from the ordinary farms or villages, be it through the quality of the finds made there or the size or character of the buildings, as well as through the general layout of the site.

In southern Scandinavia, the use of metal detectors has added important facets to our knowledge of the settlements (Axboe 1992; Hvass/Storgaard 1993, 195–201, 223–227). Sites like Gudme in Funen, Steninget in northern Jutland, Neble in Zealand, Sorte Muld on Bornholm and lately Uppåkra in Scania (Hårdh 1998, Larsson 1998) have yielded thousands of finds, often of extraordinary quality. Many other settlements have been examined, too, without equalling these rich sites either in quantity or in quality. The “central places” are also larger than most other settlements, and several of them have a special, complex layout with many contemporary clusters of farmsteads (Axboe 1995, Fig. 9.5). The finds mostly begin in the Late Roman Period and continue through the Vendel Period or even longer, the stability of the occupation in Uppåkra, Sorte Muld and several smaller Bornholm sites being emphasized by substantial culture layers. The most splendid finds come from Gudme, including foreign jewellery and hoards with gold scabbard mounts, sword buttons, bracteates, and Roman gold and silver coins, mostly deposited during the Migration Period (Nielsen/Randsborg/Thrane 1994). A unique hall complex from the Late Roman Period has also been found (Østergaard Sørensen 1994), and attached to the main settlement, which is located ca. 2 km inland, is the coastal site of Lundeberg. Of the Vendel Period sites, Sorte Muld stands out on the basis of its 2300 small gold-foil figures (*guldgubber*; Watt 1999). Such figures have been found at some other sites, too, but only in much smaller numbers.

However, “rich settlements” do not represent a uniform group. Other sites have yielded unusual finds without having the size or the structure characteristic of the large “central places”. One example is Dankirke in southern Jutland (Jarl Hansen 1989). Here Roman coins, gold bullion, unusual brooches, and a large quantity of imported Frankish glass vessels in particular bear witness to far-reaching contacts and above-average wealth during the Late Roman and Migration Periods. This affluence, however, was concentrated on one

farmstead only, surrounded by common agrarian settlements (Jensen 1991, 76ff.). Dankirke is thus interpreted as having been the seat of a local chieftain who played a role in the distribution of imported goods. At Dejbjerg in western Jutland, fragments of 10–12 glass vessels were found together with other imports and weapon fragments in a Migration Period long-house. Here the glass showed traces of wear, but again the finds point to a chieftain’s site (Egeberg Hansen 1996).

In Sweden, one must mention Slöinge in Halland, where finds from ca. 400–1000 A. D. and a succession of halls from the Vendel Period have been excavated. The finds include glass vessels, jewellery and gold foil figures (Lundqvist 1996). A special place among the Swedish sites, however, is held by Helgö in Mälaren, which yielded exceptional imports and rich remains from the casting of Migration Period jewellery (Excavations at Helgö 1961 ff.; Stenberger 1964, 632–42). The nature of this site has been debated, but it seems obvious that – without being of the same type as the large “central places” – it had unusual wealth, far-reaching contacts, and a level of production of jewellery far beyond local demands.

In Norway, special settlements of quite a different kind can be found. These are the so-called court sites (*ringformede tunanlegg*; Lillehammer 1994, 154): ring-shaped or oval settlements with up to about 20 rather small buildings radiating from and opening onto a central court. Some 20 sites have been discovered along the west coast from Jæren in the southwest to Troms *fylke* in the north, those in the southwest having been used from the Early Roman Iron Age up to the beginning of the Migration Period, and those in northern Norway into the Vendel Period. These are hardly common agrarian settlements, as byres seem to be missing, and they are often placed near farms later known as chieftains’ seats. They seem to have had a function beyond their immediate vicinity, possibly as assembly and cult places as well as more or less temporary encampments for a chieftain’s levy.

6. Defence

None of the settlements mentioned so far show any defensive features. But fortified sites do occur all over Scandinavia, albeit of differing shapes and possibly various functions, ranging from mountain hill-forts to lowland

earthen ring-forts, and from small-scale sites less than 50 m across to Torsburgen on Gotland covering 1 sq. km and Hejrede Vold on Lolland (ca. 5 sq. km, Løkkegaard Poulsen 1999). Datings are rather few and cover all periods, but quite a large number can be shown to have been in use during the Late Roman and Migration Periods (Engström 1991). On Öland, Eketorp and other forts seem to have served as fortified villages with a permanent farming settlement (Näsman in Nørgård Jørgensen/Clausen 1997, 146–155); in central Sweden some hill-forts with more limited occupation are interpreted as magnates' seats (Olausson in Nørgård Jørgensen/Clausen 1997, 157–168). Some forts where no traces of occupation could be found are supposed to have been temporary refuges in time of danger, be it for the retinue of the local chieftain or for the population of a larger area (Skre 1998, 266–288; Näsman in Nørgård Jørgensen/Clausen 1997, 146–155). Finally, some “forts” with little apparent defensive value have been interpreted as having had more symbolic or ritual functions (Cassel 1998, 129–154).

In Denmark, linear earthworks and naval blockages have been dated to the Late Roman and Early Migration Periods (Axboe 1995, 222ff.; 1999, 114; Nørgård Jørgensen in Nørgård Jørgensen/Clausen 1997, 200–209). The functionality of the naval blockages is obvious, while it is disputed whether the several kilometres-long ramparts represent efficient defence measures, symbolic border markers, or, like the Roman *limes*, a combination of both.

A notable find group in southern Scandinavia are the bog deposits of weaponry with hundreds of swords, spears, arrows, shields and other equipment (Brøndsted 1963, 209–233, 287–290). These are interpreted as having been the equipment of defeated attackers, sacrificed by the victorious local population. Several bogs contain repeated sacrifices; at least 49 offerings are known, mostly dating to the Late Roman and Migration Periods and possibly representing as many battles. Detailed analyses of the equipment indicate that the attackers mostly came from outside the area: from northern Germany, western and eastern Scandinavia (Ilkjær 1990, 332–339; 1993, 374–386; Axboe 1999, 113ff.). Accordingly the runic inscriptions in these finds (Lund Hansen et al. 1995, 326–344) should also be regarded as foreign to the area where they were found.

One of the largest sacrifices is Illerup site A, dated to the decades after 200 A.D. Though only ca. 40 per cent of the bog has been excavated, the weaponry found could equip at least 350 men. Taking into account the unexcavated area and the presumption that some attackers were able to escape with their weapons, the battle may have involved a thousand men or even more on each side (cf. Engström 1991, 275; Lund Hansen et al. 1995, 416 note 5; Albrethsen in Nørgård Jørgensen/Clausen 1997, 216). Even the minimum force of ca. 350 men and the combined use of infantry with lances, archers and mounted warriors attested by the finds must imply intensive training as well as an effective command structure. A hierarchical structure is in fact indicated by the shield parts found at Illerup site A: 5 silver bosses probably belonged to commanders, 30–40 bronze bosses to middle ranks, and about 300 iron bosses to common warriors (Ilkjær 1997, 58). In southwestern Norway, one of the areas presumed to be the origin of the attackers, groups of boathouses (*naust*) large enough to accommodate ships like those found in the Nydam bog testify to the military organization of that area (Myhre in Nørgård Jørgensen/Clausen 1997, 169–183).

7. Social and political structures

In southern Scandinavia during the Roman Iron Age, wealth and status were demonstrated through sumptuous burials, while during the Migration Period the elite showed their status through sacrifices of precious jewellery (Hedeager 1992, 27ff., 70ff., 159ff.; Axboe 2001). Thus the scarcity of furnished graves after the fourth century does not indicate the impoverishment of society, only a change in social and perhaps religious rites. All over Scandinavia, imported Roman glass and metal vessels were favoured as status symbols during the Roman Iron Age, and this is mirrored in the burials. The supply did not come through commercial trade, but is thought to have involved the exchange of status gifts among the elite to create and consolidate mutual alliances and dependencies (Lund Hansen 1987). In the first half of the 3rd century A.D. the supply from the Empire seems to have been controlled by the elite of East Zealand, especially in the Himlingøje area, which was able to retain a disproportionate number of the best items and appears to have been the centre of a system of alliances with other mag-

nates (Lund Hansen et al. 1995, 371–393). But alliance systems based on the exchange of gifts were unstable, and, just like Himlingøje had superseded earlier centres, the highest supra-regional status moved to Funen, with Gudme dominating during the Migration Period.

Other indicators of status can be included in the general picture: the building of large barrows, for instance at Högom in Medelpad, Gamla Uppsala, Lejre, Raknehaugen in Romerike (Skre 1998, 314–327) and several places in western Norway; richly equipped chamber graves; gold as a status marker in itself as well as in the shape of special types of arm- and finger-rings interpreted as symbols of rank. Special status is demonstrated not only by the “central places” and other rich settlements but also by halls at Gudme, Slöinge and even at more humble sites like Vorbasse (Herschend 1998, 14–51, 167–185), and by the ability to organize the resources of large areas, both in military contexts as in the bog finds, ramparts and naval blockages, and the presumed emergence of a retinue (Hedeager 1992, 234), as well as in civilian matters like religious rituals or the exchange of goods. Myhre (1987) has demonstrated for southwestern Norway how the complex interplay between finds of gold, graves with imports, hill-forts and the distribution of internal and imported goods can point to chiefdoms in the Migration Period.

Thus a social elite figures very prominently in the find material through large farms including halls, golden jewellery, imported objects, magnificent weapons and rich graves. Also highly visible are the “common” farmers, possibly to some degree dependent on the magnates. The existence of a class of thralls can be assumed, but the evidence is very scarce before the Viking Age: a few human sacrifices in graves; the farms becoming too large to be run by a family without additional hands; and the literary evidence of Tacitus (Skre 1998, 28–51).

The question of the emergence of kingdoms in Scandinavia is a controversial one. It must be borne in mind that the development need not have been unilinear. In the open areas of southern Scandinavia, conditions were different from those in the mountain valleys of Norway and central Sweden, and it seems likely that political hegemonies could have been established earlier and covered larger areas in southern than in central Scandinavia. But even here the find material points to unstable polities during most of the Iron Age. Struc-

tures indicating control over major parts of what was to become Denmark, like Danevirke, the Kanhave canal or the foundation of Ribe, do not appear until the late 7th or early 8th century (Axboe 1999).

8. Glimpses of the spiritual life

From the first century A. D., Roman influence can be seen in the material culture of Scandinavia, possibly to some degree at least imparted by Scandinavians serving in the Roman army (Axboe 1995, 225f.). But it is also obvious that these influences were absorbed and transformed into indigenous forms of expression. Thus runes were developed instead of adapting Roman letters, and through them and the pictorial art which emerged during the Migration Period, we can catch some glimpses of an oral culture otherwise lost or transmitted only through much later sources. Naturally enough, the evidence comes from the elite which had the contacts, the economic surplus and the impetus to develop an independent ideology and iconography. Both of the latter aspects are embodied in the gold bracteates from the second half of the 5th and the first half of the 6th centuries, transforming the imperial portraits of the Roman coins into Germanic deities like Odin (Axboe/Kromann 1992; Axboe 1998; Hauck 1998; Axboe 2001). The Germanic animal art, which developed from ca. 400 A. D. onwards, was derived from Roman military belt mounts (Haseloff 1984). Its vigorous development and conscious stylization seem to indicate a symbolic content which can still only be guessed at. And though the early runic inscriptions, when comprehensible, mostly convey personal names and magic formulae, one poetic expression (*kenn- ing*) has survived on a gold bracteate, metaphorically referring to gold as “Italian grain” (IK No. 184). Thus the elite in the halls may have known scaldic poetry 300 years before the beginning of the Viking Age.

73. Runes: Origin, development of the futhark, functions, applications, and methodological considerations

1. Older runic script
2. Origin of the runes
3. Development of the futhark
4. Functions of the older runes
5. Applications of the older runes
6. Methodological considerations
7. Literature (a selection)

1. Older runic script

1.1. Alphabetic writing

The origins of alphabetic writing lie in the Near East, where ca. 2000 B.C. syllabic signs had developed from earlier forms of pictographic writing (Healey 1990, 201 ff.). Syllabic signs represent combinations of sounds, and hundreds of them are required to render a language adequately. Writing was simplified when the alphabetic principle was conceived, according to which each distinct sound of a particular language is to be represented by a single distinctive sign. The number of separate sounds is relatively limited in most languages, and the number of alphabetic writing signs needed is thus rather small. The first alphabet was devised ca. 1700 B.C. for writing a Semitic language and included only signs for consonants. An alphabet in the modern sense came into existence ca. 1000 B.C. when the Greeks began to use certain letter-forms that they had borrowed from the Phoenicians, but which were not needed for consonants in Greek, to represent the vowels. The Latin alphabet was derived indirectly from that of the Greeks, with the Etruscans as mediators, ca. 750 B.C. The notion of the alphabet and a complete set of alphabetic writing signs spread with time also to the Germanic tribes in central and northern Europe.

1.2. Older runes

1.2.1. Germanic writing system

Runes are the individual letters of the alphabetic system devised and employed by the Germanic peoples. The term “rune”, a borrowing in the 1600s into English and German from scholarly treatises in Scandinavia, applies to the letters in a number of disparate writing systems which were employed at different times and by various Germanic peoples. Their interrelation is clear, however, and the general

nature of their connections with one another was established by Ludvig Wimmer (1874, 152 ff.; 1887, 74 ff.), who demonstrated that they all went back to a single, common Germanic runic alphabet consisting of twenty-four letters. Runes in this older version are attested in inscriptions on objects which are dated archaeologically at the earliest to ca. 150–200 A.D. The runic alphabet as such must predate the earliest known inscriptions and has traditionally been assumed to have developed around the beginning of the Christian era.

1.2.2. Forms

Idealised graphic forms of the individual older runes are found in Fig. 73.1 (cf. Krause 1966, 2), where they are ordered in the distinctive runic way and grouped in three lines or “families” (cf. 1.2.4). Only one standard variant of each sign is included in the illustration. The older runes consist normally of a combination of straight lines: long “verticals”, or “staves”, and either short or long oblique “strokes”, usually called “branches”. Verticals are a characteristic feature of a majority of the runes, four of which have two. Strokes, which usually issue from the verticals, appear to avoid running horizontally, a tendency which is often assumed to indicate that runes were originally designed to be cut into wood, on which horizontal lines, running along the

Fig. 73.1: Forms of the older runes

grain, would easily disappear. Strokes never go above or below the verticals and never issue exclusively from the bottom of the verticals. Six runes, three with reduced size, lack verticals altogether, their forms consisting only of “angles”. The formal description of the graphemic system of the older runes by Elmer Antonsen (1975, 6ff.; 1979) employs the distinctive features of staffs, branches, pockets (i.e. enclosed spaces) and crooks, combined with number, placement, laterality and continuity. The older runes occur in a number of graphic varieties (cf. Arntz 1944, 65ff.; Odenstedt 1990), depending on such factors as the chronological period, the geographical area, the substance in which they are carved, and idiosyncrasies of individuals or schools of rune-carvers. Although the forms usually appear angular due to the use of straight lines meeting at sharp angles, curved lines could also be used for both strokes and angles. Some form variants may show a geographical distribution or indicate a chronological development (cf. 3.1.), e.g. **h** with a double cross-bar (**ᚨ**), found in Continental Germanic and Anglo-Frisian inscriptions, and **e** with a straight, horizontal connecting stroke (**ᚱ**), usually (probably correctly) considered to be the earliest form. (Note that runes are traditionally transliterated in boldface.) The three runes that originally did not have full height, **k**, **j**, **ŋ**, are subject to attempts to make them conform in size (cf. 3.1.). Some systematic variants of graphic forms occur: individual signs may be reversed (turned on their vertical axis), inverted (turned upside-down) or on rare occasion mirrored (doubled with their reverse). Reversed variants are most likely a consequence of the fact that the direction of writing was not fixed for the older runes and that a reversed form in an inscription written from left to right was the standard one used when writing from right to left. Inversion may at times be connected with the reinterpretation of special forms that arose when runes were combined in ligatures or bind-runes (cf. 1.2.6). Neither inversion nor reversal leads to an ambiguous shape for any rune. Several graphic forms are symmetrical or otherwise insensitive to such rotations, whereas for others (**h**, **n**, **j**, **i**, **s**) the form and its reverse are both so commonplace (e.g. **ᚨ/ᚨ**) that neither can be considered marked. The inversion of **r** (**ᚱ**) is likewise common, and the shape mirrored with the inversion (**ᚱ**) is a Continental type. This latter form may have originated as a decorative variant, as too the

h with a double cross-bar. Anomalous shapes occur, such as **b** with only the bottom pocket.

1.2.3. Sound-values

The decipherment of the older runes had not yet been accomplished in the early 1800s, and their occurrence in Scandinavia was often considered foreign. Then in 1839 J.H. Bredsdorff succeeded in establishing most of their sound-values by comparing the older runic alphabet on the Vadstena bracteate, Sweden, with the Anglo-Saxon runic alphabet, and in 1865 Sophus Bugge determined the sound-value of the **r**-rune, interpreted the runic inscription on the gold horn from Gallehus, Denmark, and identified its language as “Oldnordisk” ‘Old Nordic’. After the distinction between **j** and **ŋ** had been established in the 1920s on the basis of their use in identifiable AN words, the only rune whose sound-value was still uncertain was the thirteenth, **ᚦ**. There are few occurrences of this sign in recognizable words, but it is traditionally interpreted as a high front vowel and designated **i**; Antonsen (1975, 1ff.), however, claims that it stands for the phoneme /æ:/, whereas Ottar Grønvik (1981, 29ff.) argues for the [ç] allophone of /h/. The original phonological value of the **Y**-rune was [z] (voiced *s*); this sound developed in AN into a palatal spirant [ʒ], which in ON coalesced with /r/, and the rune is therefore traditionally designated **r**. The standard transliteration of the runes gives a rough indication of their phonological values. The runes **b**, **d** and **g** represented consonants that, even though they could be allophonic voiced stops, most often were realized as spirants ([b̥], [ð], [g̊]); **p** stood for the voiceless spirant [θ] (E *th*). If one disregards vowel length, there is a good fit (often called a “perfect fit”) between the reconstructed phonemic system of AN and the twenty-four older runes. The alphabet includes, though, a superfluous allograph, **ŋ** (and according to Grønvik also **ᚦ** **ç**).

1.2.4. Fixed order

Each rune had a fixed place in the order of the alphabet, and although the earliest alphabet inscriptions with older runes come from the 400s, the sequence was most likely original. There is little variation among the inventories of signs: **i** and **p** are switched around on the Kylver stone, Gotland, and the last two runes are usually listed in the order **od**. The final rune is **o** in the Kylver listing, however, and

an order corresponding to **do** is also found in a number of Anglo-Saxon inscriptions. In the scholarly reconstruction **o** is as a rule placed at the end of the alphabet. The order of the runes diverges completely from the order of letters in Mediterranean alphabets and is characteristic only of the runic row, which scholars usually term the “futhark” in accordance with the sound-values of the first six runes. On the Vadstena bracteate, the older runic alphabet is divided by colons into three groups of eight runes, and in ON each group is termed a “family” (“ætt”), although the original term may have meant “group of eight” (a homograph in ON). These divisions may too have been original.

1.2.5. Names of the runes

Each rune had a name that was also a meaningful word in AN. Although the rune-names are not transmitted from the older period, most of them can be reconstructed with some certainty based on learned medieval treatises in Latin on runes and manuscript lists of the Anglo-Saxon rune-names (see Derolez 1954), related letter-names in the Gothic alphabet, the doggerel *Abecedarium Nordmannicum*, and the Anglo-Saxon and various Scandinavian “Rune-Poems”, which consist to a great extent of metaphorical circumlocutions of the rune-names. The circumlocutions resemble riddles whose solution is the particular rune-name (e.g. from the Old Norwegian “Rune-Poem”: “**f** (= *fé* ‘goods, i.e. wealth’) causes family strife”, *Ƿ veldr frænda rōgi*). The rune-names were chosen according to the acrophonic principle, i.e., the first sound of the rune-name indicates the basic sound-value of the sign. Only signs for sounds that could not occur initially in Gmc, i.e. **ŋ** and **ʀ**, depart from this principle. The AN forms of the rune-names were most likely as follows: **f** = **fehu* ‘cattle, goods’, **u** = **ūruR* ‘aurochs’, **p** = **purisaR* ‘giant’, **a** = **ansuR* ‘god’, **r** = **raiðu* ‘journey, vehicle’, **k** = **kauna* ‘boil, sickness’, **g** = **geþu* ‘gift’, **w** = **wunju* ‘joy’, **h** = **hag(a)laR* ‘hail (precipitation)’, **n** = **naudīR* ‘need, difficulty’, **i** = **īsaR* ‘ice’, **j** = **jāra* ‘(good) year, harvest’, **ī** = **īwaR* ‘yew-tree’, **p** = **perþu* ‘a fruit tree?’, **ʀ** = **al-gīR* ‘elk’, **s** = **sōwīlu* ‘sun’, **t** = **tīwaR* ‘(sky?) god; ON *Týr* (war god)’, **b** = **berkana* ‘birch twig’, **e** = **ehwaR* ‘horse’, **m** = **mannar/mannr* ‘person’, **l** = **laguR* ‘water’ (rather than *laukaR* ‘leek’), **ŋ** = **ingwaR* ‘(fertility)

god; ON **Yngr*, **d** = **dagaR* ‘day’, **o** = **ōbila* (*ōþala*) ‘inherited property’. (For the Gmc forms, see Krause 1966, 4f.; Düwel 2001, 197ff.) Despite several attempts to derive a complex Germanic cosmological system from the specific words used as names and their distinctive order, no convincing explanation for the particular choice of rune-names has been found. The words indicate items from everyday life and concepts about the world of the gods, nature and man, but they hardly present an organized world view (cf. Polomé 1991). The rune-names had a mnemonic function and helped rune-carvers to remember the sound that the individual letters represented. A runic sign could be used to represent its rune-name, and several Old Norse manuscripts use e.g. the medieval runic sign **m** as an abbreviation for its name, *maðr*. Obvious occurrences of such ideographic usage in inscriptions are, however, seldom.

1.2.6. Characteristics of the script

Writing direction was not fixed, and lines in inscriptions with older runes are written from left to right, right to left or in a back-and-forth combination thereof (Greek *boustrophedon*, i.e. ‘as the ox ploughs’). On standing runestones they may run horizontally or vertically, and then either up or down the stone, and they may be placed on a broad face or a small side. Framing lines above and below the runes were seldom used in the older inscriptions. Words were, as a rule, not separated, but were run on into one another; punctuation marks (usually raised dots or colons) are, however, employed irregularly as word separators in inscriptions with older runes. Long consonants were designated by a single graph. Double runes were, as a rule, not written, not even at word boundaries, and thus the same rune could function as the final sound in one word and the first in the following. Runes could be written together in ligatures, termed “bind-runes”, probably in order to simplify writing and save time and space. In such ligatures, the vertical of one rune functioned also as the vertical for the following rune, e.g. *ᚦ ᚱ* (but note *ᚱ ᚦ*; bind-runes are indicated in transliteration by a bow over the runes). Only infrequently does the formation of bind-runes give rise to special forms, notably the inverted form of **ʀ** (in the bind-rune of **a** and **ʀ**: *ᚱ*) and the bind-rune of **g** and **a**, where one of the diagonals of the former functions as the vertical

for the latter: $\mathfrak{X} \text{g}\mathfrak{a}$. Bind-runes may even be used over word boundaries. A special characteristic of runic orthography is the non-representation of /n/ before homorganic obstruents, such that **-lad** could stand for *-land*. This spelling may be a result of linguistic analysis on the part of the rune-carver, who could have considered the nasal simply as nasalisation of the vowel (Williams 1994). The rune **ŋ** was used either as the allophone [ŋ] of /n/ occurring in combination with /g/ or /k/, or on its own to represent the entire cluster /ng/.

2. Origin of the runes

2.1. Mythological explanations

Some carvers of older runes apparently believed that the runes were “of divine origin”, as they are termed on i.a. the Noleby stone from Västergötland, Sweden (**raginakudo** (-*kundō*)). In Old Norse mythology they are connected with Óðinn and apparently considered his invention, since according to the Eddic poem *Hávamál*, he “took up the runes” (st. 139, “nam ek upp rúnar”). The attribution of alphabets to divine personalities has parallels in other cultures (cf. Senner 1989). Ideas about the origin of the runes have sometimes had an ideological or nationalistic basis, e.g. claims in Nazi Germany that runes, which supposedly derived from Germanic “pre-runic conceptual symbols” (“vorruniche Begriffszeichen”) such as those found in rock carvings from the Bronze Age, were the original alphabet, and that Greek and Latin letters were derived from them (cf. Hunger 1984, 96ff.).

2.2. Scholarly theories

The close relationship between the runes and the southern European alphabets is obvious. A scholarly basis for examination of the origin and development of the runic script was provided by Ludvig Wimmer in 1874 (rev./trans. 1887). The question of the origin of the runes has subsequently concerned three closely related questions: (1) Which alphabet was the basis for the creation of the runic alphabet? (2) Where were the runes developed and by which Germanic tribe? (3) When did the adaptation take place?

2.2.1. Latin theory

The Latin theory was championed by Wimmer (1874, 8ff.; 1887). The basis for this ex-

planation is the close resemblance between several individual runic signs and Latin letters, combined with clear correspondences in sound-value, e.g. $\mathfrak{T} \approx \uparrow \mathfrak{t}$ and $\mathfrak{B} \approx \mathfrak{b}$. In particular the derivation of the runes **f**, **r**, **b** and **m** were possible only with the Roman alphabet as the source, not with other Mediterranean scripts. Wimmer concluded that the runes derived totally and directly from the monumental alphabet of Imperial Rome (i.e. Latin capital letters) and considered the strong cultural influence from Rome 0–200 A.D. to have been decisive for their creation ca. 200 A.D. by some member of a South Germanic tribe occupying territory near the Roman border. The specific point in time for the creation of the runic adaptation has subsequently had to be revised to a slightly earlier period since a few runic inscriptions found in Scandinavia are now dated archaeologically to somewhat before 200 A.D. Later supporters of this theory of the origin of the runes have sought the immediate source in other variants of the Latin alphabet, particularly classical cursive scripts (old Roman cursive) and provincial writing in outlying parts of the Roman empire such as the Rhine area in eastern Gaul, whereas others have argued the important role played by specific Germanic tribes, e.g. the Goths in the Vistula area. Erik Moltke (1985, 38ff.; cf. Grønvik 2001, 10ff.) saw runes as a more-or-less independent creation, with as many as seven newly invented signs lacking Mediterranean models, made in present-day Denmark or southern Sweden but under strong influence of the Latin capitals of Imperial Rome. In his opinion, differences in form, changes in sound-value and divergence in the order from the sequence of letters in Mediterranean alphabets most likely indicate that the runic alphabet was not conceived in near contact with the Romans. In the various realisations of the Latin theory, several individual runes are derived in diverse ways or from different model letters; **þ**, for example, is considered an invention by some but is derived from D by others. Recent contributions to the Latin theory have been made by Bengt Odenstedt (1990, 145ff.) and Henrik Williams (1996; cf. Derolez 1998). The latter employs a new framework for the discussion of the derivation of the runes, rigidly allowing shape alone, not sound-value, to determine origin; he derives twenty-three “proto-runes” from Latin capitals and assumes then confusion and switching of the five forms that were based on unnecessary Roman letters and could

therefore be used to represent distinctively Germanic phonemes.

2.2.2. Greek theory

The graphic form of certain runes seems to derive more easily from Greek forms than Latin ones, e.g. runic λ **o** and Gr. *omega*, Ω . Coupling this with the fact that certain Germanic sounds corresponded to Greek and not to Latin (e.g. fricative Gmc [g], χ , and Gr. *chi* X), Sophus Bugge (1905–1913, 95 ff.) conceived that a conglomerate of influences and traditions lay behind the invention of the runes, which were partially based on Latin and partially on Greek script. He proposed that the Goths came into contact with literate peoples in south-eastern Europe, learned to write with runes and then transmitted this knowledge to the other Germanic tribes. At about the same time as Bugge, inspired by him and collaborating with him, Otto von Friesen proposed the Greek alphabet as the principal source for the runes (1904; 1933, 5 ff.). He believed that Gothic mercenaries serving in the Roman legions in the Black Sea area, who would thus have come into contact with Greeks and Romans and their scripts, were responsible for the runic adaptation. The runic alphabet was supposedly created by 250 A.D. and was based on a classical Greek cursive script, supplemented by a few Roman cursive letters (**f**, **r**, **h** and possibly **u**). The Greek theory based on a cultural-historical connection with the Goths had to be abandoned when runic inscriptions found in Scandinavia were archaeologically dated to before 200 A.D., since the invention of the runes then had to predate the arrival of the Goths in the Black Sea area. It was also disconcerting that this derivation had to assume a mixing of two model alphabets. An alternate form of this theory, which claimed creation of the runes several centuries B.C. based on an archaic Greek alphabet, had been proposed prior to the Bugge/von Friesen theory and was recently revived and modified by Richard Morris (1988). He relies mainly on typological comparisons, emphasising the general archaic nature of the runic script.

2.2.3. Etruscan/North Italic theory

There is a striking resemblance between the runic forms, particularly **u**, **a**, **k**, **h**, **R**, **s**, **t**, **l** and **o**, and Etruscan letters, and in 1928 Carl

J.S. Marstrander posited a composite Etruscan alphabet as the mother of the runes. The Etruscan writing system, an offshoot of the Greek alphabet, was in use in the western Alpine region of northern Italy from ca. 800 B.C.; the culture was first Celticised and then Romanised, and by the beginning of the Christian era, the script had been completely superseded by the Latin script. Among other peoples, the Marcomanni, whose kingdom bordered on this area in the 100s A.D., were proposed as the Germanic inventors and transmitters of the runes. Various similarities with the Celtic ogham alphabet were interpreted as supporting the Celto-Latin origin of the runes in the Etruscan area. The Etruscan theory was modified and expanded by Magnus Hammarström (1929), who found the most striking parallels to a number of runic forms in various other North Italic alphabets and in addition emphasized the general archaic nature of the script. The Etruscan/North Italic theory was refuted by Fritz Askeberg (1944, 44 ff.), who doubted that a conglomeration of alphabets could provide the background for runes and showed that the various letter models in disparate North Italic alphabets did not exist simultaneously. The theory has, however, retained its allure and was recently revived by Helmut Rix (1992), Thomas L. Markey (1998; 1999) and Bernard Mees (2000).

3. Development of the futhark

3.1. Uniformity in the older futhark

Inscriptions with the older runes reveal a striking uniformity over a large geographical area and throughout a long period of time. The linguistic consistency has been explained as reflecting a runic koiné but more likely indicates that the relatively limited epigraphic material at hand is insufficient for demonstrating dialects in AN, which as a mainly reconstructed language is typically variation free (Syrett 1994, 30 ff.). Graphematically the epigraphic material is relatively uniform. The most important shape variants which may have interest for the chronological development of individual runes are (cf. 1.2.2.): **u** with two equal lines (Λ , considered to be the earliest form), **s** with three or more angles (ξ , thought to be more original than the variant with only two) and **e** with a straight, horizontal connecting stroke (Π , considered to be the earliest form). In addition, the three runes which originally did not have full height, **k**, **j**, and **ŋ**, were sub-

ject to attempts to make them conform either by increasing their size, particularly for **j**, or by adding a vertical: **k** = **λ**, **ʀ**; **ŋ** = **ʀ** (the so-called lantern **ŋ**, often rather signifying the bind-rune **īŋ**). The basis for the identification of various graphic forms as early variants is, however, tenuous (cf. Williams 1992, 196f.), and the internal relative chronology of inscriptions based on the probable typological development of shapes is unsure (cf. Antonsen 1998). It is even somewhat problematic to divide the period of older runes graphematically into two major sub-periods, one with classical forms (up to ca. 450/500 A.D.) and one with innovative or post-classical forms. The shapes on bracteates, which are dated archaeologically to ca. 450–550 A.D., must be used with caution in this connection, since the inscriptions stamped on these gold pendants are often garbled and the individual runic forms corrupt (cf. Moltke 1985, 108ff.). The innovations that lent standard height to the three smaller runes are as a rule placed in the post-classical period, but similar solutions to the perceived problem of diminutive form could well have been attempted at earlier times (e.g. Nøvling clasp's full-sized **j**, dated ca. 200 A.D.; cf. Syrett 1994, 21ff.).

3.2. Transitional forms

The transition from AN to ON ca. 450/500–700/800 A.D. represented a linguistic revolution. The radical modification of the language is characterized mainly by syncope and the changes associated with this process, in particular the phonemicisation of front and labial mutation and of breaking and a radical alteration in the distribution of stops and spirants (cf. 3.3.1.). Additional phonetic changes took place, such as the loss of initial /j/ and of initial /w/ before rounded vowels. Inscriptions belonging to this period, or at least the latter part of it, are usually termed “transitional”, based on their linguistic interpretation or on their graphic forms. In order to establish a non-ambiguous delimitation of transitional inscriptions, one may define them on the basis of runic forms alone, as Michael Barnes (1998) has done; one variant of **j**, ***** (for /j/ or for /a(:)/ (see 3.3.1.)), is clearly transitional, and the use of this shape in combination with forms found otherwise only among the older runes would indicate a transitional inscription. This definition functions well for the determination of graphematic developments, but is perhaps too restrictive for other purposes.

3.3. Younger runes

The phonetic changes of the transitional or syncope period had a tremendous effect on the language, but due to the conservative nature of alphabets in general, there was a considerable delay between the linguistic changes and pursuant graphic ones. The Eggja inscription from western Norway, usually dated archaeologically and art-historically to 650–700 A.D., demonstrates that the new language stage could be written with older runes, but they were obviously less well suited for recording ON than AN. Similar linguistic changes occurred in the Anglo-Saxon and Frisian areas, and the reaction there to deterioration in the fit between the phonemic and the graphematic systems was an expansion of the alphabet such that a total of twenty-eight to some thirty runes came into use (cf. Parsons 1996; 1999). The reaction in Scandinavia to a similar disparity was different, and enigmatic; instead of the runic inventory being expanded by the creation of new or variant characters for novel sounds, it was reduced by one-third, to the sixteen signs of the “younger” futhark: **fubark:hniastbmlr**. The transliteration indicates the primary sound-value associated with each sign; **ǰ** stood for the nasal [ǰ(:)]. The families now include six, five and five runes, and although the order of the remaining runes is otherwise as in the older futhark, **R** has been moved to the end.

3.3.1. Phonetic and phonemic changes

When *i*- and *u*-umlaut vowels became phonemicised without the concurrent creation of new runes, the basic one-to-one correspondence between phonemes in reconstructed AN and graphemes in the older futhark was disturbed. Ambiguities resulted such that, e.g., /o(:)/ and its *i*-umlaut product /ø(:)/ were represented by the same sign. The realignment of allophonic relationships between stops and spirants also had a disruptive effect. For example, whereas /θ/ and /ð/ (written **þ** and **ð**) were two separate phonemes in AN, the latter with a [d] allophone, in early ON /θ/ and /d/ were the corresponding phonemes, with /θ/ now having two allophones: [θ] (initial) and [ð] (medial and final). As a consequence of linguistic changes, the initial sounds of the names of some runes were altered and the identification of their sound-value thus changed. For instance, with the loss of initial /j/ the **jāra*-rune became the **āra*-rune (ON

ár) and various forms of **j** could thereafter be used to represent /a(:)/; the rune is then transliterated A. Similarly the **ansur*-rune developed regularly into the **áss*-rune with assimilatory loss of /n/, compensatory vowel lengthening and nasalisation, and was thereafter used to express [ã(:)]. Although these linguistic changes provide the background for the development of the younger runes, the entire graphematic innovation was not an inescapable consequence of developments in the spoken language. The creation of the system of the younger runes appears at some points to have been the result of a conscious alphabet reform. This reform, made by an unknown innovator or innovators, had two obvious goals: a reduction in the number of signs and a simplification of the individual forms. There is, however, disagreement concerning the specific background and the main impetus for the invention of the younger runes (cf. Barnes 1987). There have been claims that it had to do directly with magic, with cultural isolation and decline, with the complicated forms of the runes, with the radical phonological changes of the syncope period and with the names of the runes.

3.3.2. Sixteen-character futhark

There were quite probably fewer than twenty-four older runes still in use when the conscious alphabet reform that reduced the futhark to sixteen characters took place. For example, the problematic **ǰ** **ī** and the allophonic **ŋ** were used only peripherally in inscriptions, and since /p/ was a rare phoneme in Gmc in general, its representation **p** may rather early have been replaced by **b**. Thus the number of runes could already have been reduced by attrition to twenty-one. In addition to the changes in two rune-names mentioned in 3.3.1, which led to new identifications of the sound-value of the **jāra*- and **ansur*-runes, the initial phonemes of at least two or three other rune-names must in due course have been affected by the phonetic innovations of the period: **w** **wunju* > **ynn-*, **e** **ehwar* > **jór* (> *jór*) and **o** **ōpila* > **ōðil* (if this was indeed the form of the name). These changes would have made it possible to mark one or two of the new mutation vowels, but would at the same time have caused confusion and probably made it difficult to employ the particular runes as representations of their original sound-values. The runes **w**, **e** and **o** were at any rate not among

the signs kept in the sixteen-character futhark, and the changes in their names might explain their disappearance (Liestøl 1981, 252f.; Barnes 1987, 37f.). The rune-names may thus be the key to understanding the reduction in the inventory of signs for vowels (and semi-vowels) to four: **u**, **a**, **i**, and **a**. The rune-name explanation does not, however, pertain to the last two runes that were done away with, **g** **gebu* > *gjof* and **d** **dagar* > **dagr* (> *dagr*). No adequate explanation has been proposed for their being lost from the runic alphabet in the general course of its development, and therefore it can probably be assumed that they were eliminated deliberately. This reform meant that the voiced/voiceless opposition among both stops and spirants was unmarked, since one sign was used for each of the following phonemic pairs: **k** for /k/ and /g/ ([g]/[ɣ]), **t** for /t/ and /d/ (or [d]) and **b** for /p/ and /b/ (cf. **p** for [θ] and [ð]). This system for denotation of stops and spirants characterises inscriptions in the younger futhark. Based on the archaeological dating of the earliest inscriptions with younger runes, their creation has usually been dated to 700–800 A. D., but must now be placed ca. 700 A. D. as a result of the archaeological dating of the Ribe cranium to the 720s and a reinterpretation of its inscription as clearly younger runic (Stoklund 1996). With the meagre evidence at hand, it seems impossible to locate where the younger runic alphabet originated. There were two closely related early form variants: the short-twig runes and the long-branch runes. These variants should be considered as idealised abstractions based on clear tendencies.

3.3.3. Short-twig runes

Simplicity in form is most evident in the short-twig runes (also called i. a. the short-branch runes, the Norwegian-Swedish runes and even Rök runes, based on their predominance in the longest runic inscription known). The name “short-twig” is descriptive of their shapes, since they generally have typologically shorter strokes (branches or twigs) on their verticals (staves) than the long-branch runes. There is considerable variation among the earliest shapes, but an assortment of forms on the Rök stone from Östergötland, Sweden, dated to the 800s, as in Fig. 73.2 (cf. Loman 1965, 15), can illustrate the short-twig runes. Although several forms are identical or similar to the older runes, particularly among the first

Fig. 73.2: Short-twig runes on the Rök stone (standardized, a selection)

Fig. 73.3: The Gørlev long-branch futhark (standardized and with s reversed to h)

six runes, **fupark** (with the twigs on **a** somewhat lower and with **k** like a typologically late older runic variant), the rest of the shapes, other than the uncomplicated **i** and **l**, have been simplified, often drastically. Forms with two verticals, older **h** and **m**, have been replaced, and a single stave, or in two cases a half-stave, characterises each rune. The graphematic system is based on the economic use of a small number of predominantly binary oppositions, namely height, direction, number and length of twigs (Loman 1965, esp. 15ff.). For example, the runes **† a** and **† n** contrast in direction of the twig, and each of them contrasts with **† b** and **† a** in the number of twigs and with **† t** (especially against the variant **† a**) and **† l** in height of placement of the twig; **† l** and **† u** contrast in length of the twig/branch. Placement of the twig on the right or left of the stave (as in **†** or **†** for **a**), or even centrally on the stave (**†**), was clearly redundant, although with time the placement was standardized such that e.g. **† a** became the usual short-twig form. The system of short-twig runes was clearly the result of an act of conscious reform which achieved a simplification of shapes and an economy of contrasts. The creation of the younger runes was probably connected with an increased need for written communication. Particularly the short-twig variants must have been quicker and easier to carve than their predecessors, and easier to learn as well, with, in addition to the smaller number of symbols, many contrastive pairs.

3.3.4. Long-branch runes

The long-branch runes (which have also been called i.a. the Danish runes and the normal runes) have in general not been simplified as much in form as the short-twig variants. The name “long-branch” relates to their form, since many branches are typologically longer than those on the corresponding short-twig

runes (compare **† a** and **† a**). One set of alternate names indicates the general geographical distribution of early occurrences, Denmark for the long-branch runes and Norway and Sweden for the short-twig runes, but this distribution may be misleading for their genesis and actual use. It appears rather that the two younger runic alphabets were functional variants: long-branch runes had fuller, more decorative forms and were preferred for use on stone monuments, while the simpler shapes of short-twig runes were meant to be employed as a cursive script mainly for the practical business of everyday communication (Wessén 1957, 10f.). One variant of the long-branch forms is provided by perhaps the earliest known long-branch futhark, probably from the 800s, on the Gørlev stone from Denmark, see Fig. 73.3. Only the simplification there of **h** and **m** and the replacement of **† A** by the simpler **† a** reveal any conscious reform with respect to the forms of the older runes. Several of the earliest Danish inscriptions with younger runes even include the older runic forms of **h**, **m** and **† A**. Ever since Wimmer in 1874 established the relationship between the older and the younger runes, there has been general agreement that the long-branch runes were primary and that the short-twig variants were a subsequent formal simplification. Although primacy is perhaps a matter of definition, Michael Barnes (1987, esp. 42; cf. Liestøl 1981, 263f.) has observed that the earliest long-branch inscriptions appear to be written simply in a truncated older futhark and has argued that the elimination of **d** and **g** from the futhark should be considered part of the only radical runic reform for which there is any evidence, the one that created the short-twig runes. The long-branch runes would then have arisen as a contamination of the short-twig runes with what remained of the older futhark. It is i.a. easier to accept that the few novel long-branch shapes were made under the influence of short-twig forms than the other way around (see Barnes 1987, 41f.);

in addition, **ʃ** can only have become available as a symbol for /h/ after it had been replaced as a symbol for /a/ by **†**, but **†** is a member of the contrasting pair **†** : **‡** of a variant of the short-twig futhark.

3.3.5. Variation and mixtures

There was form variation in the early short-twig inscriptions (cf. 3.3.3.) and various mixtures of shapes in early long-branch inscriptions (cf. 3.3.4.). In time minor adjustments were made to a few younger runic forms: the branches on **ǰ** were lowered (as in the Rök inscription) and their length and lateral placement regularized (short-twig **‡**, long-branch **‡**), and long-branch **m** was opened at the top, giving **Y** (which contrasted with **ⱱ** **R**). Gradually the two form variants coalesced into several regional and chronological versions, and in these mixtures the short-twig shapes of **h**, **b**, **m** and **r** were with time superseded by the long-branch forms. Phonological changes in the 900s and 1000s were reflected in two new sound-value identifications. The palatal [ʒ] represented by **R** coalesced with /r/, first in Norway and later in Denmark and Sweden, and **r** was used for the product. Thus the sign **ⱱ** became available, and since its name in the younger runes was *ýr* ‘yew-tree’ (taken from the older **ī**-rune, **īwaz* > **ýR*), it was used for /y(:)/ in accordance with the acrophonic principle. In some Danish and Swedish inscriptions from this time, the symbol was used instead for /e(:)/, /æ(:)/ or /i(:)/, perhaps in accordance with other possible rune-name developments (**algīR* > **ælgR* (*elgr*) and EN non-mutated **īR* ‘yew-tree’, but cf. Nielsen 1994, who in this connection casts doubt on the original names of **ī** and **R**). The name of the **áss*-rune developed regularly to *óss* by the early 1000s, and the sign was thereafter used for /o(:)/ and is transliterated **o**.

3.3.6. Later developments

Although the carver’s task was made easier with the creation of the sixteen-character futhark, especially in the short-twig variety (cf. 3.3.3), the reader’s task became more difficult since the paucity of signs led to ambiguity of representation. For example, among the consonants, **k** could stand for /k/, /g/ ([g])/ [ɣ]) or /ng/, whereas among the vowels **u** could stand for /u/ (and [w]), /o/, /y/ or /ø/. Spelling ambiguity led to experimentation in the late

900s and 1000s consisting of the sporadic addition of diacritical signs to runes, whereby e.g. a dot on **k** could indicate that it stood for /g/. Although dotted **i** for /e(:)/ or /æ(:)/, transliterated **e**, rather quickly became a standard expansion of the runic inventory, the introduction of a fuller system of dotted runes appears to date to the 1100s.

4. Functions of the older runes

4.1. Cultic

The etymology of the word *rune* is debated (cf. Morris 1985). In addition to reference to runic letters, it occurs in older Germanic languages with the basic meaning ‘secret, private consultation’, and was used to translate ‘(religious) mystery’ in the Gothic Bible. Based partially on a possible connection with secrets and mystery, runes have often during the past century been considered to be a writing system for an initiated, elite Germanic caste, the ‘runic magician’ or ‘rune-master’ (as the title *erilar* in older runic inscriptions has been translated), who has frequently been equated with a Germanic priest. As such the runes were considered to be cultic or religious (often incorrectly termed ‘magical’), intended primarily for communication with higher powers. The word **erilar** (**irilar**), which occurs in ten older runic inscriptions as a title or epithet for the rune-carver in the first person, is apparently related to ON *jarl* ‘earl’ and also the Germanic tribal name *Heruli*, although there are linguistic problems with equating the three of them. (The Herulians have frequently been given credit for inventing and spreading the runes.) It does seem that the *erilar* inscriptions (and ones with functional equivalents like *gudija* ‘priest’), particularly the three which in addition contain *haiteka* (‘I am called’), have at least a cultic formulaic background; nonetheless, only a few of the actual manifestations in older runes appear to have a cultic function (Hultgård 1998, 716ff.). Some epithets that rune-carvers applied to themselves, e.g. **ungandir** ‘not susceptible (?) to sorcery’, have been construed as indicating that Germanic priests were shamans. Although in fact very little is known about Germanic priests, shamanism seems far-fetched.

4.2. Magic

In Old Norse literary sources, runes are often presented as being used for magical purposes

(cf. Dillmann 1996; Düwel 2001, 203 ff.). For example, in *Egils saga Skalla-Grimssonar* (ch. 72) a tale is told about runes carved by a boy and placed in a girl's bed to cause her to fall in love with him, but which due to carving mistakes caused her to fall ill. Similarly in the Eddic poem *Sigrdrífumál* (st. 6 ff.) knowledge is dispensed about runic spells and various types of runes, i. a. "victory runes" (*sigrrúnar*), which were to be carved on the hilt of one's sword if one wanted victory. Literary evidence emphasising the magical use of runes is difficult to evaluate since there is little obvious epigraphic evidence to corroborate it. There are, however, variants of a runic curse on two stones from Blekinge in southern Sweden with transitional inscriptions, and several clearly magical texts are preserved in younger runic inscriptions. Stephen E. Flowers (1986) views most of the older runic material as encompassing magical formulaic elements. Concerning particularly futhark inscriptions, alphabet magic has been claimed (cf. Bæksted 1952, 118 ff.), as well as letter magic for bracteate inscriptions (cf. Düwel 1988).

4.3. Number-magic

In the late 1800s it was noticed that there were twenty-four runes in the magic inscription on the Lindholmen amulet (side B: **aaaaaaa RRRnnn?bmuttt:alu:**) and just as many in several lines of the Rök inscription, i. e. the same number as there were runes in the older futhark. Magnus Olsen became the major proponent of numerical magic based on the number of runes in inscriptions, finding "intentional numerical relationships" concerning 8, 16, 24 and multiples of these, as well as 10 and even 18. He found in addition that numerous skaldic half-stanzas could be transcribed with seventy-two runes, i. e. three times twenty-four. Other scholars assigned numerical values to each rune (**f** = 1, **u** = 2 etc.) and sought more occult numerical relationships. Since i. a. the good-luck number three did not fit the third rune (**þ**, 'giant'), Sigurd Agrell proposed the *uþark* theory, whereby **f** was moved to the end of the futhark before values were assigned. Anders Bæksted's study of runic magic (1952, 173 ff.) put an end to much of this random numerical speculation. Numerical values are, as far as can be seen, never associated with runes in genuine tradition, and numbers are spelt out when they occur in texts (e. g. Tune stone: **prijor** 'three'). The order of signs does play a role in ciphered runes (cf.

Düwel 2001, 182 ff.), a system of coding known only from younger inscriptions in which runes are designate by their family and their order within that family, e. g. the "branch-rune" $\frac{1}{2} = \frac{2}{3}$ = second family (**hnias**), third rune = **i**. Judging from their actual epigraphic use, however, ciphered runes were not usually cryptic, but appear often to be used rather to demonstrate real mastery of the script.

4.4. Symbolic

The Roman historian Tacitus relates in his *Germania* (98 A.D.; ch. 10) that priests or family-heads in Germanic tribes put "signs" (*notae*) on sticks which were used as sooth-saying devices, and, although it is uncertain, these signs are often considered to have been runes. Thus, for example, the **fehu*-rune, in accordance with its rune-name, could stand for wealth itself and foretell prosperity. This is the basis for most of the occult use of runes, e. g. as a New Age phenomenon. Little is known, however, of any genuine symbolic use of runes. The ideographic function is represented by runic abbreviations in medieval manuscripts (cf. 1.2.5.), but few epigraphic occurrences with older runes can be identified. The Gummarp inscription from Blekinge, interpreted "Hapuwulf(a)r set three staves, **fff** [wealth?]", is probably an example.

4.5. Everyday communication

The north-Italian Venantius Fortunatus, later bishop of Poitiers, writing in the late 500s to a friend in Latin and encouraging him to write back, mentions barbaric runes that were painted on ash-wood tablets or sticks, a reference which apparently indicates the use of runes as an everyday script. Pragmatic scholars such as Erik Moltke have claimed the primacy of runes as everyday communicative writing signs, invented by practical men for practical needs, not by priests or sorcerers to be used mainly for their purposes. This understanding would still allow their occasional use for cultic or magic utterances (cf. Nedoma 1998). The corpus of older runic inscriptions (see 5.2., 5.3.) does not, however, include any longer, everyday texts packed with meaning. Apparently Germanic society, although not without a writing system, was functionally illiterate; thus the Germanic tribes could imitate the act of writing known to them from the highly literate culture whence they had borrowed their letters, but their culture as such

remained oral, not literate, for hundreds of years after the invention of the runes (Williams 1997, 186f.). The older runes were apparently the writing signs of an only semi-literate elite, used sporadically and for limited purposes. The younger runes, in contrast, seem to bear witness to an increased need for written communication (see 3.3.3., cf. 3.3.4.) and a more literate society.

5. Applications of the older runes

5.1. Corpus of inscriptions

Well over 300 inscriptions written with the older runes and dated to the period ca. 150/200–800 A.D. are known. Found on weapons, jewellery, memorial stones and a few artefacts of everyday life, the messages are generally short, sometimes comprising just a few runes. Only two contain over 100 signs, and fewer than twenty encompass two or more sentences. Many runic objects are preserved fragmentarily, and several inscriptions contain breaks. Since the inscribed surfaces are often weathered or have otherwise deteriorated, readings are frequently disputed, and even when readings are certain, interpretations can be controversial. A corpus with 169 numbered entries but with discussion of 221 inscriptions, i. e. most of those known at the time, was published by Wolfgang Krause in 1966. His presentation of interpretations is eclectic, and he often attempts to reconcile contrasting views. Only a portion of the occurrences of runes on bracteates were included in his corpus, namely thirty-six texts with probable linguistic meaning. The runes stamped on these mass-produced gold pendants with apparent amuletic function seem often to be more decorative and symbolic than linguistically communicative. Over 100 bracteate stamps with runes, some of which are closely related, are represented in the material, and multiple exemplars are known from several of them. In the years since Krause's corpus appeared, more than sixty new inscriptions with older runes have been found, particularly in Denmark, but also in Germany (cf. yearly reports of new finds since 1985 in the periodical *Nytt om runer*). The Illerup finds from the Jutland peninsula are among the most important (see Stoklund 1995). In addition, new interpretations have appeared of numerous inscriptions in Krause's corpus, particularly in works by Elmer Antonsen, Ottar Grønvik and (for bracteates) Elmar Seebold. The new interpreta-

tions must, however, be considered critically, since they frequently are more speculative and inspire less confidence than those preferred by Krause. In spite of the numerous new finds and attempted reinterpretations, the general character of the corpus and the fundamental categories of inscription types and inscription bearers remain unchanged. Thus Krause's corpus is still illustrative of the epigraphic material.

5.2. Grouping by inscription bearer

Krause's corpus was grouped mainly according to the object bearing the runes, although on occasion the inscription itself was given precedence (cf., with slight modifications, Düwel 2001, 23 ff.). (1) The entire futhark or larger parts thereof are found in eight inscriptions (on a stone slab, a marble column and three clasps or fibulae, and as three bracteate texts). (2) Twelve elaborate clasps from female graves, the oldest five from Denmark and southern Sweden and archaeologically dated to ca. 200 A.D., have inscriptions placed often on the back side or on the needle holder, probably owner's or giver's names or epithets (Himlingøje I: **hariso**) or a manufacturer's or carver's signature (Nøvling: **bidawarijar-talgidai**, 'Bidawarijar inscribed'). (3) Twelve weapons or other warrior's accoutrements that had been sacrificed ritually (in several instances ca. 200–300 A.D.) were found in bogs in Denmark, namely Nydam (arrow-shafts), Thorsberg/Torsbjerg (chape, shield-boss), Vimose (chape, sheath-plate, buckle, wood-plane, comb) and Kragehul (spear-shaft, knife-shaft); in addition a bone amulet was found at Lindholmen and a wooden box at Garbølle. The runic texts include good-luck words (Nydam: **lua** as a distorted **alu** 'ale (?)' (or 'I protect'; see Elmevik 1999)), probable owner's names (Vimose comb: **harja**) and manufacturer's signatures (Garbølle: **hagiradar:tawide:**, 'Hagiradar made'), and two longer, seemingly magic or cultic-ritual statements (Lindholmen, side A: **ekerilar-sawilagarhateka:**, 'I, *erilar*, am called the cunning (?)'). (4) Five spear-blades from the period 150–300 A.D. bear possible weapon names (Øvre Stabu: **raunijar**, 'tester'), although they may be manufacturer's epithets or guarantees. (5) A miscellaneous group of seventeen small objects encompasses a wooden staff; three scrapers and a comb of bone; bronze and gold rings, a gold diadem and a gold cultic horn, bronze statuettes, a

gold medaillon and a bronze fitting; a stone sinker, a whetstone, a stone amulet and a small slab. The readable and interpretable inscriptions include a possible ownership statement, a manufacturer's signature (Gallehus shorter gold horn: **ekhlewagastir:holtijar:horna:tawido:**, 'I, Hlewagastir, forest-dweller (?; from Holt/of the Holt family), made the horn'), a few names, some good-luck words (Fløksand scraper: **linalaukarf**, 'Linen/flax, leek, f'), a chant (Strøm whetstone: **watehalihinoharna/hahaskapihapuligi**, 'May the horn wet this stone, / may the second mowing (?) be harmed, may that which has been mown down (?) lie!') and a short statement. (6) Four cliff carvings, two in close proximity to older rock-carvings, contain names or epithets (Kårstad, top line: **ekaljamark[i]r**, 'I Aljamarkir (foreigner?)') and cultic statements or expressions of social relationships (Valsfjord, the readable right line: **ekhagustaldarþewargodagas**, 'I, Hagustaldar, am Godagar's servant/follower'). (7) Forty-two erected runestones or hewn slabs bear inscriptions encompassing (a) six with good-luck words (Elgesem: **alu**) or perhaps magical utterances, sometimes in connection with memorial statements, (b) eight with statements by or about the rune-carving or the rune-carver, or giving the rune-carver's name (Einang: **...daga[s]tjirrunofaihido**, '[I, Go]dagastir drew/painted the rune (message)'), (c) twenty-four seemingly memorial inscriptions ranging from several probable individual names of people commemorated (Belland: **kepan**) and simple utterances (Bø: **hnabudashlaiwa**, 'Hnabudar's grave') to a number of longer statements sometimes indicating familial and social relationships or retelling events in addition to making commemorative utterances (Tune, side A: **ekwiwarafter.woduridewitadahalaiban:worahto:?....**, 'I, Wiwar, in memory of Woduridar, provider of bread, made the (runes/monument)'; side B mentions Woduridar again, the stone and three daughters who seemingly participated in the wake and were among the heirs), and (d) four in a transitional group from Blekinge in southern Sweden, with inscriptions making memorial statements, recounting events and providing two versions of the same runic curse. (8) Four pictorial stones with runic inscriptions, partially of memorial nature, but also retelling events (Möjbro, with a warrior on a horse and two dogs: **frawaradar/anahahaislaginar**, 'Frawaradar on the (race)horse killed' or

'Frawaradar; Ana One-Eyed is killed') and perhaps uttering a curse. (9) Thirty-six individual bracteates or groups of bracteates, usually with good-luck words and formulas (**alu, auja** 'luck', **ehw-** 'horse', **laukar, lapu** 'invitation'), with statements about writing runes or the rune-carver (Femø: **ekfakarf**, 'I, Fakar, w(rote)') or with other narrative or cultic contents (Sjælland II: **hariuhahaitika:farauisa:gibuauja:?**, 'Hari-Uha I am called, travel-/danger-wise; I give good-luck'). The twenty-nine South Germanic finds in Krause's corpus, mainly Alemannic and Bavarian, are not sources for AN.

5.3. Grouping by formal contents

The types of inscriptions within various categories of runic objects were indicated and some examples given in the review of Krause's corpus in 5.2. An overview of the inscriptions based on the formal textual contents can also be illustrative. Bengt Odenstedt (1990, 171 f.) has made a coarse grouping in this way based on Krause's corpus: (1) futhark inscriptions (eight, as in 5.2), (2) a single personal name (twenty-six) or a nomen agentis (five), (3) two personal names (three), (4) *ek* 'I' plus a personal name or a noun; *ek* plus an adjective, *ek* plus the title *erilar* plus perhaps a personal name (eight), (5) simple manufacturer's formulas ("X [or: I] manufactured (this object)/inscribed the runes", "I raised the stone"; ten), (6) simple memorial inscriptions on stones ("X's stone(s)"; eight), (7) inscriptions containing good wishes (seven), (8) other short inscriptions (eight), (9) longer, more complicated inscriptions, all more or less disputed (six), (10) magical inscriptions containing good-luck words (twenty-one) or other magical texts (seventeen), (11) obscure, disputed or uninterpretable inscriptions (forty). Thus about one quarter consist of only a single word, one quarter (most of the longer inscriptions) are obscure or uninterpretable, one quarter are in some way perhaps magical (mainly good-luck words on bracteates) and one quarter are mostly memorial inscriptions, manufacturer's formulas and a wide range of *ek* formulas.

6. Methodological considerations

Runology is the linguistic or text-philological study of runes and runic inscriptions. The primary task of the field runologist is to examine inscriptions by autopsy and arrive at the most

certain readings possible (cf. Düwel 2001, 15 ff.), for only then can the text be determined. Linguistic insight is a prerequisite for establishing the text of an inscription, as is enough imagination to formulate suggestions and adequate self-criticism to dismiss idle speculation. The specialist is obliged to work in an interdisciplinary way or to have close contacts with other disciplines such that, e.g., archaeological and art-historical information concerning the finding of runic artefacts and their date can be brought to bear. Broad cultural-historical knowledge can contribute to a contextual understanding. Method became an issue in runology in 1931 when Lis Jacobsen challenged Magnus Olsen's interpretation from 1919 of the Eggja inscription by publishing her own interpretation. She criticized Olsen's "external method" (Jacobsen 1931, 13 f.), whereby the assumed cultural-historical context of an inscription provided a prefabricated framework into which the interpretation was to be fitted, often at the expense of the linguistic message of the text itself, and advocated instead the "internal method", whereby the text was allowed to speak for itself (cf. Peterson 1996, 42). Although neither of these methods should be used exclusively, the danger for misinterpretation is greater with the external method. In the wake of Jacobsen's criticism of Olsen, runology was termed a "playground of guessing", an evaluation which still often rings true as ad hoc arguments are marshalled to explain away discrepancies and justify unbelievable interpretations. Michael Barnes in his criticism of the types of argumentation found in numerous runic studies recommends i. a. that runologists freely admit the limits of their knowledge and that their theories and ideas should be recognized as such and never referred to as though they were facts (Barnes 1994, 26 f.). Methodological problems in runology from a linguistic point of view are discussed further by Kurt Braunmüller (1998). Inscriptions with older runes are rather amorphous: word divisions are as a rule not indicated, long and short vowels and geminated consonants are not marked, any rune can be read double and /n/ can be inserted before most consonants; in addition, the language itself is largely reconstructed and relatively little is really known about it. The ambiguities are only increased when powerful methodological tools are taken into use, particularly emendation by adding a rune, removing a rune, changing a rune or switching runes around (cf., however, Peter-

son's criticism (1996, 44) of Braunmüller's extensive use of emendation for interpreting a new runic inscription). Two facts should urge caution concerning interpretations of older runic inscriptions (cf. Syrett 1994, 18 ff.): (1) Virtually any series of letters containing some consonants and some vowels can be forced into sense. (2) Since the older runic inscriptions are the major direct source for AN, circularity of argument is an inherent danger in their interpretation.

74. The Ancient-Nordic linguistic system from a typological point of view: Phonology, graphemics, morphology, syntax and word order

1. Terminological problems (Ancient Nordic vs. Proto-Nordic/Ur nordisch)
2. Phonology
3. Graphemics
4. Morphology (nominal and verbal inflection)
5. Syntax and word order
6. Typological classification
7. Literature (a selection)

1. Terminological problems (*Ancient Nordic vs. Proto-Nordic/Ur nordisch*)

1.1. While the authors of this handbook use the terms Ancient Nordic and Proto-Nordic more or less interchangeably, and most follow the well-established tradition of preferring Proto-Nordic, in this article we distinguish between Ancient Nordic as a quite well-documented language, written in the so-called older futhark (24 runes), and Proto-Nordic as a linguistic construct comparable to Proto-Germanic or Proto-Indo-European. The popular G term *Ur nordisch* (Scand. *urnordisk*) ‘Proto-Nordic’ obscures this distinction because *ur-* can, by definition, only refer to a reconstructed language form and should therefore not be used in connection with directly accessible historical data, (here) runic inscriptions. (This dictum is also valid for the term *Proto-Scandinavian*; K.M. Nielsen 1975). It goes without saying that also other current terms such as Gmc or NWGmc can only be considered to be (theoretical) linguistic constructs which have a certain internal structuring function within a family tree model (cf. e.g. Grønvik 1998, 135). Going against opinion communis (e.g. Antonsen 1975), Grønvik dates NWGmc from 500–200 B.C. and NGmc from 200 B.C.–200 A.D. (pp. 145–147, cf. also art. 70.5.). In contrast, our concern here is to present a typological outline of AN and not to give an outline or account of those constructs such as Proto-Nordic or NWGmc.

1.2. AN primarily covers the period between 150/200 and 450/500 A.D. In the course of the 5th century, the beginnings of a fundamental restructuring of both the phonological and graphemic system can be observed (Grønvik 1998, 16–35 and Schulte 1998, 76–158), ending up in the late 8th century with a typolog-

ically completely restructured language, written in partly diverging runes (the so-called younger futhark of the Viking Age [16 runes]) and related to a totally revised writing system, based on a different relationship between phonemes and graphemes (predominantly without 1:1 correspondences; see 3.3.).

1.3. Genetic aspects are, however, of less importance for typological investigations but should nevertheless be mentioned in this context, at least briefly. With the exception of the (probably) EGmc inscription on the Negau B helmet (about 200 B.C. [?]) containing two (?) PN *harigasti* and *teiva*, AN represents the earliest attested Gmc language and can further be considered a direct descendant of a (reconstructed) language form called NWGmc, whereas Antonsen (1975, 26) and Makaev ([1965]/1996, 63) consider most of the runic inscriptions written in the older futhark to be documents of an attested language called NWGmc (cf. also the corresponding term *Runengermanisch* ‘Runic Gmc’, introduced by Penzl 1995). H.F. Nielsen (1989, 11) agrees with the NWGmc hypothesis in so far as OHG is excluded.

The role and position of Ingveonic/North Sea Gmc within the Gmc language family is still not very clear. But it can be assumed (a) that Ing. represents a separate branch within WGmc and (b) that Ing. may have genetically not very much in common with AN. More or less intense language contact may, however, have influenced the typological shape of AN, especially in Jutland.

1.4. The main drawback to all these approaches is that no clear answers have ever been reached about the question of whether these uncertainties are due to internal problems when reconstructing an ancient language as an abstract linguistic system or whether they are due to local, social or stylistic variations which occur in descriptions of any real language. The main reason for this obvious methodological problem is that most of the research done in this field heavily depends on principles which can be traced back to the era of the neogrammarians and which is characterized by an overemphasis on a (linear) genetic approach, sound laws and, if necessary, analogy. This means: (1) principles of internal

reconstruction and linguistic theory, including linguistic universals, have never been taken seriously enough to treat proto-languages as (virtual) constructs on the basis of their internal systematic functions (cf. the controversy about Vennemann's reinterpretation of Grimm's Law and the Second Sound Shift [1994]); (2) principles of diasystematic variation and language contact are either totally neglected or will, at most, be recalled quite unsystematically in order to eliminate divergent forms in those cases where reconstructions otherwise will have failed or run into serious difficulties.

2. Phonology

2.1. The phonological system of AN differs not very much from the one current assumed for Common Gmc or even PGmc:

(a) Five vowels are attested which can occur as (1) both short and long in (2) stressed or unstressed syllables: /i, u, e, o, a/ [\pm long] (cf. Syrett 1994, §9, esp. 266). From a typological point of view this kind of vowel system represents not only an ideal, but also a very symmetrical type of phoneme system where all five cardinal vowels occur. Compared to Proto-/Common Gmc, these systems are obviously more regular (cf. Proto-/Common Gmc: /i, u, e, a/ vs. /i:, u:, æ:, o:/ [Antonsen 1975, 2f.] vs. AN /i, u, e, o, a/ [\pm long]; cf. also van Coetsem 1994, 78 and §5 in general).

(b) Both Proto-/Common Gmc and AN have four diphthongs: /ei, eu, ai, au/. Their phonemic status is, however, not quite clear (genuine [bi- or monophemic] diphthongs or just a combination of two vowels). They are, like the vowels given in (a), not restricted to stressed syllables.

(c) The consonantal system has 18 (17) phonemes: /p, t, k; b, d, g; f, θ, h; s, z; m, n, (ŋ); l, r; w, j/, which nearly perfectly coincide with those assumed for the Proto-/Common Gmc system (though the phonemic status of /ŋ/ is very uncertain). Frequent or 'natural' phonemic oppositions are represented in this system, such as [\pm voice] or [\pm sonorant], and no position shows incomplete columns with reference to current structural diagrams of consonant systems. Only the phoneme /θ/ can be considered typical Gmc (as an innovation due to Grimm's Law).

2.2. The ratio between vowels/diphthongs and consonants in AN is 10 V/4 D: 18 (17) C. A contemporary Gmc language like German has

quite a different ratio as far as the vowels are concerned: 16 V/3 D: 19 (or 21) C (depending on the phonemic status of the affricates /pf, ts/). The higher number of vowels in German is due to phonemic split (*i/j*-umlaut). According to recent research, the corresponding *i/j*-umlaut processes must have occurred quite early in AN, namely as early as at the beginning of the transitional period. Thus, the phonematization of these umlauts took place shortly after the middle of the 5th century and must have been completed by the end of the 6th century (Schulte 1998, 257).

2.3. Let us now review some phonological features which are of relevance for a typological characterization of AN:

(a) The feature *length* occurs only in connection with vowels.

(b) All vowels can be considered to be *oral*, at least in respect to their phonemic status. Nasal vowel phonemes are obviously unknown (but cf. the phonemic analyses in *The First Grammatical Treatise* of the Snorra Edda, written in the middle of the 12th century, where 9 short and 9 long nasal vowels are mentioned, together with an equivalent number of oral counterparts: 18; cf. Benediktsson 1972, 128–137).

(c) There is probably no opposition between short and long diphthongs, as this is the case e.g. in Mod.Icel. and, partly, in Mod.Far., too.

(d) There seems, by and large, to be no significant (quantitative or qualitative) difference between accented or unaccented vowels/diphthongs (Syrett 1994).

(e) All consonants are phonematically short (like in Mod.Dan. but in contrast to all other modern Nordic languages, where consonants can be short or long, depending on syllable structure conditions).

(f) The feature *voice* is, as mentioned in 2.1., distinctive in the AN consonantal system, but not aspiration.

(g) Nasals and laterals occur only voiced (but cf. the opposition between voiced and voiceless nasals and laterals in Mod. Icel.).

2.4. Not much research has been done on phonotactics in AN. Since syncope and apocope do not occur before the transitional period, the interplay of occurrences of vowels (including diphthongs) and consonants is quite balanced. Typical words are: *laþu* 'citation', *fa(i)hido* 'I painted' and *hlewa|gastir* '(compounded PN)'. Otherwise, not more

than two consonants occur in the onset or in the interlude and coda. The only two AN words with a three-consonant-cluster in the coda, *fiskR* ‘fish’ and *hAriwulfs* ‘(gen.masc. of a personal name)’, are, however, not attested before the end of the AN period (Eggjum, about 700 A.D., and Rävsaal, about 750 A.D., respectively). Thus, they do not contradict the postulated two-consonant-principle. Further, it is difficult to imagine a realization of the consonant clusters in question without svara-bhakti: [fiskor].

With the exception of few *s*-clusters, one of the two consonants in these clusters is typically voiced (a semi-vowel or a voiced obstruent) or it is a (sonorant) lateral:

onset: *br-*, *fl-*, *fr-*, *gl-*, *hl-*, *hw-*, *sk-*, *sl-*, *st-*,
sw-, *wr-*, *þr-*,
interlude: *-fl-*, *-fs-*, *-ft-*, *-kl-*, *-kr-*, *-ks-*, *-kt-*, *-ld-*,
-lt-, *-nd-*, *-rb-*, *-rg-*, *-rk-*, *-rm-*, *-rn-*,
-rt-, *-sl-*, *-sn-*, *-st-*, *-tn-*, *-tr-*, *-þr-*,
coda: *-fR*, (*-lfs*), *-kl*, *-ld*, *-tR*, *-mR*, *-nR*,
(*-skR*), *-sR*,

To sum up, AN seems to be a very balanced Gmc language without complex consonant clusters (but cf. Mod. G *streichen* /ʃtr-/ ‘to paint; to cancel/delete’ and *Herbsts* /-rpsts/ ‘gen.sg. of autumn’, with up to three consonants in the onset and maximally five consonants in the coda). Thus, it is not surprising that Finn. has been able to borrow Gmc/NGmc/AN words without any problems regarding to phonology and phonotactics (cf. PGmc and Finn. *kuningas* vs. ON *konungr* ‘king’).

3. Graphemics

3.1. The strongest argument in favour of the reconstruction of the AN phonological systems presented in 2.1. is based on their graphemic representations. *Opinio communis* is the (nearly) “perfect fit” (Derolez 1998, Antonsen 1975, 2) of the older 24-rune futhark with the phonological reconstructions suggested (in 2.1.). The only troublesome grapheme/rune is the ʃ, the exact phonemic value of which is still unclear (/ei [Krause 1970, 15], eu, e, e, i [Düwel 1983, 2, 7], e², æ]). Antonsen (1975, 8) favours /æ/, but seen from a typological point of view, this assumption leads to a mismatched relationship between the short and the long vowel system on the one hand (/i, u, e, o, a/ [± long]) and their graphemic representations on the other (l, ʃ, M, X, f [± long]).

3.2. A main difference between the mappings of the runic and the Latin script is that the Romans treated the semi-vowels /j/ and /w/ as allophones of /i/ <i> and /u/ <v>, respectively, whereas AN clearly has two distinct graphemes as well as phonemes <ʃ, P>: /j, w/ (Derolez 1998, 112f.). These very exact mappings between graphemes and phonemes in AN can furthermore be considered to provide some of the most convincing proofs for the correctness of the traditional models for the reconstruction and the splitting up of the Gmc language family according to Grimm’s (plus Verner’s) Law and the Second/OHG Sound Shift (vs. a very early division into High and Low Gmc suggested by Vennemann 1994). Otherwise one would have to show that the runes for the unvoiced obstruents /p, t, k/ <ƿ, ʰ, < actually represent affricates and fricatives (or at least phonemically distinctive aspirates). Furthermore, we lack runic (or other written) evidence for High Gmc: the overwhelming majority of the runic inscriptions in the older futhark represent AN (and some of them EGmc/Gothic), a language which undoubtedly can, from an internal linguistic point of view, be considered a direct precursor of ON (i.e. the language of the Viking Age) but definitely not of High Gmc/OHG.

3.3. The end of the classical AN period or the beginning of the so-called transitional period of AN is characterized by the occurrence of a new rune ʰ, interpreted either as /a/ or /j/. All further restructurings of the older futhark can be interpreted as typological simplifications, probably along with a considerable change in the communicative purposes of the runic script which was used to produce longer inscriptions (mostly in stone) with narrative/historical messages:

(a) High and middle vowels including *i/j*-umlauted vowels are now represented by not more than 3 runes (l, ʃ, ʰ) marking the essential cardinal vowels. Thus ʃ stands now for no less than 4 phonemes (/u, w], y; o, ø/).
(b) In the new runic writing system, mapping the late AN/ON consonant system, the opposition [± voice] is given up. ʰ can now take the values /p, b/, ʰ the values /t, d, nd, nt/, and ʰ even the values /k, g, γ, ŋ, nk/ (cf. also ʰ, i.e. /θ/, and its complementary distributed allophones [θ, ð]).

The semi-vowel /w/ is now, in accordance with many other scripts, an allophone of ʃ and has thus no longer a separate graphemic representation.

(c) The runes for AN /r/: ᚱ (translit. as **r**) and /z/: ᚷ/ᚸ (translit. as **z**, following its supposed allophonic realization, a kind of [r]) merge now definitely into /r/, but their graphemic distribution still remains in accordance with their historical descent (NWGmc */r/: ᚱ vs. */z/: ᚷ/ᚸ).

3.4. To sum up, both the classical runic system as well as the transitional systems show a remarkably high amount of linguistic insight into the complex relationship between graphemics and phonology. Whereas the classical AN runic system has a nearly 1 : 1 correspondence between phonemes and graphemes, the transitional systems and, to a much higher extent, the 16-runes system can be considered a kind of ‘minimalist solution’ in mapping extended and thus more complicated phonological systems onto a graphemic representation which still puts the reader in a position to retrieve the corresponding phonological structures. Furthermore, linguistic redundancy and contextual factors certainly play an active part in decoding these (graphemically) ‘minimalist’ inscriptions.

4. Morphology (nominal and verbal inflection)

4.1. The grammatical morphology of AN can be characterized as inflectional or fusional, which is predominantly also the case for other ancient IE languages like Latin, Ancient Greek or Sanskrit.

(a) Inflectional or fusional means that several grammatical features, such as number, case, and class [in nominal inflection] or tense, mood, person, number, and class [in verbal inflectional paradigms], are represented all together by one morpheme each. Those suffixes may occur in different classes or paradigms; an interparadigmatic uniform symbolization is, however, not mandatory but may occasionally occur anyway (cf. gen.pl. *-ō* and dat. pl. *-mR*). Furthermore, the ending *-u* may represent a dat.sg. of a fem. noun of the *ō*-class (*runu* ‘rune [dat.]’) or the 1sg.pres. of a verb (*gibu* ‘I give’).

(b) These grammatical features cannot be isolated nor split up into single, distinct grammatical markers containing not more than one feature, as is typical for agglutinating languages such as Turkish, Hungarian or Japanese.

(c) The principle of stem inflection (according to Wurzel 1996, 499) can furthermore be regarded as typical not only e.g. for OHG but also for AN inflectional/fusional morphology. Stem inflection means that the stem of a noun, adjective or verb is preserved in the whole paradigm and is not affected by morphophonological processes caused by the following grammatical morpheme. Umlaut, syncope and other restructurings, e.g. of final syllables by a vocalization of semi-vowels (*samprāsaraṇa*), do not occur before the beginning of the so-called transitional period (500–700 A.D.).

4.2. AN has the well-known IE categories of gender (masc., fem., and neut.), but it has neither a definite nor an indefinite article (cf. also other IE languages without article(s) such as Latin, Russian or even Mod.Icel., which has not developed an indefinite article yet). Since the evolution of article systems often goes along with literacy or elaborated literary production with more need for explicit referential markers in texts, it is not surprising that AN had not established such morpho-syntactic devices. The early beginnings of this development can, however, be detected in the inscription on the whet-stone of Strøm (dated about 600 A.D.): *hali hino* ‘[flat] stone *this*’ which has a postponed demonstrative pronoun. In addition, its position in the NP correlates with SVO basic word order, which is the prevailing word order pattern in most of the older as well as in modern Germanic languages (cf. 5.1.).

4.3. Fusions which result in clitics are not untypical for AN. Enclitic processes can even be observed quite frequently in graphemics (cf. the so-called bindrunes, e.g. ᚱᚰ *ek* ‘I’). In late AN morphology, encliticized personal pronouns (1sg.; Krause 1971, 87) are documented in no less than 5 inscriptions, e.g. in Noleby (about 600 A.D.): *tojeka* ‘made-I’ and in Sealand II (a bracteate; about 500 A.D.): *haitika* ‘am called-I’ ([–] *ek* [a] ‘I’; *-ika* indicates an early phonological change, a weakening in the scope of the final syllables; Schulte 1998, 106–108). This means, seen from a typological point of view, that the encliticized definite article which is very characteristic for all modern Nordic languages (cf. Mainland Scand. *huset* ‘house-*the*’) and the occurrence of clitics in general (cf. also the development of the medio-passive forms *-mk/-sk* in early ON) can be traced back to stress patterns and morphological devices which were already part of the AN grammatical system.

4.4. A typological evaluation of the complexity of the nominal inflectional system in AN and a comparison of these patterns with other older Gmc languages (such as Gothic, OHG, OSx. or ON) shows clearly that AN definitely does not have the most complex NP/3rd.pers. inflectional system of all the ancient Gmc languages. Following Hawkins' method (1998, 62ff.) in counting how many grammatical distinctions occur in the paradigms of masc., fem. and neut. nouns and 3rd pers. prons. in Gmc languages with respect to nom., acc. and dat. (both sg. and pl.), it can be demonstrated that AN has an 11-item system like e.g. OHG, OSx. or OE (AN shows, however, a syncretism in nom./dat.fem.sg. but no homophony in nom./acc.masc.pl., as is the case for the WGmc languages just mentioned.) Gothic lies at the top of this typological scale with a 14-item system, whereas Mod.Engl. and North Frisian are situated at the bottom of it. Their nominal/pronominal systems distinguish between not more than 7 items. The data for AN are, however, based on nouns only, due to the scarcity of attested pronouns, and can therefore not be compared in all details with the ON system, which can typologically be characterized as a 13-item language.

As is also known from other ancient Gmc languages, AN had a certain tendency gradually to reduce case marking distinctions: Not only were the neut. inflections (nom./acc.; sg./pl.) neutralized but also the (nominal) fem. endings for (nom./acc.) pl. as well as dat.pl. endings (interparadigmatically *-mr*). As far as the nominal inflections are concerned, these reduction processes came more or less to a (temporary) stop in ON and did not continue in Mainland Scandinavia before the end of the classical ON period. This typological drift started first in the southeast of Scandinavia (Denmark, southern Sweden) but has not affected Icel. at all.

4.5. The paradigms of the verbal inflection show no significant differences from the ON data. In other words, ON has preserved all AN distinctions concerning person, tense and mood (as far as this can be seen from the few data available). Reduction processes do not occur before the end of the ON period either.

4.6. To summarize briefly, AN typifies an inflectional/fusional language not very much different from (the well-documented literary language) ON. In contrast to Gothic, there are, however, more syncretisms, but they affected only minor parts of some paradigms

and did not take place in e.g. all nom./acc. endings or in all the plural verbal inflections, as is the case in the further development of the (Mainland) Scand. languages.

5. Syntax and word order

5.1. (a) The basic word order type can probably be regarded as the most important typological feature when dealing with the syntax of a language. As far as AN is concerned, it had a strong tendency towards SVO order (subject-verb-object) in declarative sentences. The inscription of Rø I (about 400 AD: *ek* (name) *satido [s]tain* 'I (...) erected [this/the] stone') can be taken as a typical AN sentence with SVO order.

(b) No independent evidence is, however, available to decide whether AN can also be considered a strict V2 language which has the finite verb always in the second position in declarative sentences. But if one agrees that SVO is the unmarked or predominant basic word order in AN, a sentence like that taken from the inscription of Björketorp (transitional period, about 650–700 A.D.) may be used as rather strong evidence in favour of AN as a strict V2 language: *hAidr|runo ronu falAhAk* 'bright|runes [gen.] row [acc.] conceal-*T*: OV-*S*).

(c) Since there are many instances which support or at least do not contradict free word order in AN, EN and ON (Faarlund 1990, 85–110) on the level of the sentence/VP as well as for the NP (see 5.4./5.7.), non-configurationality can be considered another important typological feature of AN. The main argument for non-configurationality is, however, that the subject does not play a predominant role in the syntactic structure of this type of language. Sentences with no overt subject or with objects in topic position (see 5.1. (b)) may be taken as good arguments in favour of this typological criterion.

5.2. As I have shown elsewhere (Braunmüller 1982, 125ff.), about 68% of all recoverable AN sentences show SVO order. (53 inscriptions represent clear instances, and an additional 10 are more or less uncertain with respect to their basic word order.) Further, about 28% of inscriptions reflect SOV order and even ca. 4% VSO order (Braunmüller 1982, 138). Eythórsson (1998 and, to a certain extent, 2001) by and large agrees with this analysis, but Antonsen's (1975, 24) approach diverges fundamentally. He suggests, how-

ever, many quite deviant readings and bases his view of AN – in his opinion NWGmc! – on a somewhat different sample of data (e.g. without the transitional inscription of Eggjum) which now evidently seems to support SOV order (71% of his data have SOV order as the unmarked [?] basic syntactic pattern).

5.3. The conclusions to be drawn from our observations are that either the preceding (reconstructed languages) NGmc or NWGmc or even PGmc might or even must have been languages of the SOV type, such as e.g. Classical Latin. This ancient IE word-order pattern is still to be found in several marked sentences (here with alliteration, in the Gallehus inscription [about 425 AD]: *ek hlewa|gastir holtijar horna tawido* ‘I, H. (compounded PN), from H./[or a patronymicon] H.’s son [this/the] horn made’: SOV).

5.4. Other features, like the position of the nominal genitives, the attributive adjectives or the adpositions do not correlate very typically with the principles of an ideal SVO type where all NP modifiers, such as genitives, adjectives, determiners, appositions (and patronymic expressions) as well as relative clauses, occur to the right of the category to be modified: SV-O; N-gen./-adj./-det./-app./-rel. and not SO-V; gen-/adj./-det./app./-rel.-N. Only appositions and relative clauses reflect ideal SVO order patterns in AN. Along with Greenberg’s typology (1966, 109), AN can be regarded as a language of the same type (# 11) as the mod. Mainland Scand. languages: “II/Pr/GN/AN”, i.e. SVO order together with prepositions, preposed nominal genitives and preposed adjectives.

5.5. Determiners in the NP such as poss. pron. as well as dem.pron. are normally to be found in a postposition, as is typically the case in the West Nordic languages: N-det., N-poss. (Braunmüller 1994, 30f.). These categories are, however, not part of Greenberg’s typology and can therefore not be used for any further subcategorization of his type II (# 11) described above. Anyway, these NP patterns clearly harmonize with an ideal SVO language, where the object(s) and all other NP modifiers follow (not precede) the category to be modified (V and N, respectively).

5.6. Since only four instances of numerals are attested, two with a preposed [Tune 400 A.D.; Stentoft 650 A.D., reading due to Santesson (1989, 227): twice ‘nine’] and two with a postposed numeral [Gummarp 600 A.D.; Istaby

600–650 A.D.], it is impossible to decide which was the normal place for numerals in AN. On the basis of the observations made in 5.5. and with reference to the runic inscriptions mentioned here, it can be said that the SVO-conforming postposition (N-num.) became the unmarked position at the latest at the end of the transitional period.

5.7. Discontinuous phrases are by no means unusual in Old Gmc dialects (esp. in poetry) and must therefore not be forgotten when evaluating AN word order. We find instances of this in the inscriptions of Sealand II (about 500 A.D.) *hariuha haitika : farauisa* : ... ‘H. (PN) am called-I|[the man] knowing dangerous things] ...’ as well as of Noleby (600 A.D.) *runo fahi raginaku(n)do* ... ‘[a] rune [acc.] I painted [which] descends from the advisers/gods...’. Patterns like these strongly support the non-configurationality hypothesis of AN. Furthermore, they may be due to Latin influence (hyperbaton construction), as is argued in Braunmüller (2000, 8f.).

5.8. To sum up, AN represents an early stage of a newly developed, non-configurational SVO language with some marked (and/or residual) SVO patterns reflecting a previous typological stage (SOV in N/NWGmc or PGmc). This type of an SVO language is typologically not too much different from Mod.Icel., and it is definitely more consistent with an (ideal) SVO language than is the case with the Mainland Scand. languages of today.

6. Typological classification

6.1. (a) There can be no doubt that linguistic typologies neither represent theories nor have any explanatory force in their own right (Vennemann 1985, 872), but they are very useful tools for classifying and comparing languages of different origin with one another. Though the number of parameters involved is always limited, the selection of features is by no means accidental: All structures used for evaluation will always include crucial parts of any (structural) grammatical analysis (cf. Vennemann 1982).

(b) An important empirical anchor-point for linguistic typologies is provided by linguistic universals, based on a typological analysis of a representative sample of genetically different languages of the world (e.g. Greenberg 1966). Using these, no typological analysis can be seriously blamed for being totally arbitrary or lacking an empirical basis.

6.2. Seen from this point of view, AN represents a language with very normal (i.e. frequently found) phonological systems, with very balanced phonotactic structures (almost all clusters ≤ 2) and with typical (stem) inflectional patterns. But it tends towards fusion/cliticalization, both in graphemics as well as in morpho-syntax and word formation (cf. 6.3.(c)). On the syntactic level, AN represents a nearly ideal, non-configurational SVO language where most of the modifying elements are located to the right of the constituents to be modified.

6.3. Some typologically relevant questions cannot be answered yet:

(a) Why does AN – as well as all other Gmc languages – only have two tenses (present, past)?

(b) Why was reduplication in the system of the irregular verbs given up in AN/NWGmc?

(c) Why did AN and Gmc. in general develop regular verbs formed by a fusional/clitical suffix *-þ/ða* (< IE **dhē-/dhō-* ‘to do’)?

(d) Why did AN/Gmc acquire a new class of so-called weak adjectives with an individualizing/determining function? (These new inflectional paradigms coincide with the *n*-noun class.)

(e) Why did a considerable case reduction take place? (No ablatives or locatives, only some residual vocative forms.)

(f) Why were dual forms disappearing in AN and all older Gmc languages in general?

6.4. (a) For some of these questions an explanation may be given based on inner drift (Sapir 1921, 155) or on general typological (i.e. empirical) evidence (6.3. e,f). But why should a whole language family develop totally new grammatical devices (6.3. c, d)? And why were other parts of the grammar, esp. the verbal system, reduced so drastically (6.3. a, b, [e, f])?

(b) A possible answer may be found when we take processes like creolization into consideration: It does not seem implausible to characterize AN/(NW)Gmc as an IE language in a multilingual context which first became pidginized and thus underwent admixture, reduction and simplification in grammatical structure (Trudgill 1992, 59) but which later became, through creolization, i.e. expansion of the grammar, a new language, an IE creol, in its own right (cf. now Vennemann 2000, 260ff. who argues with various forms of language contact, too).

This would, furthermore, neatly explain the fact that about one third of the Gmc lexical stock cannot be traced back to any other IE language, a fact which always has caused serious problems for traditional historical-comparative philology (see Vennemann 2000, 241ff.). When making use of variational theories and sociolinguistics in connection with language typology, we may be able to find new and better answers for the questions presented in 6.3.

7. Literature (a selection)

75. The development of Proto-Nordic lexicon

1. The syntactic component of semantics: different types of runic inscriptions
2. The lexical field of runic production
3. Touching on word history and etymology: prehistory and continuation of AN lexemes
4. Conclusion
5. Literature (a selection).

1. The syntactic component of semantics: different types of runic inscriptions

Semantic representation depends heavily upon the presupposed syntactic analysis, and valency is part of the meaning of words. Hence, there is a syntactic component involved in semantics. The older runic inscriptions differ considerably in length and content. With regard to length, at least three different sentence types can be discerned: first, the minimal form (e.g. KJ 31 Øvre Stabu); second, the full form (e.g. KJ 43 Gallehus, or KJ 50 Strøm); and third, the maximal form, including more complex sentence structures and co-texts (e.g. KJ 72 Tune, KJ 96/97 Björketorp/Stentofte). Of course, this is only a preliminary categorization, and there are many subtypes and possible variations. One short form type amongst the oldest runic inscriptions consists of isolated agent nouns: KJ 31 Øvre Stabu spearhead **raunijaR**, KJ 32 Dahmsdorf spearhead **ranja**, and KJ 33 Kowel spearhead **tilarids**. These inscriptions on weapons can be interpreted as reduced sentence forms or ellipses with a complete message conveyed by one word.

KJ 31 **raunijaR** corresponds directly to ON *reynir*. It belongs to the denominal verb AN **raunijan* (> ON *reyna*, Norw. *royne*) and is generally rendered as ‘tester, prober’. This is a typical North Germanic etymon, with no corresponding representation in the other Germanic languages. Outside the sphere of Germanic, the same IE root *reu-* with *n*-extension appears in Gr. *ereunáō* ‘trace, look for’. KJ 32 **ranja** again is an agent noun belonging to the causative verb AN **rannijan* ‘cause to run’; cf. ON *renna*, OHG *rennen*, and Go. **(ur-)rannjan*. Finally, KJ 33 **tilarids** has been taken to be an East Germanic form and is etymologically more obscure. Its meaning is supposed to be ‘goal-rider’ or ‘attacker’, hence containing the same verbal root as ON *riða* ‘ride’, or less probably *tilræði* n. ‘attack, as-

sault’ (cf. Lehmann 1986, 345). As has been indicated, these short nominal inscriptions have no co-text, but a context. Their primary context is the object on which they have been written. Evidently, they were all placed on weapons and hence constitute one functional class, consisting of agent nouns in the semantic field of ‘attacking’ or ‘testing oneself (on the battlefield)’. These minimal syntactic forms can easily be transformed into full form sentences: (1) **raunijaR** = ‘I am the one that tests himself (in battle)’. The underlying verbal concept is directly reflected by ON *reyna sik* and Norw. *royne seg* ‘test oneself’. (2) **ranja** = ‘I am the one that attacks (the enemies)’; cf. ON *renna at e-m* ‘attack someone’, or ‘I am the one that makes (them) run, routs (them);’ cf. the causative ON verb *renna*. (3) **tilarids** = ‘I am the one that rides to the goal’, or ‘the one that attacks the enemies’; cf. ON *riða til e-s* ‘ride towards someone’, or less probably *ráðask til e-s* ‘undertake something’ and *tilræði* n. ‘attack’. A similar designation with the second element *-riðr* (IE root *reidh-*) is ON *Atriðr* ‘he who rides to battle’ (one of Odin’s names). The function of these nouns is clear enough: they guarantee the success of the weapon on which they are inscribed. It is worth noting that the spear is not just a material instrument – like E *cooker*, *boiler* – but a personalized agent *who* acts on *his* own. Seen in a more theoretical vein, these nominalizations are quite interesting. Of particular importance is their lexical status in Ancient Nordic: Are they still productive at this stage of Germanic, and, if so, do they result from syntactic transformations, or do they constitute independent lexical units – being already fossilized in earlier times? No final answer will be given here (for the theoretical background, cf. Ehrich 1991, 441). To conclude, suffice it to say that word semantics is intimately bound up with syntax in various ways.

2. The lexical field of runic production

The German scholar Jost Trier and his followers dealt with words in their lexical fields and developed a comprehensive field theory. In Trier’s view, language is an arrangement of fields and architectures:

„Sprache haben, an einer Sprache teilhaben heißt daher: in einem Sprachraum existieren und dessen architektonische Ordnungen, dessen Innenglie-

derungen, dessen ganzes Gefüge als ein verbindliches Gefüge anerkennen.“ (Trier 1973, 93)

Indeed, the primary focus upon lexical networks is common to all modern schools of structural semantics, whatever their other underlying premises might be. An approach along these lines should also be profitable with regard to the Ancient Nordic lexicon. The verbs AN **taujan*, **wurkijan*, **dālijan*, **faihijan*, **talgijan*, and **writan*, for instance, are semantically interconnected and make up a verbal group pertaining to the lexical field of runic production and techniques (cf. Ebel 1963, 14ff.). Unless we deal with this group as an interrelated semantic set, explanations for the subsequent shifts and restructurings of its members in Nordic will remain vague.

2.1. AN **taujan/tawōn*

There are at least four runic attestations of AN **taujan/tawōn*; cf. KJ 30 Garbølle wooden box **tawide**, KJ 43 Gallehus horn **tawido**, KJ 130 Trollhättan bracteate **tawo**, and possibly KJ 103 no. 2 Selvik bracteate **tau** (on this etymon, see Lehmann 1986, 342). In addition, there is the recently discovered Illerup silver shield-mount 2 with its inscription **nīþijo tawide** (cf. Stoklund 1985, 12f.). AN **taujan*, which is said to belong to an old lexical stratum, is generally rendered as ‘make, prepare, manufacture’. While this verbal root is attested in Go. (*taujan*, pret. *tawida*), in OHG (*zouwen*, pret. *zouuita*), and in OE (*tawian*, pret. *tawode*), it has obviously not survived within Nordic: an ON verb **teyja*, pret. **táða* does not occur. This is an example of word death: the total displacement of an AN lexeme. The latest fairly certain attestation of **taujan* is **tojeka** in the Noleby inscription from the 500s. This has usually been interpreted as a monophthongized form of East Scandinavia, stemming from older **tauju* plus affixed *-eka* (cf. Krause 1966, 150). In NGmc, **taujan* was replaced by **garw(ij)an*, which originally meant ‘make ready’; cf. NHG *garen* ‘cook well’ and *gar* ‘(sufficiently) cooked’. This verb is not attested in the older runic inscriptions. However, cf. the 8th century Rök form **karur**, which corresponds perfectly to the verbal adjective ON *gōrr* ‘prepared, ready’ (a frequent word in the Eddaic lays). AN **taujan* is usually complemented by an accusative object, but this can be elided (as in KJ 30 Garbølle wooden box and Illerup silver shield-mount 2). It may be noted that Krause

(1971, 148) reads **hagiradar i tawide**, yielding a composite expression of verb plus adverb **taujan ī*, just like **writan ī* ‘incise, inscribe [the runes]’ (cf. 2.6.). But in the light of Illerup 2 **nīþijo tawide**, this syntactic interpretation now seems to be less convincing (cf. Stoklund 1985, 13; 1991, 98).

The process of AN **taujan* can result in a material object, e.g. a wooden box (KJ 30 Garbølle), a golden horn (**horna**; KJ 43 Gallehus), a silver shield-mount (Illerup 2), or in an abstract object, e.g. ‘enjoyment’ (**unapou**; KJ 67 Noleby). Both the Trollhättan bracteate and the Noleby stone show that the end of **taujan* can be abstract: the accusative forms **lapodu**, **unapou** correspond both formally and semantically to ON *lǫðuð(r)* ‘invitation, summons’ (NHG *Ladung*) and *unað(r)* ‘enjoyment, satisfaction’, respectively. Most probably the inscription itself was meant to be included in the production (cf. Ebel 1963, 50). AN **taujan* is a true verb of doing (*verbum faciendi*) with a low level of semantic markedness. It refers to all kinds of processes, where both material and abstract results are involved. In cases such as **nīþijo tawide**, the inscription functions simply as a *håndværker-signatur* ‘craftsman’s signature’: ‘Nīþijō made it’ (Stoklund 1985, 13). Incidentally, KJ 130 Trollhättan bracteate **tawo lapodu** is paralleled by KJ 130 Halskov bracteate **fahide lapoþ**. This partial interchangeability indicates that **tau/taw-* and **faih/fāh-* were immediate neighbours in one semantic field and near-synonyms at least in late Ancient Nordic, i. e. the bracteate period (cf. 2.5.).

2.2. AN **wurkijan*

The verb AN **wurkijan* is attested in the runic corpus several times; cf. KJ 136 Tjurkö bracteate 1 **wurte**, KJ 72 Tune stone **worahto**, KJ 14 Etelhem clasp **w(o)rta**, and possibly KJ 71 By stone **orte**. Again, this is some kind of *verbum faciendi*. It is paralleled by Go. *waurkjan*, OE *wyrcian* ‘make, do; work’ (pret. *worhte* > *wrought* with metathesis), OHG *wurchen* ‘make, do; work’, NHG *wirken* ‘produce; work; weave’; outside the Germanic area, Gr. *érgon* ‘work’ and Av. *varəz-* ‘make; work’ can be directly compared (cf. Lehmann 1986, 396f.). In the runic corpus **wurkijan* usually collocates with **runo(r)**. Thus, KJ 136 Tjurkö 1 reads **wurte runoR an walhakurne ... heldaR kunimu(n)diu** ‘Heldaz wrought the runes on foreign-grain [i. e. the bracteate] for Kunimunduz’. This yields a basic lexical entry **wurkijan*

rūnōz (*ana* + dat.) ‘producing runes (on an object)’. Mention should also be made of the first part of KJ 72 Tune: **ek wiwaR after woduride wita(n)dahalaiban worahto r(...)** ‘I, Wiwaz wrought r(...) after [in commemoration of] Woduridaz, the bread-ward’. Krause (1971, 169) adds **runo(R)**, but does not entirely exclude the emendation [*mē*]r ‘for me’ either (cf. also Antonsen 1975, 44; Grønvik 1998, 38f.). The reading KJ 71 By **orte** can be defended, although the subsequent part of the inscription remains highly obscure. To sum up, there are two fairly certain occurrences of runic **wurkijan* combined with *rūnō(z)*. The form KJ 14 Etelhem **w(orta)** no doubt refers both to the clasp and to the inscription as part of it (for the use of **taujan*, cf. 2.1.).

Even though **taujan*, **wurkijan*, and **dālijan* (see 2.3.) tend to be *verba faciendi* with a low level of semantic markedness, this does not imply absolute synonymy, since they do not necessarily meet the criterion of interchangeability in *all* contexts. It has to be noted that certain contextual restrictions do exist and that the collocational range of these lexemes is different. For instance, while **wurkijan rūnōz*, **faihijan rūnōz*, and **wrītan (ī) rūnōz* are all well attested, there seems to be no parallel phrase **taujan (ī) rūnōz*. Conversely, there are no phrases **wurkijan unaþu*, or **wurkijan laþōðu* (with an abstract object), whereas **taujan unaþu* and **taujan laþōðu* have combinatorial status and indeed occur (see 3.1.). In the absence of any indication to the contrary, **wurkijan unaþu* might be assumed to be collocationally unacceptable. Therefore, it is not absolute synonymy, but near-synonymy that is involved in such cases (cf. Lyons 1995, 60–65). It follows that AN **wurkijan* presupposes concrete, i.e. non-abstract objects, whereas AN **taujan* is more process-neutral and hence does not do so (cf. 2.1.). In this regard, AN **wurkijan* corresponds with the Norw. verb *yrkje*.

AN **wurkijan* underwent far-reaching lexical change later; cf. ON *yrkja* ‘compose (verses)’ and Sw. *yrka* (*på*) *ngt* ‘insist on something’. Icel. *yrkja* (pret. *orta* and *yrkta*) has a fairly broad semantic range: ‘make poetry; formulate, say; cultivate, plant’ (cf. Magnússon 1989, 1168). Arguably, lexical enrichment of this kind is at least partially due to the Nordic loss or different prefixes **ga-*, **umbi-*, **fura-* etc., which functioned as semantic modifiers. On the other hand, the historical processes of meaning differentiation and lexical split cannot be excluded either. All these

developments are part of Nordic word history. But taking a critical stance on Grønvik’s proposal (1981, 161), it is highly improbable that **wurkijan* had already developed the ON meaning ‘compose (verses)’ in the language of the Tune inscription (see now Grønvik 1998, 38f.). In all probability, AN **wurkijan* still had the basic semantic range of NWGmc, so that a general lexical entry **wurkijan rūnōz* ‘make, produce runes’ (as well as other non-abstract objects) will suffice. This type of phrasal expression is paralleled by **faihijan rūnōz* and **wrītan (ī) rūnōz* (see 2.5.–2.6.).

2.3. AN **dālijan*

There is only one alleged occurrence of this verb, namely KJ 72 Tune **dalidun**. Nowadays it is taken for granted that **dalidun** is related to OSl. *dēlati* ‘treat, work’ and the corresponding noun *dēlo* ‘work’ (cf. Krause 1966, 165; Antonsen 1975, 45). Thus, it should belong to an IE root **dhē* plus *l*-extension, where OInd. *dadhāti* ‘he puts, holds’ also belongs (Pokorny 1959, 238). One of its cognates is the *ti*-formation seen in ON *dáð*, OHG *tāt* ‘deed’. The fact that this etymon occurs only once in the older runic inscriptions might indicate that it was infrequent during this period. It has only survived in the verbal adjective ON *dæll* ‘adaptable, affable’ (< **dālijaz*), its formation corresponding to ON *fórr* ‘passable; fit for travelling’ and *tókr* ‘admissible, acceptable’ (cf. Magnússon 1989, 142). Obviously, ON *dæll* is a relic, preserving the IE root **dhēl-*.

AN **dālijan* provides a good example for the replacement of a lexeme as a consequence of its synonymy relationship to some contiguous field members, especially **taujan* and **wurkijan*. (Later on **garw(ij)an* also played an important role, but this has not been attested in the early runic period.). With regard to meaning, **dālijan* can generally be rendered as ‘make, do, prepare’. Its object in the Tune inscription is either **staina** = ON *stein* ‘stone’ (Antonsen 1975, 45), or **arbija** = ON *erfi* ‘inheritance feast, drink’ (Krause 1966, 166; Grønvik 1981, 180). However, Grønvik’s (1981, 180 ff.) suggestion that **dalidun arbija** means “de lagde til et hyggelig gravøl” [‘they prepared an enjoyable funeral drink’] can be reasonably excluded. The semantic development of the verbal adjective *dæll* in ON furnishes no evidence of a semantic shift in the underlying verb **dālijan* itself.

2.4. AN **talgijan*

AN **talgijan* occurs at least twice in the older runic corpus, namely on KJ 13a Nøvling clasp **talgidai** and on the recently discovered Udby clasp **talgida** – both being interpreted as 3rd pers.sg.pret. forms. Cf. also KJ 25 Vimose woodplane **taliþo**, which has frequently been analysed as an agent noun **tal(g)ijō* f. ‘plane’ (cf. Krause 1966, 62; on the above-mentioned Nøvling and Udby inscriptions, see Stoklund 1985, 9; 1991, 88ff.). The elliptical sentence type **bidawariþar talgidai**, or **lamo talgida** refers to the object on which it is inscribed, and hence it belongs to the same class as **nipþio tawide** and **hagiradar (i) tawide** (see 2.1.). The Scandinavian reflexes of AN **talgijan* refer to the standard process of carving, their use being restricted to wood (but possibly also including stone); cf. the verbs ON *telgja*, Norw. *telgie*, Sw. *tälja*, the noun ON *telgja* ‘axe’ and compounds such as OSw. *trætælgþia* ‘wood-plane’, ON *talguknifr*, Sw. *täljkniv*, Norw. *teljekniv* ‘wood-carving tool’. A non-Germanic parallel is furnished by OIr. *dlongid* ‘he cleaves’, as it shows the same root extension (IE *del-gh-*, *dl-egh-*).

The crucial question remains whether the basic lexical entry for AN **talgijan* should be extended to include metal work, since the above-mentioned Udby inscription is incised in metal (a silver clasp). Consequently, it has been argued that AN **talgijan* might refer to two different kinds of processes: first, the production of the object (clasp), and second, the production of the inscription itself (cf. Stoklund 1991, 96). However, this is unnecessary. It has already been mentioned in connection with **tauþan* that the runic inscription was meant to be included in the production process (see 2.1.). To sum up, it can reasonably be argued that **talgijan* enters a relationship of near-synonymy with **tauþan* and **wurkijan*, even though it is no *verbum faciendi* in the strict sense of the word.

2.5. AN **faiþijan*

AN **faiþijan* is generally regarded as one of the most significant technical terms in runic production. It is frequently represented in the older inscriptions throughout the period. The important attestations are as follows: KJ 60 Vetteland stone ... **dar faiþido**, KJ 73 Rö stone **stainawariþar faiþido**, KJ 63 Einang stone **(go)dagaþþir runo faiþido**, KJ 67 Noleby stone **runo faiþi raginaku(n)do**, KJ 131 Åsum bracteate **ik akar faiþi**, and possibly KJ 132

Femø bracteate **ek fakar f(ahi)**, also KJ 130 n. Halskov bracteate **faiþide lapoþ** and KJ 122 Väsby bracteate **f(a)hidu uuilald**. One standard collocation – seen in KJ 63 Einang and KJ 67 Noleby – is **faiþijan rünō(z)*. This corresponds directly to ON *fá rúnar* (cf. Hávamál stanza 80). In other cases like KJ 60 Vetteland, KJ 73 Rö and KJ 131 Åsum, the object is missing. It is hard to determine whether these elliptical constructions refer to **rünō(z)*, or to the whole object, i.e. the stone or the bracteate, respectively. How-ever, this problem is fairly theoretical. As has already been demonstrated, ellipses of this kind do also occur in connection with **tauþan* (2.1.) and **talgijan* (2.4.).

It has often been said that **faiþijan* underwent semantic generalization within AN, its meaning shifting from ‘colouring (the runes with red dye)’ to ‘writing’ (cf., e.g., Krause/Jankuhn 1966, 138). However, this assumption is not imperative. It was Kuhn (1938, 57, 66) who first pointed out correspondences within the East Indo-European languages, confirming the use of related root formations in connection with both ‘colouring’ and ‘writing’. In support of this view, cf. especially OSl. *pisati* ‘he writes’ and OInd. *piṁsati* (root *piś-*) ‘he hews out, carves; decorates; forms; fashions’, as well as *piṅkti* (root *piṅj-*) ‘he tinges, paints’, and OInd. *peśas* (root *piś-*) ‘form, colour; artificial form’. Incidentally, the semantic component of form was also included in ON *fá* (pret. *fáða*); cf. *kistill gulli fáðr* ‘gold-mounted box’. Thus, it might be questionable whether AN **faiþijan* was used strictly in the sense of ‘colouring’ at the outset. On the contrary, it can be argued that it held a relationship of partial synonymy with **talgijan* and **writan* on the one hand and **tauþan* and **wurkijan* on the other. Obviously, the semantic borderlines between these lexemes are indeterminate and fuzzy. Again, we might invoke the criterion of interchangeability. In the absence of any counter-evidence, **faiþijan* includes the whole lexical range of ‘painting-incising-writing’, thereby tending to function as a weakly marked verb of doing in some contexts just like **tauþan* or **wurkijan*. In view of this, **faiþijan lapōðu* ‘painting, writing a summons’ is interchangeable with **tauþan lapōðu* ‘making, preparing a summons’, and **faiþijan rünōz* ‘painting, writing runes’ is semantically equal to **wurkijan rünōz* ‘work, produce runes’ or **writan (i) rünōz* ‘write (in) runes’ – all these collocations being attested (cf. 2.1. 2.2. and 2.6.).

2.6. AN **wrītan*

The verb par excellence for runic writing is **wrītan*. It is extremely frequent in AN; cf. KJ 98 Istaby stone **WARAIT RUNAR ÞAIAR**, KJ 70 Järsberg stone **runOR waritu**, KJ 17a Eikeland clasp **writu i runoarsni** (with a bind-rune **ar**), possibly also KJ 134 Sievern bracteate **r(unOR) wrilu** (= *writu*?), and KJ 74 Reistad stone **unnam wraita**. The standard collocation is **wrītan rúnōz* ‘write runes’, and, as Eikeland indicates, combined with the preposition *ī* also **wrītan ī rúnōz* ‘write in runes’. Contrary to Krause (1971, 144), there is no need to reckon with an adverb *ī* (cf. Stoklund 1991, 98). Neither does KJ 30 Garbølle furnish any parallel evidence for this construction (see 2.1.). The AN phrase **wrītan (ī) rúnōz* is echoed by Icel. *rista (i) rúnar*. On the near-synonymy relationship of AN **wrītan* to some of its competing lexical items, see 2.1.–2.5.

3. Touching on word history and etymology: prehistory and continuation of AN lexemes

Although the older runic inscriptions tend to be both meagre and short, they provide valuable insights into the lexicon, if not a glimpse of the breadth of the lexical stock and its internal structures. Leaving all function words aside, the remaining stock contains about 200 different content words, a good deal of which are supposed to be proper names. In his famous history of the Danish language, Skautrup (1944, 75) suggested that more than 2000 roots within modern Danish were directly inherited from Germanic, and that another 1200 uncompounded nouns arose from within Nordic (Danish). Indeed, comparative evidence indicates that many Ancient Nordic lexemes have a Germanic or even Indo-European background. Amongst them are KJ 76 Opedal stone **swestar** and KJ 72 Tune stone **dohtrir**. The first term can be equated with ON *systir* ‘sister’, a cognate of OE *sweostor* and NHG *Schwester*. Its precursor is IE **sues-ōr* (= OInd. *svásār-*). The second form’s direct descendant is ON *dótr*, the plural of *dóttir* ‘daughter’. Again, this relationship term can surely be traced back to Indo-European because of its cognates OInd. *duhitár-*, Gr. *thygátēr* etc. Another AN relationship term is represented by AN **maguz*, the precursor of ON *mogr* ‘son’; it occurs in the shape of KJ 60 Vetteland stone **magOR** and KJ 75 Kjøllevik stone **magu**. This word is closely related to

OSx. *magu*, OE *mago* and Go. *magus* ‘young boy; servant’. Its etymology is highly disputed, and it is sometimes said to be a non-IE term for ‘son of maternal lineage’ as opposed to **sunuz* ‘son of paternal inheritance’ (cf. Lehmann 1986, 240). In support of this lexical division, cf. especially ON *mágr*, Icel. *mágur*, Sw. *måg* ‘son-in-law’. But AN **maguz* scarcely follows in a direct line from IE **mak^wk^wo-* (> OIr. *mac(c)* ‘son’), or **mak^wo-* (> Cymr. *map*, *mab* ‘son’), although equating them might be tempting on semantic grounds.

The concept of ‘woods’ is reflected by different etyma which can be traced to Proto-Germanic (or even further back). One of them is AN **marku*, the forerunner of ON *mork*, Norw. *mark*. It is mirrored in KJ 53 Kårstad cliff inscription **aljamarkir** ‘foreigner’, lit. ‘one stemming from another march’ (a *bahuvrihi* compound; cf. Schol. Juvenal. 8, 234 on the corresponding Celtic tribal name *Allo-brogos*: “quia ex alio loco fuerant translati”). It should be noted that the *i*-stem formation is solely due to exocentric compounding. AN **marku* is etymologically connected with Lat. *margo* ‘border’ and E *margin*. A second etymon for ‘woods’ is represented by AN **holta-* with *a*-mutation from Gmc **hulta-* < IE *k₁do-*, *d*-extension of IE *kel-* (alleged meaning ‘cut off’). It occurs as an *ija*-derivation in KJ 43 Gallehus **holtijar**. German has the corresponding terms *Holz* ‘wood’ and *Gehölz* ‘woods’. These forms are closely related to Gr. *kládos* ‘twig’ and OIr. *caill* ‘words’ < **kel(ə)d-* lit. ‘what is cut down or cleft asunder’. A word for ‘water’ is AN **laguz*. It is represented as the first element of the personal name **lagu-þewar** on the recently found Illerup shield-mount 3 (cf. Stoklund 1985, 9–11). Incidentally, this is also the name of the 21st rune in the older Fuþark. The *u*-stem **laguz* turns directly into the unlauded form ON *lqgr* ‘water; sea’ (cf. OE *lagu*). One lexeme for ‘stone’ is seen in KJ 50 Strøm whetstone **hali** = *halli* and KJ 81 Stenstad **halar** = *hallaz*. The divergent theme vowels might indicate a dialectal differentiation within the runic language of the 400/500s. The doublet AN *hallaz* ~ *halliz* turns into the *a*-stem ON *hallr* without a significant meaning shift but with replacement of the old *i*-declension. A further inventory of forms is furnished by ON *hella* ‘flat stone’ (loanword Finn. *kallio*) and Go. *hallus*. However, the etymology is somewhat opaque (cf. Magnússon 1989, 301). In all probability, Lith. *kálnas* ‘mountain’ and Lat. *collis* belong here; cf. also OInd. *śilā* ‘stone, rock’, attested in the Old

Indian Atharva Veda. Another term for ‘stone’ is AN *stainaz*, seen in KJ 60 Vetteland stone **staina**. This etymon is widely represented within Germanic; cf. ON *steinn*, Go. *stains*, E *stone*, and G *Stein*. Historically, this is an old *no*-formation of IE *steiā* = Gr. *stía*, *stīon* ‘small stone, silica’ (on the underlying verbal root, cf. OInd. *styāyate* ‘grow dense, stiffen’).

The etymon *horn* is attested as **horna** in KJ 43 Gallehus and KJ 50 Strøm. AN *horna* goes back to Gmc **hurnan* (< IE **k₁rnom*). Its direct descendants are ON and OHG *horn* as well as Go. *haur̥n*. Parallel evidence outside Germanic is furnished, e.g., by OIr. *corn* ‘drinking horn’. Note that OInd. *śṛṅ-ga-* ‘horn of an animal’ and Lat. *corn-ū* exhibit the same root, but make use of different stem formations. AN **korna-* (with *a*-umlaut) is attested in KJ 136 Tjurkö bracteate 1 **walha-kurne** ‘foreign-grain’. It can easily be identified with ON *korn*, E *corn*, OHG *korn*, Go. *kaur̥n*. Further cognates are OPr. *syrne*, OIr. *grán*, and Lat. *grānum* (cf. Magnússon 1989, 496). Thus, the alleged proto-form is *ǵ₁ṛno-* (< **ǵ₁hno-*, with laryngeal *h*). The underlying root is IE *ǵer(ə)-* ‘grow’. The obvious lack of *a*-mutation in **-kurne** has to be accounted for. Since *kurnē* is perfect from a phonological point of view, the easiest way of explaining the non-mutated vowel is a stage with no paradigmatic leveling: nom.sg. **korna* with *a*-umlaut < **kurnan*, but dat.sg. *kurnē* without *a*-umlaut < **kurnai*. Other explanations might invoke a dialectal split or different levels of the AN language (cf. KJ 43 Gallehus **holtijar** with mutated stem vowel < *o* > instead of phonologically expected ***holtijar** = ON *hyltir*, *hyltíng* ‘man from Holt’).

With regard to weapons, KJ 22 Vimose chape **makija** is central. It has numerous Germanic cognates; cf. ON *mækir* and Go. *mēkeis* ‘sword’ (also the loanword Finn. *miekka*). The prehistory of Gmc **mēkijas* (with *ē*¹) has long been disputed. Nowadays it is generally believed to be a migratory term, a “mot voyageur” of eastern origin. This etymon can be traced back to Old Iranian *maḍyaka* > Pers. *mēdf* lit. ‘something attached to the middle, or to the belt’ (see Szemerényi 1979, 110–117). Hence, AN **mākijaz* turns out to be borrowed from Indo-Iranian; it is etymologically in line with OInd. *mādhyā-*, Lat. *medius*, Go. *midjis*, ON *miðr* (Icel. *mið-punktur*) and E *mid* (in *mid-land*, *mid-night* etc.). The concept ‘brightness of the sky’ shines forth in the compound elements KJ 96 Stentoften **hider-** and KJ 97 Björketorp **haidr-**, both

probably stemming from an old neuter *s*-stem **haidiz*. Descendants are the noun ON *heiðr* ‘bright sky’ and the adjective ON *heiðr* ‘clear, cloudless’ (cf. also OE *hādor* ~ *hædor* ‘clearness’). The underlying root is IE (*s*)*kejt-* = OInd. *cet/cit-* (on **hider-/haidr-**, see Schulte 1998, 113–117). Amongst the adjectives is KJ 76 Opedal stone **liubu** (but **leubu** according to Antonsen 1975, 40). This is etymologically related to ON *ljúfr*, OHG *liub* (modern *lieb*), Go. *liuba*. Cf. also OSl. *ljubū* and OInd. *lōbhayati* ‘he entices, excites’. Interestingly, the first element of KJ 136 Tjurkö bracteate 1 **walha-kurne** is directly related to Icel. *valhnot* ‘walnut’ and Icel. Norw. *val-bygg* ‘two-rowed barley’, its original meaning being ‘foreign’. Gmc **walha-* is believed to stem from the Celtic tribal name *Volcae*. Hence, the proper noun ON *Valir* means ‘foreigners’ as does OE *Wealh* (cf. Magnússon 1989, 1100). Incidentally, the compound **walha-kurne** ‘foreign-grain’ can be regarded as a metaphor denoting the gold bracteate. The compound element AN **gin(n)u-* occurs in three different shapes, namely as KJ 27 Kragehul spear shaft **ginu-**, as KJ 96 Stentoften stone **gino-**, and as KJ 97 Björketorp stone **gina-** (on the differing representations of the connecting vowel, see Schulte 1998, 126–129). Its basic semantic range seems to involve spatial extension, as does OE *ginn(e)* ‘vast’. Hence, it is easy to account for a meaning intensifier in compounds such as ON *ginn-heilagr* ‘extremely holy’. The underlying root is IE *ǵhēi-*, *ǵhī-* plus *n*-extension (cf. Pokorny 1959, 419f.; for the well-represented group of *gin*-formations in Nordic, see Schulte 1998, 124). In the verbal sphere there is AN *felhan*. It occurs as KJ 96 Stentoften **felah-eka** and KJ 97 Björketorp **falah-ak** (both with an affixed enclitic **eka*). The preterite form *falh* might also occur in the Tune inscription (cf. Grønvik 1998, 36ff.). In Germanic this verb combines with different prefixes such as *af-*, *ana-*, *bi-*, *ga-*, *us-*, thus modifying its semantic content. The meaning of AN **felhan* seems to be preserved in ON *fela* ‘conceal, hide’; cf. also Go. *-filhan* ‘hide; bury’ (with further lexical enrichment by prefixes). This root **felh-* can be traced back to IE **pelk-*, seen for instance in OPr. *pelkis* ‘cloak’ (for divergent semantic interpretations, see Lehmann 1986, 115). Another attested AN verb is **briutan*. It occurs in two shapes, namely as KJ 96 Stentoften **bariutiþ** and KJ 97 Björketorp **barutr**, thus reflecting Gmc **breutedi* ‘he breaks’. AN **briutan* has convincing parallels outside Germanic; cf.

Lat. *frustum* ‘fragment’, lit. ‘something broken’ and OPr. *brūsnąti* ‘he scrapes’ (cf. Pokorny 1959, 169).

This sketch, though far from being comprehensive, is intended to provide a glimpse of the lexical stock of Ancient Nordic in its broader genetic context. It is obvious that comparative investigations have not yet proved exhaustive. On the other hand, it has to be admitted that pinpointing the ultimate source of words all too often exceeds the possibilities of linguistic methods.

4. Conclusion

In this article, three different approaches have been used to shed light on the AN lexicon. The first is basically concerned with syntactic transformation. Some of the minimal form inscriptions are envisaged as reduced sentences, e.g. KJ 31 Øvre Stabu **raunijar**: ‘I am testing myself in battle’ (cf. ON *reyna sik*). The second approach focuses on lexical field theory in the wake of Trier’s research. This methodological approach is exemplified by the sphere of runic production. Different roots such as **tau/taw-*, **faih/fāh-* and **wurk-* were contrasted in terms of their use and collocational range. Third and finally, AN vocabulary is interpreted in a comparative perspective both inside and outside Germanic. It can be shown that some AN lexemes are typically North Germanic (e.g. *raun-*), others are widely represented within Germanic (e.g. *stain-*), or even further beyond (e.g. **korn-*, *horn-*). Relationship terms such as **swestar** and **dohtrir** also belong here. Thus, many AN words refer directly back to Proto-Germanic or even to Proto-Indo-European, since their root formations are shared by other Germanic and IE languages. Some AN (and Germanic) lexemes, however, seem to have been borrowed from far away in a distant past (e.g. **makija**). The exclusion of AN lexemes (e.g. **tau/taw-*) and the fate of Germanic unstressed prefixes in Nordic have been touched upon briefly. Unfortunately, the attested material is far too scarce to signal processes such as language differentiation and dialectal splits in a systematic way. However, variations like *halliz* ~ *hallaz*, or *-kurnē* (instead of *-kornē*) might indicate such differentiation. In addition, the late AN form KJ 67 Noleby **tojeka** (< **tau-j-eka*) might be due to East Scandinavian monophthongization, since Noleby itself stems from Västergötland in Sweden (cf. Krause 1966, 150).

On the whole, the AN lexicon has to be seen as a highly developed and internally structured system. It shows the significant imprint of the technical language of its time with an extant inventory of technical terms. This holds true especially for the lexical field of runic production, where a complex network of concatenated lexemes existed.

76. The development of Proto-Nordic personal names

1. Sources
2. The question of the provenance of Proto-Nordic personal names
3. Typology
4. Inflection
5. Literature (a selection)

1. Sources

Of the three kinds of sources available for personal names from this period, only runic inscriptions and place-names in *-lev/-löv* will be considered here. Literary sources, both classical and legendary history, entail too many problems involving text criticism and tradition to be considered here (see Kousgård Sørensen 1993, 15).

1.1. Runic inscriptions

The only original sources are the runic inscriptions written in the older, 24-type futhork, from ca. 160 A.D. onward (on the oldest inscriptions, see Stoklund 1995, 317f.). The inscriptions, on portable artefacts like weapons, brooches and bracteates, or on commemorative rune-stones, range geographically from Trøndelag in the north to southern Jutland and the Danish islands in the south, and from Gotland in the east to the western coastal counties of Norway. The majority are located in southern Denmark (see map in Jansson

1987, 186). In these inscriptions, there are 80 different personal names attested with some certainty (see the namelist in Peterson 1994, 162–67; six names in this list should be excluded as occurring on stones and artefacts later than ca. 600: the Gummarp, Istaby, Stentofte, Tveite and Vatn stones and the Setre comb; see Krause 1966, 317f.; Antonsen 1975, 27). Recent finds (Stoklund 1998, 60–63) yield another 3–4 names. (On the difficulty in discerning personal names from other personal designations, see Peterson 1994, 135f. and 3.2.2. below.)

1.2. Place-names

Another very important source are the place-names in (Dan. and Sw.) *-lev, -löv* (< **laiþō*) ‘inheritance’ or ‘enfeoffment’ (see art. 77). They are located in Denmark (incl. southern Schleswig), southern Sweden and southern Norway (Søndergaard 1972, 12; 189–91). It has long been acknowledged that these place-names must have been created before the Viking Age (Pamp 1988, 27); at the latest, the element *-lev/-löv* ceased to be productive around 1000 A.D. (Søndergaard 1972, 11, 156f.). Some 360 names are considered to contain an original **laiþō* (Søndergaard 1972, 35–132). From an earlier opinion that the *-lev/-löv* names almost exclusively contain personal names, modern research has arrived

at the conclusion that the specifics also can be appellatives, adjectives, adverbs and numerals (Søndergaard 1972, 146f.; Søndergaard mentions also gods' names, a much discussed matter; for brief accounts, see, e.g., Kousgård Sørensen 1989, 6f., 14; Andersson 1993, 43, 59f.; for numerals, cf. Elmevik 1979, 68 note 3). All in all, Søndergaard (1972, 154) reckons with a maximum of 181 different personal names in the *-lev/-löv* place-names (for criticism of some of these, see Elmevik 1979, 71 ff.). Place-names in *-staðir*, which often contain personal names, may to a certain extent belong to the period before ca. 600 A.D. (see art. 85, 1.2.), but since they are difficult to stratify chronologically, they will not be considered in the following (cf. Janzén 1954, 87 ff.).

2. The question of the provenance of Proto-Nordic personal names

There has been lively discussion regarding the provenance of the personal names found in PN runic inscriptions and in place-names in *-lev/-löv* (as well as in place-names in *-staðir*). In his major work from 1924, Otto von Friesen – following hints made by Sophus Bugge (1891–1903, 12, 201) – concluded that the majority of the personal names found in PN runic inscriptions were of Continental origin, i.e., they were loan-names mainly from the areas around the lower Rhine. Von Friesen's theory has encountered severe criticism (Janzén 1954; Hald 1971, 111; Peterson 1994; Andersson 1995b, 24 ff.). In the following account of the personal names in the PN runic inscriptions as well as in Nordic place-names in *-lev/-löv*, the names will be regarded as belonging to a common Germanic heritage.

3. Typology

In the Gmc languages there have been mainly three ways of creating a personal name: (a) by compounding two elements from a stock of first elements and second elements, which could be combined rather freely according to the variation system, an ancient name-giving system inherited from IE times (dithematic names; for a discussion of the definition of the term "dithematic", see Peterson 1988, 121 ff.; see also art. 85, 4.1.); (b) by using a noun or an adjective (which, in fact, can be a com-

pound in itself; see, e.g., Peterson 1986, 45; 1988, 122) as a personal name (monothematic names); (c) by making a derivation from, e.g., a noun, adjective or verb and using it as a personal name (derivational names); these are also to be regarded as monothematic (Hald 1971, 68; Peterson 1988, 121 f.; Andersson 1995a, 797). In the latter category, hypocorisms of dithematic or monothematic names constitute a subgroup, e.g. *Harja* on the Vimose comb and the Skåäng stone (K nos. 26 and 85; cf. ON *Heri*), an *-an*-stem formation of names in **Harja-* (cf. ON *herr* masc. 'army') or **-harjar* ('warrior'; Janzén 1947, 77 f., 100; 1954, 179; Hald 1971, 82). (How to render the nom. form of *-an*-stems in normalized PN in cases where it is written with the **a** rune – ending *-a* or *-ǣ?* – is a disputed matter due to different opinions of the IE etymon; see Andersson 1995b, 30 ff.; 1995c, 169 f.; Peterson 1996, 145 ff. For the sake of simplicity, the form *-a* is used in this article.) To distinguish between (a) and (b) is often difficult. Is, for example, *Hlewagastir* on the Gallehus horn (K no. 43) a dithematic name formed according to the variation principle (cf. other names in *-gastir*; see 3.1.), or is it to be regarded as formed from a meaningful compound appellative meaning 'protected/famous guest' (cf. ON *hlé* 'lee, protection' and Gr. *kléos* 'repute') or (as a bahuvrihi formation) 'the one who has famous guests'? (Hald 1971, 20 ff.; Andersson 1998, 22; see also Peterson 1994, 149 f.). In a couple of cases we even find a direct counterpart of a seemingly dithematic name in the inscriptions appearing as an appellative or adjective in later traditions: *Hagustaldar* (Valsfjord cliff and Kjøllevik stone; K nos. 55 and 75) is formally the same word as OHG *hagustalt* 'young warrior', and *Hagirādar* (Garbølle wooden box; K no. 39) the same as ON *hagráðr* 'giving good advice'; in terms of the process of their formation, these two names ought to be regarded as monothematic. Likewise, there are difficulties in distinguishing between (b) and (c); for example, in the case of *Þirbijar* on the Barmen stone (K no. 64), it has been suggested that this could be either an original agent noun meaning 'the one who makes weak' (cf. e.g. OHG *derb* 'unleavened') (for another interpretation, cf. Antonsen 1975, 48) or a derivative (a patronymic or a designation of descent) of a name **Þerbar* (ON **Þiarfr*; cf. the Runic Swedish name *Þerfr*) (Krause 1966, 145; 1971, 46; Brylla 1993, 32; cf. Kousgård Sørensen 1984, 34 f.).

3.1. Dithematic names

Taking into consideration the reservations made in 3., it seems as if there is only one name in the runic corpus that can safely be characterized as belonging to type (a), i.e. a dithematic name formed according to the variation principle: *Agila-mundō* (Rosseland stone, K no. 69; for the first element cf. ON *agi* ‘anxiety, fright’ and *egg* ‘edge’; *-mund-* ‘protector’, here in the fem.). As Krause (1971, 115) observes: “Hier scheinen doch die beiden Glieder willkürlich und ohne gegenseitigen Sinn zusammengestellt” [Here the two elements seem to be compounded arbitrarily and without any mutual meaning]. (Cf., however, Antonsen 1975, 51: “protectress of the blade?”.) There are six names in *-gastir* ‘guest’ recorded in the runic corpus: *Ansu-* ‘heathen god’ (Myklebostad stone, K no. 77): ...*da-* (first element damaged and cannot be determined; Einang stone, K no. 63); *Hlewa-* ‘repute’ or ‘protection’ (see 3.; Gallehus horn, K no. 43); *Sali-* ‘hall’ (Berga stone, K no. 86); *Widu-* ‘wood’ (Sunde stone, K no. 90); *Wāga-* or *Wāga-*, cognate to either ON *vāgr* ‘sea, wave’ or ON *vagn* ‘wagon’, cf. Go. *wagjan* ‘to move’ (Nydham axe-shaft; Stoklund 1995, 341 ff.; 1998, 61 f.). Whether these names in *-gastir* are meaningful compositions (for example, *Ansugastir* has been interpreted as ‘guest of the Æsir [i.e. gods]’; Antonsen 1975, 46) or merely the result of the variation system, is nearly impossible to determine; the question has been characterized as a notorious dilemma (Andersson 1998, 22). Another name element occurring more than once in the runic corpus is *-þewar* (cf. e.g. OHG *deo* ‘servant’). We meet it in *Wulþuþewar* (Torsbjerg chape, K no. 20; see further 3.1.1.) and *Laguþewa* (Illerup shield handle 3; Stoklund 1985, 9 f.; *Lagu-*, cf. ON *logr* ‘water’; on the [seemingly?] missing nom. ending, see e.g. Nielsen 1993, 86, 93). It has been observed (e.g. by Janzén 1954, 99; Hald 1971, 25), that many place-names in *-lev/-löv* contain as specifics personal names ending in **-harjar* ‘warrior’. According to Søndergaard (1972, 148–54), there are no less than 31 personal names in (ON) *-arr* in the *-lev/-löv* names, of which some may originate in **-gairar* (cf. ON *geirr* ‘spear’) or **-warjar* ‘defender’ (cf. ON *verja* ‘to defend’; see the references in Søndergaard loc. cit.), an astonishingly high proportion of a maximum of 181 (17%; see 1.2.). In (fairly) contemporary runic inscriptions we have *Swābaharjar* (Rö stone; K no. 73; *Swāba-* ‘Swabian’), which is also

found in *Svogerslev*, Zealand (Hald 1971, 25; Søndergaard 1972, 107), *Landawarjar* (Tørvika A stone; K no. 91; *Landa-* ‘land’), *Stainawarjar* (Rö stone; K no. 73; *Staina-* ‘stone’ or here, rather, ‘fortification’; Andersson forthcoming), and *Bīda-/Bīda-/Bindawarjar* (Nøvling fibula; K no. 13a; first element ambiguous; see e.g. Seebold 1994, 62; Stoklund 1995, 323), a total of four out of ca. 84 (4%; see 1.1.). The unbalance between the *-lev/-löv* names and the runic inscriptions must not, however, be exaggerated; the material is scarce, etymologizing place-names is difficult because of their being attested only in late sources, and we have to be content with asserting that personal names ending in ON *-arr*, whatever their origins, seem to have been common during the Migration Age in the Nordic countries. Another personal name element occurring in both the runic corpus and the *-lev/-löv* names is *-mārir* ‘famous’ (cf. ON *mærr*). It is found in *Sigimārar* on the Ällerstad stone (K no. 59; for the unexpected thematic vowel and the dating of the inscription, see Antonsen 1975, 81 f.; 1978, 283 f.), and in the specifics of the place-names *Remmarlöv* (Søndergaard 1972, 96; cf. Runic Sw., ON *Hróðmarr*, ODan. *Rothmar*), *Vemmelev*, *Vemmerlöv* (Hald 1971, 29; Søndergaard 1972, 118; cf. Runic Sw. *Vigmarr*), and *Vismarlöv* (Hald 1971, 29; Søndergaard 1972, 122; cf. OHG *Wisamar*). At least one of these names in *-mārir*, **Hrōþimārir* (*Hróðmarr*), ought to be regarded as a proper dithematic name; both elements express the meaning ‘rumour, fame’ (Andersson forthcoming). The totals of the “dithematic” names in the two corpora are, respectively, 27 (32%) for the runic inscriptions and 88 (48%) for the *-lev/-löv* names (Søndergaard 1972, 154).

3.1.1. Theophoric names

Among the dithematic names, a special group has attracted interest, i.e. the names containing as a first element a word for ‘heathen god’ or a name of a heathen god, i.e. theophoric names. In the runic corpus they are – or have been alleged to be the following: *Ansugastir* (Myklebostad stone, K no. 77), *Ansugisalar* (Kragehul spear shaft, K no. 27), *Frawarādar* (?) (Möjbro stone, K no. 99), *Wōdurīdar* (?) (Tune stone, K no. 72), and *Wulþuþewar* (?) (Torsbjerg chape, K no. 20). Personal names in *Ansu-* (ON *As-*, *Ós-* ‘heathen god’) are common in the Gmc languages (Reichert 1990,

462f.). It is only in the Nordic languages that we find gods' names as first elements (such as *Pórr-* and *Freyr-*), and they seem to have been taken into use at the earliest in the Viking Age (see art. 85, 3.1.). For this reason, among others, doubt has been cast on the theophoric content of some of the aforementioned names. *Frawarādar* is most probably to be interpreted as containing the ON adj. *frár* 'quick' (i.e., the name might mean 'the one who gives quick advice'), and not **frauja-* 'lord' (the word that constitutes the ON god's name *Freyr*; Peterson 1994, 152f.). Krause (1966, 165; 1971, 169), among others, connected *Wōdurīdar* with the ON god *Óðinn*, but this interpretation has been criticized as being untenable (Wulf 1994, 36); rather, Antonsen (1975, 45) interprets it as meaning 'the furious rider'. *Wulþubewar* has commonly been connected with the ON god's name *Ullr* (i.e. the name would mean 'servant of the god Ullr'), but, as Andersson (1993, 46ff.) has demonstrated, the name should rather be considered as a variation name made up of a counterpart to Go. *wulþus* 'glory, splendour' and PN *þewar* 'servant', two elements that are well represented in the Gmc personal nomenclature. Among the *-lev/-löv* names there are six *Torslev* (*Tørslev*). Most certainly, none of these contains the ON god's name *Pórr* (cf. Søndergaard 1972, 110, 147), but rather the personal name ON *Þórir*. However, instead of a personal name, a designation for Þórr's priest could lurk here (< **Þunra-wīthar*; Hald 1971, 46f., 50; Kousgård Sørensen 1989, 6ff.; Andersson 1993, 43f.; on the expected but missing gen. ending in **Þunra-*, see Andersson 1993, 41, 52).

3.2. Monothematic names

As was pointed out in 3., both formation types (b) and (c) are to be regarded as monothematic names. Thus, in the following, type (c) will be treated as a subgroup under (b). In the runic corpus there are several names belonging to group (b), a noun or an adjective used as a personal name (*Hagustaldar* and *Hagirādar* disregarded; see 3.): *Bera* (K no. 28; cf. OHG *bero* 'bear'), *Fākar* (K no. 132; cf. ON *fákr* 'horse'), *Hrabnar* (K no. 70; cf. ON *hrafn* 'raven'), *Mūha* (K no. 27; cf. OE *mūha*, *mūga* 'heap', ON *mūgi* 'mass, heap'; for another interpretation, cf. Grønvik 1996, 60ff.), *Winnar* (K no. 58; see Høst 1987, 155ff.; cf. ON *vinnr* 'one who works, one who performs something'); *Braidō* (K no. 54; weak form in the fem. of the ON adj. *breiðr* 'broad'; the reading

of the runes has been disputed but has recently been achieved with the help of a laser gauge probe; Swantesson 1998, 121f.), *Hrarar* (K nos. 73 and 92; cf. the ON vb. *hróra* 'to stir, to move quickly', OHG PN *Hraspod*, *Chrasmar*; i.e. 'the agile one'), *Hrōrar* (K 71; cf. OE *hrōr* 'quick'; an ablaut variant of *Hrarar*), *Lamō* (Udby brooch; Stoklund 1991, 88ff.; weak form in the fem. of the ON adj. *lamr* 'crippled'), *Leubar* (K no. 87; cf. ON *ljúfr* 'dear'; for a discussion of this name, see Peterson 1994, 136f.), *Swarta* (Illerup shield handle 1; Stoklund 1987, 284; weak form in the masc. of the ON adj. *svartr* 'black'), *Wakrar* (K no. 74; cf. ON *vakr* 'awake, fresh, brave'). (For a recent summing up of the discussion of the problematic *Hōrar/Hauhar* on the Fyn bracteate I, K no. 119, see Hauck 1998, 317f.) These twelve out of ca. 84 constitute 14%. Søndergaard (1972, 154), taking into consideration the difficulty in distinguishing between personal names and appellatives in the specifics of place-names, such as ODan. *Diūr/diūr*, *Fughl/fughl* in *Djurslev*, *Dyrlev* and *Fuglslev* (1972, 50, 63), arrives at a maximum number of 44 (24.3%), and a minimum of 32 (18.9%) in the *-lev/-löv* names. On this type of monothematic names, see further 3.2.2.

3.2.1. Hypocorisms

The term "hypocorism" is defined here as a derivative from a personal name or a personal name element, expressing a familiar or friendly attitude. The suffixes concerned are **-an-* (fem. **-ōn-*), **-ia-* (see Hald 1971, 93; Søndergaard 1972, 148), **-ilan-*, **-kan-* (fem. **-kōn-*) and **-san-* (fem. **-sōn-*). The **-an-* suffix is very common in names in Viking Age sources (not always, however, does it express a hypocorism; for a discussion of different types of names formed with the **-an-* suffix, see Peterson 1986, 44). It occurs, alongside fem. **-ōn-*, in the runic corpus ca. 160–ca. 600 A.D. in the following cases: *Al(l)a* (Vimose chape, K no. 22; cf. OHG personal name *Allo* and Gmc names in *Al(a)-* 'all'; Reichert 1990, 456f.), *Ehō* (Donzdorf brooch, found in 1964; from names in **Ehwa-* 'horse'; cf. ON names in *Jó-*; see the discussion in Peterson 1994, 144f.; Düwel 2001, 60), *Harja* (see 3.), *Ingijō* or *Igjō* (Stenstad stone, K no. 81; either from names in *Ing-* or *Ig-*; see the account in Peterson 1994, 146), *Waiga* (Körlin bracteate, K no. 137; cf. OHG personal name *Weiko* and ON women's names in *-veig*; cognate to ON *veig* fem. 'power'). These interpretations are not, how-

ever, wholly undisputed. For example, Antonsen regards *Alla* as coming from the adjective in the weak form (1981, 54), and he interprets *Waiga* as ‘obstinate, bold one’ (1975, 64), while, on the other hand, Seebold (1994, 68) and Grønvik (1996, 12f.) do not on the whole regard the runic sequence interpreted as *Al(l)a* as a name (their interpretations differing). Hypocorisms formed with the **-ia-* suffix seem to be lacking in the runic inscriptions, but according to Søndergaard (1972, 148–54) there are several of them in the *-lev/-löv* names. Together with the **-an-* formations (examples are ODan. *Øthi* and *Øthir* from names in ON *Auð-*; *ibid.* 153f.) they constitute a group of no less than 49 names, i.e. 27.1% of the whole corpus (Søndergaard 1972, 154). The **-ilan-* suffix occurs in the runic corpus in *Frōhila* (Darum I bracteate, K no. 117), *Niuwila* (Darum V bracteate, K no. 104), *Niuwila* (Skonager bracteate, K no. 118), and *Wīwila* (*Wiwila*; Veblungsnes cliff, K no. 56; see Peterson 1994, 147–49; 167). (The alleged *Mēwila* on the Etelhem brooch, K no. 14, is disregarded here; see Peterson 1998, 565). Whether the **-ilan-* suffix is to be regarded here as a hypocoristic suffix added to a personal name or a personal name element (such as names in ON *Frey-*, *-ny*, PN *Wīwar/Wiwar* on the Tune stone, K no. 72), or as an appellative diminutive formation and as such used as a name, is difficult to determine (e.g. *Frōhila* ‘young little master’; see the account in Peterson 1994, 156f.). The **-kan-* and **-san-* suffixes are represented only by *Alukō* (here in the fem.; Førde fishing weight, K no. 49) and *Harisō* (also in the fem.; Himlingøje brooch 1, K no. 9; for a discussion of its gender, see Nielsen 1998, 545 with note 13). The two names might be hypocorisms of names in *Alu-* (cf. *Alugōd* on the Værløse brooch, K no. 11, and several names in ON *Ql-*) and *Harja-* (see 3.), respectively (see the account in Peterson 1994, 155ff.).

3.2.2. Bynames

As has been markedly demonstrated this far, interpretation of personal names in the PN runic inscriptions is often far from straightforward. Even more difficult is the interpretation of what looks like bynames (nicknames), regardless of their being a sole designation of a person or being added appositionally to a main name. (For a different definition of the term “byname”, see art. 85, 3.3. with references.) The problem is whether a runic se-

quence represents a name on the whole or just an appellative personal designation; e.g., in the case of *ek Aljamarkir* (or *aljamarkir*) on the Kårstad cliff (K no. 53; cf. Gmc **alja-* ‘other, foreign’ and **mark-* ‘boundary, district’), the “name” can be interpreted simply as ‘stranger, foreigner’, i.e. a non-name (cf. Krause 1966, 119: “kaum ein Personennamen” [hardly a personal name]; Antonsen 1975, 52: “I Aljamarkiz”; Brylla 1993, 32, who includes it among bynames; cf. also Peterson 1994, 136; 163). Brylla (1993, 30ff.) discusses in an interesting experiment whether it is possible to discern ‘bynames used absolutely’, i.e. as a person’s given name, in the PN runic material by comparing them with later, medieval bynames used appositionally. She observes correspondences in the semantic contents, e.g. designations of descent (such as *Pirbijar*; see 3.), animal designations (such as *Hrabnar*; see 3.2.), and characterizing names (such as *Swarta*; see 3.2.), as well as morphological correspondences, e.g. adjectives in both the indefinite and definite form, and various kinds of derivational suffixes. It has, however, been remarked that names of this kind, ‘bynames used absolutely’, which sometimes have a derogatory content, might be founded on ancient magic concepts, e.g. given as apotropaic names (Otterbjörk 1983, 119f.) or as names expressing expectations (Andersson 1995a, 797). Also, in the few cases when an apposition is added to a personal name, one can be in doubt whether this is to be regarded as a byname or as an occasional adjectival or appellative designation (cf. art. 85, 3.3.2.; 3.3.3.). Examples of such appositions in the runic corpus include only *fārawīsa* (or *fāra-*; Sjælland bracteate II, K no. 127; either ‘wise of dangers’, cf. ON *fār* neut. ‘damage’ etc., or ‘travel-wise’, cf. ON vb. *fara* ‘to travel’), *holtijar* (Gallehus horn, K no. 43; probably ‘dweller in the wood’; cf. ON *holt*, OSw. *hult*; Kousgård Sørensen 1984, 33ff.), *sikijar* (Nydham axe shaft; Stoklund 1995, 341ff.; 1998, 61f.; probably ‘dweller in the fenland’; cf. ON *sik*, *siki* ‘still or slowly running water’; the syntactic connection to the preceding name *Wāga-/Wāgagastir* is, however, unclear; Stoklund loc. cit.), *aipalātar* (Nydham axe shaft; ‘oath-utterer’, cf. ON *eiðr* ‘oath’ and *lāta* ‘to speak’; Stoklund loc. cit.). (The alleged patronymic (*Hrōrar*) *Hrōrer* on the By stone, K no. 71, has to be excluded as being too uncertain as regards both reading and interpretation; see Antonsen 1975, 80f.; Kousgård Sørensen 1984, 34; Grønvik 1996, 126ff. For

an account of the problematic *ni-waje-mārik* on the Torsbjerg chape, K no. 20, see Stoklund 1995, 327f.)

Morphologically, the bynames discussed in this section are of various kinds. A suffix denoting relationship or extraction (geographically or personally), Gmc **-ja-*, occurs in *holtijar*, maybe also in *Pirbijar*. Another suffix with the same meaning is **-ing-*. It is represented in *Iuþingar* (Reistad stone, K no. 74; derivation base **euþa-*, cf. ON *jóð* neut. 'child'; Förstemann 1900, 982; Krause 1971, 46; Magnússon 1989, 432) and *Māringu* (fem.; Tanem stone, K no. 89; derivation base masc. personal name **Māri-la*; Krause 1971, 46; Antonsen 1975, 69). An adjectival suffix **-aga-/*-iga-* forming personal names occurs in e.g. *Gōdagar* (Valsfjord cliff, K no. 55; cf. ON *góðr* 'good'), *Hīwigar* (or *Hīw-*; Årstad stone, K no. 58; either from a word cognate to Go. *heiwa-* 'house, family' or to Go. *hīwi* 'appearance', ON *hý* 'thin hair, down'), *Laiþigar* (Møgedal stone, K no. 88; cf. ON adj. *leiðr* 'unpleasant', OHG, G *leidig* 'id'). (More examples of this suffix are given in Krause 1971, 108f.; some interpretations are, however, insecure.) For other types of derivatives forming personal names, see Peterson 1994, 168 and cf. the namelist pp. 162–67.

4. Inflection

The majority of the personal names in the PN runic inscriptions follow inflectional patterns expected for the period in question and the language group affiliation. However, two phenomena appearing in the runic corpus have attracted attention. The lack of an expected nom. ending in strongly inflected male names (*Alawin* three times, *Alawid* (-wīd?)) on the Skodborg bracteate, K no. 105; cf. Seebold 1995, 177; *Alugōd* on the Værløse brooch, K no. 11; female?; see the account in Stoklund 1995, 320f.) has caused controversy as to whether a vocative case has survived from earlier stages or the forms are to be regarded as WGmc suffixless nominatives (see e.g. Nielsen 1998, 542). Recent finds of a couple of early instances exhibiting a masc. nom. ending *-ō* of **-an-* stem formations (*Wagnijō* three times on the Illerup and Vimose lance heads; Stoklund 1987, 283ff.; *Niþijō* (or *Niþjō*) on the Illerup shield handle 2; Stoklund 1987, 288ff.) have led to the conclusion that the *-ō* ending here, occurring alongside with the more common *-a* ending (see 3.), must be regarded as an archaism from a stage prior to the PN dif-

ferentiation of gender of the *-n-* stems (see e.g. Andersson 1995b, 31f.; Nielsen 1998, 544f.).

77. The development of Proto-Nordic place-names

1. The oldest place-names
2. Hydronyms
3. Island names
4. Settlement names
5. Literature (a selection)

1. The oldest place-names

The oldest Nordic place-names still used are natural feature names, above all hydronyms (river names, lake names and bay names) and island names. They are to some extent Pre-Germanic, dating back to the Bronze Age (up to 500 B.C.). Such toponyms exist in Denmark, Norway and Sweden. It is a disputed and problematic question whether there are place-names of PGmc origin in Finland. Many old natural feature names are preserved only

in settlement names. (Andersson 1972, 5ff.; Naert 1988, 155ff.; Huldén 1990, 111ff.; Andersson 1995a, 792 f.; 1995b, 3ff.; Nes 1985, 7ff.; Bandle 1994, 24ff.; Naert 1995, 14ff.; Kousgård Sørensen 1996, 440ff.; Helleland 1997, 49ff.)

2. Hydronyms

In Denmark almost all the prehistoric hydronyms have disappeared, but it is possible to reconstruct much of the lost structure out of settlement names containing old hydronyms. In Norway and Sweden reconstruction of old names also is necessary to a great extent, but numerous old hydronyms are still in use in these countries. It is difficult to determine whether Finland has any hydronyms

of PGmc or PN origin or not (Naert 1988, 166ff.; Huldén 1990, 112ff.).

When dealing with old hydronyms, one has to distinguish between primary name formation (by derivation or composition) and secondary name formation (using an already existing word as a name). The oldest hydronyms are derivations or secondary name formations. Compound names are younger as a type of formation. Uncompounded names seem to have been the dominant category during the PGmc period. Most of the old suffixes had ceased to be productive before the Viking Age, when composition had become the most common way of forming new hydronyms. The situation in Iceland, colonized during the Viking Age, is informative in this connection (Bandle 1977, 46, 49ff.; Stemshaug 1997a, 39). The development from derivation to composition is very important during the period 0–800 A.D.: „Die durchgreifendste Strukturveränderung in der Ortsnamenbildung ist eben das allmähliche Absterben der Ableitung zugunsten der Zusammensetzung“ (Andersson 1995a, 793. Cf. Bandle 1984, 26f.; Greule 1996, 1534f.). Categories of compound original natural feature names which in many cases may go back to the period 0–600 A.D. are lake names containing OSw. **unde(r)* masc. ‘water, lake’ or the common ODan. *sio*, *s(i)ø*, *sæ*, OSw. *sio(r)*, OWN *sjór*, *sjár*, *sær* ‘lake’ and bay names containing OWN *-angr*, OSw. *-anger* ‘creek, bay, fjord’ (Nyman 2000, 124ff., 145ff.; Holm 1991, 662ff.; Bandle 1997, 40, 42).

Prehistoric uncompounded river names that are primary name formations are feminine. (Names of streams and rapids and sometimes names of small watercourses have masculine gender.) Old uncompounded but suffix-derived lake names (primary name formations referring to fairly big bodies of water) and fjord names are, as a rule, masculine; in Norway, however, there are several interesting examples of feminine hydronyms denoting lakes, among those *Mjøsa*, the largest lake in the country.

Many hydronymic secondary name formations contain words denoting water. One such hydronym is the lake name *Vättern* (OSw. *Vætur* ‘the water, the lake’). Other secondary name formations contain adjectives, e.g. the Swedish lake name *Bolmen* (*bolm* ‘big’).

Even very old hydronyms may be formally secondary, i.e. formed on the basis of another toponym. In many cases a river name and a lake name are genetically connected with each

other. The lake name Sw. *Värmeln* (< PN **Wermilax*) means ‘the lake connected with the river **Værma* < **Wermōn*’, the river name OSw. **Længia* (preserved in the parish name *Långbro*) means ‘the river connected with the lake *Lången* < **Langer* or **Langsior*’ and the basis of the river name Norw. *Orkla* is the river name **Ork* or a dehydronymic lake name **Orkull* or **Orkill* ‘the lake connected with the river *Ork*’.

A rare and very old phenomenon is the relationship between hydronyms expressed by ablaut. It is difficult to prove the existence of such relationships, but the Norwegian lake name *Mjær* and the river name ONorw. **Mors* (preserved in the town name *Moss*) are probably connected with each other by ablaut. Another supposed Norwegian instance is the relationship between the river name ONorw. **Ver* (in Verdal) and the lake name ONorw. **Værir*. Such name relations may date back to the PIE period.

The productivity periods for different suffixes are of great importance for the dating of old uncompounded natural feature names. Some suffixes already went out of use before the PN period, others were productive during this period and certain suffixes were still in use in the Viking Age (see e.g. Christensen/Koussgård Sørensen 1972, 177ff., and cf. below). The existence of secondary name formations complicates the dating process based on suffixes, because derivations containing an ancient suffix may have survived as appellatives long after the time when the suffix fell into disuse. The Norwegian fjord name *Sogn* illustrates this complication. It may be a very old hydronymic derivation with an *-n-* suffix from the verb *suga* ‘suck’, but it may also contain an appellative ONorw. *sogn* corresponding to the Sw. dialect word *sugn* ‘part of a river where the current becomes stronger near the rapids’. In the latter case it is difficult to establish a *terminus ante quem* for the coining of the fjord name *Sogn*.

One complication connected with the dating of hydronyms is the fact that an epexegetic second element in many cases has been added (or may have been added) to an originally uncompounded hydronym. The Danish river name *Gudenå*, for instance, has replaced an *-n-*derived older *Guthen*, and the Norwegian fjord name *Kvinesfjorden* (*Hviniisfjorðr*) is a younger form than ONorw. *Hvinir* (cf. e.g. Greule 1996, 1535). Another problem is the possibility of ellipsis. At least in Sweden, numerous hydronyms have been changed by re-

duction or ellipsis (reduction of elements). A *Bjuren* of today may for example be an elliptic form, having replaced an OSw. **Biurasior* 'the beaver lake'. It is often very difficult to decide whether a lake name in *-en*, *-aren* or *-ern* is an original compound or is instead a very old un-compounded derivation containing *-an-*, *-ia-* or another suffix. In Norway ellipsis has also been taken into account. Kousgård Sørensen, however, has not found much evidence of ellipsis (of the type **Biurasior* > *Bjuren*) in Danish lake names and river names. Cf. for example Greule 1996, 1535.

(Indrebø 1924, 225ff.; Olsen 1939, 32ff.; Andersson 1972, 8ff.; Bandle 1984, 19ff.; Kousgård Sørensen 1985, 25ff.; Andersson 1995a, 793 f., 1995b, 4 f.; Kousgård Sørensen 1996, 454ff.; Strandberg 1991, 160ff., 190ff., 225ff.; 1996, 59ff.; Nes 1997a, 43ff.; Stemshaug 1997a, 37ff.; 1997b, 41ff.; cf. Bandle 1994, 24ff.)

The semantic contents of hydronyms vary. One group consists of un-compounded names that are identical with designations for water-courses, lakes, bays, pools etc. (see above). River names and lake names may refer to the water itself (sound, colour, currents, location, form, size, depth, length, sand, stones, clay and so on), to natural features or animals in the water or in the surroundings, to agriculture, stock rearing or communications, to fields, mills, buildings and settlements etc., and they may express the resemblance of the body of water to different things. Compound names of small bodies of water may contain personal names.

In old times lakes and watercourses were conspicuous features in the landscape, and they were given formally primary names very early. When settlements had been established and become important, they attracted much attention, and over the course of time the original hydronyms often disappeared and were replaced by younger formally secondary names referring to settlements (for example Dan. *Esrum Sø*, after the settlement name *Esrum*, instead of the hydronym ODan. **Æsi*). Developments of that kind are particularly typical of Denmark but are very frequent also in Norway and Sweden.

Names which are results of eponymization have a special semantic background. Such names are as a rule relatively young, but there seem to be ancient hydronyms that have taken their names through very early eponymization or are conditioned by the pattern of a very old name.

(Hellquist 1903–06 3, 49ff.; Indrebø 1924, 269ff.; Olsen 1939, 32f.; Pamp 1988, 95ff.; Kousgård Sørensen 1996, 274ff.; Strandberg 1996, 59ff.; Stemshaug 1997a, 39f.; 1997b, 42.)

The old hydronymic suffixes in Scandinavia are largely the same as in other Germanic areas. In many cases Nordic hydronyms correspond to or are related to river names on the European continent or in Great Britain, sometimes to names that are supposed to belong to Hans Krahe's *alteuropäische Hydronymie*. There are, e.g., several Nordic river names (Nes 1985, 9f., 15f.; Strandberg 1988, 18) belonging to the PIE root **eis-/ois/*is* 'move fast' (Krahe 1964, 55ff.), and two originally hydronymic Sw. *Ammer* names (Andersson 1972, 18f.; Strandberg 1988, 22f., with reference to Bertil Flemström) seem to contain PIE **ombh-* 'water; vapour, mist' (Krahe 1964, 90f.). Krahe's important theories have in some respects been criticized by Nordic scholars. The possibility of secondary name formation makes the suffix-based chronology of the old hydronyms less convincing. Names connected with PIE roots with the meaning 'water', 'river', 'stream' or the like may have a more specific meaning and be due to more individual features of the rivers in question. Outside Scandinavia, *Alster* and *Elster* in Germany and other European hydronyms in *Al-* have been connected to PIE **el-/*ol-* 'flow', but in Nordic research hydronyms in *Al-* are supposed to contain Gmc **al-* 'grow'. (Andersson 1972, 11ff.; Kousgård Sørensen 1982, 47ff.; Bandle 1984, 18ff.; Andersson 1988, 59ff.; Strandberg 1988, 17ff.; Andersson 1995b, 6; Kousgård Sørensen 1996, 444ff. Cf. Schmid 1995, 756ff.; Greule 1996, 1537.)

Hydronyms on the Continent and in Great Britain have been divided into different groups according to their ages (see e.g. Ekwall 1928, xlviff.; Greule 1973, 225ff.; 1996, 1536f.). The productivity periods for the suffixes are very important in this connection. In Scandinavia much research work remains to be done in this field, but efforts have been made to establish different chronological layers (Kousgård Sørensen 1996, 454ff.: PIE names, PGmc names and PN names. Cf. Bandle 1984, 26f.). Comparisons between Scandinavia and other parts of Europe are important in this connection: the Nordic hydronym *Åtran* for example – containing the adjective **aitra-* 'swelling' with corresponding hydronyms outside Scandinavia – probably belongs to the PGmc layer (Andersson 1972, 14; Strandberg 1988, 27).

Comparisons of the same kind are also important when studying hydronyms with the suffix *-und* in primary and secondary name formations. This suffix was productive over a very long time, probably from PIE times up to and including the PN period. (Nyman 2000, 139ff. with references to i. a. Hans Krahe and Oddvar Nes). Some suffixes ceased being productive earlier than others. According to Kousgård Sørensen (1996, 456), the river name ODan. **Imbra* (*-r-* suffix) and the lake name Dan. **Als* (*-s-* suffix) probably date back to Pre-Germanic times. *-m-* and *-str-* have been regarded as PGmc toponymic suffixes (Kousgård Sørensen 1996, 457; Andersson 1974, 310 respectively). The suffixes *-an-* and *-ön-* were productive also in the PN period.

An important question is to what extent there were special “place-name suffixes”, i.e. suffixes that have lost their original character (in the formation of appellatives) and are used only as morphological instruments, deprived of their original meaning, when new toponymic derivations are made, or suffixes that have ceased to be used for making new appellatives but still function as exclusively toponymic suffixes. In Scandinavia the *-n-* suffix has had a special toponymic function and it was used remarkably late. (Andersson 1980, 17ff.; 1995b, 5.)

3. Island names

There are very old island names in Scandinavia. The oldest layer probably goes back to the PIE period. Morphologically, island names have much in common with the old river names. When dating island names, the difference between primary and secondary name formations is also very important. The Norwegian island name *Mjømna*, for example, is a secondary name formation with its starting point in PGmc or PN **međuma-* ‘middle’ (Nes 1985, 8 with references to Lennart Moberg and Thorsten Andersson); the name is probably very old, perhaps of PGmc origin, but the *-m-* suffix cannot be used as a dating criterion in this case. Original natural feature names containing a very old appellative **borgund*, PGmc **burgund-* ‘elevation’ (originally a PIE adjective with the meaning ‘high’) constitute a group of secondary name formations that has attracted much attention. Among these names are the Norwegian parish name *Borgund* and the Swedish parish name *Borgunda*, but also Nordic island names; the old

name of the Danish island Bornholm (OWN *Borgundarholmr*) is considered to have been ODan. **Burghund* (Nes 1985, 8f.; Nyman 2000, 215ff.). Suffixes like *-iō-*, *-n-*, *-str-*, *-und-* and others occur both in hydronyms and island names. The suffix *-iō-*, for example, is supposed to be contained in an ODan. island name **Hæls* (< **Halsiō*) ‘the island with the neck’ (Hald 1971, 79f.) as well as in the Swedish river name *Nissan* (ODan. *Niz*) (Sahlgren 1959, 22ff.; Bandle 1984, 21). The possibilities of dividing island names into different groups according to their ages are fundamentally the same as for hydronyms. During the Viking Age, composition (or secondary name formation) had become the normal way – instead of derivation – of coining new island names. It is probable that the *-n-* suffix took on the function of a special “place-name suffix” and was used remarkably late in island names as well as in hydronyms (Bandle 1994, 25ff.). In some cases the elevation of the land gives a *terminus ante quem* of the origin of an island name.

(Hald 1965, 237ff.; 1971, 71ff.; Andersson 1980, 9ff.; Bandle 1994, 24ff.; Nes 1997b, 46ff.)

4. Settlement names

Primary settlement names denoted settlements which were already established when the names in question originated. Secondary settlement names once denoted something else before they were attached to settlements.

In Denmark, Norway and Sweden there are types of settlement names that originated during the Early Iron Age (500 B.C.–400 A.D.) (see Naert 1995, 14ff. about the situation in Finland). At least names containing the second elements *-by/-bø*, *-heim/-hem*, *-ingi/-ungi*, *-land(a)*, *-staðir*, *-tun(a)* and *-vin(i)* constitute such settlement name types (see below). Uncompounded secondary settlement names like *Näs* ‘the foreland’, *Vik* ‘the bay’, *Åker* ‘the field’ and the plural forms *Berga* (*berg* ‘mountain’) and *Lunda* (*lund* ‘grove’) may be as old as these compound types, and secondary settlement names may contain natural feature names or field names that are much older than the settlements in question. It still remains to be discovered whether or to what extent Nordic settlement names of today may have originated during the Bronze Age.

(Hald 1965, 29ff.; Brink 1984, 18ff.; Stemshaug 1985, 90f.; Strid 1986, 187ff.;

Pamp 1988, 20ff.; Widgren 1990, 33ff.; Sandnes 1997a, 32ff.; Strid 1999, 33f., 78ff.; Særheim 2001, 300ff., 318ff.)

4.1. Ancient types of settlement names

-by/-bø

Danish and Swedish settlement names in *-by* and Norwegian names in *-by* or *-bø* constitute a very large category. In Sweden there are about 3400 *-by* names and in Norway about 1100 names in *-by/-bø* or *-boen* (many uncompounded names). Such names occur throughout Scandinavia and in the Danelaw and Normandy. In Norway the distribution of *-by* and *-bø* is complementary: Austlandet (with some exceptions) and Trøndelag have forms in *-by*. (Hald 1965, 102; Hellberg 1967, 245f.; Ståhl 1976, 71; Stemshaug 1985, 109f.)

The place-name type in question has been productive over a very long period. According to an earlier opinion, *-by/-bø* names is a younger place-name type than the *-staðir* names. The oldest Nordic layer of *-by/-bø* names, however, belongs (like the *-staðir* names) to the Early Iron Age, but the names to a great extent were coined after the period 0–600 A.D. The results of an investigation of selected material from the Mälaren region indicate that there are *-by* settlements that are older than *-staðir* settlements (Larsson 1997, 166ff.). At least many of the *-by* settlements are secondary, emanating from older settlements. (Ståhle 1946, 588; Hald 1965, 103ff.; Hellberg 1967, 238f., 246ff., 372f.; Stemshaug 1985, 110f.; Schmidt 2000, 563.)

The word EN *by*, OWN *býr* ‘farm; village’ and its parallel form OWN *bór*, Norw. *bø*, are derivations of the verb EN *bo*, OSw. *boa*, Norw. *bu*, Icel. *búa*, OWN *búa* ‘live, reside; prepare, get ready’. It is controversial whether the place-name element *-by/-bø* originally had the meaning ‘cultivation, tillage, plantation, reclaimed land; meadow’ or ‘dwelling, residence’. A traditional interpretation of *-by/-bø* in old settlement names has been ‘farm’ or ‘village’, but it is possible that the two words at an early stage denoted cultivated land of some kind (Hellberg 1967, 417f.: ‘cultivation, cultivated land’ → ‘meadow, cultivated meadow in grove’). In Dan. *-by* names ‘village’ has been regarded as an older and more frequent meaning than ‘farm’ (cf., however, Hellberg 1967, 371). (Hald 1965, 102f.; Hellberg 1967, 369ff., 417ff.; Ståhl 1976, 71; Stemshaug 1985, 109; Pamp 1988, 38ff.; Jørgensen 1994, 50; Schmidt 2000, 50ff.)

Only a few very old *-by* names in Sweden are considered to contain personal names, but anthroponyms can be found in younger instances. In Denmark *-by* names with anthroponymic first elements occur in certain areas. Many Norw. *-by/-bø* names are compounds with personal names. Nordic names in *-by/-bø* often refer to vegetation and other features in the landscape. Many names contain words for cardinal points and other words that indicate the situation of the *-by/-bø* localities in question. (Hald 1965, 103ff.; Hellberg 1967, 246f., 407ff.; Ståhl 1976, 72f.; Stemshaug 1985, 110; Schmidt 2000, 525ff.)

-heim/-hem

The prehistoric layer of the numerous toponyms in EN *-hem(-um)*, WN *-heim* belong (like *-inge* names and *-vin(i)* names) to the oldest types of Nordic settlement names. The number of old *-hem/-heim* names is approximately 1000 in Norway and, according to Stefan Brink (1991, 67), about 200 in Denmark and about 300 in Sweden. Iceland has rather few settlement names in *-heimur*, stereotyped formations which apparently are comparatively young. (There are also young Nordic names containing *hem* or *heim* as a second element; only prehistoric names are considered in the following.) The *-heim* names of Norway are widely spread over the country. Most Sw. *-hem* names occur in western provinces, above all in Västergötland, but this type of settlement name is also represented in Uppland, Ångermanland, Östergötland, on Gotland and in other parts of the country. The Danish core area of this name type is northern Jutland, where *-hem* names are particularly frequent in Himmerland and Ommersyssel. The *-hem* names in Jutland and in Halland and Västergötland to the east of Jutland have been looked upon as evidence of ancient cultural contacts straight across the Kattegat. (Hald 1942, 26ff.; Lundahl 1948, 49ff.; Hald 1965, 60ff.; Ståhl 1976, 75; Stemshaug 1985, 97f.; Pamp 1988, 31; Brink 1991, 66ff.; Bandle 1997, 40f.) The Nordic names are probably connected with continental settlement names in *-heim* (Andersson 1995b, 9f., 13, 16f.; cf. Hald 1942, 33f.; 1965, 62ff.).

Settlement names in *-heim/-hem* < **haima-* had their initial stage of productivity during the Early Iron Age. As far as Norway is concerned, particular stress has been laid on the productivity period 0–600 A.D. An attempt has also been made to date the oldest Swedish names back to the time around the birth of

Christ. In Västergötland, a province with very early settlements, the *-hem* names have become parish names in more than half of all cases. Over the course of time, the form of old names in *-hem* has often changed considerably, as, for instance, in *Viad* (< OSw. *Vihem*) and *Årja* (< OSw. *Arhem*). For the many *-hem* names in Himmerland, the time around the year 300 has been suggested as a *terminus post quem*; in that connection archaeological results and the chronology of the corresponding West Germanic names have been taken into consideration. The Icelandic names in *-heimur* are, of course, younger than the period 0–600 A.D. (Hald 1942, 30ff.; Hovda 1961, 294; Hald 1965, 62ff.; Ståhl 1976, 76; Stemshaug 1985, 99; Pamp 1988, 31f.; Brink 1991, 68ff.; Sandnes 1997b, 203f.)

The Nordic place-name element *-heim/-hem* has the meaning ‘farm, settlement’ but also ‘(large) settlement area, settlement district’ or the like. Both meanings may go back to a more original one: ‘home, place of residence’. Kristian Hald proposes a semantic development from ‘(large) settlement area (district)’ to ‘farm, settlement’. *Trondheim* in Norway means ‘the settlement district (province) of the *trønder*’. In most cases *-heim/-hem* is supposed to have the sense ‘farm, (separate) settlement’. An old meaning of ‘resource area’ or the like is worth pondering. (Sahlgren 1938, 70ff.; Hald 1942, 38ff.; 1965, 58; Hovda 1961, 294f.; Ståhl 1976, 73f.; Pamp 1988, 31; Brink 1991, 75ff.; Jørgensen 1994, 117; Sandnes 1997b, 203.)

The old *-hem* names in Denmark and Sweden do not contain personal names in their first elements, and anthroponymic first elements are very rare (only one indubitable instance) in Norw. *-heim* names. In this respect Nordic names are very different from the corresponding West Germanic names in *-heim*. The Nordic first elements often refer to things in the landscape: animals, vegetation, water, depressions, elevations, soil, fences or enclosures, etc. A number of names are compounded with adjectives. Old hydronyms are contained in *-hem* names like Sw. *Alster* (< *Alstrem*) and *Visnum*. A secondary name formation (containing a compounded appellative) is *Gudhem* / *Gudum* ‘home of the gods’, which in various forms occurs in several places. (Hald 1942, 35ff.; 1965, 58ff.; Ståhl 1976, 75f.; Stemshaug 1985, 98f.; Brink 1991, 71ff.; Sandnes 1997b, 203.)

-ingi/-ungi

The East Nordic settlement names in *-ingi* and *-ungi* (now *-ing(e)*, *-unge*) give evidence of old prehistoric connections between Scandinavia and the Germanic part of the European continent. Investigations carried out by Carl Ivar Ståhle (1946, 155ff.) have resulted in the opinion that there is an old continuous distribution area of settlement names in a singular *-ingi* (< PN *-ingia* neut.), including large parts of Sweden and all Denmark as well as Schleswig-Holstein, the North Sea coast, Nieder-Sachsen and Thüringen (Andersson 1995b, 10ff. with references to Rob Rentenaar and other scholars; cf. Bandle 1997, 46 as to the Swedish names). In Sweden there are *-inge/-unge* names in the provinces around Lake Mälaren, where they are particularly frequent, and in Närke and Götaland. An original *-unge* has often been replaced by *-inge*. The modern Danish ending is *-ing* in Jutland and *-inge* on the islands. Several toponyms originally ending in *-ing/-ung* (< PN *-ingar*, *-ungar*) have over the course of time been transformed into *-inge/-unge* names. (Hald 1965, 41ff.; Ståhl 1976, 61ff.; Pamp 1988, 34; Jørgensen 1994, 142f.)

The *-ingi/-ungi* names to a great extent originated during the Early Iron Age and the Migration Age. Some of them may date back to the Viking Age. (Ståhle 1946, 569ff.; Hald 1965, 54f.; Ståhl 1976, 63; Pamp 1988, 35.)

At least in the beginning, the *-ingi/-ungi* names as derivations were collective nouns or expressions of possession formed with the suffix *-ia-* on the basis of inhabitant designations in (pl.) *-ingar*, *-ungar* (PN *-ingōr*, *-ungōr*). This kind of inhabitant designation is very well documented in the Nordic languages and still exists there (e.g. *öläanning* ‘inhabitant of Öland’); there are place-name forms in *-unga* in Sweden which are supposed to contain the genitive plural of inhabitant designations. A toponym like *Sköldinge* (< PN **Skeldungia* neut.) then means ‘the sköldungar, i.e., the people living in a place called Sköld (PN **Skeldur*) or near an elevation with the shape of a shield’, ‘the area of the sköldungar’ or the like, and the meaning of the town name *Skänninge* then is ‘(the area of) the people living by the river Skenaån (< PN **Skain-*)’. At a later stage *-ingia/-ungia-* may have been used analogically for coining place-names directly from nouns denoting natural features, without the mediation of an inhabitant designation. (Ståhle 1946, 9ff., 100ff., 135ff., 495ff.; Hald 1965, 44f.; Ståhl 1976, 61ff.; Pamp 1988, 34f.; Jørgensen 1994, 142f.; Andersson 1995b,

10f.) The Nordic *-ingi/-ungi* names differ from the related or corresponding continental Germanic toponyms in so far as they – at least as a rule – do not have anthroponymic starting-points or bases (Stähle 1946, 558ff.; Hald 1965, 45ff.; Andersson 1995b, 13.)

-land(a)

Land is the second element in different kinds of Nordic toponyms, for example names of realms, provinces or districts (e.g. *Djursland* and *Jylland* in Denmark, *Helgeland* and *Rogaland* in Norway, *Halland* and *Värmland* in Sweden and *Finland* and *Island*), names of pre-historic settlements (villages and farms) and field names (Særheim 2001, 26ff.). It has been considered uncertain whether *land* has the meaning ‘island’ or ‘province; territory’ in island names like *Gotland* in Sweden and *Langeland* and *Lolland* in Denmark (Ståhl 1976, 143; Særheim 1997, 279f.; 2001, 32; cf. Jørgensen 1994, 172f., 183). The Swedish province name *Öland* contains an appellative, OSw. *öland*, OWN *eyland* ‘island’.

Sweden and above all Norway have numerous old settlement names with *-land* or *-landa* as the second element. The common Norwegian form is *-land*. In Sweden you find both *-landa* and *-land*. Norway has about 2000 farm names in *-land* spread over the country; they are particularly numerous in the southwestern part of Norway (Agder, Hordaland, Rogaland and Telemark). OSw. farm names and village names in *-land(a)* (roughly 300) occur most frequently in some western provinces (Bohuslän, Dalsland, Västergötland in Götaland and Värmland in Svealand). There are several *-land* names in Iceland, the Orkneys and Shetland. (Særheim 1997, 280; 2001, 36ff.)

The *-land(a)* class of settlement names has been productive over a long period. Norw. *-land* names as a rule originated before the end of the Viking Age. The archaeological material seems to indicate that many *-land* names were coined around 200–550 A.D. Another productive period began in the middle of the 7th century. There are settlement names containing *land* that probably are older than the year 200 A.D. Some uncompounded plural names, ONorw. (*)*Landir*, may go back to the Bronze Age. (Stemshaug 1985, 101; Særheim 1997, 281f.; 2001, 294ff.) The oldest *-land(a)* names in Sweden are presumed to date from the Migration Age, but they are possibly older and chronologically comparable with the settlement names in *-vin(i)* (Ståhl 1976, 82f.; Karlsson 1991, 36f.).

The old settlement names in *-land(a)* are closely connected with farming. It is probable that to a great extent they are original field names. The basic meaning of the element *land* in the settlement names may be ‘piece of land’, ‘land as property’ or ‘land suitable for farming’. An interpretation of that kind is likely also for *-land(a)* in the old Swedish names. (Stemshaug 1985, 100f.; Karlsson 1991, 37; Bandle 1997, 40; Særheim 1997, 280; 2001, 259ff.) In Sweden, however, several scholars have proposed the meaning ‘land as opposed to water, riverside, lakeside’ for *-landa* names in the southwestern part of the country. This interpretation, upheld by Hjalmar Lindroth (1923, 123), has played an important role for a long time (see for instance Lundahl 1948, 62; 1972, 22; Ståhl 1976, 81f.) and it is mentioned as a possibility also in works from the end of the twentieth century. The agrarian connection is, however, more probable.

The *-land* names in Norway often have a first element describing the topography in some way: *Fotland* (OWN *fors* ‘rapid; stream’), *Rivjaland* (OWN *rif* ‘bank, reef’), *Røysland* (OWN *hreysar* ‘mounds of stones’ or *hreysi* ‘mound of stone’) etc. Many of them contain denotations for plants or trees, e.g. *Birkeland* (OWN *birki* ‘clump of birches, birch grove’) and *Eskeland* (OWN *eski* ‘ash grove’). Of great interest with regard to the possible meaning ‘land suitable for farming’, ‘cultivated land’ or the like for *-land* are first elements denoting cultivated plants, e.g., *Rug-rye* in *Rugland*, and domestic animals, e.g., *Ross-* ‘horse’ in *Rossland* and names containing words like OWN *eng* ‘meadow’ and *hagi* ‘enclosed pasture’ (Særheim 2001, 276ff.). In Sweden we find names like *Getlanda* (OSw. *get* ‘goat’), *Råglanda* (an appellative OSw. **rughland*, **roghland* ‘field where rye is cultivated’) and *Vetlanda* (OSw. *hvet* ‘wheat’) (Lundahl 1948, 62, 1972, 22; Ståhl 1976, 82).

Numerous Norw. *-land* names are assumed to contain names of pagan gods (Særheim 2001, 283). Swedish examples of that kind are *Odenslanda* (*Oden* ‘Woden’) and *Torslanda* (*Tor* ‘Thor’) (Ståhl 1976, 81f.). First elements consisting of personal names are not common among the Norw. *-land* names (Særheim 2001, 283) and the Swedish names in *-land(a)* (Karlsson 1991, 36).

-lev/-löv

The place-name element Dan. *-lev*/ Sw. *-löv* is a distinctive trait of Denmark and southern Sweden. Their distribution in Denmark is un-

even. They occur most frequently in Zealand and the northern part of Funen; there are *-lev* names in eastern Jutland, but with one exception the name type is missing in western Jutland. Most Swedish names in *-löv* are to be found in Scania; there are also toponyms in *-löv* in the adjacent provinces to the north of Scania. The northernmost certain instance of a Sw. *-löv* name is the parish name *Häggesled* (OSw. *-lef*) not far from Lake Vänern in Västergötland. *Jale* in southern Norway has also been classified among the names of this category. Søndergaard estimates 350–360 *-lev/-löv* names in Scandinavia. (Søndergaard 1972, 10ff., 86, 179; Ståhl 1976, 63; Pamp 1988, 26f.; Jørgensen 1994, 176f.; Bandle 1997, 50f.)

The German place-name element *-leben* corresponds to the Nordic *-lev/-löv*. There are toponyms in *-leben* in Thuringia and adjacent areas. A much discussed question is whether those names were brought to Germany by tribes from Denmark. According to another opinion the German *-leben* names are genetically independent of the Nordic equivalents. It is also possible that the *-leben* names indicate a prehistoric area of distribution including both southern Scandinavia and Thuringia. (Hald 1965, 82; Søndergaard 1972, 158ff.; Andersson 1995b, 14ff.)

Most *-lev/-löv* names have anthroponymic first elements. The personal names in question are never Christian ones, which indicates that the toponyms were coined before Denmark was Christianized. No names in *-lev* are observed in the Danelaw and Normandy; the productivity of this place-name type in Denmark had probably come to an end or become rather insignificant before the Viking Age. The oldest layer of the *-lev/-löv* names is assumed to date from the Migration Age (perhaps with some still older exceptions). The year 1000 is a likely *terminus ante quem* for their productivity, but it is possible that some names originated during the Viking Age. (Hald 1965, 77ff.; Søndergaard 1972, 155ff.; Ståhl 1976, 64f.; Pamp 1988, 27; Jørgensen 1994, 177.)

The place-name element *-lev/-löv* goes back to an Old Nordic word represented by OSw. *lef* ‘survival, remnant’ and OWN *-leif* ‘inheritance; (pl.) remnants’ (< PN **laibō*), corresponding to Go. *laiba*, OSx. *leba* ‘remainder, rest’ and OE *laf* ‘rest; inheritance’. According to one opinion, *lef* as a place-name element has the meaning ‘something transferred, conveyed’ and refers to estates given as enfeoffments. It is more likely, however, that *-lev* means ‘something left, inheritance’ or ‘prop-

erty which a man can leave to his heirs’; the numerous personal names in the first elements then probably refer to the men who left the estates in question. (Hald 1965, 75ff.; Søndergaard 1972, 133ff.; Ståhl 1976, 63f.; Pamp 1988, 27; Jørgensen 1994, 176f.)

When dating the place-name type, one has to consider that the anthroponyms in the *-lev/-löv* names to a great extent are dithematic ones; several of them contain (ON) *-arr* (< **-harjar* ‘warrior’, *-gairar* ‘spear’ or *-warjar* ‘defender’) or *-marr* (< *-mārik* ‘famous’) (see art. 76). Dan. *Gørslev* and Sw. *Görslöv* e.g. contain the male name *Gotar* (< **Gautaharjar*), and Dan. *Sigerslev* and *Sejerslev* contain *Sighar*. There are also first elements which contain words other than anthroponyms. (Hald 1965, 77ff.; Søndergaard 1972, 146ff.; Ståhl 1976, 64f.)

-lösa/-løse

When dealing with *-lösa* /*-løse* names, one has to distinguish between two entirely different categories: on the one hand very old settlement names containing AN **lösa* (probably original natural feature names or field names), and on the other hand names compounded with *-lösa* ‘lack (of something)’, e.g. *Mjölsered* (OSw. *Miollösa*) ‘place where meal (flour) is missing’. In Norway there are many toponyms of the last-mentioned kind. The names expressing lack of something are considered to be younger than the other category; Ivar Lundahl, however, has maintained that “lack-names” may also be very old. (See Elmevik 1971, 15ff.; Ståhl 1976, 77f., in both cases with references.)

Attention will be focused here on the so-called “real *-lösa* names”, i.e. prehistoric settlement names in Dan. *-løse*, Sw. *-lösa* which do not refer to the lack of something. They constitute an exclusively Nordic place-name type, represented on the Danish islands and in the southern part of Sweden. They are particularly frequent in Zealand; there are no unquestionable examples in Jutland. The region around Lake Mälaren is the northernmost area where many such names are to be found. There are more *-lösa* names in the eastern provinces of Götaland and Svealand than in western ones. It is very possible that this place-name type originated in ancient Denmark and expanded northward in Sweden. It has been pointed out that these names and the western Nordic names in *-vin(i)* to a great extent occur in complementary distribution. There are no uncompounded **Lösa* /**Løse*-

names. (Hald 1965, 69, 71; Elmevik 1971, 15f.; Ståhl 1976, 78; Pamp 1988, 27f.; Jørgensen 1994, 189; Andersson 1995b, 16f.; Bandle 1997, 46f.)

Danish villages with names in ODan. *-lösa* are very large settlements. The names in Denmark and Scania seem to be older than the *-lösa* names in the region around Lake Mälaren. The oldest layer of the Nordic *-lösa/-löse* names originated before the Viking Age and probably dates back to the Migration Age at least. (Hald 1965, 70f.; Ståhl 1976, 78; Pamp 1988, 28; Jørgensen 1994, 189.)

The “real” *-lösa/-löse* names contain an ancient noun, OEN **lösa*, which is not recorded as an appellative. The meaning and origin of this **lösa* has been much debated. It probably denoted natural features or fields (meadows or pastures) of some kind. A traditional interpretation of **lösa* is ‘meadow, pasture’. An interpretation that has been well established in recent time is ‘open place, glade’. The word **lösa* then goes back to a PGmc, PN **lauhsōn* related to the adjective Dan. *lys*, Sw. *ljus*, OWN *ljōss* ‘light, bright’ (<**leuhs-*); the element *-laus-* in toponyms in Gotland indicates that the PN form was **lauhsōn* and not **lauhsjōn*. (Elmevik 1980, 86f.; 2000, 82f.) The meaning ‘open place, glade’ probably developed into ‘meadow, pasture’ or the like. According to another suggestion, put forward long ago but quite recently motivated in detail by Gun Widmark (1999, 25ff.; cf. Elmevik 2000, 82ff.), the toponymic element has to do with the adjective Dan. *lös*, Sw. *lös*, OWN *lauss* ‘loose, free’. (See about the derivation Hald 1965, 67f.; Elmevik 1971, 15ff.; Ståhl 1976, 77; Pamp 1988, 27; Jørgensen 1994, 189; Widmark 1999, 25ff.; Elmevik 2000, 82ff.)

It is often difficult to interpret the first element in a *-lösa/-löse* name. Many of the first elements denote features in the landscape., e.g. *Ramlösa* in Scania (probably *ramm* ‘boggy meadow’; Ståhl 1976, 78), *Slagelse* in Zealand (**slagh* ‘depression, hollow’; Jørgensen 1994, 260) and *Vättilösa* in Västergötland (**vætur* ‘water; river’; Ståhl 1976, 78). The Danish names do not contain personal names, but in Sweden there are *-lösa* names compounded with anthroponyms, e.g. *Gumlösa* in Uppland (the male name *Gudmund*). The personal names which have been considered are never Christian. (Hald 1965, 69; Elmevik 1971, 32ff.; Ståhl 1976, 78; Pamp 1988, 28; Jørgensen 1994, 189.)

-staðir (> *-sta(d)/-sted*)

A characteristic of the so-called “real” *-sta(d)/-sted* names is their plural form (ON *-staðir*); in the following they will be called *-staðir* names. The approximate number of Nordic settlement names in ON *-staðir* (Norw. *-stad*, Sw. *-sta(d)*, *-städe*, Dan. *-sted*) has been estimated at 220 in Denmark, 1160 in Iceland, 2500 in Norway and 2000 in Sweden. Their distribution in these countries is widespread. They occur very frequently in Austlandet and Trøndelag and the Mälaren region and Östergötland. There are toponyms in *-sta(d)/-sted* with a different background, among them names containing *stad* ‘landing place’. (Kousgård Sørensen 1958, 27ff.; Hald 1965, 84, 86f.; Hellberg 1967, 243ff.; Ståhl 1976, 69; Stemshaug 1985, 102ff.; Jørgensen 1994, 270f.; Sandnes 1997c, 421f.) With PGmc **staði-* ‘place’ (ODan. *stath*, OSw. *stadher*, OWN *staðr* masc.) as a starting-point, the Nordic *-staðir* names have been connected with English names in *-stead* and German names in *-statt/-stedt*, *-stätten/-stetten*; the character of this relationship between names in Scandinavia on the one hand and on the Germanic continent and in England on the other hand has been interpreted in different ways; according to Thorsten Andersson and other scholars these Germanic groups did not originate independently of each other (Kousgård Sørensen 1958, 295ff.; Sandred 1963, 15ff.; Hellberg 1967, 243; Holm 1967, 9ff.; 1993, 33ff.; Andersson 1995b, 13f., 17).

The oldest layer of the Nordic *-staðir* names (in Denmark, Norway and Sweden) belongs to the period 0–600 A.D., but the place-name type was productive as late as during the Viking Age (Kousgård Sørensen 1958, 239ff.; Hald 1965, 84ff.; Hellberg 1967, 238f., 248ff., 369; Holm 1967, 94ff.; Ståhl 1976, 70f.; Stemshaug 1985, 104f.; Jørgensen 1994, 270f.; Sandnes 1997c, 421f.).

The origin and meaning of the *-staðir* names have been controversial topics for a long time and the literature dealing with this complicated place-name type is extensive. One important question is whether Nordic *-staðir* names originally were settlement names or field names; the most probable answer is that there were both settlement names and field names in *-staðir* at an early stage. Another question is whether as a second element *-staðir* is the result of the reduction of different compounded words, e.g. PN **būastaðir* ‘dwelling, farm’, **haimastaðir* ‘home(stead)’ and **hūsōnstaðir* ‘place with houses’, which is a

suggestion put forward by Gösta Holm (1967, 41 f.). The plural form of the “real” *-sta(d)/-sted* names is also to be explained; one possible answer is that the plural form is due to a plurality of fields or parts of fields. When interpreting *-staðir* etymologically, a common starting point has been the meaning ‘place’ of PN **staðir*, but there are important exceptions. Lars Hellberg has proposed the meaning ‘contraption, saddle; fence’ of *-staði-*, and Lennart Elmevik maintains that Sw. *-staðir* contains another word, PN **staða* neut. ‘edge’ and supposes that the toponyms in question referred to outlying settlements (in the outskirts). The way of interpreting the first elements of the *-staðir* names has changed over time. For a long time the common opinion was that a great majority of these first elements consist of personal names. Later investigations have shown that the number of anthroponymic first elements is considerably smaller than earlier supposed. (Linde 1951, 152 ff.; Kousgård Sørensen 1958, 151 ff.; Hald 1965, 83 ff.; Hellberg 1967, 257 ff., 358 ff.; Holm 1967, 41 ff., 104 ff.; Ståhl 1976, 67 ff.; Akselberg 1984, 51 ff.; Stemshaug 1985, 102 ff.; Holm 1993, 33 ff.; Elmevik 1994, 113 ff.; Jørgensen 1994, 270 f.; Sandnes 1997c, 421 f.; Elmevik 2000, 69 ff.)

-tun(a)

Settlement names in *-tun(a)* or *-tune(r)* occur in Denmark, Norway and Sweden. There are also toponyms containing *tún* in the Faroes and Iceland and some *-tuna* names in Finland. In this account of the period 0–600 A.D., attention will be paid to the old prehistoric names in Denmark, Norway and Sweden.

In Denmark there are some probably old village names with *tun* as the second element in Jutland, e.g. *Galten* and *Orten*, and an un-compounded plural *Tune* in Zealand (Hald 1965, 72 f.; Jørgensen 1994, 307). Norway has at least 120–130 farm names in *-tun(er)* and several un-compounded names (*Tun/Ton, Tune/Tone, Tuner/Toner*), among them the well-known plural *Tune* in Østfold. More than half of the compound Norwegian names are to be found in Hordaland and Sogn og Fjordane in western Norway (Sandnes 1997d, 226). The Swedish names have plural form as a rule. They are to a remarkably great extent un-compounded (*Tuna*), a fact of importance in the discussion of their historical background. In more ancient times there was an even higher number of un-compounded *Tuna* names. The town name *Eskilstuna* (*St. Eskil*),

for instance, has replaced an early OSw. *Tuna*. The word *tun (tún)* is the first element of many Norwegian and Swedish settlement names, among them several ancient names in *-heim/-hem* and the very old town name *Tønsberg* (ONorw. *Túnsberg*). The great majority of the (nearly 120) Swedish old settlement names in *-tuna* (plural) belong to the central region of the ancient Swedes (*sviones*), i.e. the provinces of Södermanland, Uppland and Västmanland around Lake Mälaren. In Uppland alone there are nearly 50 *-tuna* names. The rest of the Swedish names are widely spread. (Holmberg 1969, passim; Ståhl 1975, 45 f.; 1976, 78 f.; Sandnes 1997d, 225 ff.) When dividing Sweden into three different culture areas, the Danish-Swedish, the Norwegian-Swedish and the Eastern Swedish areas, Jöran Sahlgren regarded *-tuna* as one of the typical place-name elements of the last-mentioned culture area (see Ståhl 1976, 57; cf. Bandle 1997, 52 ff.).

The oldest *-tuna* names in Sweden probably originated in the Early Iron Age, before 400 A.D. (Hellberg 1985, 24); the village of Nántuna in Uppland, for instance, has a graveyard from this period. Most of them, however, seem to date from the Late Iron Age (Holmberg 1969, 264 ff.; Andersson 1968, 91 ff., 103 ff.; Pamp 1988, 34). The Norw. *-tun* names have been assumed to be younger than the Sw. *-tuna* names. In western Norway names in *-tun* were given during the Middle Ages. According to Jørn Sandnes (1997d, 226 ff.), however, most pre-medieval Norw. *-tun* names originated before 600 A.D.; he takes it that the oldest stratum dates back to the Early Iron Age.

Swedish places with *-tuna* names are often remarkable from a historical point of view. The towns of Eskilstuna and Sigtuna were important religious centres in the Middle Ages. Numerous names in *-tuna* have become parish names. Some Swedish *hundare* (‘hundred’) districts bear names in *-tuna*, e.g. *Simtuna* and *Torstuna* in Uppland. *Sollentuna* and *Vallentuna* have been assumed to be ancient centres of *hundare* districts (Andersson 1991, 197 f.; cf. Elmevik 1996, 51 f.), and a number of *-tuna* names have been connected with names of pagan gods (Andersson 1991, 201 f.; however, cf. Elmevik 1996, 47 ff.). In certain cases, notable prehistoric graveyards or gold hoards have been found at *-tuna* places.

There is general agreement about the basic meaning of the word *tun (tún)* in the Nordic *-tun(a)/-tune* names: originally ‘fence’ and early on also ‘enclosure’. Etymologically ON *tún* ‘enclosed piece of land; enclosure within

which a farm house is built, farm house with its buildings' and the Swedish dialect word *tun* 'fence, enclosure' correspond to G *Zaun* 'fence' and E *town*; it is also related to the Gallic place-name element *-dunon* 'castle' (Latinized *-dunum*). As to the character of the denoted Swedish localities, however, very different suggestions have been put forward: enclosures (for cattle), farms (par préférence), enclosed cult places, trading centres, court ('thing') locations, fortifications, administrative centres. According to Ivar Lundahl (1972, 30f.) *tuna* has the sense 'farm' (cf. Elmevik 1996, 51 ff.). Karl Axel Holmberg (1969, 279 f.) is inclined to interpret *tun* in the element *-tuna* as simply 'fence' or 'enclosure'; cf. the Danish hundred name *Galten* (< **Galtatun* 'enclosure for boars') (Andersson 1991, 201; Jørgensen 1994, 89). The fact that *-tuna* names so often are un-compounded (*Tuna*) does not, however, speak in favour of the alternative 'fence; enclosure (for domestic animals)' (Olsson 1976, 74). Sahlgren (1963, 39 ff.) has connected the *-tuna* names with the ancient maritime war organization of the Swedes (cf. Tacitus, *Germania* 98 A.D.): *Suionum hinc civitates, ipso in Oceano, praeter viros armaque classibus valent*). He points out that such toponyms in Uppland (the original home of the prehistoric Swedes, *sviones*) are connected to the most important waterways and takes it that names of fortifications for the protection of the waterways were coined by means of *tuna* in the sense of 'stronghold'. Worth mentioning here is that the Norwegian town name *Tønsberg* is assumed to contain a **Tūn* referring to an ancient stronghold on a mountain in the town (Sandnes 1997d, 228 f.). Continental Germanic material is said to testify that *tun* was also used for fortifications (Andersson 1991, 199).

Lars Hellberg (1985, 20 ff.) maintains that *-tuna* settlements were administrative centres within the territory of the prehistoric Swedes. They may be predecessors of the important *Husaby* settlements (*husaby* is an old *terminus technicus* for (royal) administrative centres), which occur most frequently in the old core region of the *sviones*. Combining *-tuna* names with certain other place-names, Hellberg reconstructs toponymic "environments" that indicate Swedish administration and influence in the Iron Age. A prehistoric centre is, for example, to be found in Husby-Långhundra parish. In the Middle Ages the church village was named *Husaby Ærnavi*. A *Tuna* settlement is situated not far from the church. At Tuna

a gold find dating from the period 0–400 A.D. has been made. A big burial mound at the church village has been excavated. It contained a chieftain's or great man's grave from the sixth century with precious articles of gold, silver, ivory and glass. *Ærnavi*, the second element of which is OSw. **vi* 'holy place, sanctuary', is probably a theophoric name (see Vikstrand 2001, 304 ff. with reference to Lenart Elmevik). Another interesting *Tuna* "environment", situated in the neighbourhood of Västerås, comprises a medieval 'thing' (court) location, a very rich grave with gold finds (around 300 A.D.) at the Tuna settlement and a remarkable and famous complex of ancient monuments with Anundshögen, a very big burial mound, and a field with so-called boat-graves. Here Hellberg (1985, 20) reconstructs a large ancient settlement including Tuna and the now independent villages Långby, Närke and Sörby. *Närlunda* is a theophoric toponym, containing *Njörd*, the name of a pagan deity, and *lund* '(sacred) grove'. It is very likely that this Tuna was an important centre in prehistoric society. In the parish of Tun in Västergötland there is a big burial mound near the church and a huge mound of stones (60 × 7 metres); this is also presumed to have been a prehistoric center (Brink 1997, 69 f.).

The truth is probably that the *-tuna* names do not constitute a uniform group: in ancient societies there were *-tuna* places with different backgrounds and functions (Ståhl 1975, 48; Andersson 1991, 201 ff.). Kristian Hald (1965, 73) and Bent Jørgensen (1994, 307) reckon with the meaning 'enclosure' in the old Danish names.

There are topographic denotations among the first elements of the Sw. *-tuna* names, but they do not dominate. *Sä-*, an archaic composition form of *sjö* 'lake', occurs in *Sätuna* in some places. Inhabitant designations connected to areas or districts are contained in *Färentuna*, *Sollentuna* and *Vallentuna* in Uppland. Anthroponymic first elements are missing completely (*Eskilstuna* seems to be an exception, but did not contain the man's name *Eskil* originally) (Ståhl 1975, 45 ff.; 1976, 80). In Norway you can find *-tun* names compounded with personal names; such place-names probably are rather young. Sometimes the first element refers to a natural feature. (Hovda 1975, 50.) The Dan. *-tun* name *Vitten* may contain ODan. **wi* 'holy place, sanctuary' (Hald 1965, 73; Jørgensen 1994, 336).

The possibility of Celtic influence on the Nordic *-tun(a)* names has been pondered:

-tuna has been explained as a popular etymological transformation of Ce. *-dunon* ‘castle’ or of *-dunum*, a Latinized form of *-dunon*, used in names of fortified towns in Celtic provinces subdued by the Romans. A name of particular interest is the much discussed *Sigtuna*, denoting a very old town in Uppland, and other *Sigtuna* names in Scandinavia. According to a suggestion put forward by Magnus Olsen, a Gallic **segodunon* ‘strong castle’ was taken over by the Germanic peoples and transformed under the influence from PGmc **segi(z)-*, OWN *sigr* ‘victory’, resulting in the place-name *Sigtuna* (see Holmberg 1969, 13 f.; Andersson 1991, 199 ff.). The hypothesis about Celtic influence on the *-tuna* names has never been abandoned, but one must give priority to a vernacular Nordic morphological and semantic origin for this place-name type.

-vin(i)

Numbering approximately 1000, the settlement names in *-vin(i)* are characteristic of Norway, where the name type is widespread; most of the names belong to the southern part of the country. In Sweden the *-vin(i)* names occur in Västergötland, where they are numerous, and in adjacent western provinces; Jämtland, Medelpad and Ångermanland are also to be mentioned. There may be a few Danish instances. The *-vin(i)* names are probably as a rule secondary settlement names. Natural feature names or field names containing *vin* are recorded in Shetland and the Orkneys. In Norway there are many uncompounded *-vin(i)* names, for example *Vinje* in Telemark and Trøndelag; a Swedish instance is probably the hundred name *Väne* in Västergötland. (Lundahl 1948, 83 f.; Jansson 1951, 29 ff.; Hald 1965, 73 f.; Hovda 1976, 77 ff.; Ståhl 1976, 65 f.; Stemshaug 1985, 92; Pamp 1988, 29 f.; Jørgensen 1994, 333; Andersson 1995b, 7 ff.)

The *-vin(i)* names have had a long period of productivity and belong to the oldest place-name types in Scandinavia. The oldest settlement names may date back to the time around the birth of Christ and the youngest instances were perhaps coined in the eleventh century. The names are largely *i*-mutated. In Norway a considerable number of them have become parish names. (Jansson 1951, 385 ff.; Ståhl 1976, 66 f.; Stemshaug 1985, 96 f.; Pamp 1988, 29 f.; Jørgensen 1994, 333.)

The common ON ending *-ini* / *-ene* (< *-vini*) in the place-names was originally the singular dative form of the *jō*-stem ON *vin* in the position as second element. This word corre-

sponds to Go. *winja*, OHG *winne* ‘pasture’, and the meaning of the Nordic place-name element is ‘pasture, meadow’. It is difficult to ascertain whether the *-vin(i)* localities were small or large pastures or meadows. (Lundahl 1948, 84 f.; Jansson 1951, 259 ff.; Hald 1965, 73; Ståhl 1976, 65 f.; Pamp 1988, 29.)

The first elements are of various kinds, but there is no known example of an anthroponymic first element in Norway or Sweden. Many of them refer to features in the landscape, e.g. the town name *Bergen* (OWN *berg* or *bjørg* ‘mountain’) and *Bryne* (OWN *brún* ‘edge’) in Norway, others to animals, e.g. *Fygle* (OWN *fugl* ‘bird’) in Norway, *Gäsene* (OSw. *gas* ‘goose’) and *Kälvene* (OSw. *kalver* ‘calf’) in Sweden. In Norway there are *-vin(i)* names with names of pagan gods as first element, e.g. *Ullern* (OWN *Ullr*). (Jansson 1951, 45 ff.; Hovda 1976, 81 ff.; Ståhl 1976, 65 f.; Stemshaug 1985, 94 ff.)

78. Sociolinguistic perspectives and language contact in Proto-Nordic

1. Scandinavia and contact with the Celtic and the Roman realms
2. The runes
3. Loanwords from Old-Celtic
4. Loanwords from Latin
5. Proto-Nordic loanwords in Finnish and Sami
6. Loanwords from Iranian languages
7. The problem with the Goths
8. Toponymy in the Germanic time
9. Literature (a selection)

1. Scandinavia and contact with the Celtic and the Roman realms

During the centuries around the birth of Christ, we can trace a contact between Scandinavia and the Continent, especially in the form of imported commodities. In the Celtic period (ca. 500 B.C.–0), the most widespread objects of Continental background in Scandinavia are metal objects, first in bronze, later in iron. The iron culture is successively sipping into Scandinavia during this period, introduced by the Celts in the La Tène and Hall-

statt cultures. In the Roman period (ca. 0–400 A.D.), contacts between Scandinavia and the Continent became more intensive (see e.g. Lund Hansen 1987; 1988; Hedeager 1992; Lund Hansen et al. 1995; Andersson/Herschend 1997). Now luxury goods, such as bronze vessels, glass, silver objects, statues, weapons and silver and gold coins, as well as more humble commodities, were coming into Scandinavia in large quantities. Some were traded, obviously with fur and leather, others were brought home by Germans who had served as soldiers in the Roman army. There is also a possible exchange between Roman and Germanic aristocrats. It is self-evident that the society in Scandinavia changed due to this intensive contact. We may see this in the way of trade and market (Ekholm 1934; Hagberg 1967–77; Rausing 1987), in the measure and weight system (Herschend 1980; 1991; Fønnesbech-Sandberg 1988), in the agrarian structure and maybe also in the religious cult activities. Naturally also the language was part of this infiltrational process.

2. The runes

The perhaps most important phenomenon in this field was the emergence of runic writing in Scandinavia some 2000 years ago. In this case we may not isolate the runes to a Scandinavian problem, while it is a Pan-Germanic phenomenon. It is obvious that the runes are made on the basis of an existing alphabet, most probably the Latin alphabet, and the area of invention is, again, most probably north of the *Limes*, thus in northwestern Germany or Denmark. The invention is to be seen in a context with the intensive contacts between the Roman world and the Germanic area in the Roman Iron Age. Due to the contacts north of *Limes* we had a Germanic culture very much infiltrated with Roman culture. This gave way for many Roman loanwords sipping into the Germanic languages (see sect. 4), and obviously also the emergence of runes. I have extensively discussed the origins and development of the Germanic runes in art. 37.

3. Loanwords from Old-Celtic

As is well known, languages are in a steady drift, in a constant change. New words are borrowed from other languages, very often in a context where a new artefact, phenomenon or tool is introduced; the word for it is brought with it, old words become obsolete. In the middle of the first millennium B.C. and the centuries thereafter, when Celtic people had a dominating position in the west and north part of the Continent, several Celtic words were borrowed into Germanic. It is natural that words, related to the new iron culture, that was flourishing among the Celts, such as OSw. *iærn*, ON *jarn* 'iron', cf. OIr. *íarn*, *íærn*, were introduced. Also words related to the political realm were borrowed, such as ON *riki* n. 'power, dominion' < **ríkia-* from OCe. **rígjon*, cf. OIr. *rige* n. A third important loan from the Celts is the word Sw. *ämbete*, Dan. *embede*, Norw. *embete*, ON *embætti* from Gall. *ambactus* 'servant', which also is to be found behind the ON *ambótt* f. (< **ambahtō-*) 'femal slave, servant'. From the Celtic loanwords in Scandinavian it is evident that the Celtic society was on a higher technological and societal level than the Scandinavian culture. That is the background for the import of a new iron technology, together with the terminology, a new kind of "polity", a hierarchical structure of power, reflected in the

words for "kings" and leaders, and new social structures, for example the introduction of *ambactus* > *ambótt* 'slave, servant'. The interesting question is, if slavery was introduced into Scandinavia with this Celtic contact, as this latter word may be an indication of, or if slavery already was existing within the Scandinavian Bronze Age society, or if it is a later Roman import?

4. Loanwords from Latin

When the Roman empire later on became the dominating factor on the continent, many new words were borrowed from Latin; again, very often the word was introduced together with the new artefact or tool. There are many examples to be found: ON *ketill* (< **katila-*) 'cauldron' from Lat. *catillus*, a diminutive to *catinus* 'plate, bowl', Sw. *källare* 'cellar' from Lat. *cellarium* (an early loan, before the time when Lat. *c* before *e* changed from *k* > *s*), Sw. *port* 'doorway' from Lat. *porta* (also an early loan, before the High-German sound shift), the verb OSw. *kopa* (< **kaupian*) and ON *kaupa* < **kaupōn* 'buy', probably formed on Lat. *caupo* 'merchant (especially in wine)', and Sw. *mångla* 'hawk' from Lat. *mango* 'slave trader'. From the latter two examples, both important words in the trading and market sphere, Elof Hellquist (1948, 551) draws the conclusion that the trading with wine and slaves were the basis in the barter between the Roman empire and the Germanic people to the north. In this context it is only natural that also the word Sw. *marknad*, Dan. *marked*, ON *mark(n)aðr* is a Latin loan, from *mercatus* 'trade, market' and that ON *eyrir*, OSw. *øre* is formed on the Lat. gold coin *aureus*. In this trade with the Romans many new merchandises were introduced into the Germanic area, and normally with them also the Roman word for the commodity, such as Lat. *vīnum* > ON *vín* 'wine', Lat. *piper* > ON *piparr*, OSw. *pipar* 'pepper', etc. (See etymological lexica, Hellquist 1929–32, 912ff. and P. Scardigli in Reall. 9, 552ff.)

5. Proto-Nordic loanwords in Finnish and Sami

In this early period, Scandinavia was not only a borrowing part. It is very interesting that many Proto-Germanic and Proto-Nordic words found their way into the Sami and the Finnish languages (see *Lexikon der älteren*

germanischen Lehnwörter in den ostseefinnischen Sprachen 1991 ff.; Hofstra 1985; Thomsen 1890; 1967; Qvigstad 1893; Noreen 1923, 4f.; Karsten 1943; Fromm 1958; K. B. Wiklund in *IF* 38; J. Koivulehto 1971; 1973; 1981a; 1981b; 1995; Ritter 1993; Green 1999; cf. Larsson 1995; Korhonen 1997). This must indicate that we had fairly intensive contacts between Scandinavians and these people in this period. A well known example is Finn. *kuningas* from PGmc **kuningaz* ‘king’ (R. Ekblom in *St Neoph.* 17, 1944, 1–24), others are Finn. *ruthinas* ‘lord’ < PGmc **druhtinaz*, ON *dróttinn*, Finn. *valta* ‘power’ < PGmc **walðan*, Finn. *rengas* < PGmc **hrengaz*, ON *hringr* ‘ring’, Finn. *nauta* < PGmc **nauta-*, ON *naut* n. ‘cattle’. Some of these may be very old borrowings, pre-dating a separate Proto-Nordic language (see Fromm 1958; de Vries 1961, 256, 406; Penzl 1972, 16).

Recently Jorma Koivulehto (1986) has demonstrated that some loanwords in Finnish must have been borrowed in a very early phase, before the time of the Law of Sievers, and he can furthermore show that the North-west-Germanic sound change $\bar{e}^1 > \bar{a}$ must have been earlier than generally assumed, completed perhaps already by 300–200 B. C. at the latest. Thus, according to Koivulehto, the contacts between the Germanic and the Finnish languages, that resulted in the first Germanic loanwords in Finnish, are to be dated to an Early Proto-Finnish period, when we had a common proto-language of Lapp and Baltic-Finnic, and which may be as early as ca. 1500–500 B. C., thus the Nordic Bronze Age.

6. Loanwords from Iranian languages

Scandinavian, and Germanic, languages have also adopted some words that presumably have their origin in Iranian languages (Benveniste 1963; Green 1999). That words for horses and fermented milk may have such an origin seems of course plausible for a nomadic culture focused around the horse. Another word may be *pad* ‘path’ etc., found in some rare dialect words and place-names in Scandinavia, the most well-known perhaps being the province name of *Medelpad* in northern Sweden, OSw. *Mæþalpaþ*. Germanic words and names with initial *p-* are extremely rare and often loanwords (Green 1999, 28). The most intriguing word of this probable origin is, however, the word ON *mækir*, Go. *mēki*

‘sword’ (Szemerényi 1979; Green 1999, 26f.). It has been believed that the word has found its way from Iranian languages into Germanic, Slavonic and Finnish probably when the Goths had reached contact with the Iranian people after the move to the Black Sea area and with the Goths as intermediators the word finally reached the area around the Baltic and the North Sea. However, the word is evidenced already in one of the oldest runic inscriptions we have, namely on the Vimose sword-chape, dated to ca. A. D. 250, as **makija** (acc.sg.) (Moltke 1985, 100). As D. H. Green (1999, 26f.) has pointed out, this makes “an improbably short timespan for the Goths to have adopted the word in the south, passing it back to the north, and for North Germanic to have adopted it in turn.” Instead Green argues quite convincingly that the word reached the Goths when they still were in Poland and he also identifies the Go. *mēki* with the short *gladii breves* sword, mentioned by Tacitus as characteristic of the East Germanic tribes. In this way, a single word may write history. This fact is important in showing the potential of philology for pre-historical periods, when we lack written evidence.

7. The problem with the Goths

A huge and intensively discussed topic is the question regarding the origin of the *Goths*. This question is linked with the problem of the splitting up of the Proto-Germanic language into East-, West- and North-Germanic (cf. e.g. Schwarz 1951; Markey 1976), and it is very much linked with historical and archaeological evidence regarding the Goths (see “Goten” in Reall. 12, 1998, 402ff. for a Stand der Forschung and for references, and also Wagner 1967; Hachmann 1970; Czarnecki 1975; Wolfram 1990; Bierbrauer 1994; Heather 1996; Green 1999). The waves of discussion have been high, and still are. From a stance, where Scandinavia was believed to be the *Urheimat* of the Goths (e.g. Kossinna 1897; 1920; Weibull 1958), we had a later position where instead Germany was focused (e.g. Hachmann 1970). In the last decades, discussion has very much stressed the Continental background for the Goths. In this light it is interesting to notice a recent and important contribution by the Scandinavian philologist Thorsten Andersson (1995; 1996; 1998), which – again – highlights the Scandinavian connection, and presents linguistic arguments that

are worth considering in the future discussion.

When the Goths first are mentioned by the Classical authors, they are located at the estuary of the river Wisla/Weichsel in today's Poland. Right across the Baltic lived the *gutar* on Gotland, and further on the *gautar* in Götaland. It seems too much of a coincidence to find three people around the Baltic with linguistically related names, and not to consider some kind of affinity or relationship between them, especially when we know that water does not separate but connects people. As Andersson argues, the evidenced form *gutoni* on the Pietroassa runerung most probably reflects a pl.gen. Go. *gutonê*, corresponding to pl.nom. Go. *gutans* (PGmc **gutani-z*), which is identical with the name of the *Gutar* on Gotland. Between the *Gutar/Goths* and the *Gotar* (< *Gautar*), we find a relationship with different ablaut. What is imbued in this ablaut shift has been discussed and is a very intricate question, but an argument that related people could manifest the relationship by choosing or be manifested by given different ablaut forms of the same basis seems plausible, and may have a parallel in the place-name material, while it is believed that really ancient names of lakes and rivers, that are geographically related, to show topographical affinity are formed on the same base but with different ablaut forms, e.g. *Moss(-elven)* < *Mors-*: *Mjar* < **Merz-* (Olsen 1939, 39, 52; cf. Andersson 1972, 9ff.). Another linguistic link, that Andersson focuses on, is the fact that the progenitor, the *heros eponymos*, of the Goths was **Gaut* (an emendation from *Gapt*, that must be a misspelling). It seems obvious, after Andersson's analysis, that Scandinavia may not be excluded when we are looking for the original homeland of the Goths. There are several arguments, e.g. linguistic, that connects them to Scandinavia (cf. Hermodsson 1993, 26, et passim).

A totally different view is presented by Ottar Grønvik (1995), who argues for the existence of two homophonic names **gautaz/*gautar* during the Roman time (ca. 300–400), one West- and East-Germanic name for a god (Jordanes' *Gapt* > *Gaut*) and one inhabitant name in North-Germanic (*Götar* in Sweden). Later on, in context with the prevalent euhemeristic theory of the time, the Gothic royal line, the Amals, with its *heros eponymos* *Gaut* was (wrongly) identified with the Swedish inhabitants, which gave way for the tale of the origin of the Goths. Grønvik's

theory has several problematic aspects in need of discussion, such as the role of the *Gutar* on Gotland and the linguistic identity between *Gutar* and *Goths*.

8. Toponymy in the Germanic time

That the Germanic area in this period is still one "language community" is indicated by the occurrence of place-names. Very often the study of place-names has been conducted within the boundaries of the present states, so that scholars analyse place-names and place-name elements just in Sweden, Norway, Germany, England etc. This may be relevant for younger place-names, from ca. 1100 and later, but already place-names from A. D. 800–1100 must be studied over a wider area to make them understandable. When going back to the middle of the first millennium and in the Early Iron Age (ca. 0– A. D. 500), we seem to have, more or less, a common place-name repertoire in the Germanic area. Thus the *-inge/-inga/-ingen*-names cannot be analysed separately, but must be seen in this Germanic context, the same is the case for the *-hem/-heim/-haim*-names, the *-stad/-stead/-statt*-names, the *-löv/-lev/-leben*-names etc.

It is notable that many of these presumably oldest place-names denote a people or something areal, e.g. *-heim* and *-inga*. This may be linked with the fact that when the classical authors in this period (ca. 0– A. D. 500) are relating to the Scandinavian area, they never use place-names, but instead names of people (e.g. *theutes*, *hallin*, *bergio*, *finnaitthae*, *feruir*, *raumarici*, *ragnarici*, *heruli*, *suetidi*, *granii* etc.). It is extremely difficult to speculate on the naming strategies for this distant period of time, but one has the impression that what differs in naming practice between the Early Iron Age (ca. 0– A. D. 500) and the Late Iron Age (ca. A. D. 500–1100) in Scandinavia (and probably in the wider Germanic area) is the focusing of people and groups of people during the former period, and a more punctual – habitational or relating to the agrarian landscape – focusing during the latter. The ancient *-inge*-names go back to an inhabitant name *-ingar*, formed normally on some topographical word as the base (Ståhle 1946), never containing a man's name as is the case in England and Germany. The old *-heim*-names, obviously denoting something areal (Brink 1991), normally a settlement district (where a group of people, *X-heimar* or *X-ingar*, lived), actually also have inhabitant names as the first element

in some cases, the most well-known is *Trondheim* (Sandnes 1990, 322). In the Late Iron Age we find place-names with single persons designated in the first element, the first owner of the farm (?), in compounds with e. g. *-stad*, *-torp* etc. This opposition may reflect different attitudes to landscape or to ownership of land between Early and Late Iron Age. Especially the important question regarding ownership to land and district, of which we know nothing, in principle, for the prehistoric time in Scandinavia, is something that ought to be focused on and discussed much more in the future (cf. Skre 1998; 1999; Brink 1999, 432f.). Such a discussion is absolutely vital for understanding the semantics behind our prehistoric place-names.

IX. From Ancient Nordic to Old Nordic (from the 6th Century until 1100)

79. From Ancient Nordic to Old Nordic: Definition and delimitation of the period

1. Late Ancient Nordic and the Viking Age
2. Beginning and end of the transitional period
3. Change in the runic writing system
4. Language change
5. Literature (a selection)

1. Late Ancient Nordic and the Viking Age

As attested by the runic inscriptions, the Scand. languages began to change fundamentally towards the end of the 5th c. This change allows for the assumption of a period of transition between Ancient Nordic (AN) and the Old Nordic (ON) period following it. The duration and further subdivision of this transition period is disputed, depending on the criteria for its end point, the beginning of ON. Traditionally, the transitional period is divided into two phases. The first phase, denoting the period of time from ca. 500/600 to ca. 700/800 A.D., is called late AN (e.g. Krause 1971, 15). Grønvik (1998, 15), applying a linguistic criterion, nevertheless speaks of “Nachurnordisch” and “nachurnordische Sprache”, which he believes to have ended in the 9th c. with the loss of *i/u* after short root syllables. Haugen (1976, 132 ff.), on the other hand, due to cultural-historical criteria, suggests a single epoch reaching from the end of the Migration Age to the end of the Viking Age (that is, from 550 to 1050). During this epoch, which he calls the “Common Scand.”, the earliest differentiations of the Scand. languages (into EN and WN) are proposed to have taken place. In the Scand. tradition, the earlier part of the transitional period is called “Yngre urnordisk” (cf. Skautrup 1944, 39) or sometimes “Synkopezeit” (Seip/Saltveit 1971, 18). In the handbooks, the naming of the era following late AN varies widely, too. The German tradition often applies “Altnordisch” to that stage of language

which, apart from minor dialectal variation, remains relatively uniform and precedes the earliest hand-written records (which start ca. 1180). On the other hand, the terms “Old-dansk” and “Runedansk”, proposed by Skautrup (1944, 81 ff.), and “Runenschwedisch” (“Runsvenskan” in the Sw. original), proposed by Wessén (1970, 27 ff.), suggest that the texts and the language stage possess national characteristics, which probably does not apply at this early point of time. Likewise, the attempt to deduce a chronological division from runic texts appears questionable. Concerning Norw., Seip/Saltveit (1971, 34) speak of the “Viking Age” (“Vikingtiden” in the Norw. original), which in view of its more neutral designation of the historical era may be regarded as an alternative for “ON”. At any rate, late AN and ON constitute a transitional period of utmost significance to language and culture, during the course of which the Scand. languages began to divide. With regard to cultural aspects, the following key ideas are important: new structures of organization and trade succeeding the termination of Roman dominance; establishment of supra-regional centres of power and commerce in the Scand. countries; adoption and remodeling of the Gmc animal styles; (language) contact and settlements in the Gmc, Celtic, Slavic and Romance spheres; earliest Eddic and scaldic poems; settlements e.g. on Iceland and Greenland; adoption of Christianity and its dissemination over the whole of Scandinavia; and establishment of states and royal houses following Cont. examples.

2. Beginning and end of the transitional period

Today, the dating of the period as put forward in the older literature has to be modified in the light of new runic finds and a more precise

archaeological framework based on bracteate chronology. Nowadays, there is general agreement on an early estimate: late AN may have begun ca. 500, if not before. Important changes such as the great alphabet reform, the transition from the 24-character to the 16-character Futhark, and the further reshaping of the Futhark in Sweden and Denmark fall within the range of this period. The reform is preceded by significant changes in the language system through syncopation, loss of consonants and umlaut/breaking. The question of whether important morphological innovations such as the emergence of the suffixed article and the formation of the mediopassive might have occurred already in late AN, during the Viking Age or towards the beginning of ON is a matter of conjecture at best, but it cannot be answered with any certainty. There are several possible criteria for determining the end of late AN and the beginning of the Viking Age. Grønvik (e.g. 1998, 22) suggests the syncopation of *-i-*, *-u-* after short root syllables, which is carried out during the 9th c. Others cite the first tendencies to monophthongization in the East Nordic area, or simply the Vikings' appearance (indicated by the raid on the Lindisfarne monastery) and the earliest mentions and accounts of Scand. events by Latin sources on the Continent. The older handbooks are inclined to draw a boundary at around 800 in order to be able to correlate the language change, the reduction of the runic inventory and the onset of Scand. recorded history with the Vikings. From new finds like the Ribe cranium, however, it has become clear that the script reform must have taken place distinctly earlier, i.e. around 700; also, by this time the principal language changes in late AN were probably already complete in most parts of Scandinavia. Furthermore, Scand. and German archaeologists are currently inclined to fix an early beginning for the period. Based on dendrochronological data, which has considerably increased during the past years, it appears certain that important cultural changes such as the founding of towns and the building of a trade network were not effects of the Scandinavians' raids in terms of being prompted by examples on the Continent and the British Isles, but that they rather commenced long before, in the early 8th c. Denmark's oldest city, Ribe, was founded in about 700 (and the establishment of a city presupposes a supportive environment!); the oldest sections of the Danewerk were built sometime before 700;

cities like Wollin and Birka have a distinct pre-Viking Age phase; and the trees used in the oldest of the wooden houses erected in Staraja Ladoga were felled around 760. The dating of the foundation of Haithabu to about 800, however, seems to remain unchanged.

Diese Grabungsergebnisse zeigen, daß die bislang um 800 datierten Gegenstände wahrscheinlich 50 Jahre älter sein dürften und somit der Anfang der wikingerzeitlichen Kultur auf die Mitte des 8. Jahrhunderts festgesetzt werden muß, mit einer Übergangszeit von einigen Jahrzehnten nach beiden Seiten hin. Tatsächlich gibt es keine sicheren absoluten Datierungen für den früher angenommenen Beginn der Wikingerzeit. Das Jahr 800 wurde wegen seiner Griffbarkeit als glatte Zahl definiert, zumal die aus schriftlichen Quellen bekannten Wikingerraubzüge unmittelbar davor begonnen hatten. In Wirklichkeit hatte sich aber die Herausbildung der wikingschen Gesellschaft in mancher Hinsicht schon vor dem Einsetzen der Kriegszüge vollzogen. Deshalb sollte künftig die Wikingerzeit auf den Zeitraum zwischen 750 bis 1100 festgesetzt werden. (Ambrosiani 1995, 38; likewise Steuer 1998)

Historians and philologists, on the other hand, rather tend to keep to the year 800 as the established onset of the period. They employ the beginning of the raids and of written records concerning Scandinavia as a delimiting criterion.

In Scandinavia this is what makes the Viking Age the transition period between prehistoric and historic times, and it is hardly a coincidence that written sources start at the same time as information on raids. They probably signal serious changes in relationships between western Europe and Scandinavia. (Roesdahl 1994, 113)

Therefore, the cultural-historical caesura around 800 is retained here as the indicator of the beginning of the Viking Age. It should be mentioned, though, that an earlier dating has the benefit of more closely implicating important linguistic changes with cultural ones. As for the end of the Viking Age and accordingly the beginning of ON, there also are various possible approaches and criteria. This historical era ends in 1066 with the Norman conquest of England, which puts the phase of Scand. expansion to an end. Also, Christianization and the establishment of nation-states may be regarded as being largely completed by this time. In order to arrive at a round number, Haugen proposes the year 1050 (as do Seip/Saltveit, e.g.); others, such as Skautrup, choose 1100 just as arbitrarily. One gets

even further into the High Middle Ages by applying the earliest existence of indigenous texts written on parchment in the national language as a criterion. This step would lead to the dates 1180 for Iceland and ca. 1225 for Sweden – accordingly, Wessén sees the latter date as a dividing line between Runic Sw. (“runsvenska”) and OSw. (“Äldre fornsvenska”). Here, in agreement with Haugen, the time around 1050 is supposed to mark the transition. From a philological point of view, in any case, late AN and the Viking Age constitute periods of radical alteration manifesting itself in changes in the language, the runic writing system, and the function of the runic texts.

3. Change in the runic writing system

Even though it has since become clear from new runic finds – above all from the bogs of Illerup and Vi – that during the AN period runic script culture and the script system were not nearly as uniform as was asserted in older handbooks due to the state of knowledge of the time, this diversity does not compare to the rapid changes the script system underwent during the late AN period. The development started with the modification of single runes, which at first did not affect the system, but soon enough (some of) the language changes were reflected in some of the spellings, and the script, with some delay, reacted. Towards the end of late AN (ca. 700 if not earlier), the 24-character Futhark was drastically reshaped into the prototype of the 16-character Younger Futhark, which in turn split up into the so-called (Sw.) short-twig runes and the so-called (Dan.) normal runes. In the opinion of many runologists, the phonetic changes in the rune names, which had an important mnemonic function for the learning of the runic alphabet, played a decisive role in the first step, the reduction. A classic (and certainly convincing) example is the name of the 12th rune, *jara*, which developed into *ara*, owing to the general loss of initial /j/. As an immediate consequence, this rune can henceforth stand for the phoneme /a/ instead of the previous /j/, in which case it is transliterated A in order to make it distinguishable from the old a. Among others, the Blekinge inscriptions (Gummarp, Istaby, Stentofen, Björketorp) from the second half of the 6th c. document the completed change. Apart from the alteration of the rune names (which principally affected the vowel graphemes), the reduction of the Futhark

from 24 to 16 characters may have been motivated by a desire for a more economic script due to an increase in writing. This desire is evident in subsequent reforms. At any rate, the very fact that the change in the script coincided with the earliest foundations of Scand. (trading) towns is striking. Although this argument can definitely be applied to the further simplification of the runic letters into the short-twig runes, some questions concerning the reform proper around 700 remain open in spite of numerous suggestions. Moreover, the exact dates of the further changes within the Younger Futhark remain unknown. The short-twig runes with their outstanding writing economy were probably created around 800 or in the second half of the 8th c., the time from which the Sparlösa stone dates, featuring both older and newer rune forms in different parts of its inscription. The copper plate from Ulvsunda establishes the time around 800 or shortly thereafter as a secure terminus ante quem. From the mid-9th c. there are instances of short-twig runes from Haithabu, and the copper kettle from Gokstad provides an instance from Norway somewhat later. The 9th c. witnessed the reshaping of some runes in Denmark as well, which there, too, resulted in a script that was more economic than before (each rune has only one staff), and which, due to its greater graphical clarity, was distinctly easier to read than the often ambiguous short-twig rune-row. Previously, there was an inclination to assume that this change occurred at the end of the 9th c. However, since the new runes were already mentioned in the *Abecearium Nordmannicum* of the St. Gallen Codex, and as this manuscript was linked to Walahfrid Strabo, the Dan. normal runes must be accorded to the first half or the beginning of the 9th c. – therefore, they are probably at best slightly younger than the short-twig runes. During the entire 10th c. they served as a standard for the Dan. inscriptions, and are thus characteristic of the so-called Jelling period. It is not until towards the end of the Viking Age in the 11th c. that there were further structural changes in the runic script system. These changes (if one may disregard the special case of the staveless so-called Hälsinge runes, which occur merely in a few inscriptions after 1000) were no longer meant to facilitate writing; rather, they aimed at differentiating among the numerous homographs within the Younger Futhark: for /e/, /g/ and /y/, dotted runes were formed (in Denmark first). Owing to a phonetic change in its

name (**ansur* > *os*), the previous *ã*-rune could henceforth represent the phoneme /o/ (first in Sw. inscriptions); after the coalescence of the two (approximate) allophones /r/ and /R/ towards the end of the 10th c., the *yr*-rune also stood for /y/ in the 11th c. Digraphic spellings such as <au> and <ai> for /ɔ:/ and /æ/ anticipated the later usage of ligatures in the Latin script of the (Icelandic) manuscripts. In summary, and in simplified terms, the following sequence and motives may be presumed for the change in script during the transitional period: language changes motivated the reduction of characters around 700; a considerable extension of the employment of writing motivated the graphical simplification of the characters around 800; and the influence of and the growing familiarity with the Latin alphabet prompted various attempts at differentiating the homographs (for the 11th c., this is a mere hypothesis).

4. Language change

4.1. Language stages within late AN

Grønvik (1987, 167–189 and 1998, 16–26) develops several consecutive language stages for Late AN, “each of which can be described as a clearly definable and coherent morphological system” (1998, 16). The main criterion for the definition of the stages is the probably gradual reduction of unstressed final syllables (syncope), which can be observed in Late AN inscriptions. As far as these inscriptions are datable, the language stages are, too. Before the bracteate inscriptions with elaborate texts dating from ca. 500 A. D. would come a stage I featuring fully maintained final syllables and representing AN, according to Grønvik. Concerning the nom. sg. and pl. of the *a*-stems (type *armaR*: *ōR*), for example, one must necessarily assume a stage in which *-a-* in the sg. is apocopated while *-ō-* in the pl. is temporarily sustained until, in a succeeding stage III (“Altnordisch”), it develops into *-a-*, which is preserved from then on. Analogously, these three stages might be applied to the long syllabic *-i-* and *-u-* stems. The apocopation of *-i-*/*-u-* after short root syllables is widely held to have taken place only considerably later (Wessén 1970, 8; Heusler 1962, 36). Inextricably linked to the loss of *-i-*/*-u-* is the phonemicization of the mutated vowels in root syllables (such as in the type *gastiR* > *gæstiR*). According to Grønvik (1998, 18), the allophone phase (in which the vowels of the root syllables are

realized as [æ] or [æⁱ]) most likely falls in the last stage of (Early) AN, from 450 to 480/500, approximately. This classification corresponds perfectly with the thesis developed by Seebold (1991): he accounts for several unique rune-forms and orthographical irregularities in Dan. bracteate inscriptions from that very time by suggesting that they could have been created more or less ad hoc in order to denote umlaut allophones. (Those unique rune-forms, however, could not prevail in the further development of the runic script; the opposite occurred instead, with the reduction of the original 24 to the 16 characters of the Younger Futhark.) With all due scepticism towards Seebold’s interpretation of these inscriptions, the possibility of their featuring orthographic experiments cannot be denied, even though it also cannot yet be proved. Taking all types of endings and morphological contrasts into account, Grønvik (1998, 22f.) postulates the following sequence of language stages from AN to Viking-Age ON:

- (i): all vowels in final syllables are maintained; “Urnordisch”;
- (ii): loss of /a, i/ after long and /a/ after short syllables;
- (iib): loss of /u/ after long root syllables;
- (iii): long /o:/ in final syllables becomes /ō/ or /a/;
- (iv): loss of /i, u/ after short syllables; ON.

On theoretical grounds, Grønvik’s language stages are convincing; (more) problematic, however, is the exact specification of the time and duration of the respective stages. Regarding this matter, we have very little direct evidence and not much more indirect. Stone-cut inscriptions such as the one from Eggja, frequently presented in the handbooks as evidence for language change, cannot be dated securely (as the discussion about the horse figure on Eggja has shown, stylistic-historical criteria are not very helpful, either), and their interpretation is often disputed. This is true for the Blekinge inscriptions, for example, although there are good reasons for their being placed in the second half of the 6th c. Even if the inscription artifacts can be dated archaeologically, the general problem of dating the inscriptions arises nonetheless, because the artifacts are for the most part jewellery, which may very well have been in circulation within a family for a longer or shorter time before the inscriptions were made (cf. Steuer 1998; for a general criticism of Grønvik’s cf. Schulte 1998). In spite of all objections, the assump-

tion that stage i “Urnordisch” ended around 500 is generally plausible, given the faint evidence on the bracteates and the indirect evidence of the abundant svarabhaktis in the erlinscriptions (type **harabanaR** for *hrabnar* on Järsberg) and in the Blekinge inscriptions. Certainly these svarabhaktis do not document any additional vowels; rather, they express the writers’ uncertainty in the face of the progressive reduction of the vowels in final syllables. Stage iia is represented on the fibula from Eikeland found in 1965 in a richly equipped grave for a woman. In 1976 Grønvik presented an interpretation that he himself later modified slightly (1987, 53 ff.); it has met with general approval. Typologically, the fibula dates from Migration Age iv (to use the terms of Egil Bakka’s framework), that is, from 525–575. It features the same bind-rune **aR** as the Bratsberg fibula and the Järsberg stone; the **k**-rune is typologically somewhat older than the one on Järsberg. Bakka himself had dated the fibula at ca. 550, granting some leeway on either side. In the inscription, the masc. name **wiR** (for older *WiwaR*) shows the loss of the final-syllabic *a*, the vb. form **writu** retains the *-u* after the long root syllable, and **runoR** displays the original AN form. Finally, the word **asni** ‘beloved one’ exhibits syncope as well. To assign the language of the Eikeland fibula to stage iia is thus certainly acceptable; unfortunately its dating is also unsure. In particular, the inscription might have been made contemporaneously with the fibula, i.e. in about 540; on the other hand, it might just as well have been added to the (then old) piece of jewellery on the occasion of the burial, thus approaching the year 600. With this reservation, assigning stage iia to the first half of the 6th c. seems nevertheless tenable. Grønvik cites the bracteate from Ågedal as direct evidence for stage iib, and the clasp from Fonnås and the piece of bone from Ødemotland as evidence for stage iii. This view, however, only becomes justifiable if one accepts Grønvik’s interpretations of these texts, which are usually deemed uninterpretable; but his suggestions are hardly convincing. An object that does facilitate a secure dating, though, is the fragment of a dice retrieved from a cremation grave in Vallentuna in 1980. Given the transience of the artifact (a utensil, not a piece of jewellery as in most other cases), the inscription may be dated to the last decade of the 6th c. In this fragmentary inscription, **-hAukR** (< *haukaz*) shows the syncope of *-a-* after a long syllable. Furthermore, the shape of the

runes necessarily leads to the conclusion that the inscriptions mentioned above as well as the Blekinge inscriptions have to be assigned to an earlier point in time, namely to the second half of the 6th c. Accordingly, stage iii is manifest by 600 at the latest. It is hardly conceivable that further development, i.e. syncope after short syllables, should not have set in until more than 200 years later, but that is exactly the case according to common opinion. The conclusion that this development did not occur until the 9th c. is based on several unscopated forms in runic inscriptions from that time (or rather, these inscriptions are dated to the 9th c. *because* they contain such forms). The forms in question comprise 4–5 instances from Dan. territory (among them one misspelling, one unambiguous secondary svarabhakti, and two instances of *sunu*) and 11–12 instances from Sweden (the best-known of which are found on the Rök stone). The Sw. instances include: two probably phantom forms; two svarabhaktis; six instances of *sunu(R)* as well as *sitiR* and *karuR* from the Theodoric stanza on the Rök stone, which stanza may be many decades older than the remainder of the text; **stikuR** on the Kälvesten stone; and **sakiR** on the Oklunda stone). Therefore, challenging the validity of this evidence seems appropriate, and doing so allows for the possibility of stages iii and iv following one another at a considerably shorter (and more realistic) time span. Moreover, some inscriptions such as the Ribe cranium, which is archaeologically dated at 720, virtually show an opposite tendency, embodied in secondary svarabhaktis (type *ulfar* > *ulfr* > *ulfur*, as in Modern Icel.). This may indicate that there was indeed a weakening of vowels, at least of their lento-forms, but not necessarily a resulting reduction of the number of syllables. An earlier reduction of final syllables after long root syllables (or better, “Sprechsilben”, cf. Grønvik 1998, 40 ff., Birkmann 1995, 182 f.) certainly makes sense in terms of phonetics; the dating of the end of the syncope period, however, depends on the assessment of the runic forms from the (8th and) 9th c. discussed above: if we are dealing with morphological variants (e.g. *sunu* along with standard *sun*) or particular lento-forms, the period of syncope may well have ended in the 7th c./around 700; if one takes these forms to be the standard ones, on the other hand, one must indeed assume two phases of syncope, one for the 6th and another for the 9th c. – in which case the period of syncope would reach considerably

into the Viking Age. Current research seems to agree on the earlier variant since syncope as well as mutation are naturally continuous processes: “Our view (as opposed to Kock and his followers) is that the *i*-Umlaut is one on-going process, just like syncope” (Riad 1988, 17). In Schulte’s (1997, 199) view, umlaut is a phenomenon of the 6th c., which, moreover, points to a homogeneous common Scand. continuum of language:

Die entscheidenden Vorgänge spielen sich insgesamt früher ab, als gemeinhin angenommen. Sie sind in der 2. Hälfte des 6. Jahrhunderts weitgehend abgeschlossen. Der *i/j*-Umlaut erstreckt sich also keineswegs über mehrere Jahrhunderte, wie Kocks Modell glauben macht. Vielmehr kommt dieser Prozeß innerhalb einer geschlossenen Phase zur Durchführung, die insgesamt nur einige Jahrzehnte, kaum aber mehr als ein Jahrhundert andauert.

An interesting theory of syncope on the basis of Sprechsilben is presented by Grønvik (1998, 39 ff.); he, too, presumes the *i*-mutation to have been active for a limited time only, and that the inscription from Eggja documents the end of its effectiveness (1998, 56). There is nothing to be said against assigning this inscription to the 7th c., even if the date cannot be further specified. „Somit dürfte jetzt feststehen, daß die aktive Periode des *i*-Umlautes spätestens mit der Sprachstufe *iiia* kurz nach 600 zu Ende war“ (Grønvik 1998, 56). Nevertheless, Grønvik adheres to the view that the period of syncope ended in the 9th c., owing to the instances of the *sunu* type.

Hence, many facts indicate that the important linguistic as well as graphemic changes of late AN began towards the end of the 5th c. and concluded by the end of the 7th c. with the emergence of the Younger Futhark and the (near) completion of syncope. Consequently, all assumptions in the older handbooks, according to which the linguistic developments within NGmc show a distinct phase displacement with regard to WGmc, have to be revised. The view presented by Wessén (1970, 7) may be regarded as typical. According to this, the impetus towards syncope and umlaut originated in the south, i. e. in WGmc, and became effective in NGmc “relatively late” and “much later”, respectively. As far as we know today, syncope and umlaut run almost completely parallel in both language groups: SGmc inscriptions show that we can link the earliest reduction processes in WGmc, too, to the time around 500 at the latest (cf. Birkmann 1991). Furthermore, we can assume

these processes to have (temporarily) ceased around 700.

4.2. Language change during the Viking Age

During the Viking Age distinct dialectal differences arise within Nordic for the first time, thus establishing a WN area and an EN area comprising Denmark and Sweden. The changes did not result in the immediate formation of national languages, but rather in a continuum within which independent languages only much later emerged, due to the normative force of writing and the influence of politics. The main characteristic of the early differentiation is the so-called East Nordic monophthongization (*ai* > *e*; *au*, *ey* > *ø*), which occasionally shines through the phonetically so inaccurate runic script: spellings such as **stin** instead of older **stain** may be evidence for the change, but on the other hand may simply result from the omission of a rune. The furnishing of proof is further complicated by the not uncommon custom on the part of rune writers of using **ai** and **au** for monophthongs of middle tongue position (apparent e. g. in **aiftiR** instead of “normal” **iftiR** ‘for, after’). Thus a precise dating of the change is at present not possible. The handbooks vacillate between the 11th c. (Wessén on the Middle Sw. inscriptions) and ca. 900; the earliest instance might be present on the Gørlev I stone from Zealand. The Gotlandic picture stone from Tjängvide may be the one piece of evidence from the Viking Age for the emergence of the suffixed article; it dates possibly from the 10th c. Its fragmentary text contains the sequence **stainin**, which, granted, may merely be due to an incorrect double writing or the conjunction *en*. One can only conjecture about the implementation of nasal assimilation, as runic orthography in principle avoids double writings, and as nasals before homorganic Cs are generally not written. From the end of the 10th c., though, the inscriptions document a gradual coalescence of palatal and velar /r/, which occurs first after dentals: in this position, already on Harald’s Jelling stone **r** stands for **R**. The *yr*-rune can then represent the phoneme /y/. Finally, definite pieces of evidence for the loss of initial /h/ are found in the region around Lake Mälär, in spellings like **hut** instead of *and/önd* in the soul-formula, for example. On several further phonological changes cf. Elmevik (1998). Thus, towards the

end of the Viking Age, the first signs of independent languages/dialects are present, and this tendency increased during the ON period.

4.3. Changes in the use of runic script

Under influences from the South and the West during the Viking Age, the character of the runic inscriptions underwent a distinct change, away from predominantly magical inscriptions (which of course did not suddenly cease) towards more or less profane grave inscriptions (which also occurred before). On the one hand, the early Viking Age still profers more or less inscrutable stone inscriptions, such as the ones on Rök, Sparlösa, and Ingelstad in Sweden, Bjørneby in Norway, Hoga and Skee from Bohuslän, and Snoldelev in Denmark, which possess apparent magical components; furthermore, the Gørlev stone juxtaposes a “normal” stone-raising formula beside the magical *þistil-mistil-kistil* formula and the similarly puzzling phrase ‘I set the runes right’. On the other hand, however, the number of profane memorial stones for the dead increased significantly in Denmark during the 10th c. Initially, these memorial stones are linked to the newly established royal house and the nobility close to it. Towards the end of the 10th c., the Jelling stone ordered by King Harald Gormsson indicates, apart from its political (and religious) purpose, considerably increased literacy within society. After Jelling, towards the end of the Viking Age, the fashion of the bereaved commissioning rune stones as memorial stones (which presumably served to document the right of inheritance, too) spread rapidly, the results of which can still be observed in the open countryside and the churches today. From Sweden alone we know of well over 2,000 rune stones. Generally, the script is fitted into an ornamental frame which represents an important part of the art history of the Viking Age. (Some significant examples of additional ornamentation are found on the Norw. stones from Alstad, Dynna, and Vang, among others.) Additions subsequent to the stone-raising formula offer poetic elements, information on the life and death of the deceased, and – continually increasing towards the mid-11th c. – Christian symbols and wishes for the spiritual salvation of the dead. Then, as before and also as in the following period, mysterious, hardly interpretable, and magical inscriptions appear on loose objects; there is correspondence, obscenities, poetry: in short, the runic

script evolves into a script for everyday use. It was, in principle, capable of all functions, which were increasingly taken over by the Latin script during the ON era. This change – like numerous others – is rooted in the Viking Age.

80. The sources of the transitional period between Ancient Nordic and Old Nordic

1. Preliminary remarks
2. Place-names
3. Runic inscriptions
4. Texts in foreign languages
5. Literary documents
6. Literature (a selection)

1. Preliminary remarks

More diverse and greater linguistic sources are available for the time span between the Migration Period and the end of the Viking Age than for the previous period. These varied sources, however, cannot give us a complete synchronic and diachronic picture of the language because they are weighted with uncertainties regarding both their date and interpretation. Runic inscriptions are the most important and substantial evidence for the transitional period from Ancient Nordic to

Old Nordic. In addition, place-names, personal names and words used in texts written in foreign languages as well as vernacular literary texts provide information about the development of the language during the period from the 5th to the 11th century. Of these diverse groups of sources, only a few runic inscriptions and the vernacular literary documents themselves provide extensive passages of continuous text. Furthermore, one must often take into consideration substantial interference from other languages in the remaining sources.

2. Place-names

The oldest linguistic evidence from the Germanic area are place- and personal names. Names are often derived from appellatives,

but in some instances continue to denote objects that no longer correspond to this appellative meaning (cf. Schütte 1976, 40). Toponymic studies have been conducted extensively in Scandinavia since the 19th century and have been, above all, historically oriented, i.e. with regard to the development of settlements. However, place-names also play a significant role in linguistics as conservative substantiations, because one can acquire information from them about linguistic development. Since place-names are geographically fixed, they can supply evidence for the distribution of certain linguistic characteristics. Scandinavian place-names have been used primarily in studies of historical phonology and inflection (Jansson 1951; Tjäder 1967; Brylla 1987). Place-names can be combined into groups of names that are formed with the same ending and which are found not only individually, due to a correspondence in terminology, but are also distributed to a varying extent over larger and smaller areas. The analysis of place-name types is thereby significant for the highly debated question of a common Northwest Germanic language area. The difficulty in chronological stratification, especially with the oldest names, is a vexing problem (Andersson 1995b). For the transitional period from AN to ON, the place-names formed with the aid of suffixes are interesting because the same suffix inventory is attestable during the first five hundred years A. D. in Scandinavia as well as on the Continent (Andersson 1995b, 4). Place-names of the *-ingi*-type play a key role in the assessment of this question, for they make clear a toponymic connection between Scandinavia and the Continent (Andersson 1995c, 10). The distribution of this place-name type does indeed confirm a close NWGmc unity, but other place-names also reveal clearly that there were already early signs of the separation of W/NGmc. This finding is confirmed from the perspective of the place-names in the British Isles (Nicolaisen 1995). There, place-name types entering not only from the Continent but also from Scandinavia were productive and thereby attest the existence of a common NWGmc toponymy from which place-name types can be traced to the individual dialects (cf. Beck 1987). There are also a considerable number of place-names of Scandinavian origin in Norman and French (Gorog 1958). However, despite their use for historical linguistics, the limits of toponymy are clear: although the distribution of a type of name can show linguistic relations within

the area of occurrence, relationships can also extend beyond this area, as the distribution of *-vin*-names, which cover only a part of the Nordic area, suggests (Jansson 1951; Andersson 1995c, 9).

3. Runic inscriptions

Runic inscriptions form the most extensive and important group of sources for the transition period between AN and ON. The inscriptions are original documents which record in linguistic form the events of the period in which they originated. Contrary to the earliest period of runic inscriptions, not only does the number of inscriptions increase over time, but the texts also become more extensive and reveal linguistic changes more clearly.

3.1. Dating of inscriptions

Although the number and length of the inscriptions increases, the dating of the texts remains uncertain because only a small part of the inscriptions are found on somewhat reliably datable surfaces (on the problem of dating, see Birkmann 1995, 5f.). Linguistic changes can indeed be seen in inscriptions from the period between the end of the 5th and the end of the 9th centuries, but often a relative chronology for the individual changes can be established only with difficulty, and an absolute dating is next to impossible. Inscriptions can be dated by means of archeological, runological (i.e. in respect to the form of the runes) and historical-linguistic criteria. Even archeological datings, independent of the other criteria, often do not offer any absolute dates; instead they are usually based on a framework of relative chronology so that often different chronological systems must be reconciled. Only a few portable objects can be dated by means of archeological criteria, although runologists and philologists do not always accept this dating, even for inscriptions which may have originated much later. Because during the transition period from AN to ON runic inscriptions were carved more and more on stones, which archeologists can rarely date, at best a relative chronology using runological or linguistic criteria is often the only one possible. Since these criteria can only be used after reading and interpretation have occurred, there is a great danger of circular reasoning. The question of the time and place of a linguistic change remains, however, in a close relationship with the dating of the

source, so that problematic dating has far-reaching consequences for linguistic research. There are only nine archeologically datable inscriptions available for 550–750 A. D., usually called the period of syncopation (Birkmann 1995, 6). During the transition period from AN to ON not only did the language change, but also the form of the runic inscriptions because the elder futhark, consisting of 24 letters, was reduced to the younger futhark, consisting of only 16 letters used in different versions. Whether the reduction of the letters is to be seen as a consequence of phonological change or whether it is the result of other causes, e.g. developments in the alphabet, number magic or changes in the names of runes, is answered by researchers with the same lack of definitiveness as the questions of when and where this reduction occurred (Odenstedt 1992).

3.2. Distribution of the inscriptions

Chronologically and geographically, runic inscriptions are distributed very unevenly. While from the period from ca. 600 to 800 exclusively Norw. and Sw. inscriptions survive, the number of Dan. inscriptions grows rapidly from ca. 800, thus making Denmark as the epigraphical center of Scandinavia during the early Viking Period. Also, Denmark is usually considered the home of the younger futhark, for it appeared there for the first time in its complete form. Inscriptions found in Denmark in the younger futhark total 419, of which the Jelling inscriptions are probably the most famous. There are relatively few inscriptions from the early Viking Period preserved in Sweden. One of their number, the Rök stone, has caused most problems for scholars (see the report of reserach in Birkmann 1995, 290ff.). For the later Viking Period, Sweden becomes the new center of runic inscriptions. The inscriptions in the elder futhark are almost exclusively found on loose objects like weapons (e.g. spear blades, swords), jewelry (e.g. claps, buckles), utensils (e.g. combs, planes, knives) and bracteates. From ca. 350 A. D. the inscription of the stones, which then become the major writing surface for inscriptions using the younger futhark, begins in Norway and Sweden. From the first half of the 8th century the runes of the younger futhark were used more and more often in Denmark and Sweden, though the older signs remained in use. Since not all of the runes changed, it is not always clear, especially with

short inscriptions, whether the younger futhark was used. In Sweden this reduced runic alphabet was simplified yet again to the so-called short-twig runes, which are also called Norwegian-Swedish runes or Rök-runes because of the area of their distribution. In practice however, there was no clear differentiation between the normal runes in the younger futhark and short-twig and often mixtures of the two appear. The beginning of the 11th century brought about a still more extreme reduction of the runes: staveless runes. They were most likely used only in a small area, which is also referred to in their alternative name, Hälsing runes. In Denmark, the short-twig runes were first used in the 9th century, but did not gain general acceptance here. Around 900 A. D. a runic alphabet was established which then remained valid over a long period of time. It has simpler forms than the normal futhark but shows clearer distinctions than short-twig runes. On the Gørlev and Malt stones, one can find this runic alphabet in full length.

3.3. The problematic nature of the inscriptions

It is not only because of the difficulties in dating that runic inscriptions are a problematic group of sources (cf. Düwel 1975, 181). Often the condition of the inscriptions is so poor that at times it is not certain if one is looking at runes or accidental scratches. Since word dividers came into use relatively late, the continuous text of an inscription can be structured only with difficulty and therefore often offers many possibilities for interpretation. Furthermore, interpretation is dependent upon information from later stages of the language, above all with respect to inscriptions in the elder futhark which often consist of a single word and therefore have neither an internal nor an external context. Although inscriptions in the younger futhark contain word dividers more often and thereby allow at least suggestions of syntactic units, a new problem arises due to the reduced number of characters, because grapheme and phoneme no longer have a one-to-one correspondence. In later inscriptions there was an attempt to remedy this situation with a system of punctuation, but it was not consistently used.

4. Texts in foreign languages

Latin and Old English texts which deal with Scandinavian persons or topics often contain Nordic loanwords or place- and personal names. These works cover a time period from about the 7th century to the end of the Viking Age. The comments are sparse, especially in such Lat. works as the *Etymologiae* by Isidore of Sevilla, *Historia Francorum* by Gregory of Tours or *Historia Langobardorum* by Paulus Diaconus. The Nordic material contained therein is essentially restricted to names which normally have been latinized and therefore can offer only limited information about the stage of the Nordic language. Due to intense contact between Scandinavia and the British Isles during the Viking Age, one expects to find numerous comments in OE literature.

Scandinavian topics are dealt with above all in *Beowulf* and *Widsith*. But Anglo-Saxon chronicles, laws, charters, deeds etc. also contain, again and again, Nordic loanwords (Hofmann 1955). A whole series of these documents are datable to the early Viking Age (up to ca. 980), but they contain only sparse references to the Nordic language. Only in the later Viking Age, when Scandinavian people and lands are directly concerned in the contacts, does the number of Nordic loanwords used in English sources increase. Titles, deeds, charters and laws contain Scandinavian place-names and personal names in anglicized form, as well as terms from jurisprudence which now and then appear even in sources valid outside of Danelaw. The annals and chronicles are especially valuable for linguistic analysis because they cover the Viking Age rather completely and, above all, chronologically.

Unfortunately, the better part of the entries exist only in later copies so that it is not always clear at which state of the language the borrowing occurred. Although a large part of *Beowulf* deals with especially Scand. themes, the AN words in this work are limited almost exclusively to names which are used in anglicized form. In addition, *Beowulf* makes abundantly clear the problems that arise in the evaluation of loanwords in sources written in foreign languages. It is not always clear whether or not borrowing has occurred, especially when dealing with two closely related languages like OE and the Nordic languages, and if so, in which direction it occurred. While the editor of the standard edition of *Beowulf* postulated a clear Nordic influence (Klaeber 1922, CXX), more recent scholarship empha-

sizes the absence of Nordic loanwords in *Beowulf* as one of its characteristics (Frank 1981, 123; Bjork/Obermeier, 27). *Beowulf* survives in only a single manuscript, which can be dated, on paleographic grounds, to the end of the 10th or the beginning of the 11th century. When the work itself originated, however, remains an unanswered question. Datings vary between the 7th and the 11th centuries (cf. Bjork/Obermeier 1997; Andersson 1983; Fulk 1982). For this reason it is debatable whether the Scandinavian names have been anglicized or adopted in their authentic, i.e. Nordic, form of the 6th or 7th century (Fulk 1982, 343f.). The OE and Nordic languages were so close even during the Viking Age that many loanwords could have been borrowed without much phonetic difficulty and unusual sounds could have easily been adapted to the languages' own phonetic systems. Nordic words usually assimilated with OE declensions, and only in a few instances of borrowed names were foreign endings kept (Hofmann 1955, 253ff.).

5. Literary documents

Some Viking Age native literary texts from Scandinavia have also survived. The oldest Eddaic poems and scaldic poetry are datable to the 9th century. Because these texts are much more extensive than the average runic inscription, they contain a much broader and varied vocabulary and also much more differentiated morphology and syntax. In contrast to Eddaic poetry, the dating of which in many cases is highly controversial, scaldic poetry can normally be dated rather exactly, insofar as the author is known and the authenticity of the poem or stanza is certain. The oldest remaining scaldic poem is assumed to be the *Ragnarsdrápa* by Bragi Boddason, in which a valuable painted shield is described. Three poems about mythical and heroic prehistoric times also belong to the oldest stage of scaldic poetry: the *Haustlög* by Þjóðólfr ór Hvíni, the *Húsdrápa* by Úlfr Uggason and the *Þórsdrápa* by Eilífr Goðrúnarson. In addition there are quite a few individual stanzas, the so-called *lausavísur*, which were usually composed as occasional verse and the authors of which are often unknown, so that their dating is not always certain.

Although a wealth of literary texts can supplement the mostly rather short runic inscriptions, their ability to provide evidence for linguists is limited. Not one of the poems sur-

vives in a manuscript from the Viking Age. The oldest records of scaldic and Eddaic verse date from the 12th century, excepting the few runic inscriptions which contain parts or the whole of Eddaic or scaldic stanzas. While one assumes that scaldic poetry underwent few changes in the process of oral transmission due to the complex metrics, it is possible that works of Eddaic poetry, which uses much simpler metrics, have undergone linguistic change before coming down to us. Despite all of the problems in dating individual poems and stanzas, it is certain with regard to both scaldic and Eddaic poetry that all surviving stanzas could only have been composed after the extensive and radical linguistic changes of the period of syncope and that their value for linguists is limited to the final centuries of the transitional period.

81. Phonological and graphematic developments from Ancient Nordic to Old Nordic

1. General background
2. The vowel system
3. Prosodic phenomena
4. The consonant system
5. Graphematic changes
6. Literature (a selection)

1. General background

The different North Germanic languages emerge in written form with Roman letters over the course of the 12th and 13th c., grad-

ually establishing what could be called national written standards. For a long time, the written material shows much variation, reflecting spoken dialects more than norms for writing, although, all along, some special writing conventions characterize the various Nordic power centres. Before the Latin alphabet was adopted, Nordic dialects had long been rendered in runic script, which, however, shows tendencies toward standardization to an even lesser extent. In accordance with the overall disposition of this handbook, this article aims

at elucidating the “transitional” phase of ca. 600–1100 A.D., during which the Nordic languages in their earliest literary form developed from the preceding language stage usually referred to as Proto-Nordic or Ancient Nordic.

When the transition from Proto-Nordic to Old Nordic is discussed, it has to be kept in mind that what is described is primarily a theoretical construct. To be sure, it can be argued that Proto-Nordic is not a reconstructed language system at all, since there are indeed actual (runic) texts available, representing the language stage in question. On the other hand, any description of a language system is a highly abstract generalization – even more so when earlier language stages are described, most often on the grounds of rather poor evidence. Strictly speaking, then, Proto-Nordic is in fact a reconstructed language stage, and so are the Old Nordic languages, although in the latter case there is much more written material left to build on. What little there is of contemporary Proto-Nordic data is mostly concise and sometimes formulaic, so that a very limited selection of linguistic structures is displayed. Many of the texts have uncertain readings or are otherwise hard to interpret; they seldom lend themselves to analyses of finer detail. Even when they do, all conclusions about the underlying phonology remain risky. The runic evidence and its nature is discussed on a principle level elsewhere in this volume (art. 73f.).

There is a strong scholarly tradition telling a rather fixed story about Proto-Nordic and the following transitional period. It has to be emphasized once more, however, that much of what is considered to be the fundamental structure of Proto-Nordic is reconstructed, ultimately, on the basis of theoretical assumptions. The reconstruction largely relies on comparison between languages that are taken to be “genetically related”, in the sense “having evolved from a common language source”, in itself a very strong claim indeed. The relevant period here has often been referred to as “Common Scandinavian” or the like, i.e. a stage in itself assumed to be more or less homogeneous. The adequacy of the notion of Common Scandinavian has recently been questioned by Barnes (1997).

Another corner-stone in the reconstructive work is the language-internal evidence, i.e. various phenomena observable at later stages of the language that can be suspected to reflect certain changes at an earlier stage. A third important type of evidence consists

of borrowings from Proto-Nordic into other languages, where earlier forms may have been fossilized in an alien linguistic environment, still revealing their original structural characteristics. It goes without saying that a description of a language system based on such sporadic and inconclusive evidence as has just been exemplified, on the one hand, and hypothetical assumptions, on the other, leaves much room for uncertainty.

In face of such problems, it is easy to adopt a completely negative attitude and maintain that the whole issue is impossible to deal with. Such nihilism would be pointless here. A total revision of the field is, on the other hand, also out of the question. Rather, it seems more suitable to adopt a fairly traditional view, but more because an elaborated alternative is still lacking than because the traditional version is quite convincing in itself. The reader can refer to well-known handbooks, such as Noreen (1913), Skautrup (1944), Wessén (1962), Krause (1971), Bandle (1973), Haugen (1976), for more details.

In many existing diachronic studies, a given language stage tends to be presented as a fairly stable system, being followed by a “transitional period” leading into another rather self-contained language stage. It is well-known that language change seldom follows such a course in the real world; it is the analytical and descriptive models traditionally used which conjure this picture. However, what we call Proto-Nordic spans several hundred years, and Old Nordic another five hundred or so. Obviously, a description of such language stages is idealized to an extremely high degree, and the transition between two stages of that sort is even more of a construct, the description of which merely summarizes observed differences between the idealized stages involved. Therefore, it would be more accurate to speak about “differences between diachronic correspondences” than to imagine “phonological changes” (cf. Andersen 1973), but, again, the traditional terminology is retained here for practical reasons.

With these reservations, it can nevertheless be claimed that there is a set of important changes transforming the phonological (and graphematic) system of Proto-Nordic into that of Old Nordic. They do not, however, take place exclusively during some transitional period but occur gradually from the earliest to more recent times. Nor do they apply in exactly the same form all over the language area. The exact chronology is usually difficult

to decide (it may also vary between different parts of the language area), but in some cases changes interact in a structurally critical way, so that a relative chronological chain of events can be assumed. If the gradualness of phonological changes is borne in mind and variation is acknowledged to be fundamental to older language stages even more than to modern, more standardized ones, we stand a better chance of dealing with some of the remaining puzzling questions in a reasonable way. Gradualness, then, may imply an ever more generalized application of rules, the implementation of these from one linguistic environment to another for individuals and groups of speakers, as well as diffusion of rules in a geographic sense over a language area and among speakers within a language community, usually in accordance with social patterns.

Here a distinction is made between the terms “change” and “rule” (in contrast to, e.g., many neogrammarian studies, in which a change or a set of changes may be called a rule or a law). A synchronic phonological system is taken to be describable as a set of rules governing the observed regularities of that system. The diachronically significant fact about such systems largely consists of the presence or absence of a certain rule, or the modification of the formulation of a given rule. A change does not usually take place suddenly once and for all, but a new regularity can emerge in a language, for which a new rule has to be formulated. The diachronically significant change, then, can be defined as the introduction of the new rule. In a similar way, a regularity may cease to exist, and so the rule which was earlier in operation (or had to be formulated within a description of the language system in question to capture the observed generalization) can be said to have been lost. Still another type of change may be described as a modification of the conditions for a rule to apply. Every new language-learner takes a fresh look at the facts. Rules that are no longer well motivated by the observable regularities cannot be postulated. The constant reanalysis and restructuring of the rule

system and the lexical inventory that has to be assumed to be taking place at the individual level may also be diachronically significant in a collective perspective.

2. The vowel system

The most dramatic phonological changes during the transitional period between Proto-Nordic and Old Nordic as defined in this survey apply to the vowel system. They include the development of a more comprehensive inventory of stressed vowels, on the one hand, and a radical reduction or total deletion of vowels in syllables not carrying main stress, on the other. By the end of the period, new vowel phonemes, without corresponding counterparts in the older system, had arisen. A quite different word structure had become predominant, whereby the preconditions for the modern distinctions in the tonal system in Danish, Norwegian and Swedish had also been created. (In accordance with Scandinavian tradition, /y/ is used here to denote the high front rounded vowel; the front glide is transcribed as /j/; and /R/ denotes so-called palatal *r*, as discussed in 4.1.5.).

2.1. Stressed vowels

Towards the transition period, the Proto-Nordic vowel system contained five monophthongs, long and short, as shown in Fig. 81.1.

In addition, there were three falling diphthongs: /ai/, /au/, /eu/. It has been assumed, on the basis of comparative evidence, that a long /ε:/ was also part of the older Proto-Nordic system, but already in the earliest runic inscriptions it seems to have been turned into /a:/; thus <makia> (Vimose) ‘sword’ (cf. *Go. mekeis*). In principle, all the vowels could be either oral or nasal, depending on the phonological environment; some Viking Age inscriptions written with the younger runes still make a systematic distinction between nasalized and oral *a* (see 5.). The diphthong /eu/ was changed into /iu:/ before *i*-umlaut took place (see 2.1.3.).

	<i>Front</i>	<i>Central</i>	<i>Back</i>
<i>High vowels</i>	/i/ /i:/		/u/ /u:/
<i>Mid-high vowels</i>	/e/ /e:/		/o/ /o:/
<i>Low vowels</i>		/a/ /a:/	

Fig. 81.1: Monophthongal phonemes in Proto-Nordic.

2.1.1. Umlaut

Umlaut typically means the influence on stressed vowels by vowels in unstressed syllables, to the effect that the stressed vowel is qualitatively affected by the basic characteristic feature of the unstressed vowel. Traditionally, the main tendencies of umlaut have been associated with the vowels *a*, *i*, *u* occurring in endings. So, *a*-umlaut is supposed to have induced lowering, *i*-umlaut fronting and *u*-umlaut a rounding effect. Sometimes, the respective *i*-umlauts have been fit into a wider context, also including other environments among the triggering factors. Widmark (1991) has more clearly – and more convincingly – than most others committed herself to a view on umlaut which implies that the different umlaut phenomena must be understood as special cases of an overriding principle leading to a transfer of grammatical information from endings to stems, a “code shift” as Sigurd (1961) puts it. Thus, Widmark uses the terms “lowering”, “palatal”, and “labial umlaut”. To Widmark it is also obvious that breaking (2.1.2.) is only another aspect of umlaut. She also emphasizes the intricacy of the phenomenon, involving all sorts of variables, the theoretical and methodological importance of distinguishing between the phonetic and the phonemic perspectives etc., which all contribute to making a perfect account of the process almost impossible. A critical survey of the research on umlaut between 1950 and 1980 is given by Benediktsson (1982, with further references).

2.1.1.1. *A*-umlaut means the lowering of the short stressed high vowels /i/ and /u/ to [e] and [o], respectively, under the influence of an unstressed /a/ in a following syllable (Fig. 81.2). It can be argued, as does Widmark (1991), that all low vowels may have the same lowering effect on high vowels, hence the term “lowering umlaut”. The least ambiguous cases, however, have the form of *a*-umlaut. Thus, Old Icelandic *neðan*, Old Swedish *næþan* ‘from under’

	Front	Central	Back
High vowels	/i/		/u/
	↓		↓
Mid-high vowels	[e]		[o]
Low vowels		(/a/)	

Fig. 81.2: The effect of *a*-umlaut.

are derived from the stem *niðr*, Old Swedish *nifer* ‘down’, and Old Norse *vega* and Old Norse *vægha* ‘strike’ can be compared to Old Norse *vig*, Old Norse *vigh* ‘blow (of death)’. The alternation is also manifested by allomorphs in Old Norse inflexional paradigms: Old Norse *sonar* gen. sg., but nom. sg. *sunr* ‘son’; Old Swedish nom. sg. *kona* ‘woman’, but gen. sg. *kunu*. However, such morphological variation within inflexional paradigms has often been subsequently reduced by “analogical levelling”.

Obviously, *a*-umlaut operating on /i/ was restricted to light syllables (cf. Old Norse *finna* with Gothic *finþan*); likewise a preceding velar consonant or a following /j/ blocked the lowering of /i/, and /u/ failed to be lowered when immediately followed by a nasal or velar consonant cluster or by a glide (/j/, /w/) in the next syllable, i.e. environments that usually have a raising effect.

It is a general contention that *a*-umlaut is old in origin, strictly speaking older than the transitional period focused on here (cf. runic <horna> ‘horn’ on the Gallehus horn, dated to the 5th c.). Especially the change /u/ > [o] had repercussions on the system, since by this change a short /o/ was reintroduced into the phoneme inventory, giving rise to the symmetric vowel system shown in Fig. 81.1. The asymmetric implementation of *a*-umlaut over the Nordic language area has traditionally been taken as testifying to a fundamental split between West and East Nordic, the dialect boundary dividing Sweden and Denmark in the south, falling between Jutland and the Danish islands, leaving variants like Old West Danish *brot* ‘break’, *bogi* ‘bow’, *golf* ‘floor’, as opposed to Old East Danish *brut*, *bughi*, *gulf*, respectively (Skautrup 1944, 36–37; cf. Westén 1962, 15).

The dialect material, if taken into account, adds even more to the heterogeneous picture. Furthermore, other changes have similar effects. So the Proto-Nordic diphthong /iu:/ is turned into /jo:/ before dental consonants in Old West Nordic: *bjóða* as opposed to Old Norse *biudha*. Long /u:/ in the western part of the area often corresponds to /o:/ in the east: Norwegian *bru* ‘bridge’, *ku* ‘cow’ but Swedish *bro*, *ko*. Sometimes this distinction has been referred to as one of the oldest dialect differences in the Nordic language area (Erlandsson 1972).

2.1.1.2. Palatal umlaut, in particular *i*-umlaut proper, is by far the most debated type of umlaut in the Nordic languages. In its prototypical form it adds the phonological feature

	<i>Front</i> [–round]	<i>vowels</i> [+round]		<i>Back</i> [–round]	<i>vowels</i> [+round]
<i>High</i>	(/i/)	[y]	←		/u/
<i>Mid</i>	(/e/)	[ø]	←		/o/
<i>Low</i>	[ɛ]		←	/a/	

Fig. 81.3: The effect of *i*-umlaut.

Period 2 (= Umlaut-free period)	Acc. sg. <i>stað</i> < * <i>staði</i> Pret. <i>talða</i> < * <i>taliðō</i>
Period 3 (= Umlaut period 2)	Nom. pl. <i>gestir</i> < * <i>gastiz</i> Nom. pl. <i>synir</i> < * <i>suniuz</i> Nom. sg. <i>fráði</i> < * <i>frōðī(n)</i> Nom. sg. <i>bendill</i> < * <i>bandilaz</i> Nom. sg. <i>ketill</i> < * <i>katilaz</i> Nom. sg. <i>kerling</i> < * <i>karling-</i> Nom. sg. <i>letingi</i> < * <i>lating-</i> Inf. <i>velja</i> < * <i>waljan</i>

Fig. 81.4: Kock's 3 period theory for *i*-umlaut (after Schulte 1998).

[+ front] to what is a [-front] vowel (or component of a diphthong) at the outset, as illustrated in the schematic view in Fig. 81.3. Both long and short vowels and diphthongs are affected.

The evidence suggesting the change contains examples such as the following: /a/ > [ɛ] (OWN *ketill* 'kettle'; cf. Go. *katils*); /a:/ > [ɛ:] (OWN *mæla* 'speak'; cf. *mál*); /o/ > [ø] (OWN *norðri* 'more northern'; cf. *norðr*); /o:/ > [ø:] (OWN *dæma* 'judge'; cf. Go. *domjan*); /u/ > [y] (OWN *fylla* 'fill'; cf. Go. *fulljan*); /u:/ > [y:] (OWN *lýkr* 2sg. pres. 'shut'; cf. Go. *-lūkis*); /iu:/ > [y:] (OWN *sýki* 'illness'; cf. *siúkr* 'ill'); /au/ > [ɛy] (OWN *deyfi* 'deafness'; cf. *daufn* 'deaf'). Other processes with similar effects, obviously triggered by palatal environments (such as a following *gi/ki*, *-iR*, or *-R*) can be considered as other aspects of a general tendency towards palatal assimilation, most evident in Old West Nordic: e.g. *dreki* 'dragon', *gler* 'glass'.

It is readily seen that, in comparison with the earlier vowel inventory, *i*-umlaut gives rise to new vowels, to begin with at a subphonemic level exclusively. Thus, the back vowels /a/, /o/, /u/ develop positional variants: [ɛ], [ø], [y], respectively. When this was initiated is im-

possible to tell, but the new allophones acquire phonemic status when the triggering factor has been discarded and morphemes have been relexicalized with the new phonemes. The most common approach has presupposed close interaction between *i*-umlaut and syncope, two of the most celebrated diachronic processes in early Nordic language history. To account for the somewhat confusing data, Kock launched a theory in 1893–94 (later elaborated in Kock 1911–16), built on the assumption that *i*-umlaut had passed through three different periods, during which the range of the process differed considerably (Fig. 81.4). This is an attempt at accounting for the data on purely phonological grounds. The set of data constituting the real problem contains forms with light syllables in which *i*-umlaut has failed to apply: **staði* > *stað*, **taliðō* > *talða* (Period 2 in Fig. 81.4). Kock's solution consists of conflating *i*-umlaut and syncope into one single rule:

Period 1. A syncopated unstressed *i* triggers *i*-umlaut in heavy syllables.

Period 2. A syncopated unstressed *i* does not cause umlaut in light syllables.

Period 3. An unsyncopated *i* always triggers *i*-umlaut.

	<i>Front vowels</i> [–round][+round]	<i>Back vowels</i> [–round][+round]
<i>High</i>	/i/ ⇒ [y]	(/u/)
<i>Mid</i>	/e/ ⇒ [ø]	(/o/)
<i>Low</i>		/a/ ⇒ [ɔ]

Fig. 81.5: The effect of *u*-umlaut.

However, apart from the phonetically-phonologically abnormal nature of the proposed rule, Kock's formulation does not even account for the observed data in a satisfactory manner. Thus, e.g., *ketill* has undergone umlaut while *vaðill* has not, although they are derived from historically underlying structures that are completely equivalent to each other. Many commentators have built on Kock's ideas, trying to come to grips with the problems that he left unresolved. E.g., Hesselman (1945) and others after him proposed that there was a general change of stressed back vowels in accordance with the *i*-mutation rule, some of them arguing in structuralist terms that the variation stayed at an allophonic level, the original segment being reinserted when the triggering factor vanished (in forms with a light syllable, e.g. **staði*, **taliðō*).

Different approaches to *i*-umlaut have been reviewed by Benediktsson (1982), Widmark (1991), and Schulte (1998) and will not be repeated here. It should be mentioned, however, that among the solutions presented we find reference to prosodic circumstances, phonological (segmental) structure, morphological levelling etc. No single treatment has so far provided the final clue in all respects. The latest attempt on a larger scale has been made by Schulte (1998). He takes a partly new look at the basic data and suggests that (1) the time scope for the change should be narrowed and that (2) the umlaut process should be evaluated as one single process with different aspects, which could be summarized as "primary palatal umlaut": *ī-/i-/j*-umlaut; the role of "secondary palatal umlaut" (i.e. *gi/ki*-umlaut, *iR*- and *R*-umlaut) and its relation to the initial process is not considered to the same extent. Schulte claims that since the umlauting effect of the series *ī-/i-/j* describes a scale of palatalizing power, there are a number of factors hitherto but vaguely realized as pertinent to a correct understanding of the phenomenon. Like, e.g., Skomedal (1980), he emphasizes the necessity of scrutinizing the whole process

anew, reconstructing the entire complex of changes step by step, with constant reference to the system gradually evolving through the changes.

Since /i/ occurred so frequently in Proto-Nordic endings, *i*-umlaut has manifested itself in great masses of forms derived by inflexional and derivational suffixes. Furthermore, *i*-umlaut has contributed considerably to giving the Nordic languages their basic and characteristic phonological structure. For instance, *i*-umlaut has created a great deal of morphophonemic alternation in most word-classes, and a number of derivational affixes containing an /i/ have given rise to strong derivational patterns.

2.1.1.3. *U*-umlaut, unlike *a*- and *i*-umlaut, is a change which is by and large restricted to the North Germanic languages. Its effects are distinguishable over the Nordic language area to a varying degree. It seems to have been applied differently, but extensive restructuring through analogical levelling has, in addition to that, contributed to a very confusing picture. It is customary to reckon with an "older" and a "younger" *u*-umlaut (Widmark 1959). The effect of the change is quite clear: unround vowels get rounded (Fig. 81.5). There are far more instances bearing witness of the process in West Nordic than in East Nordic. Among the numerous examples in Old West Nordic we find /a/ > [ɔ] (OWN *mōgr* 'son', cf. Go. *magus*; *gōrr* 'ready', cf. runic (Rök) <karuR>, i.e. **garuR*); /a:/ > [ɔ:] (*ōtum* 'ate' 1pl. pret. from *át*); /e/ > [ø] (*rōru* 'rowed' 3pl. pret. from *rera*); /i/ > [y] (*tryggr*, cf. Go. *triggws*); /i:/ > [y:] (*slý* 'slime', cf. OE *slíw*); /ε/ > [ø] (*ōx* 'axe', ONorw. (sometimes) *ax*; cf. Go. *aqizi*), etc. In Old Norwegian the change has been carried out in stressed syllables, in Old Icelandic in stressed and unstressed syllables alike: ONorw. pl. forms *herað* 'district', *skilnaðr* 'separation', *skipan* 'arrangement', but Olcel. pl. *heruð*, *skilnuðr*, *skipun*. As for Old Danish and Old Swedish, there are indica-

tions of the older *u*-umlaut too, e.g. in runic forms like <tanmaurk> (Jelling; cf. OIcel. *Dannqrk* ‘Denmark’, <aunt> ‘spirit, soul’ (cf. OIcel. *qnd*) on several Swedish runestones, and in sporadic forms, such as Sw. *hon* ‘she’. Danish displays some reflexes of *u*-umlaut which are lacking in Swedish (Dan. *lov* ‘law’, *børn* ‘children’ vs. Sw. *lag*, *barn*), but there are some cases in Old Swedish texts indicating that non-umlauted forms have later been reintroduced in Modern Swedish; there may have been much levelling in Old Swedish.

U-umlaut has remained a productive rule in West Nordic well into the Old Nordic period, creating a significant distinction between West and East Nordic. In West Nordic, *u*-umlaut has given rise to extensive morphophonemic alternation, e.g. in plural forms of verbs (e.g. OIcel. *kǫllum* ‘(we) call’) and in the dat. pl. of the nominal and pronominal inflection (*mǫnnum* ‘men’, *ǫllum* ‘all’), where Old East Nordic, including Old Norwegian, have forms without umlaut (*kallum*, *mannum*, *allum*, respectively). In East Nordic, where fewer reflexes of *u*-umlaut are to be found, some additional phonetic conditions seem to have favoured the change, e.g. a labialized phonetic environment: Sw. *huru* (< **hwāru*) ‘how’, *huvud* ‘head’. The effect of the process has varied within the East Nordic language area as well: cf. Sw. *honom* ‘him’ to Dan. *ham* (< **hānum*).

The morphophonemic alternation *a* – *ö* (to a varying degree morphologized eventually) still plays an important role in the synchronic morphological system of Modern Icelandic. In Modern Faroese, morphological levelling has taken place extensively. In these cases the original oblique forms exhibiting the effect of *u*-umlaut have often carried the day, having been generalized throughout the paradigm: nom. sg. *gota* ‘street’, *søga* ‘story’; oblique forms: *gotu*, *søgu*. On the whole, however, *u*-umlaut does not play any role in the synchronic system of Modern Faroese.

2.1.2. Breaking

A short PN /e/ in stressed position has been “broken” into /ja/ or /jə/ in a great many cases all over the Nordic language area, as in OWN *hjarta* ‘heart’, *jørð* ‘earth’ (cf. *G Herz, Erde*). Breaking phenomena of this kind, just like the vowel changes mentioned above, are well known from other Germanic dialects as well, Old English not least, which is still borne out by the equivalents in English just given.

Nevertheless, the relative consistency of the change lends a characteristic trait to the Nordic languages in particular.

Nordic breaking is presented in half a dozen handbooks on Swedish language history published from the 1940s until the middle of the 1990s. Exactly the same story is repeated time and again: PN short /e/ is broken into a diphthong [ja] under the influence of a following unstressed /a/ and into a diphthong [jə] when followed by an unstressed /u/, the outcome written <ia> and <io>, respectively, in medieval manuscripts: OSw. *hialpa* ‘help’, *hiarta* ‘heart’; *biorn* ‘bear’, *iordh* ‘earth’. In *hialpa* and *hiarta*, /ja/ has later evolved into /jɛ/, and /jə/ has often been turned into /jø/ (as in OSw. *biörn*, but cf. Mod. Sw. *jord*) by so-called “progressive *i*-umlaut”, mainly taken to apply after the period examined here. This description goes back to Kock (1911–16), with modifications by Hesselman (1945). The well-established national scholarly tradition effectively conceals the fact that internationally there has been very little consensus about breaking among scholars. Their different views can be briefly summarized as follows.

The term “breaking” was coined by Grimm (1840) and was originally related to his particular vowel theory, which is now obsolete. The essence is that *e* was “broken” into *ia* in the Germanic dialects basically under the influence of surrounding consonants. In a review of Grimm (1840) in *Heidelberger Jahrbücher der Literatur* 1841, Holzmann was the first commentator who characterized breaking as a kind of *a*- or *u*-umlaut (according to Svenson 1944). Theories of breaking as a result of consonantal influence remained, however, dominant during the second half of the 19th c. Among the Nordic commentators we find Munch/Unger (1847) and Gíslason (1858); Rydqvist (1868) leans heavily on Grimm. Holzmann’s breaking theory based on vowel influence was further developed by Wahlenberg (1855). Referring to Avestian phonology for a parallel, he explains Germanic breaking as a vowel epenthesis rule, whereby a copy of the unstressed vowel is introduced immediately after the stressed vowel, resulting in a /ea/ or /eu/ diphthong, later changed into /ia/ or /io/, respectively.

The theory of vowel-governed breaking was introduced into Nordic linguistics by Blomberg (1865) and was supported by others. With Noreen (1884 and later editions), the tradition was set. From the 1880s onwards, Nordic scholars have largely concentrated on specify-

ing the details connected with the implementation of the rule over the Nordic language area. Söderberg (1890) and Kock (1890; more developed in Kock 1911–16) argued that breaking had taken place during two different periods. Hesselman (1912) related breaking to syncope in order to account for the non-application of breaking to short syllables. Kock's and Hesselman's ideas (in simplified form) still underlie the handbook information.

Quite another type of argumentation was advanced by Svensson (1944), who reckoned with spontaneous diphthongization irrespective of consonantal and vocalic environment. His proposal has not attracted much support, especially not after the critical treatment by Nielsen (1957), who, in turn, reopened the case of a general diphthongization of /e/ into [ja] when followed by /a/ or /u/, [ja] later regularly undergoing *u*-umlaut whereby it was changed into [jə] in specific environments. Steblin-Kamenskij (1957) stressed the umlaut nature of breaking, suggesting two different stages, one pertaining to the phonetic level, the other to the phonemic. In more recent years, two new theories have been suggested by Norwegian scholars. Dyvik (1978) returned to the issue of consonants being the triggering factor in Nordic breaking as in Old English. His ideas have been scrutinized and rejected by Benediktsson (1982), who also gives a general survey of the state of the art. Skomedal (1980) distinguished two different steps leading to what is called breaking: (1) a backing of /e/ by means of *a*-umlaut, followed by (2) segmentation of backed /ë/ into /ia/; in addition, *u*-umlaut may later apply to /ia/.

The earliest treatments aimed at a general Germanic perspective, which is also Dyvik's purpose. On the other hand, Benediktsson seems to deny the existence of an organic relationship between, e. g., Nordic breaking and similar processes in Old English. It is obvious that although handbooks keep repeating essentially the same information about breaking, many of the problems connected with this phenomenon remain largely unsolved. A warning by King (1975) about the "simple causation fallacy" comes readily to mind. By this he meant that sometimes a diachronic problem cannot be solved through one simple formula – language change may be too complex for that. It cannot be denied that Old English breaking is hard to reconcile with Nordic breaking, as it stands. On the other hand, there are indeed a number of breaking phenomena in the Old Germanic dialects with a striking

resemblance to each other, generally speaking. Although the changes in question cannot be captured by the same formulation, it seems unlikely that they should have emerged quite independently of each other (cf. Schirmunski 1966).

Widmark's re-examination of umlaut leads her to a consistent treatment of breaking as an aspect of umlaut. In spite of this, however, Nordic breaking is still an open case and a suitable target for future research.

2.1.3. Modification of diphthongs

Stressed diphthongs may undergo various changes in addition to those alluded to above. The diphthongs /ai/ and /au/ were contracted to [a:] and [o:], respectively, at an early date, on the condition that /h/ followed, or, in the case of /ai/, /r/; cf. Einang <faihido> with Rö <fahido>, Go. *þauh* with OWN *þó* (< */þo:h/). Towards the end of the period, the first component of the three falling diphthongs /ai/, /au/, and /eu/ had been partly assimilated by the second, so as to conform phonetically more closely: /ai/ > [ei], /au/ > [əu], /eu/ > [iu:]. The modification of /eu/ is considerably older than that of the other diphthongs, pre-dating *i*-umlaut. It also implies a stress shift (from falling to rising diphthong): */leuβ-/ > */liu:β-/ (cf. Opedal <liubu> > OWN *ljúf* fem. sg. 'dear'). A similar development may have been an aspect of breaking as well (/ea/ > /ia/ etc.). The adaptation of /ai/ and /au/, on the other hand, marks the first step towards East Nordic monophthongization, which takes place during the Viking Age: Pre-ON *stainaR*, *laukaR* > OWN *steinn*, *laukr*, OEN *stēn* 'stone', *lōk* 'lek'.

2.1.4. Vowel nasalization

Vowels were nasalized before nasals in Proto-Nordic. When nasals disappeared (4.2.1.), nasality may have become intrinsic to the vowel itself: OWN *áss* [ã:s] < */ãnsuR/ 'pagan god'. This phenomenon is likely to have applied throughout the vowel system, but in writing it is only reflected for /a/ (see 5.).

2.2. Unstressed vowels

Syrett (1994) has posited an unaccented monophthongal system for late Proto-Nordic containing the members */a/, */æ/, */o/, */i, i:/, */u, u:/. According to the general view, the

corresponding system in Old Nordic relies on the extreme members of the vowel triangle: /i, a, u/. As Syrett points out, however, there is much phonetic fluctuation in unstressed syllables and, phonologically, the vowel phonemes occurring in unstressed syllables tend to be underspecified. Furthermore, the evidence left by written material is often ambiguous. No absolutely clear-cut picture of the development in unstressed syllables is available so far.

It is likely that a number of phenomena observable in the system of unstressed vowels as reflected in the medieval texts have their history in the period considered here (see, e.g., Widmark 1991). This is true for so-called vowel harmony in Old East Norwegian and Old Swedish, perhaps also for vowel balance. Since these processes, however, are mainly productive in another period, they are not treated here.

2.2.1. Monophthongization

The Proto-Nordic diphthongs could originally occur in unstressed syllables, e.g. *-ai* and *-iu* marking masc. dat. sg. of different noun classes, *-au* originally in OWN *átta* (< **axtau*; cf. Go. *ahtau*) etc. These diphthongs have been monophthongized rather early, <-e> being the normal pre-Viking Age runic form for earlier <-ai> as the masc. dat. sg. marker (Krause 1971, 89); also cf. ON *megi* (but still Stentofte <magiu>) masc. dat. sg. of *mōgr* 'son' and Proto-Nordic runic <fahi> (< **fahiu*) 'I write' or 'I paint'. Both /ai/ and /iu/ have finally ended up as /i/ through the intermediate stage /e:/ and /i:/, respectively, /au/ usually through /o:/ as /a/.

2.2.2. Vowel shortening

All sorts of unstressed vowel reductions have often been related to syncope in one way or other (2.2.3.). Certainly, vowel shortening takes place in endings at about the same time as syncope is productive, and it may be natural to consider shortening of long vowels and deletion of short vowels as two aspects of the same principle. In a wider descriptive perspective, they certainly are (e.g. Sigurd 1961; Riad 1992). It has to be kept in mind, however, that the effects are far from equivalent. A celebrated example of vowel shortening is the Old Nordic masc. and neut. dat. sg. ending *-i*, which does not normally trigger *i*-umlaut, since it had an earlier /-e:/ value (developed

from */-ai/). It is readily seen that the long unstressed vowels in endings are usually the product of earlier diphthongs having been monophthongized (2.2.1.).

2.2.3. Syncope

"Syncope" is the traditional term for the deletion of short unstressed vowels, one of the most sweeping phonological changes in the history of the Nordic languages. It contributes to a rather radical modification of the overall phonological structure of the Nordic languages in the period following Proto-Nordic. However, the course of the change must have been rather intricate and probably spanned a rather long period of time, especially if its implementation throughout the language area is taken into account.

It will be remembered that all the Germanic languages have undergone syncope, at different points in time and under varying circumstances. Gothic bears witness of an early syncope of unstressed /a/ and /i/ (Go. *dags*, *gasts* from **dagaz*, **gastiz*), while /u/ is left unaffected (Go. *footus* 'foot', *handus* 'hand', *magus* 'son', *skildus* 'shield'). In Old English and Old High German, there is likewise a deletion of unstressed /a/ (OE *dæg*, OHG *tag*), but in the case of /i/ and /u/ in endings, the structure of the preceding syllable is decisive to the fate of the unstressed vowel: OE *giest*, *scield*; OHG *gast*, *scilt* (with a heavy stressed syllable), but OE *wine*, *sunu*; OHG *wini*, *sunu* (with a light one). Thus, variables like the quality of the unstressed vowel itself and the word structure may govern the change.

Syncope in Proto-Nordic has been assumed to have been sensitive to the same kinds of restrictions as were just mentioned. Syncope seems to apply to /a/, /i/ and /u/ in that order, or at least /a/ is subjected to deletion first. Indeed, the Rök stone provides three remaining unscopated forms, none of them containing an /a/ in the ending: <sitiR>, <karuR>, <sunu> (cf. OWN *sitr*, *gqrr*, *sun/son*).

As far as word structure is concerned, different types may have been disposed to syncope at different points in time. On the Bohuslän Rök stone we find two verb forms in the 1sg. pret.: <fahido> 'I painted' and <satido> 'I placed'. The main stress is on the first syllable in both cases, but the stressed syllable is heavy in the first form, light in the second; the medial syllable is light and the final vowel is long in both cases, /fa:hido:/, /satido:/. Syncope applied early, i.e. in the 7th c. or before,

to such structures, and probably earlier to the first type (with long stressed syllable) than to the second (with short stressed syllable). The effect in both cases implied that the medial vowel was lost: OWN *fáði*, *setti*.

If, on the other hand, the last vowel was short in trisyllabic words, the syncope rule would delete this vowel instead. On another old runic stone from Bohuslän, Kalleby, the past participle <haitinaR> ‘called’ is found. In such words, the last /a/ has been lost, as testified by OWN *heitinn*. In fact, equivalent forms occur in (other) runic inscriptions, some even written in the older futhark (e.g. <skorin> ‘cut’ (past part.) on the Eggjum stone; cf. OWN *skorinn* (from *skera*).

Syncope applying to originally disyllabic words has resulted in great masses of monosyllabic words in Old Nordic. Some famous runic inscriptions have been argued to represent a stage when syncope was not yet fully completed. The Istaby stone (Blekinge) is one such case. Here, two compounded personal names containing the Nordic word for ‘wolf’ as their second part occur in the forms <-wulAfR> and <-wulAfA>, respectively. The <A> rune in <-wulAfR> and the first <A> rune in <-wulAfA> are presumed to have been epenthesized, with no historical significance, while the final <A> in <-wulAfA> may indeed reflect an *-a* ending, the real forms being *-wulfR* and *-wulfa*. On this assumption, the case may suggest that syncope was also sensitive to the distinction between open and closed syllables (a suggestion which has not played any important role in the discussion), or it may have been delayed in syllables where the unstressed vowel alone carried important morphological information (here signalling acc. sg.; cf. Kiparsky 1972). But, again, the runic evidence is far from unequivocal.

Medial syncope operated after heavy and light syllables, and final syncope after heavy syllables or in tri- and multisyllabic words during the first syncope period. It is generally agreed that final syncope in disyllabic words with short stressed syllables postdates the first period significantly, constituting a second period of syncope. As has already been pointed out, there are forms on the Swedish Rök stone like <karuR> (i.e. *garuR*, OWN *gorr*), <sitiR> (OWN *sitr*), <sunu> (also e.g., on the stones from Sölvesborg and Helnæs; OWN *sun/son*). Again, there is seemingly contradictory evidence, e.g. on the Sparlösa stone: <makuR> (OWN *mogr*) alongside <sunR> (OWN *sunr/sonr*), both being derived from *u*-stems.

3. Prosodic phenomena

The fixation of main stress, which leads, e.g., to the cessation of Verner’s Law as a productive rule, is carried out much earlier than the period under review here. Main stress in Proto-Nordic lay regularly on the stem syllable in simple words, and in compounds on the first stem syllable. Secondary stress was, e.g., assigned to the second component of compounds. The idea often advanced that the fixed initial stress was also particularly strong is not supported by any clear evidence (Riad 2000). Various new stress patterns arose as a consequence of the sweeping structural changes during the Pre-Old Nordic period (see Riad 1992). Quantity, as such, was not much different in Proto-Nordic than in Old Nordic. Both vowels and consonants could either be long or short and, in principle, there were light, heavy, and overlong syllables all along. Full-scale vowel deletion by syncope, however, gave rise to quite new relative strengths among the word categories characterized by the different types of syllable structure.

The modern Scandinavian languages display some very particular tonal properties whose development has long been a matter of dispute. Some scholars (e.g. Kock 1878–85) have argued that the history of accent 1 and 2 in Norwegian and Swedish and *stød* and non-*stød* in Danish goes far back, at least to Proto-Nordic, perhaps to Common Germanic, some say even further. As usual, it is important to distinguish between phonetic manifestations and lexicalized properties on this point. There is a marked tendency among modern scholars (e.g. Ringgaard 1980; Liberman 1982; Riad 1992) to associate the lexicalization of the typical Scandinavian tonal features with early Old Nordic. A fuller treatment of this development is found in art. 74 of this volume.

At any rate, the distinction between accent 1 and 2 and *stød* and non-*stød*, respectively, is obviously due to a reanalysis of the significance of tonal contours characterizing different sets of lexical items. The existence of these contours as such may well go far back in time, largely with the period of productive syncope as a crucial turning-point. Scholars differ in their opinions about whether *stød* is a late phenomenon, having evolved from tonal accent (e.g. Riad in art. 124), or a phenomenon of long standing, in fact providing the basis for tonal accent (e.g. Liberman 1982).

4. The consonant system

The consonant system was considerably modified over the course of the period from Proto-Nordic to Old Nordic, both the consonant inventory as such and the distribution and manifestation of its components. Deletion of consonants in certain positions and assimilatory processes are common. Large-scale reduction and loss of unstressed vowels give rise to new combinations of segments, in turn stimulating further modifications, among the consonants not least.

There were five categories of consonants in Proto-Nordic: stops, fricatives, nasals, liquids, and glides (semivowels). They were primarily produced in the labial, alveo-dental, and palato-velar regions of the articulatory apparatus (Fig. 81.6). Both the phonemic status and the exact phonetic properties of some of the segments are a matter of dispute.

4.1. Obstruents (stops and fricatives)

A majority of the consonant phonemes are voiceless or voiced non-nasal stops or fricatives. In early Proto-Nordic, there was no phonemic distinction between the voiced fricatives /β/, /ð/, /ɣ/ and the corresponding voiced stops, but word-initially, in geminates (i.e. when long), after a homorganic nasal and, for the dental, after /l/, they were preferably manifested as voiced stops, i.e. as [b-, d-, g-] and [-bb-, -dd-, -gg-], [mb, nd, ŋg], [ld], respectively. Words containing these segments have later been relexicalised with stops in the respective positions, at different points in time in different dialects.

On the whole, there seems to have been much allophonic alternation among the fricatives. This is indicated in Fig. 83.6, where putative allophonic alternants appear within brackets. For instance, it is impossible to know whether /f/ was a labiodental or a bilabial fricative; the velar fricative /x/ has prob-

ably been pronounced with a varying degree of stricture, sometimes rather tending towards a laryngeal [h]; and the sound corresponding to runic <R> is a notorious problem (see 5.). The realization of many phonemes can be assumed to have been context-sensitive, i.e. to have alternated systematically for some time, e.g. [x] ~ [h] and [h] ~ [0] in the history of a word like OWN *slá* ‘to strike’ (cf. Go. *slahan*; see 4.1.1.).

4.1.1. Fricative voicing

In Proto-Nordic there are both voiced and voiceless fricatives, contrasting with each other positionally after first-syllable word stress became fixed (e.g. inter-vocally or otherwise in a voiced environment: By <alaifu> (dat. sg. of OWN *Áleifr*) – <gibu> 1 sg. pres. ‘I give’, *[slaxan] – *[slo:ɣum], *[finθan] – *[funðum], etc.). Later, /f/ and /θ/ gradually became voiced in an ever-increasing number of voiced surroundings, so that OWN *hefja* ‘to raise’, *úlfr* ‘wolf’, *bróðir* ‘brother’, *verða* ‘to become’ (cf. Go. *hafjan*, *wulfs*, *broþar*, *wairþan*) all exhibit a voiced fricative, thus losing an earlier distinction (e.g. /f/ and /β/ in OWN *úlfr* and *kalf* ‘calf’; cf. Go. *wulfs*, *kalbo*). In Old West Nordic, /f/ and /θ/ have two allophonic variants, [f] ~ [v] and [θ] ~ [ð], respectively, the voiceless variant occurring word-initially, the voiced word-medially (if it is not long) and word-finally, provided that voicing assimilation does not create other patterns (see 4.1.3. and Fig. 81.6).

In the case of /x/, however, it was weakened to /h/ in many positions and was later largely lost in all positions except word-initially: */slaxan/ > */slahan/ > /sla:/ ‘to strike’, pret. */slo:x/ > */slo:h/ > /slo:/. This development holds for original /x/ and devoiced /ɣ/ alike: */lauɣ/ pret. of OWN *ljúga* ‘to lie’, later */laux/ > */lauh/ > OWN *ló* and */θaux/ > */θauh/ > OWN *þó* ‘though’ (cf. Go. *þauh*). In Old West Nordic, /x/ can

	Labial	Alveo-dental	Palato-velar	Laryngeal
Voiceless stops	/p/	/t/	/k/	
Voiced stops	/b/ ~ [β]	/d/ ~ [ð]	/g/ ~ [ɣ]	
Voiceless fricatives	/f/ ~ [ɸ]	/θ/ /s/	/x/ ~ [h]	[h]
Voiced fricatives	[β]	[ð] /z/ [= R?]	[ɣ]	
Nasal stops	/m/	/n/	[ŋ]	
Liquids		/l/ /r/		
Glides	/w/		/j/	

Fig. 81.6: The consonant system of (late) Proto-Nordic.

be argued to have remained unchanged word-initially before /r/, /l/, /n/ (in words such as *hringr* ‘ring’, *hlaupa* ‘to run’, *hníga* ‘to sink down’). Otherwise, the velar fricative has become a laryngeal fricative [h].

4.1.2. Final devoicing

Proto-Nordic obstruents were liable to devoicing in word-final position in a similar fashion as can now be observed in Modern Standard German. As long as the voiced obstruents lost their voicing in an easily definable environment, thereby giving rise to morphophonemic alternation, word-final devoicing was simply part of the phonological system as a synchronic rule. The rule ceased to function as a consequence of syncope, i.e. when a great number of new instances of voiced obstruents emerged at the end of words and made the devoicing rule opaque. Word-final devoicing is thus chronologically prior to syncope. Its earlier existence can be deduced from a set of relic forms, e.g. OWN *batt*, *hélt*, *gékkt*, *dró* (< */dro:x/) , *sté* (< */steix/) from *binda* ‘to bind’, *halda* ‘to hold’, *ganga* ‘to go’, *draga* ‘to pull’, *stíga* ‘to rise’, respectively.

The chronology of final devoicing is somewhat obscure. It cannot have been an integral part of the phonological system as long as /z/ remained a voiced fricative obstruent. Otherwise, in a great number of word-final occurrences this sound would have failed to develop into /r/, through a putative intermediate stage usually referred to as “palatal *r*” (4.1.5.). Final devoicing in the Proto-Nordic dialects seems to have been a process which operated during a rather limited period, much in the same way as it did in some other medieval language systems, where the phenomenon was obviously due to temporary influence from a neighbouring language (Ralph 1980).

4.1.3. Obstruent assimilation

Voiced obstruents are devoiced in voiceless environments, a very natural co-occurrence phenomenon. Much morphophonemic alternation is created in stems through influence from inflectional and derivational endings and their value regarding voicing and from the phonological structure in compounds.

Voiced segments have lost their voicing in the position next to a voiceless sound in, e.g., OWN *ljúft* [f] (neut. of *ljúfr* [β] ‘delightful’), *systkin* ‘sisters and brothers’ (as compared to

feðgin ‘parents’), *lanz* (<z> for [ts]; gen. sg. of *land* ‘land’), *konunx* (<x> for [ks]; gen. sg. of *konungr* ‘king’). The devoicing effect usually wins out both progressively and regressively; thus, /tt/ is the result of /t + ð/, /ð + t/, /d + t/, and /dd + t/ combinations: OWN *bætta* pret. of *bæta* ‘to improve’, *gott* neut. sg. of *góðr* ‘good’, *blint* neut. sg. of *blindr* ‘blind’, *fótt* neut. sg. of *fóddr* ‘born’. Voicing/voicelessness may also be mediated by an intervening /l/ or /n/: cf. forms like OWN *siglda*, *girnda* (pret. of *sigla* ‘to sail’, *girna* ‘to desire’) to *vixlta*, *væpnia* (pret. of *vixla* ‘to exchange’, *væpna* ‘to arm’). In some cases, the etymology of the word is reflected by its inflexional ending in Old West Nordic, in so far as the earlier presence of a voiceless segment is testified by the form of the ending: *mælda* pret. of *mæla* ‘to measure’ but *mæltá* (< **mabliðō*) pret. of *mæla* ‘to speak’ (Go. *mabljan*).

Allomorphic variants of inflexional endings originally starting in a voiced sound may come about in this way; e.g., the pret. ending *-ðō of the weak verbs turns up as *-þa* in early Old West Nordic documents: *dreyppþa*, *reisþa*, *vakþa* (pret. of *dreyppa* ‘to let fall in drops’, *reisa* ‘to raise’, *vaka* ‘to (be) awake’). In that position, /θ/ has later been changed into /t/ (see 4.1.4.). The same ending has ultimately given *-da* in most voiced environments, including *eydda* (from *eyða* ‘to make empty’) and *talda* (from *telja* ‘to count’).

Probably in rather late Proto-Nordic times (albeit before the completion of syncope), /θ/ is assimilated by a preceding /l/ or /n/: OWN *gull* ‘gold’, *hollr* ‘faithful’, *ellri* ‘older’; *annarr* ‘other’, *finna* ‘to find’, *nenna* ‘to be willing’ (cf. Go. *gulþ*, *hulþs*, *alþiza*; *anþar*, *finþan*, *nanþjan*, respectively).

The voiced dental fricative /z/ (or perhaps rather the palatal *r* later developed from this sound; see 4.1.5.) is assimilated by a following voiced dental stop /d/ and the dental nasal /n/, respectively. The result is long /d:/, /n:/. Examples are OWN *gaddr* ‘string’, *rōdd* ‘voice’, *broddr* ‘point’; *hrōnn* ‘wave’, *rann* ‘house’ (cf. Go. *gazds*, *razda*, OHG *brort*; OE *hærn*, Go. *razn*, respectively). The dating of this change is uncertain.

In /ht/ (perhaps /xt/) combinations, /h/ (/x/) is assimilated and a preceding vowel lengthened: OWN *átta* ‘eight’ (G *acht*). In *sótta* (pret. sg. of *sækja* ‘to search’), *mátta* (pret. sg. of *mega* ‘to be able’) etc., the same rule has applied to secondary /h/ (/x/), derived from stem-final /k/ and /g/.

4.1.4. Shift of continuancy

Within the obstruent system there are several cases where fricatives become stops and vice versa. Thus /f/ in front of /t/, /s/ and after /s/ is often realised as /p/: OSw. *opta* ‘often’, *næpsa* ‘to rebuke’, OWN *húspreyja* ‘wife’. There has probably been a certain amount of variation in such words, as suggested by written compromise forms in medieval texts like OSw. *gífptia* ‘to marry’, *þurfpti* pret. of *þurfa* ‘to need’.

There are many instances of an earlier fricative having been transformed into a stop in the preterite of weak verbs (see 4.1.3.). Furthermore, nouns derived by the *-iðō suffix end in /-t/ in Old West Nordic when following a voiceless sound: *dýpt* ‘depth’, *tylft* ‘a number of twelve’; and in /-d/ after voiced sounds: *hvild* ‘rest’.

After a short vowel (and occasionally a following short consonant) /x/ (or /h/) has been dissimilated into /k/ before /s/: OWN *uxi* (with ⟨x⟩ for [ks]) ‘ox’, *fylxni* ‘hiding-place’ (Go. *aihsna*, *fulhsni*). When the vowel is long, /x/ is deleted: OWN *þisl* ‘cart-pole’ (G *Deichsel*).

In unstressed position /k/ and /t/ have, by the reverse process, become fricatives: e. g. adjectives ending in OWN *-ligr* (cf. Go. *-leiks*), unstressed words such as *að*, *við*, *mikið* (from *at* ‘to’, *vit* ‘we two’, *mikit* ‘much’). These tendencies are reinforced in Old West Nordic.

4.1.5. “Palatal r”

It is generally contended that during the Proto-Nordic period a /z/ that had arisen from /s/ by Verner’s Law developed into a more *r*-like sound, which later, after full sonorization, merged with original /r/. The exact nature of this change as well as its full chronological course is not established with certainty. The presence of a particular sign for this sound in the runic script, distinct from both ⟨s⟩ and ⟨r⟩, bears witness to its existence, but to what extent phonetic details are brought to light by runic script is notoriously difficult to evaluate. The use of the ⟨r⟩ rune seems to end up as an orthographic convention exclusively (see 5.). By tradition, the presumed sound has been referred to as “palatal *r*”, and it has been transcribed as *R* (Tjäder 1961; Peterson 1983). This usage has been adopted here too. It is probable that “palatal *r*” had a phonetic value of fricative [ʃ] or [ʝ].

Palatal *r* has been assimilated to neighbouring dental consonants in combinations arising

from syncope: OWN *stóll* ‘chair’, *ketill* ‘cauldron’, *steinn* ‘stone’, *aptann* ‘evening’, *aurr* ‘gravel’, *hamarr* ‘hammer’, *iss* ‘ice’, *ýmiss* ‘mutual’. The assimilation takes place after a heavy accented and a light unaccented syllable, usually being blocked after light accented syllables ending in /l/, /n/ and in syllables ending in long /ll/, /nn/: OWN *selr* ‘seal’, *svanr* ‘swan’, *fullr* ‘full’, *linr* ‘mild’ (but cf. e. g. *minni* ‘smaller’ as opposed to Go. *minniza*). A palatal *r* was assimilated to an /m/ in inflexional endings, e. g. OSw. *hæstum* dat. pl. of *hæster* ‘horse, stallion’ (cf. ⟨hagestumR⟩ on the Stentofte stone), but obviously not in stressed syllables: OWN *tveimr* dat. ‘two’, *þrimr* dat. ‘three’. As far as the assimilation of palatal *r* involves inflexional endings, the result may vary considerably over the Nordic language area. Endings may later have been reinserted analogically.

4.2. Nasals

Among the nasals, /m/ and /n/ had phonemic status, while [ŋ] was a positional variant only. Nevertheless, there was a special runic sign for [ŋg], in the older Futhark, although it was sometimes used for just [ŋ] (see 5.; Krause 1971, 35).

4.2.1. Nasal assimilation

When followed by a voiceless homorganic stop (i. e. in /mp/, /nt/, /ŋk/ combinations), the nasals are assimilated, leaving long stops: /pp/, /tt/, /kk/ (or /p:/, /t:/, /k:/), respectively. In some forms assimilation applies all over the Nordic language area: in sporadic words such as Icel. *drekka*, Dan. *drikke* (cf. E *drink*); in neuter forms of (usually unstressed) articles or pronouns, e. g. Sw. *ett*, *mitt* (from *en* ‘a, one’, *min* ‘my’); in pret. forms of strong verbs like Dan. *fik* ‘received’, *gik* ‘went’ etc. Assimilation may be observed more often in Old East Nordic than in Modern Danish and Swedish: e. g. OSw. *gak* (= *gakk* < **gan̄k* < **gann̄g*), *stat* (= *statt* < **stant* < **stand*), imperative forms of *ganga*, *standa*; Mod. Sw. *gå*, *stå* (inf. and imp.).

The change has thus left traces in all parts of the Nordic language area, particularly when it has applied early, e. g. in the pret. part. *bundit* (< **bundint*, and in the neuter form of adjectives ending in *-inn*, e. g. OIcel. *loðit*, *mikit*, with degemination of /tt/ in unstressed position). It has not been preserved as a pro-

ductive morphophonemic rule in East Nordic to the same extent as in the western dialects: Icel. *binda* – *batt* ‘bind’, *hanga* – *hékk* ‘hang’ etc., but Sw. *binda* – *band*, *hänga* – *hängde* etc. In the more easterly dialects, there has been much morphological levelling, whereby the original alternation has been obscured. E. g., the OSw. paradigms *springa* – *sprak(k)*, *stinga* – *stak(k)*, where the preterite forms derived by word-final devoicing followed by nasal assimilation have given rise to new lexical units, Mod. Sw. *spricka* ‘to burst’ and *sticka* ‘to prick’, distinct from *springa*, *stinga*, from which, in turn, new preterite forms have later been derived (*sprang*, *stang*).

Nasal assimilation has generally affected Icelandic, Faroese, West Norwegian, partly West Swedish dialects (in fact also some Danish), but Modern Standard Danish and Swedish do not reflect the effect of the rule to the same extent. These changes give rise to a West – East Nordic opposition in many cases: OWN *kroppin* ‘crippled’, *sqppr* ‘mushroom’; *brattr* ‘steep’, *stuttr* ‘short’; *ekkia* ‘widow’, *sökkva* ‘sink’ vs. OEN (OSw.) *krumpin*, *svamper*; *branter*, *stunter*; *ænkia*, *siunka*.

These assimilations have been investigated by Moberg (1944), who has also suggested a dating: 650–850. An earlier version of nasal assimilation – or rather loss of a nasal leading to compensatory lengthening of vowels in tonic syllables – took place in certain environments, e. g. before /s/ in OWN *gás* ‘goose’ (cf. G *Gans*), before /f/ in OWN *ffl* ‘fool’ (< **fimfla*-), before /n/ in OWN *Pórr* ‘Thor’ (cf. OHG *Donar*); the exact conditions are not quite clear. This change should probably be kept together with the loss of nasals word-finally: OWN *á* ‘on’ (cf. runic <an>, Tjurkö), *i* ‘in’ (G *in*); all infinitive forms have lost an earlier /-n/, e. g. OWN *binda* ‘to bind’ (Go. *bindan*).

4.2.2. Nasal dissimilation

In the sequence /mn/, the nasal /m/ has, in Old West Nordic, undergone dissimilation into /f/ (<β) in words like *nafn* ‘name’, *safn* ‘collection’, *hifni* dat. sg. of *himinn* ‘heaven’. Very confusingly, the equivalent of OWN /fn/ is sometimes /mn/ in East Nordic, although /fn/ reflects the original state more faithfully: Sw. *hamn* for Icel. *höfn* ‘harbor’, *jämn* for *jafn* ‘even’, *sömn* for *svefn* ‘sleep’ (cf. G *Hafen*, *eben*, OE *swefn*).

4.3. Glides

The Proto-Nordic glides are involved in two types of processes with quite different results. First of all, glides are lost under various circumstances. Word-initial /j/ is dropped generally at the very beginning of the transitional stage: OWN *ár* ‘year’, *ok* ‘yoke’, *ungr* ‘young’ (cf. G *Jahr*, *Joch*, *jung*). Word-initial /w/ is later lost before rounded vowels: OWN *orð*, *óðr*, *úlfr*, *æpa*, *yrkja* (cf. G *Wort*, Go. *wods*, G *Wolle*, *Wolf*, Go. *wopjan*, G *wirken*, respectively). These changes are characteristic of the Nordic languages. A /w/ also drops before /r/ followed by the same vowels: OWN *róg* ‘slander’, *rægja* (cf. OE *wrógian*). Deletion of word-initial /w/ before /r/ continues to apply in early Old West Nordic (but not in Old East Nordic): OIcel. *reiðr*, *reka*, *rangr*, *rist*, *riða*, *rô* (cf. OSw. *vreþer*, *vræka*, *vranger*, *vrist*, *vriþa*, *vra*). Occasionally, /w/ has also been eliminated before /l/: OWN *litr* (cf. Go. *wlits*).

One phonological trait which discriminates the Nordic languages and Gothic from the other Germanic languages is the sharpening of long glides: /ww/, /jj/ have become /ggw/, /ggi/ (OWN *tryggr* ‘trusty’, nom. sg. acc. *tryggvan* – Go. *triggws*; OWN *tveggja* gen. of *tveir* two’ – Go. *twaddje*; cf. OHG *gitriuwi*, *zweio*). This change is usually considered to be early, because it is shared by both Nordic and Gothic, but it is in fact difficult to find other, more decisive, arguments for this. A similar process later occurs in Faroese: *siggja* [søʝ:a] ‘to see’, *gjógv* [jɛgv] ‘ravine’; cf. OWN *sjá*, *gjá*. The lengthening of the stop /k/ followed by /j/ or /w/ and /g/ followed by /j/ seems, at least superficially, also to be related: OWN *hyggja* ‘to think’ (Go. *hugjan*), *rökkva* ‘to darken’ (Go. *riqis*), *knekkja* ‘to crack’ (derived from *knaka* ‘to creak’).

Towards the end of the period considered here, all remaining instances of bilabial /w/ in word-initial and postvocalic position are eventually changed into labiodental [v]: OWN *var* ‘was’, *æfi* ‘age’ (cf. runic *was* Kalleby, OHG *ewi* ‘eternity’). The original pronunciation has been maintained in various dialects. By contrast, /j/ seems to remain a semivowel much longer.

Word-final /w/ has always been deleted: OWN *ey* ‘always’ (Go. *aiv*), *song* 1 sg. pret. ‘sang’ (Go. *saggw*).

4.4. Reanalysis phenomena

A peculiar synchronic rule is observable in the oldest forms of Old West Nordic (e. g. the scaladic language; Jónsson 1921, 285–287), where-

by a /ð/ is generated from /nn/ before /r/. It is common in, e. g. pres. forms of verbs: *breðr* (= *brennr* from *brenna* ‘burn’), nom. sg. forms of masc. nouns: *bruðr* (= *brunnr* ‘well’), nom. pl. *teðr* (= *tennr* ‘teeth’), *iðri* comp. ‘inner’ (cf. *inn(i)* ‘in’), the most consistent forms probably being *maðr* ‘man’, *aðrir*, and other inflexional forms of *annarr* ‘other’. In many cases, the “regular” forms are later reinserted by analogical levelling (*brennr*, *brunnr* etc.). Non-inflecting forms are subsequently relexicalised with /θ/: OWN *suðr* ‘south’ (cf. *sumn-an* ‘from the south’). The process seems to be due to a reanalysis based on the cumulative results of a number of historical phenomena (Ralph 1975, 75–98), a type of process too often neglected in analyses following the Neo-grammarians tradition.

Restructuring is also a natural consequence of the so-called “three consonant law”, which implies that clusters containing three or more consonants tend to be reduced with the effect that the middle consonant is dropped: OWN *norræn* ‘Nordic’ (cf. OHG *nordroni*), *enskr* (= *engskr*) ‘English’. These modifications probably occurred late during the transition period, gaining input from syncope.

5. Graphematic changes

During the period in question, the only script used in the Nordic area is the one referred to as runic writing. Runology is treated in its own right elsewhere in this volume. Here, some brief comments on the graphematic system will be made.

The runic script in its oldest form is obviously patterned after the classical (Greek or Roman) alphabet or some variety of it. The number of runes, 24, bears this out quite clearly, and a majority of the signs themselves show much graphic resemblance to the letters of the alphabet, in particular if well-known variants are taken into consideration. The only disturbing fact about the runes in this connexion is the unparalleled fixed order in which they are presented, from which the term “Futhark” is derived. Towards the end of the period during which runes are used in Northern Europe, i. e. in the Middle Ages, the systematic correspondence between the runes and the letters becomes even more exact, the Futhark being gradually filled in with new signs for the missing letters. So the Futhark eventually ends up as a true “runic alphabet”.

Between these end-points, however, the Futhark developed as an autonomous graphematic

system (one version is discussed by Loman 1965), although never acquiring such strict rules of application (e. g. orthography) as can be noted for alphabetic writing. Furthermore, there is a partial disruption in the continuity of runic usage, as the older Common Germanic Futhark is replaced – in the Nordic countries and the areas which they controlled – by the younger Viking Age Futhark (in two basic versions). The older Futhark was fairly well matched with the Proto-Nordic phonemic system, but the later development implied a significant reduction of runes. (For a survey of the different theories presented, dealing with this development, see Birkmann 1995). The remaining vowel signs were ⟨i⟩, ⟨u⟩, ⟨a⟩ – represented by the original ⟨a⟩ rune – and ⟨A⟩, represented by a sign taken to be developed from the original ⟨j⟩ rune. In due course, much confusion arose between ⟨a⟩ and ⟨A⟩, and ⟨a⟩ gradually adopted the function of ⟨o⟩, especially in Norway and its Atlantic colonies, where a new vocalic function ⟨y⟩ was also assigned to the earlier ⟨R⟩ rune. The shift from the older Futhark to the younger ones was gradual in so far as some runes from the older system tended to linger on considerably, but there is much orthographic confusion (e. g. in the use of digraphs or of just one sign for the diphthongs). The system of the Viking Age Futharks was subsequently filled in by so-called dotted runes to distinguish between phonologically related variants.

The reduction of 24 runes to 16 also affected the consonant system. In particular, voicing is given up as a distinctive feature with ⟨b⟩, ⟨t⟩, ⟨k⟩ representing [p, b], [t, d], [k, g], respectively. Furthermore, nasals are sometimes suppressed before homorganic obstruents so that, e. g., ⟨k⟩ may designate [k, g, kk, gg, ŋk, ŋg] (no consonant length distinction is made in runic writing; see Braunmüller 1998 for the methodological implications of such conditions). The earlier rune for [ŋg] is dropped altogether. The function of ⟨w⟩ is taken over by ⟨u⟩, and that of ⟨j⟩ by ⟨i⟩. In the older Futhark, ⟨j⟩ already played a confusing role. It is generally agreed that the earliest ⟨j⟩ rune was later modified and used for [a], probably as a consequence of word-initial ⟨j⟩ being lost generally. It will be remembered that the runes were memorized by means of their individual names: ⟨j⟩ was PN *jāra*, OWN *ár*. A parallel is ⟨R⟩ being used with the function of ⟨y⟩ after the coalescence of [r] and [R] (see 4.1.5.); the Old Nordic name of the ⟨R⟩ rune was *ýr*.

It is easy to realize that, after this reduction, the runic evidence is even more unreliable with respect to phonetic detail. It is a matter of dispute what caused the change from the older to the younger Futhark, but it has often been maintained that it is exactly the disruptive changes that have been outlined in this article which had the triggering effect.

82. Morphological developments from Ancient Nordic to Old Nordic

1. Introduction
2. Nominal morphology
3. Pronominal morphology
4. Verbal morphology
5. Word-formation
6. Conclusion
7. Literature (a selection)

1. Introduction

Assessing *morphological change* between Ancient Nordic (AN) and Old Nordic (ON) brings problems of definition immediately to light. Whether the language of the runic inscriptions in the elder futhark should be regarded as particularly ‘Nordic’, or whether a common ‘Nordic’ should be reconstructed for Viking-age Scandinavia, are still vexed questions. The paucity of direct linguistic evi-

dence renders it unavoidable that many morphological developments within the ON dialects can only be identified against reconstructed systems of Proto-Germanic (PGmc) or its various macrostructures. It seems clear that many such developments seem to follow the same trends evident elsewhere in the Germanic group. The development of an initial accent and the resultant tendency to transfer linguistic information from inflectional to root syllables brought about similar processes of weakening or loss of desinences, which in turn led to mergers of distinct morphological classes. On the other hand this impoverishment of the morphological system was countered by a renewal of resources through various innovations, many of which are again likely to have been common to PGmc (Werner 1984). A further consequence, particularly in ON, was

a trend for root syllables to carry morphological information previously held by inflectional ones through the operation of various phonological phenomena, as in Old Icelandic (OIcel.) neut. nom./acc.sg. *land* vs. pl. *lǫnd*, or 3rd pers.sg. pret.ind. *taldi* vs. subj. *teldi*. Such processes also introduced a fair amount of allomorphy, as with the OIcel. weak preterites *taldi* vs. *gerði* vs. *mælti*. This interaction between morphology and phonology often makes it difficult to establish which factors were behind a given development, and a complex interplay can be identified in fields such as the remodelling of the ON nominal paradigms.

2. Nominal morphology

This reorganization was partially prompted by the loss of stem-vowels at syncope. Of the competing pressures on the nominal system two perhaps stand out; a drift towards differentiating grammatical gender opposed by one towards more transparent equations between single morph and single function. A clear example of the latter can be seen in the history of the dat.pl. ending, where the Nordic and Ingvaemonic dialects reveal a uniform morpheme in *-um* extended across all nominal paradigms, which may already be attested in the sixth-century Stentoften inscription.

2.1. Nominal reorganization

The masc./neut. *a*-stems were relatively undisturbed during the transition to ON (Noreen 1923, §§ 356–72). The only significant innovation seems to be the intrusion of the gen.sg. form in *-ar* alongside the historical reflex in *-s*, which may be explained by influence from other paradigms facilitated perhaps by phonotactic considerations. The same trend is also visible in the *ja*-stem subgroup, but this group also exhibits confusion with original *i*-stems, possibly due to the collapse of certain desinences or via the medium of a large cluster of nouns ending in a velar with intrusive semi-vowel, such as ON *hryggr* ‘back’, dat.pl. *hryggjum*. This merger worked in different directions in the various dialects, with the *i*-stem nom.pl. *-ir* winning out in WN, in EN however the *ja*-stem nom.pl. *-jar*. In the ON dialects the most consistent distinctions between the masc. nominal classes largely turned on the choice of nom./acc.pl. endings, and the frequent levelling of *-i* in place of *-u* in the *u*-stem acc.pl. shows that even this system was breaking down.

2.1.1. The feminine nominal classes

Tensions between these endings also played a role in the striking reorganization of the ON fem. nominal classes (Noreen 1923, §§ 373–92), which reveal heavy confusion between the *ō*- and *i*-stems. While a sg. paradigm developed that seems to reflect *ō*-stem endings, a contrary trend involved the growing productivity of the nom./acc.pl. *-ir* proper to the *i*-stems. A limited number of originally thematic nouns also drifted towards the athematic paradigm with gen.sg. and nom./acc.pl. *-r*. Studies of the mechanisms behind these developments have focused on phonological coalescences between the various paradigms (Wessén 1927) or drives towards *gender* disambiguation (Bjorvand 1972). Both seem to have played a role, and a further cause might also have been the presence of word-formational suffixes that could fluctuate between the nominal classes with the same morphological function (Syrett 1994, 98–102), which also ultimately helped to prompt widespread confusion between *i*- and *u*-stems of all genders. The regular survival of original *ō*-stem desinences, such as the dat.sg. *-u*, only in nouns formed with the *-ing/-ung* suffixes (Syrett 1994, 113–18) could then be explained by the fact that they stood outside such morphological confusion.

2.1.2. Athematic nouns

The athematic monosyllabic “root” nouns seem to have represented a small group of nouns already in PGmc, and the low number of ON masc. nouns were heavily reformed according to thematic paradigms (Noreen 1923, §§ 413–14), a drift that may well be ancient. Although various forms in the elder futhark inscriptions have been seen as athematic, the examples are uncertain (Syrett 1994, 66). Other traces of the athematic paradigm were obliterated with the identification of the formative stem-syllables of the “consonant stems”, particularly the *r*- and *n*-stems, as desinences leading to the development of new paradigms (Werner 1984, 193–96). An AN athematic ending is still attested in the form **dohtrik** ‘daughters’ on the Tune stone, but the ON paradigms seem to be the combined result of unclear phonological developments and the generalization of allomorphs across distinct categories. The ON dialects share with Ingvaemonic, for example, the levelling of the **-an-* stem throughout the masc./neut. paradigms, and runic evidence confirms

this already for AN (Syrett 1994, § 7.11). The *r*- and *n*-stem paradigms in ON also show a tripartite distribution of load differentiating the nom.sg., oblique sg., and nom./acc.pl. forms (Noreen 1923, §§ 399–409; §§ 419–21). The development of this pattern is again uncertain, and approaches towards the problem involve an uneasy mixture of morphological pressures, phonological developments, and inherited allomorphs. Tensions between these methodologies are particularly well exemplified by the debate over the origins of the ON weak masc. nom.sg. *-i* and its relation to the AN runic forms in *-a* or *-o* (Syrett 1994, 134–52), which now seems generally interpreted as reflecting two different analogical impulses working at different periods. Firstly the nom.sg. was levelled before the AN period to **-a* to conform with the vowel grade of the oblique cases and to differentiate it from the fem. nom.sg. in **-ō*; then, once this desinence was lost at syncope, the **-i* proper to the *jan*-stems was borrowed to distinguish the nom.sg. from the oblique forms (Nielsen 1995, 118–21). Another example of gender disambiguation appears in the pl. endings, where the strong nominal paradigms were responsible for the reinforcement with *-r* in the fem. nom./acc.pl. but only in the nom.pl. ending in the masc. paradigm. A similar innovation within eastern dialects of AN might also account for the split between the neut. nom./acc.pl. in WN *-u* vs. EN *-un*, if this does not simply reflect different sound-laws.

2.2. The adjective

A common PGmc innovation was the adaptation of the *n*-stem paradigm to create the ‘weak’ adjective with an individualizing or definite function, and the two distinct but parallel paradigms were maintained in ON (Noreen 1923, §§ 432–35). Strikingly, these paradigms failed to distinguish grammatical gender within the pl., which seems to be a specifically Nordic innovation. This may have been partially prompted by the collapse of the fem./neut. nom./acc.pl. endings in *-u*, but also facilitated by the need to resolve clashes when adjectives agreed with nouns of different genders. Within the strong adjectives levelling worked across nominal classes rather than gender, and it is apparent that ON developed the common Germanic trend towards a single paradigm based upon the *a/ō*-stems particularly fully, leaving only the *j*- and *w*-stems as relics of divergent stem-formations (Noreen

1923, §§ 424–31). Inscriptions in the elder futhark attest to different stem-classes in forms such as **wajemarir** on the Thorsberg chape, suggesting that this adjectival levelling took place within the transition from AN to ON. It is however difficult to identify any formal split between substantival and adjectival paradigms for AN, and this distinction was gradually reinforced by the adoption of pronominal endings by a good part of the adjectival declension. This contamination is again a PGmc development, but its precise results vary between the various branches depending upon the selection of available morphs. Two endings emerge as innovations possibly specific to ON; the addition of the morpheme **-z* to the masc. nom.pl. **-ai* (Grønvik 1981, 67–68), and the baffling neut. dat.sg. *-u* (Boutkan 1995, 302–03).

2.3. Loss of categories

Alongside reorganization of the nominal stem-system it is also probable that the transition from AN to ON entailed the loss of certain morphological categories. For example, from a comparative perspective the ON dative must ultimately be viewed as a conflation of several IE cases such as the dative, locative, and instrumental, some of which still appear as separate categories in other Germanic branches. Phonological collapse of the relevant desinences is at least partially to blame for this reduction of the morphological system, and it is tempting to suspect that AN maintained some of these categories to some extent, although this is not visible in the elder futhark runic inscriptions.

A better case can be argued for the existence of a *vocative* in AN, a category which was replaced by the nom.sg. by the ON period. A number of attempts have been made to identify endless voc. sg. forms in the older runic inscriptions, but some seem corrupt and other interpretations are also available (Syrett 1994, 62–67). Stiles (1984) also argued that **swestar** on the Opedal stone represented a voc. (cf. Syrett 1994, 222–31), but despite his valid observation that positing a formally distinct vocative for AN is perfectly reasonable on comparative grounds, it is still uncertain whether it is actually attested anywhere. Less certain again is another putative example of loss of category in the history of the Nordic languages, in the form of the dual number. The IE nominal *dual* left only faint relic traces in PGmc, which in itself tends to cast doubt on

Vennemann's identification (1989) of **horna** on the Gallehus horn as an acc. dual rather than sg. form. The criticisms levelled by Strunk (1992) and Klein (1992) rightly dismiss this as very unlikely.

3. Pronominal morphology

In some respects pronominal morphology seems more archaic in such terms as category loss. The origins of the ON dative are illustrated by the conflict between the masc. dat.sg. *þeim* and the neut. *þ(v)í*, the latter apparently reflecting an older locative, and this also comes out with the dual.

3.1. Genderless personal pronouns

Dual pronouns in Germanic are only attested in the genderless 1st/2nd person, but it can only be guessed whether AN maintained dual verbal endings for these categories as did Gothic. Although dual pronouns fell out of use in many EN dialects they were more successful in WN, where their development is linked by Guðmundsson (1972) to the growth of 'honorific' plural pronouns. While the sg. pronoun system maintained three numbers, four cases and a reflexive, the pl. forms show a range of reformations which are likely to reflect a mixture of common Northwest Germanic (NWgmc) analogical trends and phonological developments (cf. Seebold 1984a, 37–39, 44–57).

3.2. Third person pronouns

The 3rd person pronouns in ON reveal an even greater array of innovations, perhaps reflecting the lack of any coherent system in IE (Szemerényi 1990, 215–24). The IE 'anaphoric' pronoun reflected in Gothic *is* was adapted in the various branches of Germanic (Prokosch 1939, 274–75) and a fossilized masc. nom.sg. form seems to have supplied the ON relative particle *es/er*. The interrogative pronoun **hwaz* was also reformed and largely replaced by an extended stem in **hwarj-* (Noreen 1923, §474). However, the arising of a 3rd person pronoun in **hān-*, ON *hann/hon*, is the most significant feature. The fact that it only appears in the masc./fem. sg. might suggest that it was a Nordic innovation designed to reinforce the distinction between 'real' and 'grammatical' gender. Etymological links have been proposed with Gothic *jains* (Brøndum-Nielsen 1928–73, §566), and dia-

lect geography suggests that the reinforcement of pronominal roots with initial 'deictic' **h-* was an Ingvaemonic impulse that petered out in Nordic and Old Saxon (Nielsen 1975, 10). Overall **hān-* shows such parallels with the other demonstrative root in **hin-* that the two seem inextricably interlinked (see 3.3.).

3.2.1. Demonstratives and other compounded pronouns

The fate of the IE demonstrative **so, *to* in PGmc and AN is difficult to reconstruct as the various Germanic branches show much variation. In ON a tendency emerges for the pronoun to be reinforced by the addition of nominal markers, yielding by-forms such as masc. nom.sg. *sá(r)* or neut. nom./acc.pl. *þau, þaun* (Noreen 1904, §508). The EN dialects in particular show greater levelling of the root through features such as the replacement of the masc./fem. nom.sg. forms *sá, sú* with *þan/þæn* or *þē* respectively. Another common theme seems to be the re-identification of the root as **þa(i)-* with the addition of (pro-) nominal endings, reflected as early as the Istaby stone in the form **þaiar** which seems an unsuccessful rival to the AN **þār* seen in Olcel. *þær*. Inscriptions also make it clear that the demonstrative contained a 1st person deictic function 'this' as well as a 3rd person 'that' (Sprenger 1977, 31–68). As a result the NWGmc languages all exhibit an extended demonstrative to carry the deictic function 'this' more strongly, formed by the addition of a particle in **s-* of uncertain origin (Noreen 1904, §509). The variation within the paradigm reveals a shift from internal to final inflection, which is ultimately reflected in the gradual levelling of a pronominal root in *þess-* with affixed endings. Divergences between forms like the Olcel. masc. acc.sg. *þemma* and runic forms in **þansi** are often ascribed to competing enclitic particles, but it also seems possible that the extension of forms like *þenna* reflects the secondary adoption of weak nominal endings to reinforce the distinction against equivalent simple demonstratives such as *þann*. Other compounded pronouns developed in the ON dialects also show a drift from internal to final inflection. As with the demonstratives disruption of this pattern only persisted in a few categories, most notably forms of the neut. nom./acc.sg. (Noreen 1923, §§475–79) as with *engi, ekki* 'none, no-one'. The fusion of different roots, as in the indefi-

nite *nqkkurr* ‘some’, is even more striking, and confirms the strong Nordic trend towards the univerbation of enclitics (cf. 6.).

3.3. The “definite article”

The most innovative example of this is the ON postposed “definite article” *-inn* and its relationship to preposed *hinn*. The origin of these forms, and the nature of their relationship to one another, is disputed (Brøndum-Nielsen 1928–71, § 576), but it is commonly held that *inn* reflects an IE demonstrative **eno-* while *hinn* is a reinforced version of this root with the initial deictic **h-* also visible in the 3rd pers. pronoun *hann* (Prokosch 1939, 273–74). Since neither pronominal root in **hin-* nor **hān-* has any immediate parallels elsewhere in Germanic, it is possible to argue that they are both innovations that arose together in the AN period; in addition, the appearance of two forms in *inn* and *hinn* might suggest in turn that it is unlikely that both of them could be distinct inherited forms, neither of which has left a clear trace elsewhere. While the two pronouns form minimal contrasts when preposed, with *inn* ‘the’ contrasted against *hinn* ‘that, the other’, this opposition is only reflected in WN. In EN, on the other hand, the form *hinn* is dominant and the evidence of Viking-age inscriptions confirms that this might have been the original state (Jacobsen/Moltke 1942, 667). It is possible therefore that the WN functional opposition before adjectives might be secondary. However, studies of the development of the ON postposed article have tended to try to account for both origins and usage under a single argument. Johnsen argued that *inn* was postposed in ON “because no emphasis of its specific meaning was possible” (1976, 126–27), although the etymology and original functions of such a colourless particle are not explained. An etymological approach is also reflected in Seebold’s idea (1984b) that the article represents a legacy of an IE trend to place deictic particles after nouns while demonstratives preceded them. However, Braunmüller (1982, 222–38) pertinently notes that all Germanic languages develop article-like pronouns from older demonstratives, which were originally generally postposed after nouns.

It is possible to identify several stages of innovation which gave rise to the postposed article: the origins of the pronominal roots in **(h)in-*; the weakening of any deictic or demonstrative function; its distribution before

adjectives but after nouns; and its univerbation in *enclitic* position. The form **hino** on the Strøm whetstone seems readily interpreted as such a deictic demonstrative pronoun already in AN, but examples are rare in Viking-age inscriptions in postposed position. Phrases such as **harats hins kuþa** on the Sønder Vissing stone formed the basis for views developed by scholars such as Delbrück (1916) that the ON postposed article originated in false segmentation of sequences like *konungr(-)inn góði* ‘the good king’. However, the essentially preposited usage of the pronoun remains transparent, and it seems likely that such usage played a role in the gradual loss of deictic function when demonstratives appeared before definite adjectives to support their individualizing function (Kovari 1984, 13–26). If ON *(h)inn* is taken as a weakened deictic demonstrative, then its infrequency in runic inscriptions could be attributed to its loss of deictic power, which rendered it unsuitable for use in the formulaic texts (Birkmann 1995, 238). A progressive development is also suggested by the fact that an ‘article’ is still facultative rather than obligatory in the earliest ON manuscripts (Sprenger 1977). The most significant specifically Nordic innovation is the univerbation of this article with preceding nouns, a trend paralleled elsewhere in the history of the Nordic languages (cf. 4.3.2.; Braunmüller 1982, 229–31). Here the variation between the dat. pl. in WN *-unum*, EN *-umin* suggests that this was a fairly late and partially dialect-specific development. Although much obscurity still surrounds the development of this particularly Nordic phenomenon, it seems reasonable to suggest that it was the end product of an unrelated series of morphological and syntactical developments within the progression from AN to ON.

4. Verbal morphology

Within verbal morphology many of the same trends can be identified as in the nominal system; tensions between competing stem-classes, inter-paradigmatic levelling, and loss of some morphological markers or categories.

4.1. Loss of categories or markers

A number of such features are plausibly interpreted as common NWGmc developments; these include the loss of the putative dual number category and formally distinct 3rd person imperative forms. The same also

applies to divergences in development of the *weak preterite*, where the 3rd pers. pl. form **dalidun** on the Tune stone agrees with WGmc rather than with Gothic disyllabic forms *-dedun*. The interpretation of pret. sg. endings can also be viewed in this light (Syrett 1994, 242–55; Grønvik 1998, 132–34), although the idea that forms like **talgidai** on the Nøvling clasp reflect traces of the IE *middle voice* seems implausible given the distinct traces of the middle preserved in Germanic.

Outside Gothic relics of the middle only appear in forms of the verb **haitan* in the sense ‘to be called’ rather than ‘to call, order’. The marginalization of this category to one verb may well have taken place already in AN, and attested runic 1st pers. sg. forms in **-e** agree with ON *heiti* suggesting preservation of the original desinence (Syrett 1994, 238–40). Unless the ON 2nd/3rd pers. sg. *heitir* is remodelled from this *heiti* on the analogy of the active, it too looks to represent a more archaic theme-vowel than Gothic *haitaza*, but also with apparent levelling from the 2nd to the 3rd pers. sg. mirrored in the present active (see 4.2.1.).

A further example similar in terms of dialect geography is provided by the loss of *reduplication* as a preterite marker of those strong verbs traditionally grouped together as class 7. While Gothic maintains this feature in verbs like *haitan*, *haihait*, the NWGmc languages tend to replace it with forms of ablaut that are largely innovatory, yielding ON *heita*, *hét*. Numerous approaches have been posited for this problem, ranging from a levelling of the reduplicating syllable to a single morph such as **-ez-* (Bech 1969) or its re-interpretation as a vocalic infix (cf. d’Alquen 1997). It is difficult to find secure traces of reduplication in AN (but cf. Grønvik 1987, 122–24), and relics only appear in ON with *verba pura* such as *sá*, *seri* (Noreen 1923, § 506). However, although the tendency to abandon reduplication is common to NWGmc, this does not apply consistently to its results and Mottausch (1998, 47–52) argues that a dialect-specific development yielded different results in EN and WN. If so, then it seems perhaps reasonable to argue that morphological re-analysis of reduplication was a common NWGmc feature, but that the precise phonological and analogical ramifications were only fully worked out on a dialectal basis.

4.2. Verbal reorganization

The reorganization of the verbal system of ON is complicated by uncertainties surrounding the precise stem-formation of the weak classes and the choice of allomorphs open for selection within them. However, one interesting aspect turns on the functional load ascribed to certain morphemes leading to levelling or re-analysis of some personal endings.

4.2.1. Personal endings

A striking example is the collapse of the PGmc 2nd/3rd pers. sg. pres. ind. endings in **-z*, **-þ/-ð* in ON *-r*; this is reflected in early inscriptions, where the archaic form **bariutiþ** on the Stentofte stone parallels **barutr** on Björketorp, equivalent to ON *brýtr*. However, the idea that the 2nd pers. sg. ending was simply extended into the 3rd pers. has rightly seemed dubious to most commentators. Both Kock (1898, 230–32) and following him Holland (1980) argued for influence from the enclitic pronoun **eR* (cf. 3.2.), but neither Kock’s assimilation nor Holland’s appeal to ending-less verbal forms seem particularly convincing. Bech’s notion (1970) that the 2nd pers. sg. was levelled due to the coalescence in the new middle voice also runs up against chronological problems (cf. 4.3.3.), while the presence of competing endings in *-sk*, *-zk* provides no clear analogical model for such a reformation. However, the observations that **-R* was both less amenable to opaque assimilations after consonants than **-ð* and also was far more consistently a 2nd pers. sg. marker than the latter was a 3rd pers. marker are significant and may well have played a role, especially if combined with the apparent sporadic confusion of /r/ and /ð/ in certain environments.

The replacement within Old Norwegian of 2nd pers. pl. forms in *-ið* with *-ir* has also been ascribed either to the influence of a following enclitic pronoun or analogical extension of *-r* from other forms of the paradigm (Seip 1954, 75–82; Hagen 1984), and similar approaches have also been mooted for the further striking contrast with the EN ending *-in* (Noreen 1904, § 561.3; Kock 1898, 234–40). That the 2nd pers. pl. seems so open to reformations suggests that it occupied a marginal position within the ON verbal system, and this is perhaps also reflected in the levelling of a single morpheme across all verbal classes, a trend evident in all ON pl. verbal forms.

4.2.2. Levelling within verbal classes

The ON dialects maintain the distinctions between the various Germanic weak verbal classes fairly well (Noreen 1923, §§ 507–20), and class III may even show moves to differentiate itself further from other stem-formations (Dishington 1978). The scarcity of securely identified verbal forms in the older runic inscriptions, however, makes a precise evaluation of the AN system difficult. For example, it seems that the subgroup of class I weak verbs which formed their weak preterite without a connecting vowel were to some extent marginalized in Nordic; yet attempts to harmonize the anomalous ON preterites *seldi*, *setti* with both this group and recorded AN forms like *satido* have proved awkward (Grønvik 1998, 62–64). Overall it might be said that AN inherited a greater coherence within the verbal classes than in the nominal, and so there was less scope for large-scale reorganization.

4.3. Innovations in the verbal system

The history of the ON verbal system also reveals a number of areas of innovation, including the development of new verbal categories, which were to some degree fuelled by a tendency to fuse verbal endings with a following enclitic pronoun.

4.3.1. New infinitives

One striking aspect is the development of new infinitive forms, which can be linked to the growth of the acc. plus infinitive construction (Kuhn 1939). On the analogy of the phonological collapse between the 3rd pers. pl. and the infinitive in *-a* new infinitives were formed in *-u* for modals such as *skulu* that originally lacked infinite forms (Sćur 1963), although alternatives like *mega* attest to the more Germanic trend to form new infinitives on the model of other verbal groups. More interestingly ON also developed secondary infinitives of preterite form (Sćur 1962). While genuine preterite infinitives such as *föru* ‘to have gone’ as opposed to *fara* ‘to go’ were mostly restricted to verse and ultimately unsuccessful, prose shows extensive use of modal forms like *myndu* or *skyldu*; these however reflect the essentially timeless nature of the Germanic infinitive and indicate not tense but conditionality (Kuhn 1939, 127–28).

4.3.2. Enclitic pronouns

The Nordic dialects exhibit a striking trend for enclitic pronouns appearing after finite verbal forms to become unverbated by loss of word-juncture (cf. 3.3.). This might be linked to the destructive rhythmical operation of ON syncope also attested in the loss of pretonic syllables (see 5.1.), although enclitic 1st pers. sg. forms are already attested in the elder futhark inscriptions (Krause 1971, §100.1). The effects on the pronominal system include “weakening” of enclitic pronouns as in *-g* for *ek* and also the arisal of forms like 2nd pl. *þér* through false segmentation (Noreen 1923, §465), but the most striking aspect was the fusion of the reflexive *sik*, *sér* with verbal endings to form a new verbal category, the “middle” voice.

4.3.3. The ON “middle” voice

On semantic and syntactic grounds it seems that the middle voice was still evolving in the ON period, although the fluctuation in the form of the endings shows that much levelling of the system had already occurred (Noreen 1923, §§ 543–44). While the earliest WN forms appear to reflect an enclitic acc. form *sik*, the more standard EN reflex in *-s* is normally related to the dat. *sér*. However, runic forms indicate that the acc. also played a role in Danish (Brøndum-Nielsen 1928–73, §§ 912–13), and frequent WN byforms in *-z* or *-s* may perhaps be taken back to a competing dat. origin. It seems likely that in all the ON dialects phonological simplification took place once the final sequences had been re-identified as inflections. A loss of contrast seems a more likely root of the WN forms in *-st* than influence of enclitic 2nd pers. pronouns, while it may be argued that *-z* came to be used in almost ideographic fashion as a middle marker.

This steady evolution can also be identified in the functions of the middle. When first attested in Viking-age runic inscriptions its origins are betrayed by its reflexive sense in verbs like *berjask* ‘to fight’, but frequent forms of *andask* ‘to die’ reveal a shift to something more akin to a middle (cf. Nygaard 1905, 154–74; Braunmüller 1982, 242–47). The growth of the passive in verbs like *fæðask* ‘to be born or raised’ is traditionally held to have been hastened, if not necessarily caused, by the use of the middle to gloss Latin passive formations in mediaeval translations (cf. Ureland 1988). Overall the new middle voice

is possibly the most striking instance of the Nordic tendency towards loss of word-juncture and grammaticalization of enclitic forms.

5. Word-formation

Although perhaps less spectacular, the history of word-formation in the Nordic languages also reveals a number of innovations and developments.

5.1. Loss of prefixes

Perhaps the most striking is the loss of pretonic syllables, including all verbal prefixes along with others such as **ga-* which lacked the accent in PGmc. This must to some extent be ascribed to phonological loss, perhaps facilitated by the drift towards loss of morpheme-juncture manifested elsewhere in Old Nordic morphology and revealed in relics of **ga-* in forms such as (*g*)*likr* ‘like’. It seems certain that unaccented prefixes were still current in AN, even though examples are rare; the prefix **ga-* may be attested with a sociative function on the Kragehul spear-shaft (Grønvik 1996, 55) but does not appear before past participial formations (Krause 1971, §103). The only moderately clear example of a verbal prefix occurs in the Reistad inscription, where the form **unnam** seems to reflect a compound of the prefix **unð-*, **unþ-* and the ancestor of Old Nordic *nema* (Grønvik 1996, 112–24).

It was established by Kuhn and Dal that these prefixes had however left a partial legacy in the “Füllwort” or “expletive particle” *of* or *um* attested in skaldic verse. The precise mechanisms of the loss are however still disputed. While Kuhn assumed morphological levelling of certain prefixes such as **of-* at the expense of others (1929, 94–99), Dal argued for a phonetic collapse of pretonic syllables in a ‘Murmelvokal’ that was re-analysed as *of* or *um* in certain phonological environments (1930, 63–85). It is certainly likely that the largely redundant nature of many verbal prefixes helped to allow for their disappearance, since their functions were disparate and vague and could be supplanted by adverbs, often prepositional (Christiansen 1960). However, nominal prefixes, which normally bore the accent, were moderately well maintained into ON elements such as *ør-*, and it seems likely that the particle *of* before nouns largely reflects only older **ga-* (Hinderling 1967,

93–102); during the ON period, these nominal prefixes could then re-enter the verbal system.

5.2. Compounding

Aspects of compounding also reveal several stages of innovation from AN to ON, but they seem to mirror other Germanic dialects and so have ancient roots. The AN runic inscriptions reveal a picture similar to that proposed for PGmc, that the *a-*, *i-* and *u-* stems at least still employed their stem-vowel as a compositional syllable (Syrett 1994, 69–82). The subsequent transition to root- rather than stem-compounding, already present before word-formational suffixes (cf. 5.3.), was largely the result of the loss of stem-vowels at syncope. It is however uncertain what form fem. *ō-* stems appeared in as the first elements of compounds, and Widmark (1991, 78–88) argues that the presence of *u-*umlaut, particularly in short-rooted forms, demands assuming a phonological raising of the compositional syllable **-ō-* to **-u-* as in final syllables. It might alternatively be suggested that already within late AN there was a drift away from stem-formation such that a nom./acc.sg. **faru* was employed in place of **farō-*.

The Nordic languages also shared in the growth of secondary compounds, largely containing a genitival first element. However, no clear semantic distinction can be discerned between stem- and genitival formations (Meid 1967, 17–19), and the picture is obscured by frequent phonetic atrophy of compositional syllables such as the gen.sg. *-ar*, along with the subsequent growth of compounds with weak adjectival first elements (Jóhannesson 1929, 22–25). Such compound-types can be interpreted as a fusion of original syntactic phrases, and so a shift away from the most common compounding types of PGmc.

These seem to have been primarily determinative or exocentric, the latter largely in the form of *bahuvrihi*-compounds (Meid 1967, 23–35), and such types are attested for AN in elder futhark runic inscriptions (Krause 1971, §26). The Nordic languages participated in the general drift towards differentiating such *bahuvrihi*-formations from their simplex by the addition of certain formative suffixes such as the past participial *-ð-* (Carr 1939, 252–65). A further tendency which appears to have common Germanic roots but which again only developed fully within the individual branches was to utilize verbal roots as the first element of nominal compounds,

as in ON *sendimaðr* ‘emissary’ (Carr 1939, 193–95). Although it is sometimes difficult to reconstruct any specific PGmc or AN formations exemplifying these tendencies, it seems likely that the original impulses were inherited and employed by the Nordic languages to give a high degree of flexibility in compounding.

5.3. Word-formational suffixes

The growth of the root rather than stem as the favoured ‘base’ for word-formation is a further feature that developed in the same way (Meid 1967, 49–51). Indeed, the notion that many formative suffixes ever employed the stem-vowel of the base is often more theoretical than demonstrable, and attempts to explain the “suffix ablaut” in cases like the *-ug/-ig/-ag-* formatives show a tension between morphological and phonological factors (Syrett 1994, 172–76). Phonological atrophy of unaccented syllables certainly seems to have played a major role in the loss of certain formational suffixes and the transfer of their functional load onto others. An example is the growth of **-inga-* at the expense of **-ija-* to form patronymics and other derivatives denoting origin; the latter appears still in forms such as **holtjjar** on the Gallehus horn, but Old Nordic *-ir* is only well maintained in agentive formations largely confined to verse (Torp 1909, § 13). A trend is also visible showing the development of new formative suffixes by the use of certain nominal elements such as *-dómr* for abstracts or the *bahuvrihi*-type *-likr* for adjectives. Most of these are largely common to NWGmc at least, but some ON innovations can also be identified such as *-lár* (Torp 1909, § 53).

6. Conclusion

Many of the innovations undertaken by the Nordic morphological system can therefore be seen to reflect trends common to the Germanic, and to some extent the IE, group of languages; this applies, for example, to the abandonment of certain marginal morphological classes, formal differentiation of gender, or the tendency to harmonize desinences of equivalent function across different “classes” of various origins. While many such moves correspond to the classic definition of “analogy” as restoring system parity in the face of destructive phonological impulses, the ON dialects, especially WN, show a strong willingness to adapt irregularities into new

morphological patterns. The most striking area of distinct innovation within North Germanic remains, however, the capacity to innovate by univerbation leading to the two new departures of the post-posed “definite article” (3.3.) and the middle voice (4.3.3.), and although difficult to quantify it is hard not to have some sympathy with suggestions that this in turn is at least partially a result of language contact with eastern European dialects which show parallel phenomena (Ureland 1988).

83. Syntactic developments from Ancient Nordic to Old Nordic

1. Introduction
2. The noun phrase
3. The subject
4. Word order change
5. The reflexive verb form
6. Literature (a selection)

1. Introduction

A description of the syntactic development from AN to ON of course presupposes a knowledge of AN syntax. Among the inscriptions in the older runic alphabet whose deciphering and interpretation is sufficiently certain and non-controversial, it is possible to identify some 50 combinations of words that can be considered syntactic constructions.

It goes without saying that it is impossible to present anything even remotely reminiscent of a full syntactic description of the language on the basis of this small corpus. (For a partial description, see Faarlund 2002.) Much of our knowledge of the syntax before the ON period must therefore be based on comparative evidence and reconstruction.

From the evidence that we have, it seems that AN was a typical IE language of its time. In comparison, ON exhibits quite a few “modern” features, not only phonologically, but also syntactically. The examples from AN used in this article are all attested in inscriptions in the older *futhark*, but they have of course been transliterated. The data are mostly based on the interpretations given by Antonsen (1975). An AN inscription is traditionally identified by the name of the place where it is found. This name is given in parenthesis after each cited form.

2. The noun phrase

2.1. Order of elements

In the AN material there are about 40 complex noun phrases. The dominant ordering pattern is head-dependent. This is the case in all the examples with an adjective: *Hlewagastiz Holtijaz* ‘Hlewagast Holtian (= (son) of Holt)’ (Gallehus), *Swabaharjaz sairawidaz* ‘Swabahar wound-wide (= with gaping wounds)’ (Rö), *SigimARAZ AfsAKA* ‘Sigimar off-guilt (= free of guilt)’ (Ellestad).

Possessive and demonstrative determiners also follow the head noun: *magoz minas* ‘son mine’ (Vetteland), *swestar minu* ‘sister mine’ (Opedal), *hali hino* ‘stone this’ (Strøm), *runAZ þAIAZ* ‘runes these’ (Istaby). There is one exception: *þat azina* ‘that (hearth)stone’ (By).

Dependent genitives as well mostly follow their head: *erilaz Asugisalas* (Kragehul), *þewaz Godagas* ‘servant of G.’ (Valsfjord), *gudija Ungandiz* ‘priest of U.’ (Nordhuglo). In three instances, where the head noun denotes the monument with the inscription and the genitive the person commemorated, the genitive precedes the noun: *Ingijon hallaz* ‘Ingio’s stone’ (Stenstad). All the attested examples with genitive nouns or possessive determiners are consistent with an observation by Smith (1971) that animate heads require a following genitive and inanimate ones a preceding genitive (see also Antonsen 1975, 24). Numerals may precede or follow their head: *þrijoz dohtriz* ‘three daughters’ (Tune), *staba þria* ‘staves three’ (Gummarp).

In ON, the word order within the noun phrase is very variable. The adjective may precede or follow the noun: *eldar stórir* ‘fires

great', *mikinn her* 'big army'. Demonstrative and possessive determiners may precede or follow the noun: *sá hinn helgi maðr* 'that the holy man', *minir góðu vinir* 'my good friends', *maðr þessi* 'man this', *móðir mín* 'mother mine'. A genitive phrase usually follows the head noun: *þræll konungs* 'slave king's'. Statistically, it seems that the order within the NP is freer in ON than in AN. The absence of examples with an adjective preceding the noun seems to indicate that the unmarked order was noun + adjective. ON may therefore have been at a transitional stage between AN and modern Scand., where the adjective always precedes the noun.

2.2. The definite article

In one instance the order noun + determiner has been fixed in ON. In AN the demonstrative *hin-* could follow the noun, as in *hali hino* 'stone this' (Strøm). Through a process of grammaticalization, the demonstrative was cliticized to the noun, and semantically bleached into a definite article. The definite article remained a clitic rather than an inflectional suffix for a long time, and it was still a clitic when the tonal system was introduced. Therefore monosyllabic roots with a definite article were treated as monosyllables by the tone assignment rules.

3. The subject

Many IE languages are so-called "pro-drop" languages, in the sense that the subject may be omitted and represented through the number and person inflection on the verb. This is still the case in e.g. Spanish and Italian. And it was the case in Latin and other ancient IE languages. However, ON, like all the contemporary Gmc languages, has to express the subject if it has a specific reference:

- (1) *Ek geri þér skjótan kost, þú skalt reka heim
fimm tög úsauðar*
'I make you a quick deal, you shall drive home fifty ewes'

Since this is different from what seems to have been the rule in PIE, the expression of a specific subject must have been made obligatory at some point in the history of Gmc. But on the basis of the kind of data we have from AN, it is impossible to determine for certain whether the language was a "pro-drop" language or not. The evidence is as follows.

All finite verbs in the material are either first or third person. The first-person verbs have either a subject consisting of a pronoun and an apposition, as in (2), or a clitic pronoun, as in (3):

- (2) *ek erílaz runoz waritu*
'I erila runes wrote' (Järsberg)
(3) *Hariuha haitika farauisa*
Hariuha am-called-I travel-wise
'I am called Hariuha, the travel-wise'
(Zealand)

There is no example of an independent pronoun by itself. There are, however, several examples of verbs without a subject, as in:

- (4) *wurte runoz an wallhakurne*
'wrought runes on Celtic-grain' (Tjurkö)

The third-person verbs either have a NP (mostly a proper name) as the subject, as in (5), or the subject is missing, as in (6). There is no certain occurrence of a third-person pronoun.

- (5) *bidawarijaz talgidai*
'Bidawari carved-3sg.' (Nøvling)
(6) *flagdafaikinaz ist*
'deceitfully-attacked is' (Vettelund)

The sentence types exemplified in (4) and (6) are quite common in the AN corpus. Since most of the examples of missing subjects are sentences that appear together with other material (decipherable or not) in the same inscription or on the same stone, it is not possible to determine whether they are instances of pro-drop or just subject deletion under recoverability, as is very common in ON:

- (7) *þá lét Óðinn bera inn í höllina sverð, ok
váru svá björt ...*
'then let Odin bring into hall-def swords-acc and [-] were so bright ...'

(cf. article 105). For example, the sentence in (4) occurs together with the two names *Heldaz Kunimundiu*, in the nominative and dative, respectively, on the same stone (Grønvik 1987, 151). The subject is therefore recoverable from the word *Heldaz*. There is in fact only one short inscription where the subject is missing and where there is no possible linguistic context that it could be inferred from.

- (8) *tawo laþodu*
'make-1sg. invitation' (Trollhättan)

Since our material is mainly of an epigraphic nature, we certainly have no evidence to conclude that AN belonged to the type of lan-

guage where subject pronouns could be freely omitted. On the other hand, there is no clear evidence that AN was not a pro-drop language, either.

4. Word order change

4.1. VO and V2 in Old Nordic

ON is a verb-second language, like all the modern Gmc languages (except E). Whenever the verb occurs in first position in a main sentence, the pre-verbal topic position can be considered empty (cf. article 108).

- (9) a. *jarl för i dal djupan*
 ‘earl went in valley-acc. deep’
 b. *átti hann margt fê*
 ‘owned he-nom. much money-acc.’

This is a specifically Gmc feature among the IE languages. And again, the question is whether this feature already existed in AN or whether it came into being with the transition to ON.

ON is also a VO language, which means that objects and predicate adverbials regularly follow the non-finite verb:

- (10) *þá skal ek sjalfr veita þeim lið*
 ‘then shall I myself give them-dat help-acc.’

4.2. OV and V2 in Ancient Nordic

In the AN material it is possible to identify some 30 sentences with verbs, whose interpretation is more or less certain and uncontroversial. When these are analyzed carefully, two distinct patterns emerge. The oldest inscriptions are verb final, as in (2) above. They represent an OV structure without verb movement to the second position. Consistent with an OV grammar, the auxiliary follows the main verb, as in *haitinaz was* ‘called was’ (Kalleby), see also (6) above. But during the fifth century a different pattern emerged, so that the verb tended to precede its complement:

- (11) *hAþuwoLafa sate stAbA þria*
 ‘Hathuwolf set staves three’ (Gummarp, 7th c.)

(cf. also (4) and (8)). This may look like a transition from OV to VO. But it is worth noting that all the verbs which precede their object are finite, and they are all in first or second position. They may therefore be analyzed as having undergone verb movement from their

final position. There is not one single inscription in the entire corpus that contradicts an OV structure, since there is no non-finite verb which precedes its complement.

What happened in the fifth century may have been the introduction of verb-second order. If Grønvik’s (1987) interpretation of the Setre inscription (from the last part of the sixth century) is correct, it clearly shows an OV language with verb movement:

- (12) *hAl mAZ mA unA Alu nA Alu nAnA*
 ‘leaning girl may be-happy all obtain all accept, i. e. A girl who is lying down may feel happy, obtain everything and accept everything’ (Setre)

It is true that this is a very unclear inscription which has received many different interpretations, but if Grønvik is right, we have here a sentence with a finite auxiliary, *mA* in second position, and two infinitives, *nA*, *nAnA* which follow their objects.

The only two (almost identical) subordinate sentences in the material (from the first half of the seventh century) are also verb final:

- (13) *sAZ þAt barutz*
 ‘he-who that breaks’ (Björketorp)

This example dates from after the introduction of the verb-second rule, but since this is a subordinate sentence, verb movement does not apply, and the verb remains in final position, preceded by its object. (This may also, however, be an instance of “stylistic fronting” (cf. article 105) whereby a constituent moves into an empty subject slot in subordinate sentences.)

4.3. The origin of the verb-second rule

The verb-second rule may have started as a movement of auxiliary verbs to the second position of the sentence, where it is cliticized to the first element (Hock 1986, 330). A process of cliticization of particles and pronouns to the first autonomous word in the sentence, known as “Wackernagel’s Law” is well documented and described for several IE languages. As a result of such a process, certain elements would regularly appear in second position. The implication is that auxiliary verbs belonged to the class of elements that could cliticize in this way. Hock cites as evidence the fact that auxiliary verbs in many languages would undergo phonological changes that otherwise occur only in unstressed syllables: Latin *habet* ‘has’ became *ha* in Italian and

Spanish, etc. In Nordic the 3rd-person singular of the copula and auxiliary 'be' lost its final consonant. Compare the form *ist* in (6), where the auxiliary is still in final position, to reduced forms found in second position in later inscriptions, as in (14), and the rhotacized form *er* in ON and later.

- (14) *sikli s nAhli*
 'clasp is death-shelter, i.e. The clasp is protection against death' (Strand, ca. 700)

The next step was then presumably an extension of the movement rule to all finite verb forms.

4.4. The change from OV to VO

The change from object-verb (OV) to verb-object (VO) as a basic word order pattern has been reported or at least reconstructed in many languages (cf. Lehmann 1974 for PIE; Braumüller 1982 and Faarlund 1990a for Gmc). The change can be understood as a result of focusing, that is a movement process whereby an element is brought into a position where it is interpreted as being the focus of the sentence. The focus of the sentence is that part of the sentence which carries new information, or which is least predictable from the context. Focusing is thus connected with pragmatic and communicative factors. Every declarative main sentence has a focus, and typically in many languages, the focus is not the subject of the sentence. It seems to be a universal tendency of human modes of expression and perhaps of thinking to begin with something known and then add something new to it. That is why in most languages where there is any systematic correlation at all between information structure and word order, focus elements tend to follow non-focus elements in the sentence. In transitive sentences the object is typically the focus. Not only is it less predictable and less known than the subject, but it also usually carries more new information than the verb. For one thing, many transitive verbs express more or less abstract relations, such as 'have', 'own', 'receive', 'know', 'remember' etc. Even when the verb is semantically very specific, the object is still usually the focus of the sentence. From the point of view of information structure, therefore, the OV order would sometimes be felt as less natural. One way to remedy that would be to move the object to the right of the verb. Thus, if a language has a movement process

that is sensitive to the focus, that rule will move constituents to the right.

As it becomes common to move a focused element to the end of the sentence, the language develops two possible utterance forms, OV and VO. The choice between these two then depends on whether the object is focused or not. From an underlying OV order, it gradually becomes more and more common to move the object to the right. Since the object is the most frequently focused sentence element, the VO order will soon be perceived as the unmarked form, and by subsequent reanalysis it also becomes the underlying form. This leads to the disappearance of the OV order. If the underlying form is VO, a movement rule would be needed to get OV. If there is no functional motivation for such a movement, e.g. if the OV order is not required by some principle of information structure, then such a movement process will disappear from the grammar, and the OV order will disappear from the language, as happened in Nordic with the transition from AN to ON (cf. also Faarlund 1985).

Another factor that may have favored this reanalysis, is the introduction of the verb-second rule (cf. 4.2.). In transitive sentences with just one verb, this created a VO order on the surface, as in e.g. (11) above.

5. The reflexive verb form

The ON verb has a form in *-sk* with a reflexive or medial sense: *leggja* 'lay' -*leggjask* 'lay oneself, lie down, go to bed'. The suffix *-sk* is a clitic form of the reflexive third-person pronoun *sik*. There is no reflexive verb form attested in AN, nor is there a reflexive pronoun attested. We therefore do not know when the cliticization process started, but it must have been after the change from OV to VO, since the clitic, being a complement to the verb, was added as a suffix, even on non-finite forms. Another piece of evidence that the clitic form was quite recent in ON is that it remained a productive synchronic rule throughout the ON period. We find the reflexive both as a clitic and as an independent pronoun:

- (15) a. *Flosi bjó sik austan*
 'Flosi-nom. prepared himself-acc. from-east, i.e. Flosi got ready to go west'
 b. *hann lagðisk í rekkju*
 'he laid-refl. in bed, i.e. He went to bed'

On the other hand, by the time the reflexive form appeared in ON texts, it had already undergone a certain degree of morphologization and become independent of the full form. The suffix *-sk*, which is the contracted form of the accusative third-person pronoun, was from the beginning of its attested history also used for other oblique cases. Thus the verb *bjarga* ‘help, save’ normally takes an object in the dative, but in (16) it has the suffix *-sk*:

- (16) *verðið þér nú at bjargask við slíkt sem til er*
 ‘become-2pl. you–nom.pl. now to help.refl. with such as is, i.e. You will have to help yourselves with whatever there is’

The suffix was also used in the second person, as in (17a). Only the first person had a separate form, *-mk* (17b), which was also eventually replaced by *-sk* (17c).

- (17) a. *sakask eigi þú*
 ‘blame-refl. not you-nom., i.e. You do not blame yourself’
 b. *hétumk Grím*
 ‘called-1sg.refl. Grim, i.e. I called myself Grim’
 c. *ek skal giptask bónda einum*
 ‘I shall marry-refl. farmer one, i.e. I shall get married to a farmer’

84. Lexical developments from Ancient Nordic to Old Nordic

1. Introduction
2. Changes in word formation
3. Composition
4. Nominal derivation
5. Verbal derivation
6. Changes in the composition of the lexicon
7. Literature (a selection)

1. Introduction

The lexical changes that took place during the transitional period from Proto-Nordic to Old Nordic are difficult to describe with any high degree of precision. The main reason for this is the fact that our source material is rather limited, and that it is often far from repre-

sentative for the language actually spoken at the time in question.

1.1. Sources

Contemporary sources in the proper meaning of the word only consist of runic inscriptions written in the elder 24-character alphabet (elder futhark) or, later in the Viking age, in the 16-character alphabet (younger futhark). The runic inscriptions provide a basis for direct comparison between the beginning and the end of the period. Without this material, the following discussion would be completely speculative. Besides the runic inscriptions, Old Icelandic poetry as it appears in Eddaic and

scaldic poetry is the only source that to a certain extent can elucidate contemporary speech habits.

In addition, direct and indirect conclusions can be drawn through etymological and semantic analyses of the lexicon that has been handed down to us. However, the possibility of stratifying the material chronologically is limited. Personal names – to the extent they are recorded in runic inscriptions – and place-names – if their age can be determined – are also of interest.

1.1.1. Runic inscriptions

The runic inscriptions of Scandinavia present rich material which moreover can be pinpointed geographically and even chronologically (to a lower degree of precision). It is worth noticing that the transition from the elder to the younger runic alphabet took place in the transitional period between the Proto-Nordic period and the Viking Age – the earliest Viking Age rune row being the one documented by the Ribe skull inscription, dating from about 725 (Stoklund 1994, 109f.). The language of the oldest runic inscriptions has been discussed intensely for a long time, and by now even the division of Germanic dialects and the relationship of Proto-Nordic and Gothic have become topics in this discussion. Today most scholars agree that East Germanic (Gothic) split from the North Germanic branch at a relatively early period (before the first c. A.D.?) and that there was a subsequent period of relative linguistic unity comprising the whole North West Germanic area, including the Germanic speaking parts of Scandinavia. Opinions differ, however, as to when Proto-Nordic appeared as a more independent dialect. According to some researchers, North West Germanic split up as late as in the 5th c. (e.g. Haugen 1976, 92, 107ff.).

The runic inscriptions have come to occupy a prominent place in this discussion. Kuhn's opinion that the language of the Proto-Nordic runic inscriptions could represent the early stage of any West Germanic dialect is well-known (1969, 173; for the discussion as a whole see the references in Grønvik 1981, 35ff. and H. F. Nielsen in Düwel 2000, 25ff.).

Even if one agrees to the independent status of Proto-Nordic, the question remains whether runic inscriptions can provide authentic evidence for the language that was actually spoken in Scandinavia at this time. They might just as well be sources of written lan-

guage only, perhaps of a sort of koine, which was used all over the North West Germanic area. The present author shares the view that the language of the older inscriptions found in Scandinavia is to be considered as Proto-Nordic (Grønvik 1981, 69; for a schematic chronological overview of the Proto-Nordic runic inscriptions, see Krause 1966, 312ff. and Krause 1970 §§ 42–44; for a critical discussion on dating, see Haavaldsen 1991).

1.1.2. Eddaic and scaldic poetry

Generally, it is a problem that written sources are hardly ever older than from the 13th c. A.D. The oldest scaldic poems date from the 9th c. A.D. and by the 13th c., the whole genre had fallen out of use. As the bulk of the material is found in the period between ca. 900 A.D. and 1100 A.D., most scaldic poetry does not fit within the period investigated here, if seen from a strictly chronological viewpoint. The Edda poems probably originate from the relevant period to some extent, yet they are generally hard to date precisely. The fact that scaldic poetry is strongly dependent on form and tradition makes it plausible to consider the language forms found there as representative of the later stages of the transitional period.

Seen as source material, Old West Nordic poetry is problematic in various ways. The poetic language contains a great number of words that cannot be found in other Germanic and Indo-European languages. It is rich in both archaisms and innovations and it is often difficult to determine which is which.

The heroic ideals of the court and the *hirð* 'the retinue of the king' have certainly influenced the lexicon of scaldic poetry. The scalds indulge in elaborate descriptions of weapons and battles, abounding in the use of intricate metaphors (*heiti* and *kemningar*).

However limited and pattern-dependent scaldic poetry may be, it offers possibilities for observing lexical changes. The lack of a certain word in a kenning can indicate that the kenning is of more recent origin, the substitution of a certain word for an other one can in a similar way indicate a change in the use of language (cf. Lindow 1975, 6).

Eddaic poetry contains many archaic features and, what is more, characteristics that point to an origin outside Iceland. In other words: the colonization of Iceland in the 9th century cannot be regarded as an indisputable time-limit (for a critical survey of the often

animated discussion on the origin and age of Eddaic poetry, see Einar Ólafur Sveinsson 1962, 203 ff.). Following Lindow (1975, 6), we may say in summary that, although there are problems of dating, Eddic poetry can still serve as a valuable source for lexical analysis, as it is generally archaic in nature and shows various affinities to PGmc poetry.

1.1.3. Place-names and personal names

Place-names present a huge amount of material, which, too, is often difficult to handle from a source-critical viewpoint. Place-names of prehistoric origin are often hard to classify chronologically. This is also the problem with personal names (cf. Hellquist 1929–30, 289 ff.; Skautrup 1944, 55 ff.; Christensen/Kousgård Sørensen 1972, 176 ff.). Personal names cannot be considered primary source material to the extent that place-names can; still, they can provide important evidence in lexical investigations.

1.1.4. Other sources

Even other old Germanic languages, e.g. Gothic as it is recorded in Bishop Wulfila's translation of the Bible (Codex Argenteus), are important for the reconstruction of the Proto-Nordic lexicon. Scandinavian loanwords in Finnish and Sami are also of interest (Haugen 1976, 113; with references).

2. Changes in word formation

In the transitional period, several changes in word-formation patterns can be observed. First, a number of words formed with inherited suffixes lack equivalents in other Germanic dialects. Such words can be seen as representing Proto-Nordic innovations, especially if they are found both in Old West Nordic and Old East Nordic. Secondly, some suffixes occur in words that have equivalents in other Germanic languages. Such suffixes are likely to have ceased being productive before the beginning of the transitional period. It is necessary to be cautious here though, since the source material does not reflect the whole range of the lexicon.

3. Composition

Germanic preserved the two modes of forming new words found in Indo-European: derivation and composition. It is hardly possible,

however, to determine a chronological order in the sense of one possibility having been more frequent than the other at a particular period of time.

3.1. Nominal composition

In Germanic, there were two types of composition: juxtaposition (“genuine compounds”) and case composition (“artificial compounds”).

3.1.1. Juxtaposition

In compounds of this type, the first element is a pure nominal stem (i.e. a stem without inflection), as in e.g. Go. *footu-baird* ‘foot-stool’: *footu-*, *u*-stem; Go. *mati-balgs* ‘provisions’: *mati-*, PGmc *mati-*, *i*-stem; Go. *himina-kunds* ‘heavenly’: *himins* m., PGmc **hemina-*, *a*-stem.

As a means of word formation, juxtaposition probably originated before case composition (Wessén 1965, 76). In Proto-Germanic, this was the dominating type of composition, as can be shown in Germanic loanwords found in Finnish, Slavic languages and names of Germanic origin in the works of the classical authors, which are all of this type without exception. The same is true for Gothic: *weinagards* ‘vineyard’, *lustusams* ‘long-desired’, *sigislaun* (*s*-stem) ‘reward for a victory’ (Wessén 1965, Krahe/Meid 1967 § 18).

Examples from Proto-Nordic runic inscriptions are *fara-wisa* ‘the one wise (i.e. who is experienced) in danger’ (cf. *far* n. ‘danger’), *alja-markir* ‘foreigner’, *Sali-gastir* ‘stranger in the hall’ (Krause 1966 nr. 127, 53, 86).

3.1.2. Case compounds

Case compounds originate from syntactic collocations and are therefore usually considered younger and more accidental in their nature. A characteristic feature of these compounds is that the elements keep the inflected form they had in the original collocation. The constituent parts are often easily separated from one another: *διόσκουροι*, gen. *διός* + *κουροι* ‘Zeus’ sons’; *Νέα πόλις*, *Νεάπολις*; Sw. *lands lag* > *landslag* etc. Case composition is likely to have been productive in the transitional period. Go. *bairgswaddjus* ‘city wall’ is usually quoted as the earliest occurrence in Germanic (see e.g. Wessén 1965, 76). However, the names of the days of the week, formed after

the Latin model, also provide relatively old examples: OE *wodnesdæg* ‘Wednesday’, OHG *Donarestag*, cf. Lat. *dies Mercurii* > Fr. *mercredi* (Hellquist 1948; Krahe/Meid 1967, 18).

In Old Nordic, the stem vowel in the linking morpheme has disappeared as a result of syncope. However, it is still possible to distinguish between juxtapositions and case compounds, cf. e.g. *landbúi – landslög*, *friðbrot – friðargerð*, *sólhvarf – sólarhiti*. The material handed down in literature shows an increasing number of case compounds.

3.2. Verbal composition

3.2.1. General

Like in other Indo-European languages, verbal composition, i.e. the combination of noun and verb with the noun as the determining word, is not common in Germanic (Krahe/Meid 1967, 35. Concerning compositions that are only apparent, like *staðfesta*: adj. *staðfastr*, see Wessén 1965, 105ff.). The composition of verb and verbal stem can occur in the imperfect of weak verbs, namely in the case of verbs forming their imperfect by periphrasis with IE **dhē/dhō* (cf. E *do*, G *tun*), as in Go. *salbō-da*, 1. pl. *salbō-dēdun*; cf. **tawide** 3. sg. ‘made’, **satido**, **fahido** 1. sg. ‘set up’, ‘painted’ (Garbølle, Rö, Krause 1966 nr. 30, 73). Cf. Krahe/Meid 1967, 35f.; Skautrup 1944, 55.

3.2.2. Prefixation

On the other hand, prefixation is very common. Here, a striking development can be observed. Proto-Nordic, at an early stage, was obviously rich in verbs with prefixes of the same kind as in other Germanic dialects, e.g. Go. *of-*, *ana-*, *anda-*, *in-*, *uz-*, *at-* and especially *ga-*. The Proto-Nordic runic inscriptions seem to reflect a period when such prefixes had disappeared, with only a few exceptions remaining. Such exceptions are *ór-* (cf. Go. *uz-*, *us-*), *um(b)-* (*umhverfis*), pejorative *fra-* as well as the particles *of* and *um*. The latter two have preserved their perfective meaning even in runic Swedish and Old West Nordic (Wessén 1965, 111 with references in note 11; on the difficulties of reconstructing Proto-Nordic verbal prefixes, see the overview in Harding 1951, 6f. with references).

A more precise account of the disappearance of prefixes is hard to give, but doubtlessly its major cause was syncope in Proto-Nordic.

The fact that the main accent lay on the stem syllable resulted in a weak accent or lack of accent on the prefix, which thus finally disappeared. As to nouns, conditions were exactly the other way round, with the result that the prefixes were lost in verbs, the particles were often preserved in the corresponding deverbal nouns. Besides the OWN verb *svara* ‘to answer’, we have the noun *andsvar* ‘answer’ showing that the original verb had a prefix: **and-swarōn*. Evidence for the occurrence of prefixed verbs in an older period, is most often found in this way. For OWN *ágætr*, we posit PN **an-getan* (‘to mention, to talk about’) and for OWN *íprótt*, a PN verb **in-driugan* ‘to execute’ (Johannisson 1939 passim; cf. also Wessén 1965, 112 with further references).

The prefix *ga-* is particularly interesting in this connection, as it was unstressed even in nominal compositions but still has left behind some traces. A reason for this is the fact that its consonant usually has been preserved before *r*, *l*, *n* in e.g. OWN *greiða* (Norw. *greie*) < **ga-raiðian* ‘to prepare for riding’, OWN *glíkr* ‘equal, similar’ (Go. *galeiks*), *gnógr* ‘enough’ (Go. *ganohs*), *granni* ‘neighbour’ (Go. *garazna*). Obviously, however, the reduced prefix lost its productivity.

The ON prefix *fra-*, cf. Go. *frawardjan* ‘to corrupt’, *frawaúrkan* ‘to sin’, is quoted by Wessén (1965, 111) as an illustration of how a particle could resist the “destructive tendency” because it possessed a strong emotional connotation. In its weakened form, *fra-* was associated with the preposition *for*, and both came in turn to be replaced by OWN *fyrir*, OSw. *firi* (cf. *konä firigär manni* ‘woman puts man to death (by poison or magic)’, *Västgötalagen*). The latter is the only unstressed verbal prefix that has been preserved into historical times (Johannisson 1939, 6).

When the unstressed verbal prefixes had disappeared, a new verb type with a stressed prefix began to emerge, probably originating in the formation of denominal verbs like *afsvara* ‘to deny, to decline’: *afsvör* ‘refusal’ (Johannisson, 62ff., with further references).

4. Nominal derivation

There is no general chronological relation between composition and derivation as principles of word formation. Still, it can be noted that most of the inherited derivational suffixes disappear and that composition becomes a more and more common type of word formation. Sometimes a derivation is replaced by

a compound with the same meaning. In the Viking Age, *stýrimaðr* was the usual term for 'navigator, skipper' (cf. Sö 161, U 922, 1011, 1016, DR 1), but in the poetic Edda, the same meaning is carried by the derivation *stýrir*, which is moreover found in Swedish place-names: *Stýrsö*, OSw. *Stýrisö* etc. (Hellberg 1978, 71; cf. 4.1.3).

4.1. Changes in suffix function

Many suffixes that played a prominent role in Proto-Germanic/Proto-Nordic word formation disappear or have already disappeared in the transitional period. The reason for this is the fact that their morphological structure had disintegrated or become obscure because of sound changes, the most important of which was the syncope of unstressed vowels in word endings.

4.1.1. Suffix *-a*

In Proto-Germanic, the *a*-suffix was used to form denominations for living creatures, first in the form of nomina agentis with ablaut from the present stem of verbs: Go. *wraks* 'pursuer': *wrekan*; ON *vargr*: PGmc **wergan*. In a later period, this suffix became productive even for derivations from the present without ablaut, as is evidenced by a large number of formations occurring particularly in OWN poetry: *bjóðr* 'giver' (cf. *bjóða*), *þrjótr* 'one who does not fulfill his duties' (cf. *þrjóta* 'to desert'). This type is particularly frequent in compounds: *kolbíttr*, *blóðdrekktr*, *hringbrjótr*, *folkvaldr*.

When the *a*-suffix lost its characteristic feature, the vowel *a*, because of syncope, its functions were taken over by other suffixes (Olson 1916, 127) – a frequently occurring process (cf. e.g. Skautrup 1944, 57). There is no doubt that the loss of transparent morphological features in important derivational suffixes, which was caused by syncope, and the resulting functional changes present the most prominent changes in word formation in the transitional period.

4.1.2. Suffix *-an*, *-ōn*

IE *-ēn*, *-ōn* is believed to have been used for deriving nomina agentis from verbal stems even in ancient times; cf. OInd. *rajan* 'ruler': *raj* 'to rule', Gr. *πευθήν* 'one who asks': *πεύθομαι*. In Germanic, this function became

very common. Originally, when the accent lay on the suffix, the *-an*-stems were derived from the weak root stage, e.g. OWN *liði* 'retainer, follower': Gmc **liþan*. In this way, a pattern was established which soon came to allow for *-an*-formations even from other ablaut stages and from weak verbs (Olson 1916, 10). In Scandinavia, agents formed by the *-an*-suffix became common in compounds: *gialdkeri* 'tax claimer', *dróttseti* 'steward at the king's table', *oformaghi* 'minor, immature' and particularly in OWN poetry: *hringbroti* 'giver of rings (= lord, prince)', *sæfari* 'seafarer' etc. In formations of this type, *-an* came to be replaced by *-ari* over the course of time, a process which may have already started in the later stages of the transitional period (Wessén 1965, 44f., 120ff.).

In Proto-Nordic times, the suffix was very much used for producing weak equivalents to strong nouns: OSw. *haghi*: *hagh*, OGotl. *luti*: *lutr*, OWN *gluggi*, OSw. *glugga*: *gluggr* etc. According to Olson (1916, 214), compounds in which *-an* had some kind of modifying function (cf. Go. *mannleika*: *leik* n.) may have led to the establishment of a model here. Probably, a reason for the popularity of this suffix is the fact that one more syllable strengthened the word morphologically. A similar tendency can be observed in short-stemmed formations with the suffix *-ia* (of the type *meginbyri*: *byrr*, see 4.1.3.).

4.1.3. Suffix *-ia*

Originally a denominal suffix producing adjectives, *-ia* became productive most of all as a deverbal suffix. This can be observed in Old Nordic terms for persons, which are partly denominal (cf. *hilmir* m. 'chief', i.e. 'helmet-bearer') and partly deverbal. The reason for this seems to have been the fact that the *-ia*-formations were associated with verbs derived from the basic noun in question, rather than from the noun itself. In this way, e.g. *hirðir* m. 'shepherd', derived from *hiþrð* f., could be understood as a derivation from the verb *hirða* 'to guard', and *fylkir* m. (from *folk* in the sense of 'troop') as a derivation from the verb *fylka* (Torp 1909, 35; Wessén 1965, 38). When this pattern became common, *-ia*-derivations denoting persons could even be formed from weak verbs: *stýrir*: *stýra*, *stillir*: *stilli* (**stillir flutna** on the Rök stone: 'leader of the sea-warriors'), *lagabötir* 'law-improver', *basatömír* 'one who empties the stall', in other words: 'robs people of their cattle' (cf. Olson 1916,

7f.; Torp 1909; Wessén 1965, 38). OWN scaldic poetry is rich in derivations of this type.

The pattern does not seem to have spread beyond the frame of denominations for persons. Olson, however, points to the fact that in OWN poetry, such derivations are used for personified animals: *hiðbyggvir* ‘the one who builds (or lives in) a lair’ = ‘bear’ and even objects: *fellir* ‘the one who fells’ = ‘sword’ (1916, 91).

Denoting coherence, the suffix was abundantly used in forming collectives in Proto-Nordic. It is believed that the North Germanic derivations of this type (*smiði*, *fylki*, *minni* ‘memory’ etc.) were originally prefixed (cf. 3.2.2.) like Go. *gaskôhi* ‘pair of shoes’, OSx. *giwâpni* ‘weapons’ (cf. also G *Gebirge*, *Gelände* etc.). However this may be, the suffix continued to be productive in this particular function even after syncope (Olson 1916, 177).

Frequently, the meaning of the derivations of this type appears to be identical with that of the basic word: *virki* n. ‘work, stronghold’: *verk* n. In OWN, this is particularly frequent in compounds (of the type *ungmenni* n.: *ungir menn*), which however often lack the collective meaning: *biarndýri* n. ‘bear’. This latter phenomenon is of ancient origin, cf. Lat. *adverbium*: *verbum*, *plenilunium* ‘full moon’: *plena luna*, Gr. εὐαγγέλιον ‘good message’: ἄγγελος ‘messenger’, μεσονύκτιον ‘(at) midnight’: νύξ ‘night’. Among Scandinavian derivations, the so-called tree-name collectives are particularly interesting: *birki*: **biþrk*, Sw. *hässle*: *hassel*, *eke*: *ek* (‘birch-, hazel-, oak-grove’ or ‘-wood’). Finally, it is worth mentioning that collective meaning is also found in many short-stemmed neuters like Sw. *gräs* ‘grass’, ON *net* ‘net’, *ber* ‘berry’ (Wessén 1965, 39ff.; Olson 1916, 177f.; Torp 1909, §13,3a).

Krahe/Meid (1967, 56) emphasizes the fact that only the suffixes containing one or more consonants resistant to the sound changes were really productive in Germanic. Neither the *-an-* nor the *-ia-* suffix contained such resistant consonants and both were consequently replaced by the suffix *-ari* (3.1.5). Once more, the reason was the fact that too much of the morphological structure had been lost over the course of sound developments (PN *-ia-* > ON *-i-*), which implied too weak a manifestation of the agent function. In this connection, it is interesting that short-stemmed *ja-* stems (of the type *gräs*) take a disyllabic form in compounds which is identical to the two-syllableform of long-stemmed *ia-*

stems: *illgræse* ‘ill weeds’, *meginbyri* ‘strong wind’, *hádegi* ‘noon’, *snórviði* ‘undergrowth’ (Modéer in NoB 37, 1949, 171ff.). Cf. above 4.1.2. on the *an-* suffix in composition.

The role the suffix *-ia* played in the derivation of inhabitant names is still subject to discussion. The word *holtijar* on the Gallehus horn is thought to be an early example of such a derivation (cf. Lindquist 1947, 17 and Modéer 1948, 186f. with references). According to a hypothesis by Torp, proposed as early as 1909 and by now commonly accepted in Scandinavia (cf. Wessén 1965, 39), *-ia-* derivations appear in a number of old Norwegian inhabitant names like *egðir*: *Agder*, *háleygir*: *Hálogaland*, *rygir* (older *rygiar*): *Rogaland*, *sygnir*: *Sogn* (Torp 1909, 36). It is striking, however, that the same material has been considered to be *i-* stem-derivations by scholars approaching the problem from a West Germanic perspective (see Krahe/Meid 1967, 67 and, for an overview, Melefors 1983, 20ff.). Indeed, the derivations in question are declined as *i-* stems in the 13th and 14th c. (According to Torp, they belong only secondarily to this declension.)

The existence of Proto-Nordic *-ia-* derivations of this kind has, however, been questioned (Melefors 1983, 21ff.). First of all, it can be noticed that Gothic declines the names of foreign peoples as *i-* stems. Wulfila even uses *i-* stem inhabitant names where Greek uses place-names (dat. pl. *Twrim jah Seidōnim* for Τύρρι καὶ Σιδῶνι).

Moreover, Proto-Nordic runic inscriptions show that *i-* derivations were used in Scandinavia to denote persons: *un-gandir*, Nordhuglo ca. 425 (Krause nr. 65), *alja-markir*, Kårstad ca. 450 (Krause 1996, nr. 53). As regards *Ek Hlewagastir Holtijar*... on the Gallehus horn, *Holtijar* has been interpreted in two different ways: as an inhabitant name derived from a place-name *Holt* (cf. *Holstein*, OWN *Holtsetaland*) or as a patronymic beginning with **Holt-* (according to Antonsen 1975, 41 from **Holtagastiz*). Considering the uncertainties concerning the *-ia-* suffix’s role in the formation of Scandinavian inhabitant names from place-names, it is perhaps the second alternative which should be preferred.

4.1.4. Suffix *-ian*, *iōn*

This suffix has its origin in *n-* derivations from *i-* or *-ia/-iō-* stems and has been functionally confused with the *-an/-ōn-* suffix. In Gothic and West Germanic, it was very productive in

the derivation of *nomina agentis* (Wessén 1965, 46). In Scandinavia, it is less frequent, but present e. g. in *foringi*, Runic Sw. *forungi* (< **fora-gangian*) ‘the one walking before’ = ‘chieftain, leader’, *hǫfðingi* (< **haubūð-gangian*) ‘the one walking at the head; leader’, *valkyrja* ‘the one who chooses the future casualties’, *bryti*, *skyti*, *hamingja*, *fylgja*, *ekkjja*, *gyðja*, *ketta* (cf. *kǫttr*), *gänta* (cf. *gantr*) (Olson 1916, 230; Krahe/Meid 1967, 96 ff., 70).

Chronologically, the *-ian*-suffix can be situated between *-ia* and *-ari*. Once more, the reason why the suffix gradually lost its productivity is Scandinavian syncope. Indeed the morphological difference between the suffixes *-ian*, *-ia* and *-an* became smaller and smaller; cf. PN **brutian* > OWN *bryti*; *granni* < PN **garaznan*; *hirðir* < PN **herðiar* = Sw. *bryte*, *granne*, *herde*.

Kluge 1926, 8 points out how *-jan* and *-an*-derivations can alternate in one and the same word, cf. Go. *arbja* (*jan*-stem): ON *arfi* (*an*-stem) ‘heir’. Such cases do not necessarily involve two different suffixes, as sometimes the *ij*-component of the *-jan*-suffix has been lost because of regularization in the paradigm: „Man [möchte] dem Nordischen eine Neigung zur Durchführung der *j*-losen Form zuschreiben.“ An interesting example in this connection is ON *goði*, *guði*: Go. *gudja*. The existence of a corresponding feminine form, the OWN *jōn*-stem *gyðja*, possibly indicates that *goði*, *guði* was originally a *jan*-stem just like Go. *gudja*.

4.1.5. Suffix *-ari*

The suffix *-ari*, Gmc *-āria*, *-aria*, is originally derived from Lat. *-arius*, which is common in terms for professions and occupations and the like, e. g. *monetarius*, *molinaris*, *mansionarius* (Krahe/Meid 1967, 81 ff.). The great number of Latin loanwords with this suffix in Germanic led to an indigenous production of corresponding formations. In Gothic, derivations of the same kind as the ones quoted from Latin can be found: *laisareis* ‘teacher’ (cf. *laisjan* ‘teach’), *bōkareis* ‘literate person’ (cf. *bōka* ‘letter, book’); *daimônāreis* ‘exorcist’ etc. Both Gothic and West Germanic show an original form *-aria*, which is inflected as an *ia*-stem, while in Old Nordic, *-ari*-formations are treated as *an*-stems (Olson 1916, 41; Wessén 1965, 120). In this connection, there is also reason to mention the existence of a Nordic variant *-eri*, where the initial vowel of the

suffix has been changed because of *i*-umlaut, as in OWN/OGotl. *dōmeri*, OWN *skaperi*, OGotl. *rauferi* (Wessén, loc. cit., note 1).

Originally a denominal suffix, *-ari* came to be productive even in derivations from verbs. Indeed, this function became dominant, with *-ari* becoming the primary instrument to construct *nomina agentis* of the type ‘the one who does (or has done) this or that’ (see e. g. Olson 1916, 39 with further references).

The *-ari*-suffix may have reached Scandinavia towards the end of the transitional period or a little later. Krahe/Meid (1967, 82) observes that it seems to have spread more slowly the more removed an area was from the influence of Roman culture. In the OS. *Heliand*, we only find a few examples like *fiscari* ‘fisherman’ and *gardari* ‘gardener’, in *Beowulf* only *scēawere* ‘spy’. In the poetic Edda we encounter *tjúgari* ‘robber’ (*Vǫluspá*; of etymologically obscure origin), and *mútari* ‘bird of prey’ (in compounds only). Olson 1916, 110 considers among others OWN *gangari* ‘ambler’ to be an old derivation; according to de Vries, we have to do with a loan translation from Latin (*ambularius* or *gradarius*), which was mediated by Old English. In addition, the suffix is only occasionally found in the oldest testimonies of Old West Nordic (Jóhannesson 1927, 22).

The borrowed suffix obviously was first used in the same way as in Latin (above), cf. *skipari* ‘sailor’ which occurs in several runic inscriptions (DR 82, 218, 275, 363, 379, Sö171, 335, Sm 42). In this function it quickly superseded the agentive suffixes which had lost their morphological characteristics due to syncope: *-ja/ia*, *-jan/ian*, *-an*, *-ila* (cf. Krahe/Meid 1967, 82 f.).

4.1.6. Suffix *-ila*, *-ala*, *-ula*

Derivations with the *-l*-suffix inherited from Indo-European, but without a middle vowel (*-la*), probably belong to the common Germanic period (Krahe/Meid 1967, § 86). When the suffix later appears with a middle vowel, this is most often *-i(-ila)* in nouns), in Scandinavia also *-u(-ula)*. The forms *-ala*, *-ula* were used to form adjectives meaning ‘tending to’: e. g. *sögull* ‘talkative’, *svikall* ‘treacherous’.

As they were productive in the transitional period, their agentive, instrumental and diminutive functions are of interest. Derivations were made both from strong and weak verbs, and also from nouns. *Attila*, the Germanic name of the ruthless ruler of the Huns, is an example

of the last category, expressing a diminutive sense ‘little father’ (Go. *atta* ‘father’).

Proto-Nordic derivations with agentive-instrumental meaning are probably *lykill* ‘key’: *lúka* ‘to lock’, *støkull*, *stökkvill*, OSw. *stænkill* ‘sprinkler’: *stökkva*, OSw. *stænkia*, as well as *værpil*: *værpa* ‘throw’, which is only found in the plural *værplar* in the special meaning of ‘leather straps tied to a falcon’s feet, used to “throw” the bird towards game’ (Olson 1916, 238 ff.; Wessén 1965, 57 f.).

5. Verbal derivation

New verbs can be formed by derivation from nominal or verbal stems and roots. The strong verbs inherited from Indo-European are seldom used as a pattern for new creations (Krahe/Meid 1967, § 176). Primary weak verbs, i.e. verbs which are not derived from a basic word, are derived with the suffixes *-ē* and *-ō*. Such verbs (e.g. ODN *lifa*, *hafa*, *kaupa*, *þora*, *þola*) are often Germanic or Proto-Nordic innovations (Torp 1909, 63 f.; Wessén 1965, 89). In Old Nordic as well as generally in other Germanic languages, the bulk of new verbs is derived from the four categories of weak verbs. Particularly often, new verbs are derived from the first category of weak verbs ending in PN *-ō* and containing denominals (Go. *fisk-ōn* ‘to fish’: *fisks* m.) as well as deverbals (Krahe/Meid 1967, 240 ff.). The suffix IE *-io*, PN *-ia* is also very productive. When the initial vowel of the suffix came to be realized as a consonant after short root syllables, the originally homogeneous group of *-ia*-derivations split up into two groups developing differently. This is evident when we compare the verb *gleðja* (*-ja*-verb) < PN **gladjan* with *fasta* (*-ia*-verb) < PN **fastian*. As a result of syncope the latter category loses its morphological mark. Although the *-ja*-verbs on the other hand preserve their *i*-element, even the derivation with the *-ja*-suffix seems to stop when the umlaut ceases to appear. In this way, the *-ō*-verbs with their morphologically prominent past tense ending in *-aði* remain as the only productive category.

As an inheritance from Germanic, a number of suffixes which were productive in the formation of weak verbs from verbal stems and nouns are still present in Proto-Nordic (see Wessén 1965, 103 ff. with references, and Krahe/Meid 1967, §§ 175–197).

Apart from the ones mentioned, no dramatic changes took place in the transitional

period. The suffixes which retain their distinctive feature in the form of a consonantal element (e.g. *-k-*, *-l-*, *-s-*, *-sk-*) even after syncope also preserve their productivity at least into Old Nordic times.

Among deverbal *-ō*-formations, a group of derivations from adjectives ending in *-ugr(-igr)* is noticeable, cf. e.g. *staðga*: *støðugr*. In Scandinavia this even became a pattern for new formations lacking the basic adjective: e.g. *blómga* ‘to make bloom’, *lifga* ‘to enliven’: *lif* (Torp 1909, 64).

The verbal suffix *-nō* (Krahe/Meid 1967, 252 ff.), which is possibly derived from a little group of Indo-European nasal presentia, is of great interest. In the Nordic languages as well as in Gothic, its meaning is inchoative and medial: ODN *brotna* ‘to be broken’ (: *brjóta*), *drukna* ‘to be drowned’ (: *drekka*), *þrotna* ‘to become tired’ (: *þrjóta* ‘to lack’). Verbs derived by means of the *-nō*-suffix are particularly frequent in ODN poetry. The root syllable often shows weak ablaut. Therefore, this type has become associated with the past participle of strong verbs and has, as a consequence, been interpreted as derived from those (Wessén 1965, 48, 95, 98). Yet the development proceeded even further. The suffix became productive from adjective stems and gradually also from nouns, even without changing the quality of the root syllable: Go. *gahailnan* ‘to recover’, *mikilnan* ‘to become big’, ODN *harðna*, *hvitna*, *kvikna* (op.cit., 99). An example of the verb *þiðna* ‘to thaw’ corresponding to Icel. *þiðr* ‘not frozen’ found in the Edda poem *Guðrúnarhvot*: (*þiðni sorgir* ‘may the sorrows melt’) indicates that this widening of function must have taken place early.

6. Changes in the composition of the lexicon

6.1. Aspects of linguistic origin

Most lexical elements in Proto-Nordic are of native (i.e. Indo-European or Germanic) origin. In the runic inscriptions, we find only one supposed non-Germanic loanword: *walha* ‘Celtic, Welsh’ on the Tjurkō bracteate (cf. Jansson 1987, 16) and only one borrowed suffix (*-ari*). To sum up, we can therefore establish three main categories of words:

- (1) words inherited from Indo-European
- (2) Proto-Germanic innovations
- (3) Proto-Nordic innovations.

In the Proto-Nordic period, the few words that were borrowed mainly originate from other Germanic dialects. Loans from non-Indo-European languages are likely to be very rare. Cultural contacts with Celts, Romans, Greeks, different Slavic, Fenno-Ugric and Baltic peoples form the theoretical basis for linguistic loans, but traces of such are – with some exceptions – very rare.

The search for possible loanwords should preferably be directed towards areas where we can expect them to occur as a result of cultural and sociohistorical changes. Such areas are religion, social/military organization and trade.

6.2. Loss of words and new formations

6.2.1. Social and military organization, comitatus system

Scandinavian comitatus-terminology is partly of common Germanic origin and partly consists of innovations. (For an overview of the discussion of the notion of the comitatus see Kristensen 1983, ch. 1). The subject can only be touched upon briefly in this section which is based on Lindow (1975).

One of the oldest lexical fields consists of a group of words derived from the verb known from Gothic as *driugan* ‘to do military service, to make war’ = OWN *drjúga* (Lindow 1975, 84ff.). Lindow stresses the fact that the verb must have existed in North Germanic. Indeed there is solid evidence in the inscription on the Fagerlöt runic boulder (Södermanland, Sö 126): *Hann draug orrostu* ‘he did battle’ (Jansson 1987, 140). The group of words in question contains terms for:

- (1) the single retainer, in the form of a nomen agentis derived by means of an *-a*-suffix: OWN *draugr* m.
- (2) the retinue itself as a collective: **druhtiz*, OWN *drótt* f., and finally
- (3) its leader, the chieftain or the king: **druhtinaz*, *dróttinn* m.

Most interestingly, the only evidence for a Germanic *a*-stem **draugaz* comes from OWN. It occurs in the kennings *draugr dólga þrúðar* ‘executor, performer of the goddess of battle; executor of battle’ on the Karlevi stone (Öl 1; Jansson 1987, 36; Lindow 1975, 89 with slightly different translation) and *orlygis draugr*, with the same meaning, in Bragi’s *Ragnarsdrápa*, considered to be one of the earliest examples of scaldic poetry.

Even in Scandinavia, the word fell out of use relatively early. Lindow (94ff.) is probably right in explaining this as a result of competition with the homonymic OWN *draugr* ‘ghost, undead person’, which is of etymologically different origin (cf. IE **dhreugh-* ‘to deceive, injure’). As **draugaz* ‘retainer’ is unknown from West Germanic sources, Lindow assumes that the word had already gone out of use before 600, while it lived on in Old Nordic for a few centuries more. Alternatively, there is a possibility that the word is Scandinavian only, even if the formation of the word as an agentive *a*-stem with ablaut (cf. 4.1.1.) indicates Proto-Germanic origin. An additional cause for the early disappearance of the word is probably the increasing belief in revenants in the Viking Age. This in turn may have been caused by the changes in funeral customs that occurred in connection with the advance of Christianity.

According to Lindow, the word *draugr* came to be replaced by *rekkr*, PGmc **rinkaz*, OE/OSx. *rinc*, OHG *rinch* (1975, 106). This latter term only means ‘warrior’ in West Germanic but is nevertheless considered by Kuhn (1944) to be the oldest designation of rank in the retinue system. According to Lindow, *rekkr/rinc(h)* is likely to have been a common term for the single retainer up till the end of the Viking Age, when the lexical system changed in connection with the replacement of the term *drótt* by the OE loanword *hirð* (cf. 6.3.).

Two other terms, *þegn* and *drengr*, are often mentioned in connection with the comitatus system, but according to Lindow, none of them actually belongs there: “Instead, they seem to have been moral terms [...] or perhaps ethnic terms” (Lindow 1975, 110, with references). He is convinced that, while the first term denominates an older, married man, the second was used for a young, unmarried man. Thus, both were used for representatives of “the large, free middle class of farmers who made up the backbone of old Scandinavian society” (op. cit., 111). For several reasons this view has to be reconsidered, however (cf. e. g. Strid 1987).

It is obvious that *þegn* as an appellative had a more common meaning, but when Lindow refers to the existence of place-names of the type *Rinkaby*, *Tägneby* in Sweden, he seems unaware of the fact that place-names indeed present weighty counterevidence to his removing of *þegn* from comitatus terminology. The villages bearing those names, OSw. **RinkabyR*

and **Pægnabyr*, occur in the same toponymic milieu, and it must be concluded that both first morphemes, gen. pl. of *rinkr* and *þegn*, indicate the presence of professional warriors of high rank in the service of kings or chieftains (Strid 1987, 306 with references in note 10). The terms are thus probably equivalents. Moreover, the testimonies of the runic inscriptions are interesting (cf. Moltke 1985, 286ff. concerning the interpretation of *þegna* on the Rydsgård stone (DR 277); cf. also Strid, 301 ff.). Possibly *rinkr* and *þegn* are distributed complementarily in an either chronological or geographical order (Strid 1987, 305 with note 9).

In neighbouring fields, interesting examples of lexical changes may be found. Hellberg has examined the terms *hersir/hersir* and *stýrimaðr/stýri(r)*, the first of which is a denomination for local chieftains, who according to the Icelandic sagas played an important role in the resistance against Harald Hárfagri and his desire to subdue Norway. In OWN poetry, kenningar with an aristocratic ring like *hersa dróttinn*, *hersa valdr* are frequent, but *hersar* are mentioned neither in the Old Nordic law codes, nor in any other historical document. While, from a source-critical viewpoint, their very existence could be questioned, place-names like Sw. *Hersby* still indicate that the Old Icelandic *hersar* did have a number of equivalents in Eastern Scandinavia (Hellberg 1978, 69f.).

6.3. Loan of meanings and words

An example of an appellative borrowed into comitatus terminology is the word *hirð*, OE *hīreð*, which came to replace *drótt* in the later Viking Age (6.2.1.). This loanword, a proof of the close cultural contacts with England since the migration period (Lund Hansen 1987, 253), is perhaps connected with the change in the retinue's function when a stronger, more centralized royal power arose (Lindow 1975, 56ff.).

There has been a tendency to underestimate the possibility of linguistic influence from Slavic areas, although there were fairly close contacts between Scandinavia and the Slavic-speaking peoples across the Baltic. Not only did the Svear found the principalities of Novgorod and Kiev, but intermarriage between the royal dynasties was also common. It is seldom acknowledged that Sigrid Storråda, the wife of Erik Segersäll, was a Polish princess (daughter of Mieszko I), or that their son,

Olov Skötkonung, had a daughter who married Prince Jaroslaw of Kiev (cf. Holm 1974, 64). Among supposedly Slavic loanwords, Sw. *piga*, *träsk* and *silke* should be noted. As Gösta Holm has shown, the name *Gustav* probably belongs here too (1974).

6.3.1. Loanwords from Latin and Greek

Trade terminology of Roman and Greek origin is commonly believed to have entered Scandinavia, like imported goods, by mediation of other Germanic people along the trading routes (Hellquist 1929–30, 562; compare also Gustavson in Düwel 2000, 179ff., particularly 185, and Lund Hansen 1987, 165ff., particularly 192f.). Linguistic influence from Latin is first noticeable in words denoting cultural products, but also in terms connected with the mercantile transactions themselves (cf. what has been said on the suffix *-ari* in 4.1.5.). The OWN verb *kaupa* and the corresponding names for the trading place, OWN *kaupangr*, Sw., Dan. *köping*, *köbing*, Finn. *kaupunki* 'town', are all derived from Latin *caupo* 'merchant'. As to the verb, it is worth noting that its past tense, *keypta*, seems to presuppose the existence of a parallel verb formed with the *-ia*-suffix. The noun on the other hand changes between the *-ing*, *-ang* and *-ung* suffix-variants (de Vries 1962; Holm 1996, 500ff.; cf. on the verb Hellquist 1929–30, 920 with note 1).

Among other often quoted examples one could mention OWN *vin* 'wine' (< *vinum*); *qrk* 'case' (< *arca*, borrowed before the *u*-umlaut, cf. Finn. *arkku*), *ketill* 'bowl' (*catillus*), *mylla* 'mill' (*molina*; according to Hellquist 1929–30, 918 possibly mediated via OE), *kerra* 'cart' (Lat. *carrus*, Gallic Lat. *carra*; according to Hellquist 1929–30, 918 coined on Scandinavian soil, PN **karrion*; otherwise see de Vries s. v. *kerra* with references), *mottull* 'cloak', Sw. *mantel* (*mantellum*), *kápa* 'coat' (Late Lat. *cāpa*), *belti* 'belt' (*balteus*; possibly borrowed via OE).

Greek words have often entered the Nordic languages via Latin and other Germanic languages. An interesting exception to this is perhaps ON *piparr* 'pepper'. When in the 8th c. (due to Islamic expansion) the ancient trading routes from the Orient through the Mediterranean were closed, the trade in silk and spices found new routes through Russia and over the Baltic Sea. The Greek *πέπερι* is likely to have entered Scandinavia through this route (Hellquist 1929–30, 620 note). In the same way and from the same route the word

silke ‘silk’ was imported from Russian or the Baltic languages. A possible Slavic loan is *kōsungr*, *kasungr* ‘fur coat’. The word, which in this case is identical with Russ. *kazuch* (*kozuch*), could according to Holm (1996, 42 ff.) have been brought home with the Varangians or other Scandinavians travelling the Eastern route.

6.3.2. The influence of Christianity

Terms for the Christian church, its priests, members and teachings as well as for its central rituals and ritual objects must have been known in Scandinavia before the Viking Age and before the transitional period discussed here. The etymologically obscure word, *goð*, *guð* is probably of common Germanic origin. It came to denote the Christian God all over the Germanic world, while at the same time displacing all other terms for higher god-beings (OWN *týr*, pl. *tívar*, *hopt*, *regin*, *bōnd* etc.). The word is morphologically, phonologically and semantically interesting, and there are reasons to dwell upon some of those features here. In pre-Christian times, *goð*, *guð*, an *a*-stem with neutral gender, is likely to have been used most of all in the plural for gods in a collective sense: ‘the powers’, just like the other terms mentioned above. The fact that *goð*, *guð*, in contrast to the other terms, could denote a single god has been pointed out as a reason why this word came to be used for the Christian God (Cahen, 1921). The term which was most frequently used in the singular, *áss* ‘As’, would have been impossible to use because of its heathen undertones.

Interestingly enough, however, *guð*, *goð* is still found in the plural in medieval sources. The prohibition against invocations of *hult eþa hauga*, *eþa haþin guþ* (‘groves or burial mounds or heathen gods’) in the *Gutalag* and the oath formula of the *Västgötalag*: *Sva se mār gud hull ok uattum minum* (freely: ‘so help me the gods and my witnesses’), are well known examples. Indeed, the older opinion that the oath formula is a heathen relic has now been rejected (Thors 1957, 408, with references). However, an obvious parallel can be found in the phrase *Guð hialpin* ‘may God help’ in the runic inscriptions (Sö 138, U 41, 56, 272, 971, G 134, 188). The proper sense would be ‘may the gods help’, since the verb is in the subjunctive plural (cf. also U 41: **kristr hialbin**).

Christianization implied replacing the neuter gender with the masculine. While the word

kept its neuter gender in the meaning of ‘heathen god’ in Old West Nordic, *guþ* is always masculine in Old Swedish. In West Germanic, the word underwent *a*-umlaut. In Eastern Scandinavia, *guð* is normally found without umlaut, as could be expected, but on some rune stones we find instances of *goð*. Old West Nordic has both forms *guð* and *goð*, but the latter seems originally to have been the most common one.

Concerning the term for the Christian community, Germanic did not take over the New Testament’s ἐκκλησία (cf. Fr. *église*). The word *kirkia* (in its supposedly oldest common Nordic form) is derived from the Greek adjective κυριακός ‘belonging to the lord (κύριος)’. According to Frings (1932), who later was supported by Thors (1957, 29 ff.), the Scandinavian languages most probably borrowed the word from Old English, which in turn imported it from the Franks. He assumes that it first entered the Germanic world in the episcopal sees of Lyon or Trier, like many other cultural terms from Greek. Formerly it was believed that the word, which is also found in ChSl. *cruky*, was borrowed by the Goths and then spread to England via West Gothic church language in southern France (Thors 1957, 21 with references).

Instead of Gr. βαπτίζειν, Old English most often used *fulwian*, *fullian*, while Gothic preferred *daupjan*. Like βαπτίζειν, Go. (*uf*)*daupjan* has the basic meaning ‘to immerse’, which led to the conclusion that it received its particular Christian connotation among the Goths in the Balkans, where the basic meaning of the Greek verb was known. In Scandinavia the equivalent to *daupjan* is *deypa*, but this verb takes the dative, which shows that it is an indigenous word with a borrowed meaning (Thors 157, 188 f. with references). *Skíra* ‘to clean’ is another ON verb used in this special sense (cf. the baptismal formula of the Borgarthing’s law: *ek skíri þik í nafni foður ok sonar ok andans helga*). The verb *kristna* ‘to christen’ (cf. “Um huru bonde skal olia älla barn kristna”, *Östgötalagen*), on the other hand, is either borrowed or formed after WGmc pattern (p. 190).

The word *húsl* (*húnsl*) ‘eucharist’ is a noteworthy testimony to the Anglo-Saxon mission in Scandinavia. The OE equivalent usually carries the same meaning, but also occurs in the sense of ‘sacrifice’ (θύσια), known from Gothic. There is uncertainty as to the origin of ON *húsl*. If it is an Anglo-Saxon loanword, the fact that it occurs on the Rökstone, which

dates back to the 9th c. and is located in a part of Scandinavia where Christianity was probably not adopted until more than a century later, indeed raises questions of interest.

The conversion to Christianity is by far the most radical change that has taken place in Nordic society. The linguistic consequences are immense, but they do not appear on a larger scale until after the transitional period.

85. Developments of personal names from Ancient Nordic to Old Nordic

1. Sources
2. Typology
3. Names and name elements in use: the Germanic heritage
4. Name-giving systems
5. Foreign names
6. Literature (a selection)

1. Sources

1.1. Runic inscriptions

The richest sources for this period are the runic inscriptions in the younger futhark, although it is not until the 10th and 11th centuries that they really become abundant. There are very few runic inscriptions from the 7th and 8th centuries (written in the older futhark or a mixture between older and younger rune-forms) containing personal names (see the inscriptions in Birkmann 1995, 89–142, 227–259). The most spectacular ones are the so-called Blekinge stones, where the names *Hariwulfr*, *Haþuwulfr* and *Heruwulfr* occur (see 4.1.). Sweden has about 3,000 runic inscriptions from this period, Denmark about 320, Norway about 125, and the Faroes two only, while Great Britain and Ireland together have about 60 inscriptions. (There are no Viking Age runic inscriptions in Iceland or Greenland.) Altogether they contain more than 7,000 instances of personal names; the number of separate name lemmas can be estimated at about 1,300 (Scandinavian runic-text data base). In contrast to the sources mentioned below (1.2., 1.3.), the runic inscriptions are the only original documents.

1.2. Place-names

Important sources for the knowledge of personal names from this period are place-names, above all those ending in *-staðir*. There are nearly 6,000 names in *-staðir* in the Nordic countries; the bulk of them seem to have been created ca. 400–ca. 1000 (Brink 1984, 20ff.; Pamp 1988, 38; Sandnes/Stemshaug 1997, 421f.). Earlier opinion was that most of the specifics of *-staðir* names are personal names, above all bynames (i. e. nicknames; see 3.3.) (Olsen 1934, 86ff.; Janzén 1947b, 25ff.; 1947a, 244ff.), which at that time generated all too many reconstructed, otherwise unknown personal names; however, modern researchers are more critical, recognizing that a great number of the specifics in *-staðir* names are, e.g., adjectives or appellatives (Dalberg/Kousgård Sørensen 1979, 156; Strandberg 1993, 7 with references). Thus, for example, Kousgård Sørensen (1958, 279) concludes that 18 per cent of the Danish *-staðir* names have a personal name as a specific, and Brink (1986) considers that we can only be certain that 14 per cent of more than 800 North Scandinavian *-staðir* names contain a personal name. Nevertheless, the *-staðir* names no doubt conceal several personal names not attested otherwise. Place-names in *-býr* (whose age can vary considerably; Hald 1957, 381f.) do not contain personal names to any great extent; those which do so are regarded as post-Viking (Hald 1957, 384; Hellberg 1967, 247, 370, 374; Pamp 1988, 40). Two exceptions are the *-býr* names in southern Schleswig and the southern parts of the Danish islands on the one hand and in

the Danelaw on the other (Hjorth Pedersen 1960, 10ff.; Fellows Jensen 1968, XXXIIff.; for criticism of the dating of the names in Schleswig, see Laur 1984, 94ff.). Place-names in *-þorp* (in Scandinavia there are about 10,000; Eriksson 1974, 492) very often have a personal name as a specific; however, the age of the place-names can vary considerably in these cases as well (Hellberg 1954, 106ff.; Eriksson 1974, 493ff.; Pamp 1988, 43). Lerche Nielsen's study (1997a, 109ff., 149ff.) shows that the main proportion of the *-þorp* names in Denmark, which is the region where the oldest Nordic *-þorp* names generally are assumed to appear (Eriksson op. cit., 493; Pamp loc. cit.; cf. Hellberg op. cit.), must have been created after ca. 1100.

1.3. Literary sources

Among literary sources, *Landnámabók* [Book of Settlements], describing the settlement of Iceland by about 400 men and women during the decades around 900, has long been held as one of the most reliable sources for the Viking Age personal nomenclature of Norway and Iceland. However, doubt has been cast on the authenticity of the *Landnáma* names; the oral tradition before *Landnámabók* was written down (some time in the 12th century) may have led to the addition of both persons and personal names to the story; moreover, the first elements of place-names which look like personal names may have been transformed (Stemshaug 1983, 7ff.). Stemshaug (1983, 18) concludes that *Landnáma* still can be considered representative of the *types* of names during the Settlement Age. The *Íslendinga sögur* [Sagas of Icelanders] also contain rich information about people's names among the first generations of Icelanders. But even here one has to be cautious as to the historical truth (Halvorsen 1968, 199f.; Kristjánsson 1988, 203f.).

1.4. Sources outside Scandinavia (except runic inscriptions)

The name stock from this period is reflected in the many Nordic personal names in various sources from the Viking settlements in the Danelaw and Normandy. Comprehensive works on this subject are Fellows Jensen 1968, Insley 1994, and Adigard des Gautries 1954.

2. Typology

Like the personal names during the earlier period (see art. 76), the personal names during the period from the 7th century to 1100 are formed in three ways: compound names (dithematic names), original appellatives or adjectives (monothematic names), and derivational names (strictly speaking these are also monothematic; see Peterson 1988, 121f.). It is hard to evaluate the proportion of names falling into these categories. This is due partly to the difficulty in defining the three groups (see discussions in Peterson 1986, 44f.; 1988, 121ff.; Lerche Nielsen 1997a, 47ff.), and partly to the fact that all the material has not yet been analysed. An attempt at categorizing the names in Danish Viking Age runic inscriptions has been made by Lerche Nielsen (1997a, 47ff.; 1997b, 9ff.). The proportions he arrives at are as follows (the corpus comprises about 290 different names borne by 531 persons): 125 dithematic names (246 persons), 115 monothematic names (167 persons), 27 hypocorisms (93 persons; only male names in *-i* and female names in *-a*, the derivational basis being dithematic names); the rest consists of names of supposedly foreign origin and uninterpreted names (Lerche Nielsen 1997a, 54). The fact that the hypocoristic (and monothematic) names increased in use during the Viking Age has long been acknowledged (see, for example, Kousgård Sørensen 1958, 223; Søndergaard 1972, 154ff.). The typological difference between the Migration Age and the Viking Age personal names has been used in order to date certain place-name types (Kousgård Sørensen loc. cit.; 260f.; Søndergaard loc. cit.; see the criticism in Peterson 1986, 37ff.).

3. Names and name elements in use: the Germanic heritage

For the most part, the personal nomenclature of the period is of Germanic origin (cf. 5.1. and 5.3.). There are name elements in the Ancient Nordic runic inscriptions that have totally disappeared or are very uncommon during the Viking Age, such as *-gestr* < *-gastir*, *-riðr* < *-riðar*, *-þér* < *-þewar*. Also, complete names like *Landawarjar* (Tørvika stone A) and *Hagustaldar* (Valsfjord cliff inscription and Kjølevik stone) lack counterparts in later times, contrary to, e.g., *Stainawarjar* (Rö stone), which survived as *Steinarr* (see art. 76). On the other hand, new names and name elements appear in Viking Age Scandinavia, such

as *Ketill* (Wessén 1927, 70ff.; Hald 1971, 63ff.) and *Þór-* (see 3.1.).

3.1. Theophoric personal name elements

Names in *Þór-* were extremely popular during this period; there are between 400 and 500 instances in the runic inscriptions, spread over the whole area from east to west. At least 30 different combinations are attested, of which 10 are women's names. Names in *Frey-* occur less often; the runic inscriptions contain about 65 instances, all from the East Nordic areas (cf. Wessén 1927, 75; Janzén 1947a, 259). There are 4 different men's names and 4 different women's names attested. The first elements *Þór-* and *Frey-* are newcomers in the personal nomenclature in Scandinavia, if they are regarded as sacral elements (see below). While Nordic personal names in *Ás-* and *Guð-* fit into an Old Germanic nomenclature, the gods' names *Þórr* and *Freyr* as personal name elements are exclusively Nordic (Andersson 1993, 42 with references). However, these two name elements seem to have been secondarily connected with the two gods through a re-interpretation of their original meanings, 'thunder' and 'lord' respectively (Andersson 1993, 42ff. with reference especially to Wessén 1927, 76f.). Beside the gods' names *Þórr* and *Freyr*, the names *Óðinn* and *Týr* also seem to appear as first personal name elements. *Óðindisa*, a woman's name in a Swedish runic inscription, is exceptional and has been explained as *Dísa* with a byname prefix giving expression to the bearer's pagan faith (Otterbjörk 1983, 117). The name *Óðinkárr*, borne by several persons in Viking Age Denmark and later (Hald 1971, 38) and seemingly containing the god's name *Óðinn*, has convincingly been explained as 'the one inclined to rage' (Kousgård Sørensen 1974, 108ff.). There are some personal names in *Tý-*, *Ti-* in the Nordic medieval sources, which are regarded as containing the god's name *Týr* (or an appellative in the singular of ON *tívar*; Hald 1971, 41); they occur especially in the northern Swedish province of Jämtland (Wessén 1927, 99 fn. 1; Andersson 1992, 512 with references.). They have, however, been questioned. Williams (1996b, 140f.), actually following Wessén (loc. cit.), asks whether they should not rather be connected with *Tið-* as in *Tiðkumi* and *Tiðfriðr*, known from Swedish runic inscriptions. Thus, the "theophoric" personal name elements would seem to be devoid of religious content in Viking Age Scandinavia. On the other hand, Christian name

elements like *Krist-* (in OSw. *Kristmoþer*, ON *Kristrún*), introduced during or after the Christianization period, bear witness to the contrary: personal names reflect the society in which they are used (Andersson 1992, 517).

3.2. Frequencies and geographical distribution

Being original sources, only the runic inscriptions have been employed in the following calculations. (For example, for a list of the most popular names in *Landnámabók*, see Wessén 1927, 70 with fn. 2; Janzén 1947b, 28; and for a list of the personal names in the Danish *-þorp* names, see Lerche Nielsen 1997b, 29ff.; cf., however, 1.2. and 1.3. above.) What must be borne in mind is that the spread of Viking Age runic inscriptions is very uneven (see 1.1.), and the picture they present of which names and name elements were actually in use during those times may be misleading. (An attempt at supplementing the distribution picture in two Swedish provinces, Västergötland and Södermanland, with the help of place-names has been made by Strandberg 1994, 141ff.; cf. also Janzén 1947a, 243ff.) The twenty most common male names in the whole corpus are *Sveinn* (ca. 150 persons), *Björn* (ca. 125), *Þorsteinn* (ca. 90), *Ulfr* (ca. 80), *Eysteinn*, *Gunnarr*, *Ólafr*/*-leifr*, *Þorbjörn*, *Þórir*, *Qnundr* (between 50 and 60 each), *Ás*/*Æsbjörn*, *Freysteinn*, *Halfdan*, *Holmsteinn*, *Ingifastr*, *Karl*, *Ketill*, *Ófeigr*, *Porketill*/*-kell*, *Qzurr*/*Andsvarr* (between 30 and 50 each). The twelve most common female names are *Ása*, *Ásfríðr*/*Ás*/*Æstriðr*, *Gimm*/*Gillaug*, *Guðfríðr*/*Gyriðr*, *Guð*/*Gullaug*, *Helga*, *Holmfríðr*, *Inga*, *Ingigerðr*, *Sigriðr*, *Póra* and *Þorgerðr*/*-gerða* (between 12 and 25 each). On the frequencies of names in *Þór-* and *Frey-*, see 3.1. Because of the overrepresentation of Swedish inscriptions in the material, among them the Upplandic ones (more than 1,200), these lists can be said to reflect the Viking Age Swedish nomenclature rather than the Nordic. Dividing the material into smaller groupings reveals geographical differences.

3.2.1. East Nordic (esp. Swedish)

Wessén (1927, 97ff.) noticed that there are name elements typical of the East Nordic (notably Swedish) runic inscriptions: the first elements *Fast-*, *Folk-*, *Heðin-*, *Holm-*, *Ígul-*, *Jofur-*, *Ketil-*, and the second elements *-djarfr*, *-fastr*, *-njótr*, *-reifr* (male names), *-vé* and *-elfr* (female names). On the whole, Wessén was

right, though his observations were founded on editions now obsolete. Just a few cases will be given here to shed light on what was found later (esp. thanks to the Scandinavian runic-text data base). There are more than 300 instances of names in *Fast*-/*-fastr* in the Swedish inscriptions, but only three in the Danish (*Fastulfr* once, *Porfastr* twice). Most favoured among compounds with *Fast*- are *-björn*, *-geirr*, *-ulfr* and the female *-laug* and *-vé*. Compounds with *-fastr* are (in declining order of frequency) *Ingi*-, *Holm*-, *Sig*-, *Guð*-, *Vé*-, *Por*-, *Ígul*-, *Ern*-, *Ketil*-, *Ragn*-, *Geir*-, *Arn*-, *Borg*-, *Heðin*-, *Rún*-, *Stein*-, *Þing*-, *Á*-, *Ás*-, *Ginn*-, *Hjalm*-, *Styr*-, *Vig*-. Women's names in *-fast* (*-fōst*) seem to be confined to the Upplandic inscriptions (Peterson 1981, 27f.): they are *Heðin*-, *Ingi*-, *Jó*- and *Jōfur*-. About 20 instances of the hypocorism *Fasti* are recorded; there does not seem to be any feminine counterpart (Peterson 1981, 112 fn. 84). *Holm*- only occurs as first element in compound names, although the simplex name *Holmr* is found once in an inscription in Södermanland. Nearly 130 persons bear names in *Holm*-, among them about 30 women. Most popular are compounds with *-steinn*-, *-fastr*-, *-geirr* and the female *-friðr*. Both *Holmi* and *Holma* are well attested, although they are not very frequent. While names in *Fast*-, *Folk*-, *Heðin*-, *Holm*-, *Ígul*- and *Ketil*- are fairly well spread in Sweden (on *Heðin*- see Peterson 1998, 5ff.), it is only in Uppland that names in *Jōfur*- occur (with an uncertain exception in Södermanland). Beside the common simplex *Jōfurr* (10 persons), there are two women's names, *Jōfurfast* (*-fōst*) and *Jōfurfriðr* (8 and 2 persons respectively), and one man's name, *Jōfurbjörn* (1). (On the contracted form *Jór*- in, e.g., *Jórunnr*, attested in Swedish and Norwegian inscriptions, see Janzén 1947a, 261; 1947b, 84.)

An East Nordic innovation is names in *Sas*-/*Ses*-, such as *Sassurr*/*Sōssurr* (6 times in Danish Viking Age inscriptions, twice in Upplandic) and *Sasgerðr* (once in Danish inscriptions), in later sources also *Sestriðr*. Obviously, they are to be connected with the name element *Ás*-/*Æs*-, but the element's origin is disputed (Dunås 1957, 21ff.). An interesting pattern of distribution for the exclusively Swedish man's name *Pegn* (Wessén 1927, 98) has been observed by Strid (1987, 301ff.): while the appellative *þegn* is known from ON sources, Danish and Swedish Viking Age runic inscriptions, the name *Pegn* (*Þiagn*) is confined to the Central Swedish provinces Södermanland and Uppland.

3.2.2. Denmark

The ten most common male names in the Danish inscriptions are *Tóki* (22 persons), *Sveinn* (14), *Ás*-/*Æsbjörn* (10), *Tófi* (10), *Assurr*/*Qssurr* (8), *Bróðir* (8), *Ásgotr* (7), *Tosti* (7), *Þorgisl*-/*-gils* (7) and *Tómi* (6); female names borne by more than one person are *Ása*, *Guðfriðr*, *Gunnhildr*, *Tófa*, *Tonna*, *Þorgunnr* and *Þorvé* (between 2 and 6 persons each). (The numbers are compiled from the name lists in Lerche Nielsen 1997b, 1ff.) What is striking in the Danish lists are the hypocorisms of names in *Por*-. Hald (1971, 86f.) has observed that six men's names, *Tobbi*, *Tófi*, *Tóki*, *Tóli*, *Tómi*, *Tosti*, and four women's names, *Tófa*, *Tóka*, *Tóla*, *Tonna* together are borne by about 58 persons in the Danish runic inscriptions. *Tobbi*, *Tófi*, *Tóki*, *Tosti*, and *Tófa*, *Tóka*, *Tóla*, *Tonna* are known also from the Swedish inscriptions, but, with the exception of *Tóki* and *Tosti* (19 persons each), their positions in the ranking lists are low. Neither in the Norwegian nor the British or Irish Viking Age runic inscriptions are there any hypocorisms in *T*-. The island of Gotland also lacks them (see 3.2.3.).

3.2.3. Gotland

The runic inscriptions on Gotland belonging to this period (about 80) exhibit quite an extraordinary personal nomenclature: there are no hypocorisms of names in *Por*- at all, but rather a rich variety of dithematic names compounded with elements, some of which are typically or even exclusively Gutnish. The most common first element is *Bót*- (for the most recent discussion of its origin, see Ryman 1996, 131ff.); it occurs in otherwise non-attested composites such as *-björn*-, *-hvatr*-, *-reifr*-, and the female *-heiðr*. Also favoured are *Geir*- and *Hróð*-; otherwise unattested are *Hróðfúss*-, *-gautr*-, *-hvatr*-, and the female *-þjóð*. Typical of Gotland are names in *Likn*- and *-líkn* (see Ryman 1996, 136ff.), the latter exclusively Gutnish. Not attested elsewhere are *Liknhvatr*-, *-reifr*-, and the female *Liknvé* and *Eilíkn*. (For a survey of first and second elements of old personal names in farm names on Gotland, see Olsson 1994, 70f.)

3.2.4. West Nordic

The Viking Age runic material is sparse in Norway, the Faroes, Great Britain and Ireland (see 1.1.) and cannot be regarded as representative of the personal nomenclature in

these areas. What can be said to be characteristic is that names in *Pór-* are common (30 instances) (cf. 3.1.) and that hypocorisms of the *n*-stem declension are rare. The impression one gets tallies rather well with the lists of names in *Landnámabók* given by Wessén (1927, 70 with fn. 2) and Janzén (1947b, 28) (cf. 1.3., 3.2.).

3.3. Bynames

The term *byname* here means an appositional element after a person's main name (see discussions in Andersson 1983, 16ff.; Peterson 1983, 123ff.; Brylla 1993, 27f.; Lerche Nielsen 1997a, 50ff.). With the help of such an apposition, which can be a patronymic, an adjective, or a noun of some sort (whose motivation very often is obscure), it was possible to distinguish between persons bearing the same forename. The custom of bynames kept pace with the increasing use of naming after another person (see 4.3.), which entails a smaller stock of forenames.

3.3.1. Patronymics

Perhaps an early example of patronymics during this period is *Hafuulfur Heruwulfur* on the Istaby stone, dated to the 7th century. It has been questioned, however, whether *Heruwulfur* (a derivative with the *-ia-* suffix) might not rather be a designation of ancestry (Kousgård Sørensen 1984, 46ff.; cf. Peterson 1985, 141). Patronymics formed from the father's name in the genitive + *son/daughter* and placed immediately after the main name – i. e., the prototype of later, “real” patronymics (Kousgård Sørensen 1984, 10, 68, 80, 209f.) – occur only about 40 times in the Viking Age runic inscriptions (for Denmark, see Kousgård Sørensen 1984, 68f.; for Norway and the British Isles, see Johannessen 1993, 124ff.). Only twice (maybe three times) do metronymic designations occur.

3.3.2. Adjectives

It is often difficult to distinguish between adjectives used as occasional epithets and more permanent additions to a person's forename (Ekbo 1947, 270ff.; Lerche Nielsen 1997a, 50f.). Formal types found in the runic inscriptions are (1) strong forms (*Tómi Spár* ‘able to tell fortunes’), (2) weak forms (*Fastulfr Mjúki* ‘the soft, limp, gentle one’), (3) weak forms

with the definite article (*Rúnulfr hinn Ráðspaki* ‘the wise one who gives good advice’). How many such adjectival bynames the entire runic corpus comprises is difficult to estimate at present. For the Danish inscriptions, see Lerche Nielsen 1997b, 15. For examples from Old Nordic literary sources, see Ekbo 1947, 271f. Mention should be made of the type where the adjective is prefixed to the forename: e. g., a Swedish rune-carver calls himself *Balli hinn Rauði* and *Rauð-Balli* alternately.

3.3.3. Nouns

Appositions such as *bryti, jarl, skáld, stýrimaðr, vikingr*, even *englandsfari* and *grikkfari*, all occurring in the runic material (no less than four persons, three in Sweden and one in Norway, have names with the addition of *skáld*), are difficult to demarcate from the class of bynames; they might be classified as titles of professions (see discussion in Lerche Nielsen 1997a, 51f. with reference to Ekbo 1947, 269). There are about 20 instances in the runic material where the apposition must be regarded as a byname (nickname). Noticeably common are those that refer to parts of the body: *Hnakki* (‘neck’, 2 persons), *Hqnd* (‘hand’), *Kanpr* (‘moustache’), *Lippi* (‘lip’), *Nef* (‘nose’). Another category is designations of animals or part of an animal: *Elgr, Gedda, Selshofuð*. All these are words taken from the common stock of nouns; one can only speculate on the motivations for using them. Other formation types occur, e. g., *Kópu-Sveinn* (a prefixed byname), *Rauðumskjaldi* and *Sviðbalki* (for their etymologies, see Jacobsen/Moltke 1942, 437f.; 675; Knudsen/Kristensen/Hornby 1949–64, 920; Kousgård Sørensen 1994, 193ff. respectively). For further types of byname formations found in Old Nordic literary sources and their varying motivations, see Ekbo 1947, 273ff.

4. Name-giving systems

The “variation” name-giving system was used in practically all the Indo-European languages (see examples in Peterson 1988, 124); it was still flourishing in Viking Age Scandinavia (see 4.1.). Because of the Germanic shift of accent, alliteration came to be a characteristic trait of Germanic name-giving; however, not many unequivocal examples can be found in Viking Age Scandinavia (see 4.2.). The custom of naming a child after another person, which is

thought to have very ancient roots (Janzén 1947b, 35f.), is manifested in several examples (see 4.3.).

4.1. Variation

The period's oldest (and best known) example of variation within a family can be seen in the three names on the so-called Blekinge runestones: *Heruwulfr*, *Haþuwulfr*, *Hariwulfr* (for an account of possible relationships between the three (or four?) men, see Birkmann 1995, 137ff.; cf. 3.3.1. above). In the later Viking Age runic inscriptions there is an overabundance of examples of the variation system practised then (see Wessén 1927, 10f.; Janzén 1947a, 236f.; Peterson 1999, 19). For several examples from *Landnámabók*, see Wessén 1927, 7ff.; Janzén 1947b, 33f. When children share name elements with their parents or earlier ancestors (e.g., two sons of *Eybjörn* are called *Eygeirr* and *Ketilbjörn*), it is possible to speak of them being named after, or “partially” named after someone (Janzén 1947b, 36f.; cf. 4.3.).

4.2. Alliteration

Often cited are the alliterating names of the kings in the genealogical *Ynglingatal* and the later Swedish kings Emund, Erik, Olov, Anund and Emund (e.g., Janzén 1947a, 237f.). The alliteration system does not seem, however, to have been practised to any great extent in Scandinavia during this period (Wessén 1927, 18; Janzén 1947a, 237f.; 1947b, 35). The best known example from the runic inscriptions comes, again, from the names on the Blekinge stones (see 4.1.). An example from Viking Age inscriptions that resembles this one is *Pormundr* son of *Þjóðmundr* (Uppland). Whether the alliteration is accidental or was intended in a case like *Helga* and *Holmfriðr* daughters of *Holmfastr* (Uppland) cannot be determined.

4.3. Naming after

From ON literary sources it is evident that the custom of naming a child after a dead relative was very common in Scandinavia (Wessén 1927, 18ff.; Janzén 1947b, 35ff.). Probably it was not until after Christianization that it became possible to name a child after a living relative (Janzén 1947a, 238). The runic inscriptions offer few examples of naming children after relatives because they seldom give infor-

mation about more than two generations. A couple of instances occur where both father and son have the same name, e.g., *Tóki* son of *Tóki* (Bregninge, Lolland), or *Bjarnhqfði* son of *Bjarnhqfði* (Björklinge, Uppland). The runic inscriptions give evidence of the new fashion of naming after famous persons who are not related. The name *Knútr* is borne by seven persons in the Swedish inscriptions; probably they were named after Canute the Great (died 1035). (Canute himself is mentioned in three inscriptions.) The most renowned example from Viking Age Scandinavia of naming children after a famous person is *Magnus* (King Magnus the Good, born ca. 1024), son of Olav Haraldsson (St. Olav), who, according to Snorri Sturluson gave his son the name *Magnus* after the Franconian king (Lat.) *Carolus Magnus*; the name *Magnus* was, however, borne by Scandinavians earlier than this (Knudsen/Kristensen/Hornby 1936–48, 886f.; Kruken/Stemshaug 1995, 189).

5. Foreign names

5.1. Celtic

Several names of Celtic origin, introduced by immigrants, are attested from 9th and 10th century Iceland and Norway; a few of them became popular later, e.g. *Njáll*, *Kjartan* and *Koðran* (Janzén 1947b, 139ff.; Halvorsen 1968, 203). In Swedish runic inscriptions the name *Kiulakr*/*Giulakr* appears four times, apparently referring to different persons. Probably this is a Swedish variant of ON *Kjallákr* (from Old Irish *Cealleach*, *Cellach*; Janzén 1947a, 250; 1947b, 139).

5.2. West Germanic

Whether persons in Scandinavia during this period bearing German or English names were immigrants or natives is often difficult to determine. (For lists of such names in ON literary sources, see Janzén 1947b, 133ff.) Two Norwegian rune stones commemorate, respectively, a woman named *Magnhildr* (a name of supposedly German origin) and a man named *Vilhjálmr* (English) (for the latter, see Hagland 1994, 34ff.). Similarly, a runestone in Sigtuna, Sweden, was erected *eptir Albóð fēlaga Slóða* (‘in memory of Albóðr, Slóði’s partner’). In this case, it is expressly stated that *Frisa gildar* (‘Frisian guild-brothers’) erected the stone. (The name is not Frisian but rather Old Low German; Ahlsson

1988, 11f.) Several English minters' names occur, written in runes or Latin capitals, on coins stamped in 11th century Denmark. Two of them, *Eadwine* and *Godwine*, appear as specifics in Danish place-names in *-þorp* (Lerche Nielsen 1997a, 74f.).

5.3. Christian

The Biblical name *Johannes*, in the Old Nordic form *Jón/Jóan/Jóhan*, is attested no less than 13 times in Swedish 11th century runic inscriptions (Eldblad 1994, 56ff.). Saints' names borne by persons in Swedish inscriptions are *Klemet*, *Nikulas* (twice), *Kristin* (female), and *Vinaman* (after a local martyr) (Williams 1996a, 70f.). Maybe *Petar*, found on a Swedish rune-stone, also belongs to the 11th century (Stille 1999, 87f.). (On the elements *Bót-* and *Líkn-/líkn*, formerly regarded as Christian, see Ryman 1996, 139ff.; Williams 1996a, 71ff.) The Viking Age Danish runic inscriptions do not offer any Christian personal names. According to the 11th century cleric Adam of Bremen, members of the first generations of the Danish royal family after King Gorm were given names of Christian personages: Sven Forkbeard was also called *Otto*, two of his children, Knut and Estrid, were also baptized *Lambertus* and *Margareta* respectively. According to later sources, two younger sons of Sven Estridsson were called *Benedictus/Bændikt* and *Nicolaus* respectively. It has been noted that these first names of Christian origin in Denmark were given by the kings to daughters and younger sons, while the eldest sons, the potential heirs to the throne, received names of Nordic origin (Meldgaard 1994, 203ff.). Nor do the Norwegian, British or Irish Viking Age runic inscriptions exhibit any personal names of Christian origin. According to later West Nordic sources, *Jóan/Jón*, *Markús*, *Nikolás*, *Páll*, *Pétr*, *Símon*, *Brigit*, *Cecilia*, *Elín*, and *Margrét* are attested in 10th and 11th century Norway and Iceland (Janzen 1947b, 141ff.). The Icelandic *Jónsstaðir* is the only place-name in *-staðir* containing a personal name of Christian origin (Sandnes/Stemshaug 1997, 421).

86. The development of place-names from Ancient Nordic to Old Nordic

1. Settlement names in Scandinavia
2. Central places
3. Scandinavian pagan religion and place-names
4. District names
5. Place-names in the Viking colonies
6. Literature (a selection)

1. Settlement names in Scandinavia

1.1. Dating

The most important and reliable method of dating a Scandinavian place-name type to the Viking Age is to proceed from those name types that were in productive use to form names in the western Viking colonies (the isles in the Atlantic, northernmost Scotland, England and Normandy). These types must have been productive also in the Scandinavian

homelands at the time of the colonization. One can include here names in *-bolstaðr*, *-by*, *-holt*, *-setr*, *-staðir*, *-toft*, *-þorp* and *-þveit*. On the other hand, it is more doubtful whether one can conclude the opposite: that older name types which are absent in the colonies had ceased to be productive in Scandinavia. The reason for this could instead be that the name types in question, due to social, historical or economic reasons, were not suited for the new settlements in the colonies. Thus, with reservations, we can say that the mainly pre-Viking types in *-hem/-heim*, *-inge*, *-land(a)*, *-losa*, *-lef* and *-vin* (on which see art. 77) to a certain degree may have continued their productivity during the Viking Age in Scandinavia, although they can not or only to a limited extent be found in the western colonies. In addition, some younger name types such as *-rydh* and

-rum, with their main period of productivity during the Middle Ages, undoubtedly were already productive in parts of Scandinavia during the Viking Age, despite the fact that they are not found in the western colonies. We can draw this conclusion from other methods of place-name dating, mainly archaeological dating, vocabulary dating and comparison of village sizes.

1.2. Frequent Viking Age place-name elements

1.2.1. *-staðir* and *-by/-bø*

Names in *-staðir* and *-by/-bø* (for more detail on both, see art. 77) have had a long period of productivity, before as well as after the Viking Age. Furthermore, they are both very frequent and can be found generally in the same regions. For that reason researchers have tried in several ways to differentiate between them in regard to age or meaning. So far the most common theory has been to regard the names in *-staðir* as older on average; but the opposite view has also been proposed recently for central Sweden (Larsson 1997, 175). Whatever the original meaning of the two name elements was, it is likely that their significations during the Viking Age generally were ‘farm’ for *-staðir* and ‘farm’ or ‘village’ for *-by/-bø*.

1.2.2. *-bolstaðr*

Viking Age place-names in *-bolstaðr* in Scandinavia can be found partly in eastern Sweden, partly in Norway. The primary meaning of the word is ‘land of a farm or village’, from which has developed the sense ‘separated part of a village’ (Hellberg 1987, 142ff.). As a place-name element it has, at least in the West Nordic countries, come to be used about out-parcelled farms, i.e. secondary settlement units detached from an older, larger farm or village (Gammeltoft 2001, 271). In Sweden there are some names in *-bolstaðr* with the name of a pagan god as the first element, e.g. *Ullarbolstaðr* and *Frøiubolstaðr*, from *Ull* and *Frøyia* respectively. Semantically these should be grouped together with a quite large number of *Helgabólstaðr* in Norway, Sweden and the western colonies, where the first element has been supposed to be a weak form of the adjective *heilagr* ‘holy’ or a noun formed from the same adjective **helgi* ‘the holy one’, an

assumed word for a pagan priest. How the connection between the sacral first elements and *-bolstaðr* should be explained is an unsolved problem. It has been suggested that the theophoric names are elliptic forms (reductions) of reconstructed names like **Ullarguðabolstaðr* with **ullarguði* ‘Ull’s priest’ as the first element and, accordingly, refer to a kind of detached pagan “rectory” (Hellberg 1986, 63f.; 1987, 145; Elmevik 1990, 501ff.). It is, however, methodologically questionable to assume ellipsis throughout a whole, semantically defined group of names. Another common first element is *mikill* ‘big, large’ in *Miklibólstaðr*.

1.2.3. *Nybyli*

There are quite a lot of place-names in Denmark and southern Sweden which superficially seem to be compounded of the first element *ny* ‘new’ and the second element *-bole* (on which see art. 108). As Lars Hellberg (1985, 62ff.; cf. Højgaard Jørgensen 1986, 147ff.) has pointed out, these names refer to considerably larger and older settlement units than other place-names in *-bole* and are instead formed from an appellative compound **nybyli* ‘new settlement’. The name type in question seems to be mainly from the Viking Age. There is also one example of *Nybyli* from the Danelaw.

1.2.4. *-toft(a)* and *-tompt(a)*

Place-names in *-toft(a)* (e.g. *Bøketofta* with *bøke* ‘beech (forest)’ and *Slagtofta* with *slag* ‘hollow’) in Scandinavia can be found in Denmark, southern Sweden and southern Norway (Holmberg 1946, map 14). The more unusual variant form *-tompt(a)* (e.g. *Avatompta* with *ave* ‘shallow creek’ and *Forntompta* with *for* ‘old’) is limited to central Sweden and southeastern Norway. The meaning of the place-name element is debated. According to one view it is plainly ‘farm site’ (Holmberg 1946, 333ff.). Other scholars hold the opinion that the meaning is ‘deserted farm site’ (Hellberg 1967, 200ff.). A third proposal is ‘enclosure, fold’, thus primarily referring to fields (Andersson 1984, 300ff.). The age of the names in *-toft(a)/-tompt(a)* probably varies a great deal regionally. In certain areas there are solely or mainly Viking Age names of this type, in other areas evidently also younger names.

1.2.5. *-setr* and *-sæter*

In the middle of Sweden there are settlement names in *-sæter*, e.g. *Biornasæter* ‘the forest meadow where bears have been seen’, which can be dated to the Viking Age and the Middle Ages and where the primary meaning of the name element is ‘outlying meadow, forest meadow’. They correspond formally to the Norwegian names in *-set*, for which, however, as a rule the meaning ‘dwelling place, habitation’ has been assumed as well as a somewhat earlier dating (the Viking Age and just before). The West Nordic place-names in *-sæter* ‘summer pasture farm’, which is related by ablaut, also occur in Norway and neighbouring parts of Sweden. They are also to a considerable extent medieval. The semantic relationship between the three name groups is, in spite of many notable research efforts, still obscure (Hedblom 1945, 223ff.; Beito 1949, 11ff.; Brink 1987, 79ff.; Helleland 1989, 59ff.).

1.2.6. *-þveit*

Place-names in *-thvet* (*-þveit*), e.g. *Rúgþveit* ‘the clearing where rye is grown’, *Grimsthvet* ‘Grim’s clearing’, are relatively common in southern Norway and Denmark, but also occur sporadically in southern Sweden. The meaning is ‘clearing, cutting’ and indicates new settlements in forest areas (Markey 1978, 70). The name type is mainly from the Viking Age, but continued to be productive also in the early Middle Ages.

1.2.7. *-þorp*

Names in *-þorp*, e.g. *Svensthorp* ‘Sven’s settlement’, *Sioarthorp* ‘the settlement by the lake’, are very frequent in Denmark and southern Sweden and can also be found in south-eastern Norway. The name type was productive over a very long time span before, during and after the Viking Age. According to a theory put forward by Lars Hellberg (1954, 106ff.), we are dealing here with two different age strata of names in *-þorp*: on the one hand (at least in Sweden and Norway), an older, pre-Viking layer (mainly names in the simplex *þorp*); on the other hand, a younger layer, which during the Viking Age spread from the European continent through Denmark to Sweden. Chronologically, Hellberg’s hypothesis is convincing, but the idea of an import from the Continent (which has been taken from Jöran Sahlgren; see further art. 108) is doubtful. Rather,

it is a question of two different types of place-name formation: the word *þorp* has existed in the Scandinavian languages all the time, although before the Viking Age it only occasionally had come to be part of place-names, while from the Viking Age onwards it became productive as a type-forming place-name element in the sense that it could be used in analogical naming. The motivation for this may in itself very well have come to Scandinavia from the European continent.

The place-name element *-þorp* during the Viking Age undoubtedly denoted secondary settlements separated from older, larger settlement units.

1.2.8. *-rum*

The place-names in *-rum*, e.g. *Algutsrum* ‘Algut’s open ground’, *Yxnarum* ‘the open ground where oxen graze’, are on the whole concentrated in eastern Götaland in Sweden (Lindroth 1916, map). A few names occur in Denmark. The meaning is most likely ‘open ground (in a forest)’. A considerable portion of the names probably originally denoted meadowlands (Strid 1986, 187ff.; Strid 1987, 297ff.). The name type was productive both during and after the Viking Age.

1.2.9. *-riudǫ(r)*

This place-name element is *-rjóðr* in Old West Nordic, *-riudh* > *-rydh* in Old East Nordic. The greatest number of such names exists in south-western Sweden, e.g. *Tranurydh* ‘the clearing where cranes stay’, *Horydh* ‘the open land where hay is harvested’. There are some further occurrences in Norway. The meaning is ‘clearing’, on the one hand, but more generally ‘open ground (in a forest)’. As was the case for *-rum*, many such names primarily denoted meadowlands, but new settlements in forests were also given names in *-rydh* (Fridell 1992, 243ff.). A considerable share of the names were formed in the Viking Age, but the majority nevertheless are medieval (Ejder 1979, 362ff.; Fridell 1992, 203ff.).

1.2.10. *-hult*

Place-names in *-hult* (*-holt*), e.g. *Ælmihult* ‘elm forest’, *Haraldshult* ‘Harald’s [farm] in the forest’, are common in most parts of the Nordic countries, with the exception of northern Sweden. The basic meaning of the place-name element *hult* most likely is ‘forest’, a sense

which is clearly documented in many old names of large forest areas. Also suggested for it is a more specialized meaning 'coppice', i.e. a kind of cultivated deciduous forest (Hellberg 1967, 100ff.; Strid 1996, 19ff.), but the arguments are uncertain and not very convincing. The great number of medieval place-names in *-hult* in older forest districts indicates rather that the names on the whole have denoted new settlements in forests (Benson 1972, 35f.). In the West Nordic countries a secondary meaning '(rocky) hill' has evolved, which usually is assumed in the Icelandic place-names in *-holt*. The oldest layer of the Nordic *-hult*-names certainly is as old as the Viking Age, but most names are medieval.

2. Central places

Certain types of place-names in Scandinavia, especially in Sweden, can function as indicators of ancient central places (Hellberg 1979, 128, 150ff.; Hellberg 1984b, 135ff.; Hellberg 1987, 289ff.; Brink 1990, 58ff.; Brink 1996, 235ff.; Vikstrand 2000, 213ff.). This relationship, however, is not simple and clear-cut, i.e. not all central places have special, characteristic names.

Some place-name elements are in themselves designations for administrative central places. In order of age, that is the case for *Tuna*, *Husa* and *Husaby* which, particularly in the early state organization of the *Svear*, have been used for places from which the economic, military and political power and influence of the kingdom was organized. The names in *-tuna* (often the simplex *Tuna*) are pre-Viking; the names in *-husa* (often the simplex *Husa*) belong to the early Viking Age and the period before that; while *Husaby* (always a simplex) probably originated in the late Viking Age. All three designations have evidently during their periods of productivity also functioned as appellative nouns and in many cases replaced other, older names of settlements, which became royal estates and acquired the role of administrative central places. Whilst the origin of the plural denomination *Husa* still is obscure, it is likely that the word *husaby* derives from *Husa* with the addition of *-by*.

A smaller group of place-names in Sweden with the first element *Inge-* probably contains a denomination for the king of the *Svear* and thus marks the position as royal estate. *Bo* and *Bosgarðr* also have a Viking Age connection to royal farms and designate the residence of the royal bailiff.

As a place-name element *-sal(a)* surely also can be used to denote important places, where large buildings, *hallar* 'halls', have existed. This interpretation has been proposed e.g. for *Skiringssalr* in Norway and for *Uppsala* in Sweden. In the latter case the interpretation is certainly tempting but not without problems.

Besides these types of place-names, there are others which taken together often form a place-name environment that is typical for central places: on the one hand, theophoric and other pagan sacred place-names (see 3); on the other hand names with first elements that signify different kinds of warriors or soldiers: *rinkar*, *þægnar*, *svæinar*, *drængiar*, *karlar*.

One further piece of evidence of military organization and defence in Viking Age and medieval Scandinavia comes from the names of sites for beacons that existed around the Scandinavian coasts which were lit to warn against invaders. These place-names can be used to reconstruct extensive systems of beacons. The most common of such place-name elements, each with a specific regional distribution, are *böte*, *varðr* and *viti*.

3. Scandinavian pagan religion and place-names

Place-names are an important source of our knowledge about the Scandinavian pagan religion (Vikstrand 2001, 17ff.). There are a large number of pagan sacred place-names in Scandinavia, although uncertainty concerning the interpretation of individual names makes the delimitation of the name group difficult. The names are also hard to date more precisely, and in general one cannot say for certain if such a name is from the Viking Age or older.

A central category is the theophoric place-names, i.e. those having a denomination or name of a pagan god as their first element. The gods most often occurring in place-names are *Froyr*, *Froyia*, *Niærðr/Niorðr*, *Oðinn*, *Þorr* and *Ullr*. Recently (Elmevik 1997, 107ff.) it has been suggested that the name of the goddess *Froyia* does not exist at all as a first element in Scandinavian place-names, but this is clearly an untenable thesis. There is regional variation in the occurrence and frequency of the names of gods. *Froyr*, *Froyia* and *Niærðr/Niorðr* are more common in Sweden and Norway, but quite rare in Denmark. *Oðinn*, on the other hand, is more frequent in Denmark

and Sweden than in Norway. *Ullr* does not appear at all in place-names in Denmark, whereas *Tyr/Tir* occurs only there; *Ullinn* can only be found in Norway and *Frigg* probably only in *Friggeråker* (< *Friggiarakr*) in Sweden (differently but not convincingly interpreted by Elmevik 1995, 73ff.).

The words for 'pagan god' existing in place-names are *guð*, *tyr/tir* and probably also *as*, e.g. in several Scandinavian *Guðhæim* (formed from a homonymous appellative noun; cf. Kousgård Sørensen 1992, 233), *Tiveden* < *Tiviðr* and *Ásum* < *As(a)hæim*.

Second elements in pagan sacred place-names may to some extent tell us something about the place where the pagan cult existed. The only second element that we are certain always means 'cult site' is *vi/væ*, originally an adjective meaning 'holy' converted into a noun. It can be found both as a simplex, first and second element, e.g. *Oðinsvi*, *Frøyiuví*. Theophoric names with *-vi/-væ* as a second element exist in Denmark and are especially numerous in Sweden. *Harg* and *hof* (as a simplex or in compounds) certainly can also denote cult sites, e.g. *Porsharg*, *Ullinshof*, although the words in themselves do not always have that meaning. As a second element in theophoric compounded place-names, *-hof* occurs almost exclusively in Norway. Other second elements that probably can refer to constructed cult sites are *-al*, *-hille* and *-salr*, as in e.g. *Frøyiual*, *Oðinshille* and *Oðinssalr*.

In addition, natural features designating second elements occur remarkably often together with theophoric first elements, from which follows the obvious conclusion that the words denote cultic sites in the open. To this group belong names in *-lund(a)* 'grove', *-eke* 'oak grove', *-vangr* 'field', *-akr* 'tilled field', e.g. *Frøslunda*, *Þorseke*, *Oðinsvangr*, *Friggiarakr*. We know from other sources and traditions that groves, especially oak groves, have been considered holy and the scene of cultic acts. It is probably true that in principle every pre-Christian place-name in *Lund-* or *-lund(a)* has a sacred reference, i.e. denotes a grove with a cultic function. How to understand the many theophoric place-names in *-akr* is an open question. The great number of names favours in itself an interpretation of the place as cultic sites.

Theophoric place-names with second elements designating other types of natural features such as *-as*, *-biærg*, *-næs*, *-sior*, *-viðr*, *-øy* can, of course, also have denoted cult sites, but they may perhaps rather have been holy

places, localities or areas which had been sanctified to a divinity.

Still another category consists of theophoric place-names with second elements denoting a field. This type is particularly common in Norway, where one can find such names in *-land*, *-set*, *-þveit* and *-vin*. In Sweden there is mainly a small group of names in *-riudh* > *-rydh* which belongs here. The background in terms of history of religion to this kind of place-name is obscure. Perhaps they refer to cultivated land that was sanctified to a god in the hope of a richer harvest?

Furthermore we can mention the theophoric place-names with a second element denoting a habitation or settlement (e.g. *Þorsstaðir*, *Frøyiubolstaðr*), which offer even more problems of interpretation. Maybe they should be understood in analogy with *Guðhæim*, i.e. as habitations where the gods actually were believed to be present, or maybe instead as settlements sanctified to and under the protection of a divinity?

Finally we must mention the few, but clear cases of theophoric place-names with a second element denoting a district (e.g. *Frøyshærð*, *Frøystolpt*).

4. District names

Sweden and Denmark have, at least since the beginning of the Viking Age or just before that, been divided into administrative districts for jurisdiction and, at the earliest, probably also for military organization (Andersson 1965, 7ff.; Andersson 1982, 52ff.). For these districts the word *hærað* was used in Denmark and Götaland (southern Sweden). The term, which originally presumably meant 'power over an army', has existed all over Scandinavia in a more general sense as 'settlement district' (Swedish *bygd*, i.e. a group of settlements, normally in a geographically delimited area, forming a community), but in Denmark has developed the special meaning 'administrative district', a sense that later was spread to Götaland (southern Sweden). A corresponding subdivision into *hundare* has existed in the east of Svealand, in the old nucleus area of the *Svear* in eastern central Sweden around lake Mälaren. It was preceded by an earlier subdivision into *hund*, which can be deduced on the one hand from some original names of *hundare* preserved as names of *hundare*, such as *Haghund* and *Oppund*, and on the other hand from the names of the three lands in Uppland – *Attundaland*, *Fiæðrundaland* and *Tiundaland*

– meaning ‘the land consisting of eight, four and ten *hund* respectively’. *Hund* originally means ‘a hundred men’ and *hundare* ‘army of a hundred men’. The etymology of the words indicate that the *hund* division arose from the *ledhunger*, i. e. the naval military organization. The term *hundare* later replaced *hund*. In the year 1350, the word *hærað* was used as a term in the first national Swedish law and from then on thereby gradually displaced *hundare*.

Names of *hærað* as well as *hundare* can be classified by the way they are formed into primary names, i. e. such names that were originally formed as names of *hærað* or *hundare*, and secondary names, i. e. old names of settlement districts (Swedish *bygder*), which in turn came to be used as district names.

5. Place-names in the Viking colonies

The most predominant characteristic of the place-name inventory of Iceland generally speaking is the great number of names in *-staðir*, a place-name element which here, in contrast to the other Nordic countries, to a certain extent continued to be productive after the Viking Age in the formation of names of small farms. The meaning in Iceland is probably simply ‘farm’ (another opinion is presented by Sigmundsson 1990, 61 ff.). The elements *-bær*, *-bolstaðr*, *-bu*, *-bæli* and *-land* were also used to a minor extent for the formation of settlement names. Another typical trait of the old structure of settlement names in Iceland is the very large proportion of primary natural feature names used.

Primary natural feature names dominate the Faroese settlement names even more heavily. The most important of the other type of place-names are *-bøur* ‘farm; cultivated land’, *-garður* or *-gerði* ‘enclosure’ and *-toftir* ‘site of farm’ (Matras 1939, 53 ff.; Thorsteinsson 1996, 183 ff.). There is no established chronology for Faroese place-names, but it is likely that the elements mentioned above were productive during the Viking Age as well as the Middle Ages.

On Shetland, the Orkneys and the Hebrides, as in northernmost Scotland (Caithness), a relatively larger number of Scandinavian place-name elements have been used. Most frequent is *-bolstaðr*, but *-bær*, *-setr*, *-toft(ir)*, *-staðir* and *-þveit* can also be found.

The larger Scandinavian colonized areas in England (the Danelaw) and Normandy show interesting differences in their place-name inventories. Thus names in *-by* (often with a per-

sonal name as the first element) are very frequent in England, but seem to be entirely absent in Normandy. The element *-þorp*, which is very common in the east of the Danelaw, is quite rare in Normandy. On the other hand, *-toft* is particularly frequent in Normandy, but rather unusual in England. Place-names in *-þveit*, however, are to be found relatively generally in both areas. It is also noteworthy that Scandinavian place-names in *-staðir* are totally absent both in England and Normandy.

The variation in place-name structure that can be found in the different western colonized areas can partly be explained through heterogeneous conditions for settlement and cultivation in the colonies, partly because the colonizers emanated from different areas – Denmark and Norway – with partially different place-name inventories existing in both homelands.

87. Sociolinguistic perspectives in the transitional period between Proto-Nordic and Old-Nordic

1. The emergence of the Old Nordic language
2. The societal context
3. The Old Nordic poetry – a special skaldic language?
4. Travelling, trade and linguistic interactions
5. The linguistic impact of the new Christian culture
6. The imprints of the Danes in the Danelaw and Norsemen in Ireland
7. Linguistic exchange due to Viking expansion to the east
8. Literature (a selection)

1. The emergence of the Old Nordic language

Already in the 6th century, according to some runic inscriptions, a Proto-Nordic (Sw. *urnordisk*) language was emerging from the Proto-Germanic (Haugen 1976, 150). This happened during a time which saw a lot of changes in Germanic language, with several new dialects beside Proto-Nordic, such as Old English etc. During the following centuries, in the so-called syncope period, several sound changes and innovations took place, especially the umlaut and the breaking, so that in the Viking period the Proto-Nordic was split up in an East- and a West-Scandinavian language. During the 8th century also the indigenous writing system, the runes, underwent a drastic change, with a reduction in the alphabet from 24 to 16.

This process, we can see from historical and archaeological evidence (Näsman 1991; Hines 1998, 291), was taking place at a time – ca. A.D. 600 to A.D. 800 – when we also had intensive contacts in the North Germanic area, which may seem rather odd. Normally these kinds of evolutions and developments have been explained within a strict linguistic

framework, as internal sound changes over time. Today it seems obvious that purely linguistic explanations cannot answer all questions. New sociolinguistic evidence has shown us that it is important also to establish firmly the linguistic evidence in a socio-historical context, to find arguments for changes and developments (Thelander 1979; Widmark 1994 a). The bottom line is that today it seems impossible to put up an isolation hypothesis as a background for these dialectal split-ups. Some other factors have been at work. Already in 1964 Karl-Hampus Dahlstedt argued that an important background for the splitting up of a language into dialects was the strife and desire to differ. Language is often used for social and territorial demarcation, something that Amund B. Larsen coined as *naboopposition*. Later William Labov (1972) gave us a classical and illustrative example of this phenomenon, with his study of the language in Martha's Vineyard in New York state, where dialectal or sociolectal variations in the language were used in a deliberate way by the inhabitants to demarcate against neighbours.

Important in this process is, however, also the role of the uppermost social stratum in society. There is during this period an emergence of a new social aristocracy and we find royal power within stable kingdoms. These changes are used as an explicatory background when John Hines (1994; 1998) is trying to explain the emergence of the English language. Instead of seeing the occurrence of an English language in a linear evolutionary context, he uses sociolinguistic theories. Language is used by individuals and groups for identification and for demarcation. Language varieties are created and spread by admired and coveted prototypes. In this context, the emer-

gence of languages may not be seen as a linear successive split up of proto-languages, such as Old Swedish, Old Norse and Old Danish < Old West Nordic and Old East Nordic < Proto-Nordic, but instead as a result of new socio-political situations, with new groupings (kingdoms) that are using the language for identificational purposes. In line with this one can see that there are evidences of a political cultivation of distinctive scripts and textual characteristics in this period, often out from a centralized scriptorium (Keynes 1980; Dumville 1993; Hines 1998, 293). Of course, also this written language may have an impact on the homogenization of a language and to put it in a direction to make it distinctive and as a tool for demarcation towards neighbours.

2. The societal context

During the transitional era between Proto-Nordic and Old Nordic time there has also been assumed a fundamental change in society, with an ideological change and a hierarchization in the upper social stratum. A new kind of aristocracy evolved (see e.g. Mortensen/Rasmussen (eds.) 1991; Herschend 1998). This process has been linked to a theory of a change in religion. According to Charlotte Fabech (1991; 1994) the cult in the pagan religion, in general terms, moved its focus from lakes and bogs into the chieftain's hall. The new aristocracy got hold of the cultic performance, with religious feasts and cultic activities, conducted in their halls. Thus the king's and chieftain's hall building becomes important (Evans 1997, 88ff.); it constituted the focus in the landscape of power during the Late Iron Age in Scandinavia (Lönnroth 1997; Meulengracht Sørensen ms), in the same way as the castle was for the feudal Middle Ages.

The importance of the hall in early Scandinavia has been known to scholars for a very long time. The first "historian" to focus on the hall was Snorri Sturluson, for example in his narrative of the grand hall in Gamla Uppsala, the *Uppsälir*, in Svithjod. But during the 19th and a large part of the 20th century, the artistocratic society was toned down very much, in the context of the view of an egalitarian Germanic peasant society, which was on the agenda in that time. Archaeology has revolutionized our knowledge in this field during the last decades. Suddenly we are starting to find grand hall buildings, not everywhere, but on the most prestigious sites in early society. In archaeological excavations we have

found a "king's" hall at Lejre, at Gudme, at Dankirke and at Gamla Uppsala, and probably chieftains', if not kings' halls, in Tissø on Zealand, Högom in Medelpad, Slöinge in Halland, Borg in Troms etc. (Herschend 1993; Brink 1996 b). These new findings, along with a new theoretical framework, in which a hierarchical society is much more pronounced and the egalitarian peasant society is toned down, has forced us to rewrite the social history of early Scandinavia. Society was obviously hierarchical, with several social layers, from the thralls at the bottom to the aristocracy and the royal families at the top.

3. The Old Nordic poetry – a special skaldic language?

In our few written sources that reflect this period, we can see that these chieftains could be called – or had around themselves some specialists called – *þulr*, *skáld*, *lytir*, *goði*, *vifill*, *erilar* etc. (cf. Sundqvist 1998). From the context or out from etymology we may assume that these were cult leaders or cultic specialists in some way in Late Iron Age society in Scandinavia. This observation linked with the evidence of the Eddaic and skaldic poetry makes it fairly obvious that poetry and the performance of these poems was a constituent and important part of life, at least for the nobility, during this period. And the social arena and geographical focus was the hall of the king or chieftain. Around the leaders assembled skalds. In Norway very often the skald was an Icelander, taking a seat at some king's or chieftain's hall (Clunies Ross 1999). This is in a way remarkable, since coming from an environment in Iceland with barely no courtly life, they in Norway and elsewhere became specialists of the courtly and elitist art of skaldic poetry.

The skald must have had a central position – at least "ideologically" – in early Scandinavia (cf. Bloomfield/Dunn 1992). The finest gift you could receive in the "gift-based" early Scandinavian society was a poem, a praise poem to the one sitting in the high seat or someone just deceased (such as *Eiriksmál*, *Hákonarmál*, *Höfuðlausn*, *Glymdrápa*, *Vellekla* etc.). Since all gifts were reciprocal, normally the king or chieftain paid back with a precious object, such as a gold ring, a *baugr*, or by offering the gift-bestower, the skald, to become a member of the hird and an advisor to the leader. A remarkable example of this

is the story of *Sigvatr skáld*, used both by Bjarne Fidjestøl (1975) and Margaret Clunies Ross (1999) for exemplifying the Icelandic skald at the Norwegian king's court. The Icelander Sigvatr lived in the first part of the 11th century and was active as a skald during the time of Canute the Great (*Knútr*) and Olafur Haraldsson, also known as Saint Olafur. Although the author of an *erfidrápa* over Canute the Great, Sigvatr was primarily Olaf's skald as well as his friend and *stallari*, i. e. a member of the king's *hirð*. In the time when Olafur was king, Canute laid claim to Norway, and sent agents into the country to bribe chieftains with gold to win them over to Canute's side. In this time, Sigvatr came home from a journey to Normandy and England, where he had spent time with Canute and the latter had tried to persuade him to stay as a skald with his *hirð* in England (*Vestfaravisur*). Thus, Sigvatr was a guest and member in both *hirðs* of the two enemies Knútr and Olafur. This may indicate the role and status of a skald in Viking society.

In several cultures around the world the execution of power has been formalized and ritualized regarding the communication, or rather the way leaders spoke to their subordinates. For example in Madagascar, Maurice Bloch (1989, 19ff.) has demonstrated that such a ritual language, with a special syntax and intonation, was used. This formalized communication, called "speaking the words of the ancestors", appeared at political assemblies in Madagascar, for expressing power. Also in Polynesia, a for commoners unintelligible, archaic language was used for such occasions. It has been assumed that we may count on some kind of similar, archaic, poetic language, used by skalds in their handicraft and different to what commoners used in everyday communication (Jónsson 1901; Kristensen 1907; Ohlmarks 1944; Schneider 1962; Holtmark 1970; Turville-Petre 1976; Fidjestøl 1982; Klingenberg 1984; Fidjestøl 1993; Smirnit-skaia 1994; Fidjestøl 1997; Liberman 1998; Gurevich 1998, Sundqvist ms), a language characterized by many obsolete and ancient words (Liberman 1998, 10ff.). This archaic language should be reflected in the Eddaic and skaldic poems, where the *heitis* and often unintelligible *kennings* were constitutional. Poetical words, archaic and charged with certain connotations, were used in halls throughout northern Europe, this due to the close contacts between the aristocracy in the Germanic area. This fact may explain the existence of precisely the word *hall*, *holl* in Eddaic and skaldic

poems, a word never reflected in old, genuine dialects in Scandinavia or in old place-names, and very seldom in written texts and documents. The most probable way to explain this rare occurrence is to assume that *hall* was a word used in the poetic language that did not find its way into the common language; the indigenous word for a "hall" was *salr*. Perhaps it is a "loan" in the poetic language from Anglo-Saxon or some other West-Germanic language (Brink 1996 b, 251 ff.; 1999, 21 ff.). There are other rare words found in the Edda as in Beowulf. In the same way we find the same or similar myths or motifs in Germanic poetry (Heusler 1941; Schneider 1962; Arent 1969; Liberman 1986; for a short but good historiography, see Ólason 1993; cf. Fjalldal 1998; however see Liberman 1999), basically reflecting a common aristocratic ideology and eschatology all over the area.

From these facts it is most likely that the poetry performed in the halls in the Germanic area during ca. A. D. 600–1000 was very much the same or at least similar. This goes well with the often stated fact that the Eddaic poems are to be seen in a wider Pan-Germanic context. It was in a later period that Scandinavian poetry introduced innovations, different from the rest of the Germanic language area (Noreen 1926, 143; Turville-Petre 1974). One has also to take into account the possibility that Scandinavian poetry saw great impact from Irish poetry, something that has been assumed by several scholars (Turville-Petre 1976; cf. Noreen 1926, 144ff.; Foote 1984, 239).

4. Travelling, trade and linguistic interactions

During the transitional period between Proto-Nordic and Old Nordic another important economic, political and societal phenomenon is introduced into Scandinavia, namely the town (preceded by the proto-town). In contrast to the older central places, the towns were primarily mercantile. The background to the north European towns was that the *emporia* functioning in the Roman realm more or less disappeared with the collapse of the Roman empire during the 5th century (Hodges 1989; Hodges/Hobley 1988). In the 6th, 7th and 8th centuries new towns emerged, such as Canterbury, London, Hamwich (predecessor to Southampton), York, Ipswich, Domburg, Dorestad, Quentovic, Wollin, Truso, Grobin.

In Latin these towns were called *vicus*, an element found in town-names such as *Hamwich*, *Ipswich*, *Quentovic* etc.

The first town we know of in Scandinavia seems to have been Ribe in Denmark, that recent archaeological excavations reveal was founded ca. A. D. 705 (Jensen 1991). On the south border of the Danish realm Hedeby was founded in the middle of the 8th century and was in function as an important port of trade to the end of the Viking Age (Clarke/Ambrosiani 1993, 60). Åhus, in northeastern Scania, is another old market place/town, that was established in the beginning of the 8th century (Callmer 1982). Kaupang in Vestfold, Norway must have been an important port of trade for Norway and may be dated to especially the 9th and 10th centuries (Blindheim et al. 1981). In Sweden we know of early Viking Age towns or market places in Köpingsvik on Öland, Paviken on Gotland, but the most well known is of course Birka in Lake Mälaren. The town was in function similar to Kaupang, from ca. 800 to ca. 1000 (Clarke/Ambrosiani 1993, 71). When Birka is abandoned, its role is obviously taken over by Sigtuna (Tesch 1992).

These early towns functioned as a kind of cultural melting pots, where people from many places met and lived. In Sigtuna, for example, we know from runic evidence of Frisian inhabitants in the town. Dorestad surely must have played some role in introducing the Frisian customs and language into the Scandinavian culture and language. It has been argued that many Frisian and West Germanic words, such as navigational terms as *kugg*, *kogg* ‘cargo ship’, OSw. *ankare*, OWN *akkeri* ‘anchor’, OWN *bákn* ‘beacon’, trading terms as OSw. *klæpe*, OWN *klæði* ‘cloth’, OSw. *mantel*, OWN *mottull* ‘mantle’ etc., came into the Scandinavian language with Dorestad as the channel (Wadstein 1920; 1929; 1933; Haugen 1976, 164). The most cosmopolitan place in Scandinavia has been considered to be Hedeby, and this is probably correct. A marked Swedish element during the Viking Age has been noticed and discussed, out from archaeological, runic and toponymic evidences (Jacobsen 1929; Askeberg 1944; Lund 1982; Moltke 1985). Bengt Hesselman (1936) argued that these linguistic “melting pots”, such as Hedeby and Birka, created innovations that got access into the language. During the Viking Age therefore in Sweden, along the Baltic, a language he called Birka-Swedish (*birkasvenska*) was spoken. The inno-

vations that constituted this “new” language should have been minted or formed in Hedeby, that was Hesselman’s idea, under a perhaps reciprocal impact from Frisian. Seldom scholars have commented on this hypothesis by Hesselman, but recently Gun Widmark (1994 b) picked up the thread and gave further arguments for a possible existence of a “Hedeby-Nordic” (*hedebynordiska*), a term she prefers (p. 198). This language, or rather certain characteristics in this language, may easily have spread to other towns, such as Birka and Kaupang. The characteristic traces to discuss are, according to Widmark: *e > je/jä*, *au > o*, *w*-breaking, metathesis of *wr*, loss of *h*- etc. Again she uses a sociolinguistic argument for understanding the spread of this innovation, namely that the Hedeby-Nordic was a prestigious dialect or sociolect.

Since Widmark (1994 b) stresses trade as an overall important factor during the Viking Age, it more or less becomes natural for her to argue for the old idea that the word *Viking* should be seen in context with Lat. *vicus*, OSx. *wik*, OE *wic*, and hence a *vikigr* would mean someone who visits the ports of trade, the *vici*. This is in line with the recent trend in stressing the point that the Vikings were not so much pirates and warriors as peaceful merchants (Sawyer 1978). The discussion of the etymology of this problematic word will probably go on (for a good summary of hypotheses, see Askeberg 1944, 114ff.; for recent contributions, see e.g. Hellberg 1980; Daggfeldt 1983; Hødnebo 1987; Holm 1988 a; 1988 b; 1992; Widmark 1994 b, 205ff.), but seeing the word in context with Lat. *vicus* is probably the most acceptable interpretation at our present state of knowledge. However, the playing down of the Vikings’ conduct abroad as not fierce and horrifying, with manslaughter, raping and stealing on the agenda, but instead as peaceful tradesmen must not be overexaggerated – unfortunately.

5. The linguistic impact of the new Christian culture

The age of the Vikings and the transitional period in the 8th, 9th, 10th and 11th centuries is also a period of language contacts and blending. When Christendom began sipping into Scandinavia and somewhat later, when the Continental and Insular Church were starting to penetrate and organize in Scandinavia, the Nordic lexicon received a large bulk

of new words concerning the Christian religious life and church, especially from England, such as *kyrka* 'church', *kristendom* 'Christendom', *ärkebiskop* 'archbishop', *munk* 'monk', all of AS origins (Taranger 1890; Jørgensen 1908; Thors 1957), but also other new words were imported via OE: *hirð* f. 'court' (< OE *hîrêd*), *stallari* m. 'king's marshal' (< OE *steallere*), *mynt* f. 'money' (< OE *mynet* < Lat. *moneta*), *penningr* m. 'money', 'penny' (< OE *penning*) etc. (Haugen 1976, 164). The Christianization was an elongated process that stretched over several centuries and that was part of a grand Europeanization of Scandinavia, with several new phenomena beside the new religion, such as towns, coins in a monetary society, a "state formation" into kingdoms, a new agrarian system, followed by the organization of the church, the introduction of a new written language, a Continental judicial system, a taxation etc. The religious change, in context with all these other changes, has been studied in a recent project, summarized in Nilsson 1996.

6. The imprints of the Danes in the Danelaw and Norsemen in Ireland

On the other hand we had an opposite direction in the Danelaw, where many words of Scandinavian origin found their way into the English language, such as *law* (< *lagh*), *wapentake* (< *vápntak*), *both* (< ODan. *bathæ*), *window* (< ODan. *windughæ*) (Geipel 1971; Page 1971; Kisbye 1988). A central judicial as well as ecclesiastical word was ON *sókn*, OE *sôcn*, with different meanings in both time and place. It is very difficult to establish if the word ON *sókn* 'parish' is a loan from AS or the other way around (see Brink 1990, 68ff.; 1991; 1998). The most notable effect of this contact were however the numerous Scandinavian place-names in the British Isles, mostly found in the Danelaw, parts of Scotland and on the isles (Fellows-Jensen 1972; 1975; 1978; 1985; Sandred 1979; Crawford 1995). An excellent discussion on the language contact problem between Nordic and Anglo-Saxon is Barnes 1993.

Another contact was between Irish and Scandinavians. Also here some Scandinavian words were borrowed into Irish, such as *erell*, *iarla* < *jarl* 'earl', *bád* < *bátr* 'boat', *laideng* < *leiðangr* 'naval force', *traill* < *þræll* 'slave' (Craigie 1894; Marstrand 1915; O'Corráin 1997, 103ff.). The other way around borrow-

ings are somewhat more seldom but occur (Sigurðsson 1988); however, some personal names found their way into Scandinavia, the most famous is perhaps *Njáll*. An interesting phenomenon in this language contact is borrowing of not words into the lexicon, but names into the onomasticon. Such an example is the place-name *Dimun*, found in the North Atlantic, in the Faroes, Iceland and even in Greenland. It is believed that the background for these names is some well known Irish/Gaelic place-name, a compound of Ir. *di* 'two' and *muinn* 'top', 'neck', that has served as a kind of prototype. In Scandinavia *Dimun* has become an eponymized littoral toponym, used for islands or mountains with two peaks (Brink 1996 a, 67f.). The etymology of the lexical elements has most certainly been obscure, *di* and *muinn* never found their way into the lexicon, but the name *Dimun* 'a land feature with two peaks' found its way into the onomasticon in western Scandinavia. Finally it has been proposed that the verse metre *dróttkvætt* is a loan from Irish poetry (Turville-Petre 1954; 1976; Árnason 1981; cf. von Sydow 1920; Foote 1984, 239; 249; 299f.). In this context it is also interesting that Irish language had impact on Old Norse poetry, which is well stated in Rígsþula (Young 1933).

7. Linguistic exchange due to Viking expansion to the east

Hitherto we have dealt with Scandinavians in contact in the west, but a similar contact and exchange was taking place in the east. Especially Fredrik Tamm has discussed Scandinavian loanwords in Slavic, such as *buda* < *bodh* 'simple house', 'cott', *jakor* 'anchor', *saida* 'haddock', *stod* 'idol, god', *snekkja* 'a kind of ship' (Tamm 1882; see also Thörnqvist 1948; Forssman 1967). A reverse borrowing took also place, with Slavic loanwords in Scandinavian, such as *bulvan* 'decoy', *torg* 'market square', *piska* 'whip', *steglitsa* 'goldfinch', *tolk* 'interpreter' (Tamm 1881). However, the most famous Scandinavian word or element in Slavic must be *rus*, that already early was assumed to be derived from the people coming from *Roslagen* in central eastern Sweden, first presented by V. Thomsen (1877) and elaborated by R. Ekblom (1915) and Stender-Petersen (1954). The origin of the word *rus* has been debated intensively, sometimes with political overtones, and is still under vivid discussion. Today Thomsens hypo-

thesis seems to have got a broad acceptance (e.g. Ekbo 1958; 1981; Falk 1981; Lågreid 1984; Melnikova/Petrukhin 1991; Holm 1993; cf. Franklin/Shepard 1996), even in Russia, in the aftermath of the communist era (see Melnikova/Petrukhin 1991; Melnikova 1996 for references), but there are still new interpretations popping up (e.g. Söderlind 1978; 1984; however see Ekbo 1981, 144; Thulin 1981, 175).

There are many aspects of the transition in language and society during the dramatic centuries ca. 600–1000, some are focused upon above. An excellent, however slightly outdated, overview regarding historical as well as philological problems, is Askeberg (1944). Normally the Viking period has been highlighted, for obvious reasons, and here the literature is huge. A recent work to recommend is Sawyer 1997. Many aspects are also covered in Nilsson 1996, with extensive references.

88. Language contact in the period between Ancient Nordic and Old Nordic

1. Introductory remarks
2. Zones of language contact
3. Conclusion
4. Literature (a selection)

1. Introductory remarks

While much research has been devoted to language contact during Old Nordic and later Nordic times, the investigation of earlier periods barely illuminates the situation in the Dark Ages. This might be due both to the scarcity of sources and to methodological problems. Among the existing standard works, mention should first of all be made of Fischer's (1909) and Höfler's (1931–32) studies, which investigated the entire stock of loanwords in ON. In addition, Marius Kristensen's *Fremmedordene i det ældste danske skriftsprog* of 1906 investigated loanwords in the oldest Danish documents.

The perspective of this survey is a pre-ON one, where early language contact will be described from a Scandinavian point of view (on foreign language interference in early ON, see arts. 115f.). At present, research methodology

still rests mainly on loanword studies. Although this focus on lexical items might be a good starting point, it remains extremely one-dimensional (cf. art. 24). More central are interrelations between the structures of languages: their lexical, phonological, morphological and notably their syntactic components (on the theoretical aspects of language contact, cf. Bechert/Wildgen 1991). However, this will have to be worked on by a later generation of scholars. The present outline confines itself to the presentation of existing research work.

In keeping with the aim of this article, the material, which is far too varied and extensive to be presented here in detail, can be examined fully in the literature; hence the abundant references to be found in the bibliography (see 4.). For the basic distinction between language contact and dialect contact, see art. 24.

2. Zones of language contact

The Nordic sphere of influence was much more extensive in the past than it is now. During the Viking Age, the Scandinavian in-

vaders, traders and settlers had reached many parts of Europe. About 1000 A.D., the extent of the Nordic language area reached its maximum: it included Greenland in the north-west, Normandy in the south-west, Russia in the east, and Slesvig in the south.

The following historical core zones for Nordic contact need to be mentioned. In the west were the Celtic and the Insular Germanic (Anglo-Saxon) domains, while in the south there was the Continental West Germanic area; Normandy will be discussed separately. In the north of Scandinavia was the Sami population (Lapps), and to the east lay the spheres of the Finno-Ugric and Slavic languages. The following discussion focuses on contact from a linguistic perspective (on the sociolinguistic aspects, see art. 78).

2.1. North and West Germanic in the British Isles

The zone with the most intense contact between North Germanic and the West Germanic languages was in the British Isles. In June 793, the monastery of Lindisfarne was plundered by northern Vikings. This is generally said to be the beginning of the Viking raids. The Viking incursions from the 9th until the 11th centuries led to intense contact. The Nordic settlement in England, the so-called *Danelag* (Danelaw), provided a basis for highly fruitful and frequent contact between the Danes (as the main representatives of Scandinavia) and the Anglo-Saxons. This historical situation gave rise to bilingualism. Not only did this interaction have a strong impact on the two language groups in question, but it also led to the integration of their cultures and literature.

In a systematic philological study, Hofmann (1955) investigated the Nordic-English loans from the Viking Age. One of his conclusions was that Nordic poets living in the *Danelag* were strongly influenced by the Anglo-Saxons in various ways. For instance, the famous *Hofuðlausn* and the *Eiríksmál* by Egill Skallagrímsson apparently show Anglo-Saxon influence (Hofmann 1955, 50f.). Even the first Eddaic poem *Vǫlospó* and the lays of Helgi (*Helgakviða Hundingsbana I*, *Helgakviða Hjörvarzsonar*, *Helgakviða Hundingsbana II*) are believed by some scholars to show Anglo-Saxon influence and to have been composed in the British Isles during the Viking Age (cf. Kuhn 1943, 58f.; Hofmann 1955, 114ff.).

Going further back in history, the precursors to English speakers – the Anglo-Saxon tribes and the Jutish people – immigrated into England from the south and the south-west. Their original homelands were the German and the Danish coastlines of the North Sea region. These Anglo-Saxon immigrants gradually drove back the British (Celtic) people, or forced their assimilation. As archeological evidence indicates, settlers from southern and western Norway moved to the English east coast as early as the beginning of the last quarter of the 5th c. (cf. Hines 1990, 29). These early Scandinavian migrants had already initiated North Germanic-Anglian contact in the 6th c. throughout the area which Bede referred to as Anglian England. This intensive contact, which continued for centuries and culminated in the *Danelag*, explains parallel developments between early Anglian English and Scandinavian. Linguistic parallels pertain to the lexicon as well as to the morphological and phonological systems.

In his comparative study *Old English and the Continental Germanic Languages*, Nielsen (1985, 252) takes a fairly critical stance towards this view and denies “a special relationship between Angl[ian] and N[orth] G[ermanic]”. This is particularly exemplified with regard to the apparently similar processes of Old English back mutation and Nordic breaking (Nielsen 1985, 239–243). However, following Hines (1990, 29), the existence of “common or similar suprasegmental or sub-phonemic aspects” such as stress features and the rise of new allophonic patterns has to be emphasized. With regard to *i*-mutation (fronting), it can even be shown that the phonological process in Anglian occurred simultaneously with that in North Germanic in the early 500s. These parallel (though separate) developments could have reinforced each other during close on-going contact (cf. art. 24).

In the 6th c., the linguistic situation in the British Isles was indicative of a dialect continuum in the process of differentiation. For example, the runic inscriptions of Scandinavia and Anglia, first and foremost the bracteates, already exhibited significant linguistic divergence at that time. Hines (1990, 31) views the establishment of a single language system in Britain as a normative process which entailed the loss of differences between the northern and western ends of a postulated North-West Germanic continuum – North Germanic becoming characterized by stasis, and West Germanic by innovation.

The history of place-names in the British Isles points to different historical layers, including Scandinavian and Celtic ones. Basic research in the field of English place-names was done by the Swede Eilert Ekwall (e.g. 1924). With regard to the Isle of Man, Marstrander (1932, 338) mentioned four strata:

a prehistoric stratum, as it seems of no great importance, a Celtic stratum, beginning with the rise of the Irish church, a Norwegian stratum which sets in with the early 9th century, to a great extent overlapping but never entirely supplanting the Gaelic, and finally an English stratum, which, however, does not seriously assert itself before the days of the Stanleys in the 15th century.

As to the provenance of this Scandinavian language, Marstrander is convinced “that the Norse material on Man, just as that in Ireland, points to a south-western Norwegian idiom closely akin to the Norwegian dialects of Agder, Jæren, the Faroe Islands and the isles north and west of Scotland” (ibid., 340).

It is worth noting that the Nordic (Norwegian) language in Caithness, the Hebrides and the Isle of Man was ousted by Gaelic in the 15th and 16th centuries, respectively. In the Orkneys and Shetlands, where the Nordic language was known as *Norn* (< ON *norróna*), it survived even longer (cf. art. 126).

2.2. North Germanic in Normandy

In Normandy, the Vikings were probably assimilated swiftly. *Rollo*, the leader of the Normans (i.e. the Vikings in France), successfully invaded Normandy – the geographical name being linked to the Normans. *Rollo*, baptized as *Robert*, was supposed to be a Dane. The Vikings went further south to Brittany and to Spain, but these excursions did not result in new settlements.

Nordic loanwords in French are very infrequent. As well as other seafaring terms, the ON term *biti* ‘cross-plank in a boat’ was transferred into Fr. as *bitte*, and into Russ. as *bet*. The Scand. legal term *lagu* (either n.pl. or f.sg.) was borrowed as Celtic *lagh*, Old Norman *lage* and E *law*. ON *rannsaka* ‘search, investigate’ appeared as Celtic *ramnsachadh*, Norman (Fr.) *rannsaquer* and E *ransack*. Place-names were also taken over from Scandinavian (cf. Hansen 1999). An example is the frequent village designation *La Houlgate* in Normandy, originally meaning ‘narrow pass’ (G *Hohlgasse*) and appearing in different shapes. A frequent

place-name element is Norman (Fr.) *-tot* from ON *-topt* (Norw. *toft*, *tomt*). The name of the community *Biéville-Quétiéville* involves a *dvandva* compound containing the personal name *Ketill* as the second element. Nordic-Norman contact is also evident in personal names such as *Turstin* (ON *Porsteinn*). However, these Nordic forms left few traces in Norman nomenclature, since they were quickly displaced by Franconian names.

2.3. North and Continental West Germanic

Contact between North Germanic and the Continental Germanic languages has been proven in later times, with Low German as an important intermediary (cf. art. 24). Another central influence was the early relationship between the Frisians and the Scandinavians which started in the 8th or 9th c. *Birka*, the name of the oldest commercial town in Sweden (having been visited by the missionary Ansgar around 829), is believed to be of Frisian origin. On the place-name *Birka* and the stock of Frisian loanwords in Nordic, see Wadstein (1922). Other early trading centres in Scandinavia functioning as major contact zones were *Haithabu* and *Helgö*.

The German influence on the Nordic languages (excluding Icelandic and Faroese) has been enormous. It began long before the Germans made their way northwards to the Baltic Sea. In the 12th c., they ruled over the entire southern coastline of the Baltic Sea (cf. art. 115). But already in the period between 825 and 1100 A.D., the Germans – besides the Frisian and Anglo-Saxon peoples – played an eminent role in the Christianization of Danes, Norwegians and Swedes. Admittedly, the details of this conversion are unknown to us, and pinpointing the origin of the oldest loanwords of church terminology in Eastern Scandinavian is a difficult task. On the other hand, loanwords in Western Scandinavian in general are linked to Old English/Anglian (cf. 2.1.).

In earlier times, that is in Ancient Nordic, contact between Scandinavian and Continental Germanic (West Germanic) is difficult to prove. In this sphere of contact, the question of name loans (i.e. of personal names) is central and has been debated for decades. It has long been observed that personal names in the runic inscriptions of Scandinavia correspond to a high degree with the West Germanic inventory of names. But the crucial question remains whether these parallels are mainly due to a common heritage, a North-West Ger-

manic nomenclature, or due to massive loans from the Continent.

Von Friesen (1924) argued in favour of extensive North Germanic name-borrowing from the south:

En fullt tillräcklig förklaringsgrund är kulturblandningen utefter en livligt trafikerad handelsväg. Helt naturligt är att herulerna som förmedlare av den livliga transitohandeln mellan Rhen och Östersjön trädde i synnerligen nära förbindelser, även äktenskapliga, med sina affärsvänner väster om Sønderjylland. Också är det rimligt att västgermaner tagit direkt del i handeln inom Norden och bosatt sig här. Bågge omständigheterna ha medfört att västgermanska namn blevo kända och använda här först och främst i handelskretsar. [A fully valid explanation is to be seen in the cultural blend that one finds along a frequented trade route. It is quite natural that the Herulians as middlemen participating in the lively transit trade between the Rhine and the Baltic Sea had especially close contacts, even to the extent of intermarrying, with their business friends west of South Jutland. It is also plausible that West Germanic people took a direct part in the trade in Scandinavia and settled there. Both circumstances led to West Germanic names becoming known and being used there, first and foremost amongst the traders; von Friesen 1924, 114f.]; my transl.

In recent times, Insley (1991) followed this line of reasoning in researching the relationship between Old English and Older Runic personal names. Although this debate might not be over, Peterson's article *On the relationship between Proto-Scandinavian and Continental Germanic personal names* (1994) marks a turning point. Taking a critical stance on von Friesen's view, she argued against the possibility of extensive name loans. In addition, Peterson stressed the point "that personal names hold an exceptional position in the vocabulary of a language. ... We have to accept that the chosen subject of study is not a very suitable one for establishing the true nature of the relationship between Scandinavia and the Continent during the Migrations" (Peterson 1994, 159).

2.4. Nordic contact with the Celtic languages

As a starting point, it can safely be stated that "the Germano-Celtic vocabulary [indicates] a close cultural contact throughout a considerable period of time" (Lane 1933, 263). This contact pre-dates all our sources (including

early AN ones), since it is supposed to have ended approximately in the middle or the second half of the first millennium B.C. With regard to the AN period, the time of the older runic inscriptions (ca. 150–600 A.D.), direct language contact between Celts and Scandinavians is apparently not traceable. By consensus, the earliest contact between Celts and Scandinavians is assumed to have been around 600 A.D.

Around the year 840, the Vikings had subdued nearly the whole of Ireland and had made a marked impact on the Irish language. In the Irish sources, the Scandinavian invaders were identified as Danes (*Danair*) and as Norwegians – the geographical designations *Hiruaith* and *Lochlann* probably refer to the Norwegian districts of *Hordaland* (ON *Hǫrðar*) and *Rogaland*. A classic work on this is Marstrander's *Bidrag til det norske sprogs historie i Irland*, which appeared as early as 1915. This research, which is based on the lexicon (including place-names and personal names), is mainly concerned with phonological questions. As mentioned in 2.1., Marstrander identified the Nordic language of Ireland with south-western Norwegian dialects (especially from Agder and Jæren) and the language of the Faeroe Islands and the Scottish Isles (the Hebrides and the Orkneys). Celtic languages other than Irish (Goidelic) might also have been influenced by the Vikings' language. Thus the question of ON loanwords in Cymric is dealt with by Schulze-Thulin (1993).

Another fairly recent study by Sigurðsson (1988) is devoted to the *Gaelic influence in Iceland*, and provides copious bibliographical references. As is well known, the Norwegian settlers of 7th and 8th c. Iceland met up with a population of Celtic inhabitants who had sailed for Iceland earlier. The Sagas of Icelanders (*Íslendinga sögur*) contain names of Celtic origin such as *Njáll* (OIr. *Niall*), *Kjartan* (OIr. *Cerd(d)án*) and *Melkorka* (OIr. *Mael-Curcaigh*). The famous *Laxdæla saga*, for instance, provides its main figure *Kjartan* with royal Irish kin. An example of literary interrelations between Nordic, Anglo-Saxon and Irish is provided by the half-skaldic *Darraðarljóð* (cf. Hofmann 1955, 112ff.). This poem, which is included in *Njáls saga*, probably refers to the battle at Clontarf in Ireland in 1014. Undoubtedly, there are Irish motifs and topoi in *Darraðarljóð*. This is particularly obvious in connection with the opaque term *vefr darraðar* 'web of *Dǫrruðr*', which also occurs in Egill's *Hofuðlausn* (cf. 2.1.).

2.5. North Germanic-Finnish contact

Within Finno-Ugric research, numerous works deal with loanwords in the Finnish language. A presentation of research to date is provided by Kylstra (1961) and Hofstra (1985), where the latter work complements the former; cf. furthermore Koivulehto's article on the Finnish language and its contacts in Reall. (s.v. *Finnland*; cf. also arts. 24 and 67). Since Thomsen wrote *Den gotiske sprogklassens indflydelse på den finske* in 1869, methods in this field of research have been considerably refined. A central problem concerns strata of Germanic (and Nordic) on which the Finnish loanwords are based. Of special interest is the age of the oldest Germanic loanwords in Finnish and Lappish (e.g. Wiklund 1917–29; Sköld 1979; Ritter 1993). Typical for the presyncope period (PGmc and early AN) are loanwords such as Finn. *kaltio* (ON *kelda*) 'spring, fountain', Finn. *kulta* (ON *gull*) 'gold', or Finn. *juhla* (also *joulu*) 'festival' (ON *jól*, OSw. *jul* 'Christmas'). Many of these lexical borrowings can be traced back to AN or even to PGmc on linguistic grounds. The main criterion is that linguistic developments such as the transition of $/\bar{e}^1/$ (\bar{a}) $>$ $/\bar{a}/$, or $/ai/ > /ā/$ (before *h*) have already taken place. Hence it is argued that loanwords predate certain sound changes and therefore refer to the AN period or even further back.

In this context the works of Koivulehto are pioneering, if not epoch-making. Koivulehto distinguishes between different layers of loanwords, especially on the basis of consonantal criteria. An old stratum of loanwords is provided by the so-called *ts*-layer, where the sequence of dental (*d*, *d*, *b*, *t*) plus semivowel (*i*) is supposed to develop through $/\acute{c}\acute{c}/$ and $/cc/$ to Finn. $/ts/$ (Koivulehto 1986; Hofstra 1985, 418f.). The sound change in question can be illustrated as follows: Finn. *katsoa* (stem *katso-*) 'guard, tend (cattle)' $<$ early PF $*ka\acute{c}\acute{c}V-$ \leftarrow AN $*g\bar{a}t(i)ja-$ (PGmc $*g\bar{e}t(i)ja-$) $>$ ON *gáeta*, OFris. *gēta*, also *gāta* (Koivulehto 1986, 268–272; Schulte 2001b). Note that Finn. *katsoa* presumably falls into the early AN period, since its root vowel is based on AN $/\bar{a}/ <$ Gmc $*\bar{e}^1/$. On the other hand, Finn. *miekka* 'sword' does not do so, coming either from a pre-AN source, or an EGmc one (Gmc $*m\bar{e}kijaz$, or Go. *mēkeis* respectively). Therefore, Finn. *miekka* is not a candidate for the AN stratum. On the runic evidence for the shift $/\bar{e}^1/ > /\bar{a}/$, cf. the attested forms on the Thorsberg chape *waje-mariz* ($<$ Gmc $*waja-$

mēriz), and the Vimose chape *makija* ($<$ Gmc $*m\bar{e}kija-$ acc.sg.). Incidentally, Gmc $*m\bar{e}kijaz$ (AN $*m\bar{a}kijaz$) is supposed to be a migratory term, a "mot voyageur" of Indo-Iranian origin (see art. 75).

To sum up, early AN (and PGmc) loanwords can be traced in Finnish. Linguistic evidence includes the establishment of a *terminus ante quem* (signalled by the retention of medial and final vowels, the lack of Nordic breaking $e > ja, j\acute{o}$ etc.) and a *terminus post quem* (signalled by the transition $/\bar{e}^1/ > /\bar{a}/$ etc.). However, it has to be noted that the lowering of Gmc $/u/ > /o/$ and the raising of Gmc $/e/ > /i/$ occur only sporadically in Finnish loanwords; cf. Finn. *porras* 'path, staircase' as opposed to Estonian *purre(s)* 'path'; also Carelian *ruohtina* (in *sündü-ruohtina* 'Saviour') as opposed to Finn. *ruhtinas* 'sovereign' \leftarrow Gmc $*druhtinaz$ (ON *dróttinn*). As to the runic inscriptions, *a*-umlaut of $/u/ > /o/$ is attested in the Gallehus forms *horna* and *holtijaz* from the early 400s. Leaving these vertical umlauts aside, we conclude on the basis of examples such as Finn. *katsoa* that it is possible to uncover a specific stratum of AN loanwords in Finnish. But in general, it is hard to determine how far back in time these loans go. Borrowings probably continued later on, taking new shapes due to Nordic sound changes and dialectal differentiation. Incidentally, Finn. *juhla* 'festival' (dialectally also meaning 'Christmas') is borrowed from the same Germanic-Nordic source as Finn. *joulu*; however, they belong to different strata of loanwords.

2.6. North Germanic-Sami contact

From early on, Scandinavia has represented a contact zone between the Nordic and the Sami (Lappish) languages, and several studies have been devoted to the contact and interaction between them. Scholars have paid due attention to the old contact between AN and Lappish (e.g. Wiklund 1892; Qvigstad 1893; Sköld 1961). Attempts have been made to pinpoint the exact area where this contact occurred; it would seem that the coastal region of northern Norway is of primary importance (cf. Sköld 1961, 38f.; Jahr 1997, 942ff.). On linguistic grounds, it has been maintained "that the forebears of the Lapps and the Scandinavians met in Northern Norway about the time of the birth of Christ, and it is possible that the Lapps were there when the Scandinavians arrived" (Sköld 1979, 111). Basic histori-

cal research on the extent of the Lappish regions carried out by Collinder (1953, 12) points to a large district including not only northern Norway, but also huge parts of northern Sweden and Finland. Obviously the domain of the Lapps has diminished since AN times, and the historical situation must have been more complex than Collinder suggested (cf. Larsson 1992, 98 ff.).

As the Sami language is less conservative than Finnish, studying Nordic-Germanic loanwords in this language is a difficult task. Furthermore, some Sami loanwords were borrowed through Finnish. Modern research in this field has been carried out, among others, by Koivulehto (1992); a classical study is Qvigstad (1893). It has been roughly estimated that more than 3,000 loanwords from Nordic have entered the Sami dialects of northern Scandinavia. As in Finnish, different layers of loanwords can be discerned on linguistic grounds (cf. Sköld 1979, 106). The oldest strata can be traced back to early AN or even further.

The following list, which is based on Ureland (1987, 58), gives a glimpse of different lexical domains of borrowing into the Sami language (different dialects are not marked):

- | | |
|------------------------|--|
| (1) <i>Sailing</i> | Lp <i>pârte</i> 'upper plank of a boat' (ON <i>borð</i>)
Lp <i>kielas</i> 'keel' (AN * <i>keluz</i>) |
| (2) <i>Sea</i> | Lp <i>áhpe</i> 'sea' (ON <i>haf</i> < IE * <i>kapo-</i>)
Lp <i>viertas, fierta</i> 'fjord' (AN * <i>ferðúz</i>) |
| (3) <i>Agriculture</i> | Lp <i>gussa</i> 'cow' (ON <i>kussa</i>)
Lp <i>mielhke</i> 'milk' (ON <i>mjolk</i> < AN * <i>meluk-</i>) |
| (4) <i>Fishing</i> | Lp <i>társke</i> 'cod' (Finn. <i>turska</i> ← AN * <i>þurska-</i>)
Lp <i>fáles</i> 'whale' (ON <i>hvalr</i> < AN * <i>hwalaz</i>) |
| (5) <i>Reindeer</i> | Lp <i>ráito</i> 'string of pack reindeer' (ON <i>reið</i>)
Lp <i>támes</i> 'tame' (ON <i>tamr</i> < AN * <i>tamaz</i>) |

From a linguistic point of view, these loanwords must be old. Most of them belong to the pre-syncope period, and they often pre-date Nordic sound changes such as breaking (*e* > *ja*, *jǫ*, e.g. ON *kjǫlr*, *fjǫrðr*), rhotacism (*-s#* > *-z#* > *-R#* (> *-r#*), and EN monophthongization (cf. arts. 100 ff.).

2.7. North Germanic-Slavic contact

The Vikings left many traces in eastern Europe from the 8th to the mid-eleventh century (cf. art. 68). There are, for instance, Nordic narratives in Russia: the so-called *Nestor Chronicle* contains a stock of legendary events from the Varangians (cf. Hofmann 1955, 271 f.). However, the main sources of evidence are Skaldic verses and the runic inscriptions of the 10th and 11th centuries. Melnikova emphasizes the importance of the runic inscriptions as sources of north-eastern relations and divides them into two groups:

The first comprises inscriptions on the Viking Age memorial stones in Scandinavian countries which mention voyages to the east, i.e. the eastern Baltic region, Rus', Byzantium. The second group consists of inscriptions on diverse objects found mostly during archaeological excavations in different places of eastern Europe. These objects were brought from the north or produced on the spot by Scandinavians who traded, settled, or served as mercenaries in Rus' (Melnikova 1998, 648).

In the runic inscriptions, about 20 place- and ethnic names of eastern Europe are found, a very frequent term being *austrvegr* 'eastern route'. Names of eastern Baltic peoples and the corresponding country names such as *Eisttir*, *Eystland*, *Finnir*, *Fin(n)land*, and *Tafeistaland* occur. The prominent term for Ancient Rus' in ON is *Garðariki*. Interestingly, the compounds ending in *-garðr* typically occur in eastern Europe, marking the major routes to *Byzantium* (= *Garðariki*): *Novgorod/Holmgarðr* – *Kiev/Kænugarðr* – *Constantinople/Mikligarðr* (Melnikova 1998, 653). The runic inscriptions found in eastern Europe also stress the linguistic and cultural contact between Scandinavians and the local population. Intense contact existed between the North-East and Gotland, the Mälaren region and probably also Östergötland.

On the whole, runic inscriptions document extensive interaction between Scandinavians and Slavic people in the east. Historically, it seems appropriate to reckon with a general process of Nordic assimilation. However, some isolated communities with a Scandinavian cultural background might have coexisted with the local cultural traditions for centuries (cf. Melnikova 1998, 658 f.). On a linguistic evaluation of the Vikings' contacts with the East, see art. 67.

3. Conclusion

As has been shown, the study of early Nordic language and dialect contacts is a vastly complex topic. Different phases and zones of contact existed. On the whole, continuous contact in the north and in the east are more easily discerned than in the south and in the west. This is at least partially due to the fact that the contacting idioms in the north-east belonged to different (i.e. outer-Germanic) groups. Therefore it is clear why research on Germanic-Finnish (Finno-Ugric) interrelations is so fruitful, while inner-Germanic studies are not. Language and dialect contact within Germanic is far more difficult to interpret. This is most strikingly shown by the ongoing controversy on name loans between North and West Germanic, where a critical attitude in the wake of Peterson (1994) might be appropriate (see 2.3.). The same is true, at least partially, for Celtic-Germanic relations. On the basis of lexical evidence given by Lane (1933) and others, it is argued that close cultural contact existed for centuries during Proto-Indo-European and Proto-Germanic times (until around 500 B.C. or even later). Hence, linguistic correspondences used as direct evidence for language contact in literary times must be evaluated carefully.

The earliest discernible contact with Germanic outside the Indo-European sphere was within the Finno-Ugric domain. This contact seemed to continue through the ages; it extended over different language periods from early Proto-Germanic via Ancient Nordic down to Old Nordic, Old Swedish and Old Gutnish (cf. Sköld 1979, 110). However, the delimitation of an AN stratum of loanwords in Finno-Ugric remains a problem, since the borderline between Ancient Nordic and Proto-Germanic is difficult to draw. For instance, the above-mentioned change of /ē¹/ > /ā/ which is attested in early Ancient Nordic (e.g. in the shapes of Old Runic **wajemariz** and **makija**), might be traced further back (see 2.5.).

It has reasonably been argued that the earliest Scandinavian contact within the Germanic sphere might have been in the British Isles with the Anglians from the 6th c. onwards. Especially within the *Danelag*, this ongoing close contact must have led partially to bilingualism. As for the church terminology, particular attention must be paid to the existence of interlinear translations added to the Northumbrian gospels in the 10th c. (Lin-

disfarne and Rushworth). These interlinear versions connected the vocabularies of the Nordic and the Old English languages via Latin and led to all kinds of interference (Hofmann 1955, 167ff.). Celtic-Nordic language contact is perceptible at approximately the same time as for Anglo-Nordic.

At the end of this survey, the author's opinion is that much of the past and present research in the field of early Nordic language and dialect contact seems to be one-dimensional. This is equally true of Finno-Ugric contact research in two ways. First, the main stream of research reduces language contact to the transfer of words, hence the focus on borrowings into the Baltic languages from Ancient Nordic and its preliminary stages. Second, a certain directionality of this loan process is assumed, namely from south-west to north-east. Though this is in line with common sense, it is far from proven. In order to provide a broader interpretational basis, other more integral models of mutual language interaction between Finno-Ugric and (North) Germanic have been put forward, e.g. Wiik 1997; Künnap 1997; 1998a and 1998b.

1. Introduction

The development of the state and Europeanization are major features of the Scandinavian High Middle Ages, together with the Church as the main cause behind. Through these the Scandinavian countries grew more differentiated and more similar to each other at the same time. Each kingdom experienced its own internal developments, but at the same time they all became more European. They went through more or less the same stages, but at a different pace. The states received the same influences from European educational centres, but were affected differently according to their geography: Denmark was closer to central Europe, especially Germany, Norway had close connections with England, and Sweden was more oriented to the east than the others.

As the new religion gained a foothold in society, it developed its organization into a powerful institution, with enormous influence over most areas of life and subjects. The kingdoms acquired organizing abilities by looking at the Church, depending on its skilled people during an early phase of developing internal matters of the state. The Church was introduced and established with necessary help from the kings, but it soon became a considerable power in its own right. Nevertheless, the king and upper class continued to maintain their power by handing over huge assets, mainly estates. It was also the Church which

brought Scandinavia closer to Europe, by channelling new thoughts within religion and philosophy straight to the main centres of culture and power. To summarize the Scandinavian High Middle Ages therefore means looking closer at the Church as one of the main institutions behind further development.

Over the last decades, a new direction within historical research has been conspicuous. This is the field of the history of mentalities, which has initiated new ways of looking at development and structures. The concept implies a focus on the collective understandings, attitudes and values of earlier individuals (Rygg 1999, 88f.). The basis for this theme stands on the assumption that people living at different times have different mentalities, and that collective mentalities do exist (Bagge 1998, 13f.). Within the history of mentalities, social and cultural aspects of development and earlier institutions are considered equally as important as, for instance, economic impact, the great men of history and their lust for power. This trend in historical research has greatly influenced the way longterm effects of the development of the state have been seen. Over the centuries from the Early Middle Ages to the nation states of the modern world, increasing control, legislation and a monopoly on punishment formed society and people's way of thinking. This has been called the process of civilization, viewed as a change from nature to culture. The arguments were that as wild and unrestrained behaviour disappeared, arbitrary violence decreased; instead early modern humans arose, individuals, able to control their emotions and affections and take well calculated actions. The arrogance in this theory is the reduction of earlier people's ability to make choices, claiming they had no rational sense. Further it is a reduction of culture and intellectual level in medieval society. What this theory also does not take into ac-

count enough is the enormous impact the Church had on forming people's mind, meaning their beliefs and ideas, using the same means as the state. The Church had a clear ideology, there were set arguments behind its actions, and it threatened sinners with the eternal flame. It is useful to have this theory in mind when looking into cultural and historical preconditions of language change. Institutions and major developments led to more changes than deeply altered systems of administration and government, and advanced culture and art inspired from abroad. Even if the process was slow, it did mean the start of a profound change in thinking, of a more regulated and predictable life, including the common man and woman.

2. Population, material culture and general structure of society

Scandinavia followed the general pattern of western and central Europe regarding an increase in population, but it was small in comparison. Numbers cannot be accurate due to the lack of reliable sources, so only a general picture can be drawn. Around 1300 there were about two million people in the whole of Scandinavia (Sawyer/Sawyer 1993, 42). Denmark, including Scania, had a population about one million (Ulsig 1989, 41), Norway, with the Atlantic islands, had about half a million people (Sigurðsson 1999, 196) and Sweden the same (Derry 1979, 55). These numbers are seen as the peak, for a decrease started in the early 14th c. By then most arable land was in use, so there was less room for new expansion. New settlements in the 12th and 13th c. were often on marginal land which was hard to cultivate. Climatic changes that occurred before the mid-14th c. weakened the population, especially in marginal areas. When the bubonic plague hit Scandinavia around 1350, it accelerated the decrease in the population that had already started. Known as the Black Death, it reduced the population by as much as up to two thirds in the worst affected areas, such as Norway. In other places reductions of one third were usual. During the following decades and centuries, numbers stayed low, as similar plagues kept the later coming increase on hold.

The creation of the three Scandinavian states was largely completed by 1100, with only Sweden being divided into landscapes until about 1250. The main division was between

Svear in the east, with Uppsala as its centre, and Götar in the south. Borders between the Scandinavian neighbours were not completely set, and they all held areas outside their mainland, especially in the 13th c. Around 1260, Norway included Iceland, Greenland, and the Western isles: the Orkneys, the Faroes, Shetland, the Hebrides and the Isle of Man. The latter two were sold to the Scottish king a little later (Sawyer/Sawyer 1993, 64; Helle 1993a, 436), but the Orkneys and Shetland were kept for another two centuries (Paludan in Historien, ed. Rudi Thomsen, København 1970, 795). Still Norway held major areas west of the North Sea, partly due to expansion dating from the Viking Age. To the south, Norway had supremacy in Bohuslän, along the coast of today's Sweden, down to Götaälv. Further down the coastline, the area of Halland and the adjacent southern area of Scania were under Denmark, which expanded further to the east. Holstein, Vendland and Rügen came under Danish control, as well as eastern Baltic areas such as Estonia. This occupation was temporary and for most areas came to an end towards the middle of the 14th c. Medieval Sweden included today's mainland of Finland, extending as far as Viborg. To the north and far east, Sweden bordered on Russia, a growing empire. Sweden tried to conquer the important and powerful city of Novgorod towards the middle of the 13th c., but was unsuccessful. To the west, Sweden bordered on Norway, Jämtland and Härjedalen being under Norwegian control.

The medieval borders point to the sea as a means of communication. Seas between the isles and conquered areas kept the realm together, rather than dividing it. Denmark controlled all the traffic from the North Sea to the Baltic Sea and eastern regions, Sweden naturally oriented itself towards Finland as the main coastline faced east while Norway's coastline faced west. Still, this is claimed to be primarily a time of internal consolidation, as governmental matters show signs of firmer routines and control. Disputes about borderlines were usual, but the picture above shows the main extent of the Scandinavian realms.

The differentiation of society that went on during the High Middle Ages, was strengthened by urbanization. New social classes appeared and some disappeared. The clergy was an important and powerful group, and the lowest class, slaves, disappeared. The specialization of professions began in the towns, some of which started to fill the functions of

a capital. Legislation for each country became more uniformed from the end of the 13th c. and onwards. Nevertheless, society was strongly hierarchical, with division among working people, the lay aristocracy and the clergy. Medieval society had no official place for women either in politics or in religion except for heads of convents and some female regents; the rest depended on personal abilities to achieve influence. The division between social layers is especially visible in the study of primary sources. To a great extent they were produced both by and for the upper class, and the earlier they are the more this applies. Secular leaders demanded the history of their life and reign to be told, and aimed for a glorious and honourable tale, to secure their posthumous reputation. The writers were often clergymen or others who had received their education from the Church or a monastery. Such an interaction was typical during this entire period, and the secular and clerical powers both benefited from demanding each other's services. This also brought them into conflict, as they both grew strong and claimed supremacy during these centuries. The organization of the Church was far ahead of that of the state, as it had woven a net of parishes and people serving it, secured its income and achieved a fixed structure. The development of both institutions meant a change for the increasing populations, who had to meet the demands of these two forces. From the time when it became more usual to put transactions and agreements into writing for the more common man and woman, we know more about the lower social classes. Such documents and diplomas provide an opportunity to trace information leading up to settlements and trade.

The societies were based on agriculture, so holding land was valued. In Norway the typical farmer combined raising livestock and farming with other economic activities, such as fishing and hunting (Sigurðsson 1999, 210). Most farmers in Denmark were villagers, the farm being part of a village. The system in central parts of Sweden was quite similar to the Danish one. In the northern regions of Sweden and Norway, with mainly Sami settlements, hunting and fishing provided a living.

A basic issue is whether the farmers owned their land themselves or were tenants under a landlord. For Denmark, historians have described the century before the Black Death as involving a change from owning to renting land (Fenger 1989, 30). For Norway, earlier historians thought this transformation came

about during the High Middle Ages due to higher taxes levied by the king, but recent historians have questioned this connection and pointed out other ones. Along with the increasing population, new land was cleared. By then all land was owned by someone, preferably the king. Newly established farms were therefore under a landlord from the very outset. At the same time, slaves were scarce and therefore expensive, so free workers became more economic to use than slaves (Sigurðsson 1999, 202). The social group of slaves slowly disappeared, and they gradually became tenant farmers instead. In Sweden this development came later, and slaves were used up to 1300. The main issue for historians today revolves more around the right to use the land and keep the harvest, while the question of owning or renting is of less importance (Fenger 1989, 31). For the farmers it did not make any great difference whether the land belonged to themselves or to a distant landlord (Ulsig 1989, 44f.). Tenant farmers had a quite safe position, and signed contracts which often secured their rights for their lifetime, and sometimes even for their heirs.

3. Towns

The first traces of urbanization in Scandinavia came during the Viking Age. The population and production had by then reached a level which made urban centres possible. They were mainly based on trade, and were of a seasonal character (Helle 1993 b, 647). During the High Middle Ages, towns grew in number and size, took over constantly more functions and established permanent bases. Trade was still one of the basic functions of the town, both domestic and international. Towns served as depots for goods brought in for landlords, such as the Church, a monastery or the king. Many of these goods were sold on the local market, which also attracted farmers and peasants from nearby. Coastal towns were often visited by ships carrying valuable goods. From the 13th c. the Hansa league became a growing factor in foreign trade. It consisted of a chain of towns from which merchants traded with other towns around the North Sea and the Baltic Sea. One of its four main offices was in Bergen, Norway, but from several other important trading points the Hansa covered the Scandinavian market.

The landlords, including the ecclesiastical ones, played another important part; besides

bringing in goods and thereby inspiring economic growth, they initiated major building activities. By enhancing their institutions with churches, cathedrals, and royal estates, they increased their importance further. This also meant firmer control and administration. With set tasks and permanent officials, it was easier to have a more efficient form of administration, and offices for issuing documents became more accessible to common people as well.

In Norway, the kings became active in promoting the growth of towns during the 11th c. This was seen as an important task for political unification (Helle 1993 b, 647). During the following century they continued to strengthen these centres, especially as episcopal residences. By establishing this power there, the towns were guaranteed further growth and had a well-organized institution to lean on for the organization of domestic matters. In Denmark, this development occurred even earlier than in Norway. Towns became important centres for administration and minting, and where the religious institutions also had a foothold, there were major centres. For Sweden, urbanization came somewhat later, due to the later development of ecclesiastical institutions and political unification. Two of the main factors promoting urbanization were not present to the same extent in Denmark and Norway until the late 12th c. and the start of the 13th c. and onwards (Helle 1993b, 647). Denmark had by far the most towns; it was also the state with the biggest population. Around 1300, there were approximately 100 towns in Denmark, 40 in Sweden and only 16 in Norway (Sigurðsson 1999, 159).

For a city to be a capital it needs to fulfill major functions for its surrounding area, on a permanent basis, and it must be the seat of the government (Poppe 1997, 191 ff.). Roskilde in Denmark and Nidaros in Norway seem to have been close to fulfilling these demands; they were major sees and of great importance. Between the 12th and 13th c. this changed. In Norway, Bergen became more important, and later Oslo, in Denmark, Copenhagen increased in strength. To begin with, Copenhagen was under the bishop of Roskilde, but in 1416 changed to the king. In Sweden there was no city with a similar profile. Stockholm was founded in the middle of the 13th c., and did not become strong until a century later. What seems to have disrupted the early development of the main cities were in-

ternal disputes. The powerful leaders could not rest long enough in neither of the cities to develop it as a more permanent base. Life in the towns differed from life in the villages or countryside. First of all, production was specialized. Craftsmen became masters of their profession and employed trainees, building up workshops. Merchants built up their business in much the same way. Both could gather together in guilds or fraternities which were exclusively for skilled men in their respective professions. From the 12th c. guilds were founded in Denmark, which had the largest number, but these organizations were also represented in Norway and Sweden (Jacobsen 1993, 249). In later centuries their influence increased, and women were occasionally accepted, but mainly as daughters or widows of a deceased master, if they carried on his trade.

4. The Church

The change in religion from paganism to Christianity represented a change of cult and practice more than a change of belief (Aarflot 1978, 11). The way was prepared by the contact Scandinavia already had had with Christianized countries, by way of trade, travel and visiting missionaries. Some Christian ideas are seen by some to already exist in pagan mythology (Aarflot 1978, 9). For the kings this new religion was a handy tool for use in their attempts to unify countries under their crown. Compared to Europe, the kings were strengthened when Christianity was introduced and accepted. The king stood as the supreme protector of the Church, with the right to choose its vicars and bishops. Local powerful leaders had to accept this superiority of the king together with accepting the new religion. Scandinavian kings must have realized the benefit of this, and so the early Church in Scandinavia is seen by modern historians as the king's church, not so much the peoples' (Sigurðsson 1999, 102). By the start of the 12th c. Christianity was accepted, with a varied amount of resistance in different areas (Sawyer/Sawyer 1993, 101). Where there was a strong local figure of power there also was much resistance to this change, but through use of pressure and force, resistance was quelled.

The Church extended its organization to cover the whole area. People were divided into parishes belonging to a church and under the control of a bishop who had an increasing number of ombudsmen to assist him with ad-

ministration, legal matters, pastoral visits and education within the bishopric (Norseng/Nedkvitne 1991, 107). Through this system the Church could gain control and make sure that all its rights and privileges were respected. One of these was the tithe, an annual tax every household had to contribute for the services the Church offered (Liebgott 1984, 34). The earlier system involved paying for each service, a practice strongly condemned by the central Church and the Pope, as they claimed this amounted to simony – the sale of ecclesiastical services and positions within the Church (Norseng/Nedkvitne 1991, 68). The new tax, the tithe, was divided into three parts in Denmark and Sweden, and into four parts in Norway: one part for the upkeep of the church, one for the vicar, one for the bishop and, if split into four, the fourth part was for the poor. Thus a steady income was secured, but in many places the patron of the church kept part of it (Sawyer/Sawyer 1993, 110). It is most likely that tithing was introduced at the beginning of the High Middle Ages, and by 1130 it was well established in Norway and Denmark. In Sweden tithing was established somewhat later, around 1160. For all the states it is linked to the founding of archbishoprics. If not earlier, the tithe then became part of a well-organized system. This set contribution, together with the canonization of saints and most of all the establishment of monasteries, was important for the founding of further archbishoprics in each of the states. Each country had a royal saint: in Norway the Viking King Olav, Denmark had King Knud, and Sweden chose King Erik. Not all of them were immediately enshrined or declared saints by the Pope, but by having their own sanctified king as a central holy figure, the countries were recognized as politically separate states (Fenger 1993a, 97).

Up to 1103/04, Scandinavia came under the archbishop of Hamburg/Bremen, but due to a conflict between the Pope and the German Emperor, Lund in Scania was established as a see for the archbishop of Scandinavia. In short the Emperor did not accept the supreme power of the Pope, and he was supported in this by the archbishop of Hamburg/Bremen, who therefore was dismissed by the Pope. The foundation of the see in Lund was a political move by the Pope, to put the Scandinavian Church directly under his control. Half a century later, the Pope sent one of his cardinals to Norway in order to establish a separate archbishopric. It was founded in Nidaros in

1152/53, now the city of Trondheim. This was made possible through carefully prepared groundwork. The cardinal went on to Sweden for the same purpose. Due to a conflict about where to place the see, Linköping or Uppsala, the attempt was not successful. A decade later the archbishopric of Sweden was founded at Uppsala in 1163/64. Through this the Church became a strong power in each of the countries, the division from Lund meaning that each state had a complete ecclesiastical organization within its borders.

The influence of the Church reached far, even into marriage. From being an agreement between two families, it became a sacrament of the Church at the beginning of the 12th c. (Holtan 1996, 66). The Church claimed that the bride and the groom must both give their consent for the marriage to be valid, but in reality the woman had no way of refusing the advice of her father or her legal guardian in spite of her own wishes (Sawyer 1994, 22). As marriage became a holy agreement, divorce was no longer an option unless the marriage was proved to be based on false assumptions (Sigurðsson 1999, 220). The Church focused on marriage as a sacrament along with demanding its own clergy to observe celibacy. The main goal of marriage was to secure lawful heirs, but the property and economic power of the Church was not to be split up through inheritance. So few priests got married, instead they lived together with their concubine outside the law and the intentions of the Church, but with the general acceptance of secular society. Towards the end of the 13th c. the Pope gave permission to use banishment from the Church as a punishment for its men still living in sin, showing that the doctrine of celibacy was by then well established.

5. The monastic movement

One important political precondition for the see in Nidaros was that monasticism already had gained a foothold in the country (Helle 1995, 26). Monasticism had a great impact on cultural life in all Scandinavia, starting ca. 1100. In the whole area it is estimated that there were about 200 monasteries and convents at the same time that the population reached its peak, giving one religious house per approximately 10,000 inhabitants (Gunnes 1987a, 34). Most, about 125, were in Denmark, there were about 50 in the Swedish area, and the rest were in Norway

and Iceland. Benedictine houses were established first, representing a practice with hundreds of years of tradition behind it, based on the rule of St. Benedict of Nursia. This rule was originally made for a male order, but was used by women as well. Soon to follow were the reformed Cistercian monasteries, as well as the more pastorally oriented Augustine houses. In Scandinavia, the monasteries have been seen as isolated cells interacting poorly with society around. They were foreign by origin, and in the Scandinavian kind of society they could not fit in well. But the number of houses shows that they were not a marginal phenomenon, and being situated near or within growing towns, they were both visible and audible to a lot of people. The monasteries had more contact with the nearby community than estimated earlier, and by being holders of great estates, they had indirect contact also in less densely populated areas (Inntjore 2000, 104, 176). For the monks and nuns, time was divided between prayer and labour: praying for their souls and for Christendom, working for self-preservation. The latter was meant to reduce contact with the outside world to a minimum, idealistically according to the original tradition (Gunnes 1987a, 36). The houses were mainly for religious specialists. Monks and nuns were seen as such because they lived a holy life and therefore had greater influence. The prayers they read benefited the rest of society, securing the salvation of Christian souls and being a counterweight to the consequences of sin. Laymen who gave these enclaves economic support received special benefits by being included in the prayers. For donations of a certain size one could become brother or sister in a monastic house, the closest one could come to membership without actually joining the order. This is called the economy of salvation: holy people performing vicarious merits in exchange for maintenance of their institution (Lawrence 1989, 69). Both sides were givers and receivers of necessities, creating a system of functional reciprocity (Burton 1994, 210, 211).

Founding religious houses was an action of the upper classes, and both ecclesiastical and secular powers stood behind this (Liebgott 1984, 58; Gunnes 1987b, 66; Nyberg 1993, 416). Together they had economic means, basically land, and they were also the promoters of the new religion. Bishops and kings had connections abroad, and could invite foreign monks to go north and start a new tradition. The founders often became special patrons of

the institutions. They gained prestige through their religious activity, and gave prestige to these institutions by belonging to the upper class. Both men and women were founders; in Sweden the first monastic house was a nunnery founded about 1110 by the queen and her king (Sawyer 1994, 15). In Norway, it was English monks who first constituted the earliest communities, which were gradually taken over by natives. The same was partly true in Denmark, but with closer contacts with central Europe. In Sweden, it was mainly French monks who were the first (Lindqvist 1992, 243). It has often been pointed out that there were far more monasteries for men than convents for women, and that houses for monks were larger and richer than those for nuns. In England, most convents were small and poor, more than half of them with fewer than ten members (Power 1975, 89). In comparison, the Scandinavian convents were larger and richer, but also here monastic houses for men outnumbered those for women. Denmark had about thirty convents, Sweden fewer than ten and Norway only five (Andersson 1996, 1; Gunnes 1987a, 34; Langkilde 1973, 13). One reason given for this lack of balance was that women could not read mass themselves, and because of this people preferred to give money and land to monks who could organize a full service and mass. But priests were attached to convents and carried out the sacraments there, clergymen from a nearby church could easily provide the services needed, and nuns could say the daily prayers under the leadership of the abbess or prioress. In some male orders there was massive opposition to their nuns, especially by the Premonstratensians and Cistercians in the 12th and 13th c. The Pope helped out, issuing a declaration which prohibited new female orders to be founded. This must have held back establishment of convents also in Scandinavia, as is shown by the fact that most convents were Benedictine houses both in Norway and Denmark. Only in Sweden were most of them established as, or turned into, Cistercian convents.

A change came with the two new orders founded at the beginning of the 13th c., Franciscans and Dominicans. These, the mendicant orders, had a different ideology from the traditional monasteries. They valued poverty and moved among the people, situated their houses in towns, and preached directly to the people. Their houses and churches were open to everyone, and they achieved great success. They became rivals to the established clergy

and older monasteries, as people supported these new orders and so decreased their support for the older ones. The mendicants directed criticism towards the greed within the main Church, an accusation most people could agree with. Annual confession was compulsory from 1215, and this meant a new potential income for the Church. Many people preferred going to the barefooted brothers, as they also were known, and economic issues like this triggered many a dispute with the main Church (Ullern 1997, 23, 24). Another great change came with the Brigettines, a new order founded in the last decades of the 14th c. after years of planning. The founder was Birgitta of Vadstena, named after the main monastic house of her order. It was the only original contribution to monasticism from Scandinavia, and it was special in having men and women within the same institution. This was usual in the early monastic phase in Europe, but was later prohibited for the sake of moral standards. In the Swedish order the abbess was to be leader of the entire house, meaning the monks were under her supervision. There were to be no fewer than 60 nuns, but only 12 monks plus their leader. The brothers had the functions of hearing confessions and performing the sacraments, and so the whole community had the required expertise within their walls. The movement grew stronger during the Late Middle Ages, spreading throughout Scandinavia and Europe. Its high cultural and educational level was one of the main assets of the order; it held among other things well-equipped libraries.

6. Education and literary centres

Teaching was seen as an ecclesiastical function, and the Church was the main educator (Le Goff 1993, 66). It introduced scholarly studies into Scandinavia, based on European tradition. The first monks to establish houses in Scandinavia were foreign, with education from abroad. This tradition was continued; even if the monks were recruited at home, they still received their main education in central Europe, primarily in Paris and Bologna (Bagge 1981, 141). Besides studying religious literature and liturgy, canon law was the most common and almost a compulsory subject. All the Scandinavian countries had a large number of students abroad, and some special scholarships for Scandinavians, covering housing costs. From Sweden alone about 900

students went to Paris during the 13th and 14th c. (Lindqvist 1992, 244). For Norway, it is estimated that about half of the canons had a university education, in Denmark even more (Bagge 1993, 153). At first it was the great monasteries, such as St. Victor in Paris, which provided this education and gained an enormous reputation for its scholars. St. Victor was an Augustine monastery, and the Scandinavian clergy who were educated there became well acquainted with Augustinian traditions and organization. Scandinavian bishops often wanted to organize both their diocese and canons according to Augustinian practice. Members of the order had to be ordained as priests, so a high level of education was needed. It also meant that they could teach new priests, and skilled recruits were always needed for the growing Church. Around the sees, important educational, literary and cultural centres arose, and cathedral schools were founded. This change was again based on a European trend. During the 13th c. secular universities gained new ground in providing education at the expense of the monastic houses (Bagge 1986, 224, 225). For the clergy, a secular education involved the same subjects and level of knowledge, but for women the change was dramatic. Universities and cathedral schools were closed to women, who were normally not allowed to attend these public places (Bagge 1986, 178, 179). Apart from aristocrat homes, convents represented the only possibility for women to be educated, but being excluded from the most important places of learning, it became difficult for women to remain within the learned elite.

It is clear that the Church in all the states was important for education, both initiating it and demanding it. Religion was based on the written word. Literary activities grew at the same pace as the Church and urbanization developed, but neither of these factors was sufficient to create a literary centre (Mundal 1994, 71). The secular and the pagan kings already made use of writing for legislation, and Iceland had no urban centres, but still had well-developed educational and literary activities. The main factor behind the development of literary centres was social differentiation. With a growing elite, time and the means were available to engage in such activity. Books and parchment for letters and diplomas were expensive to buy or copy, and the work took a great deal of time. With an expanding upper class containing educated clergymen, the means became available.

7. Finances and succession

The initiating and economic force behind the Church and the religious institutions was, as already mentioned, the upper class. The lower classes gave to these institutions as well, but of course less, although more frequently in the later Middle Ages. The habits of the leading elite diffused down to the lower social levels, but as the ideology of the Church tightened its grip on people's souls, this also resulted in economic benefits. Maintenance of churches was to some extent voluntary, in contrast to the obligatory taxes to support the king and growing state. Farmers, peasants and townspeople contributed to maintaining the upper class and the king through the whole of the High Middle Ages. The king's main tasks were to secure peace and administer justice. This applied both within the realm and in order to secure its borders. From the time of itinerant kings, he had the right to visit his subjects and to receive lodging and food for himself, his horses and the companions who travelled with him. Through inheritance and confiscation the kings built up a system of estates or larger farms which became special residences and local administrative centres. The king could then direct his subjects to bring their tributes to these places. Maintaining the roads, conveying goods, and working on the estate were among the duties of his subjects.

Of great importance were the military services, especially at sea, as travelling by water was the most common means of transport. The usual system was to divide people into groups which were responsible for a ship; they took turns at being the crew and securing supplies for three months (Hørby 1993, 538). On land, a change in the military service came in the middle of the 13th c. During the 12th c. the armies had met increasing resistance from European cavalry (Malmros 1993, 389). This made it clear that the earlier horde of armed peasants was too ineffective and old-fashioned. It became necessary for the Scandinavian kings to keep a trained elite of soldiers. The kings also fortified the borders on some strategic points. Castles and fortresses were built on royal ground, but with civil support. In Denmark, the building of castles began about 1150 (Hørby 1993, 538), the same time as for Norway (Roesdahl 1993, 215). In Sweden it started somewhat later, in the 13th c. (Fritz 1993, 541). To build and maintain these strongholds, more money was needed. The fleet was not sent out every year, so in-

stead the king started to demand a fixed amount of money for each year it was inactive. This came to be an annual contribution, along with taxation for military service ashore. In the courts, the king had another means of gaining income. More uniform legislation and prosecutors working on his behalf secured an increasing source of income from fines. But even with a more predictable income, the Crown was almost constantly short of funds. In all the three countries there were longer periods of civil war, connected with struggle for the crown. The general pattern was that two families or political fractions both claimed the right to the throne. In Denmark and Sweden the kings gradually pledged larger parts of their countries to foreign lords, mainly German ones, in exchange for military aid or loans to cover the cost of this warfare.

A candidate for the Crown had to meet two opposite demands: he had to be related to a previous or the present king, and to be elected by leaders at the regional assemblies (Jochens 1993, 621). Every son of a former king could claim hereditary rights, and so there could be many potential successors. During the 12th c. the principle of legitimacy acquired the same level of importance that the Church put on marriage. The system moved towards one of primogeniture, meaning that the oldest legitimate son was automatically the legal heir. Even so, he still had to be elected – the assemblies had the option of either finding him suitable and accepting him, or not. Accordingly there were decades of joint rule by brothers or competitors, but the focus on primogeniture ended horizontal succession and led to one-man rule. In the early 14th c. Norway and Sweden came together in a personal union under the same king. Previous alliances through marriage led to one candidate being entitled to both crowns. Repeated decades of civil wars, with several assassinations, had reduced the number of direct successors, and finally the economic crisis made it preferable to have only one king to maintain. Shifting relations finally led to a union of the three Scandinavian countries at the end of the century.

8. Legislation

The general view has been that the oldest laws were transmitted orally for centuries before they were written down, and that this custom provided proof that they were of native origin. Recent scholars have questioned this, as it has

been shown that the West-European laws are quite similar, and as well as Germanic law, they are based upon Mosaic law in the Bible (Sjöholm 1993, 387). It is now estimated that most preserved laws or fragments contain both native elements and foreign influences, and that these two elements in some cases cannot be separated and distinguished (Sawyer/Sawyer 1993, 19f.). By 1100 Norwegian laws were influenced by the Church, which exerted further influence on Scandinavian laws by providing scribes when they were codified and written down. As the clergy received a European education, especially in canon law, they were the leading elite in pursuing legislation. The archiepiscopal see in Lund held special sway over Danish and Swedish laws, while the see established later in Nidaros had a similar influence on Norwegian laws. In spite of uniform influences, laws and legislation differed within the states (Sawyer/Sawyer 1993, 17ff.). For Norway and Sweden, we know of early provincial laws, covering a region known as a "landscape". They were compiled by the assemblies in these regions, often initiated by local aristocrats. In Norway, the laws were accepted as such, while in Sweden it seems that laws were understood more as recommendations than as actual regulations. For Denmark, the earlier laws (before 1241) covered selected issues rather than a region, and were to some extent perceived as agreements (Fenger 1993b, 384). In Norway, the earliest codification of regional laws began at the end of the 11th c. (Rindal 1993, 385). During the following century these lawbooks were copied, and the canon parts were revised on the initiative of the archbishop. Further revision occurred in the 13th c., now with the king as the force behind it. A general law for the entire state was established, followed by a special law for towns. A similar development took place in Sweden, but recording of the regional laws started somewhat later, and the revised versions were not accepted as general law until the middle of the 14th c. For Denmark, no general law was established throughout the Middle Ages. The king tried to promulgate regulations as general laws during the 13th c., but was defeated by a strong aristocracy which limited the king's possibilities as a legislator (Fenger 1993b, 384).

90. Old Nordic: A definition and delimitation of the period

1. Introduction
2. Delimitation in time
3. Delimitation in space: the language area
4. Internal composition of the area
5. Literature (a selection)

1. Introduction

In this handbook, the term “Old Nordic” is used for all the North Germanic languages from around 1100 to the mid-14th century: Old Norwegian-Icelandic, Old Danish, Old Swedish, and Old Gutnish. The language of the Icelandic sagas plays a special role in this connection, as it has in various ways set the standard against which the language of the oldest manuscripts in the other Scandinavian languages has been measured. This period lies between the pre-manuscript Common Nordic period and the subsequent radical simplification in all the other languages, of a morphological system quite similar to the Icelandic one. Old Danish fits poorly into this mould, because the earliest manuscripts in that language already show an advanced stage of morphological simplification.

A term commonly used for Old Nordic is “Old Norse”, with a distinction between West Norse and East Norse. An alternative, narrow use, as e.g. in Haugen (1976), restricts Old Norse to the West Nordic languages. This variation in meaning is to some extent veiled by the widespread use of Old Icelandic as a representative of all the Old Nordic languages, e.g. in comparative Germanic studies. This practice underlies the common use of *Altnordisch* in the German research literature since Grimm, who was influenced by Rask’s equating “det gamle Nordiske Sprog” with Icelandic. In Danish, a commonly used term has been *oldnordisk*, where *old-* means something older than *gammel-*. The Dan. usage has been largely motivated by the view that Old Icelandic was a faithful enough representative of the common Nordic language which was also the ancestor of the language of the oldest Dan. manuscripts. In Icelandic and Swedish works, there is a marked tendency to call the old language Icelandic (with or without further specification of the language stage), even sometimes when Old Norwegian is included. In the

Norwegian literature, it was common to label WN generally as “Old Norwegian” (*oldnorsk*, *gamalnorsk*), and in accordance with the usage of the OIcel. sources, *norrønt* (meaning Norwegian – see 4.) has gained wide currency for WN more recently, especially in Norway.

2. Delimitation in time

In delimiting the Old Nordic period, various criteria can be applied having to do with the language itself, its use and its (cultural) environment, and also with the primary sources available. These criteria are not equally applicable to all the languages, they do not give precise results when applied to the individual languages, and results for the individual languages call for varying approximate dates. As for the earlier time limit, around 1100, the individual criteria applied to the various languages would thus call for a time limit anywhere from around 1000 to the mid-13th c. A purely linguistic criterion (e.g. Haugen 1976) which applies equally to all the languages is the split of Common Nordic into East and West Nordic as separate entities, which in turn requires deciding what counts as separate entities. It is a common assumption that the first significant differences between the Nordic languages emerge in the 11th c. (e.g. Noreen 1913, 17f.; Skautrup 1944, 133f., 180; cf. Haugen 1976). Another criterion has to do with the emergence of manuscripts in the vernacular, which is an important factor in the external conditions for language development, and at the same time leads to an explosive growth in preserved primary sources for the languages concerned. With regard to Dan. and Sw., this aspect has commonly been used to set apart the preceding period by the use of the labels *runedansk* and *runsvenska*, as the rather numerous Runic inscriptions are the only vernacular texts in that period. Both Brøndum-Nielsen (1928–1973) and Skautrup (1944) use the term *runedansk* for the period up to around 1100. Runic inscriptions in Denmark stop for the most part around 1050 (except in Bornholm, where they continue for a couple of centuries). Then there is something of a gap in the vernacular writing tradition, as the first Dan. laws were committed to writing in 1171–74, and the oldest preserved manuscripts are from the mid-13th c. As for Sw., the commonly accepted limit for *runsvenska* is that given by Noreen (1904), around 1225. This is the time when the Swedes are assumed to have started committing their

vernacular laws to writing, and the oldest preserved fragment is assumed to be not younger than the mid-13th c. There are relatively few Sw. Runic inscriptions from after the early 1100s. In Iceland, the earliest securely datable cases of manuscripts being written in the vernacular are from the early 12th century: the law book *Grágás* in 1117–18, and the historical work *Íslendingabók* in 1122–1133. The earliest Icel. manuscript fragment is from the mid-12th c. A very old and respectable tradition has it that Norwegian laws were first written down in the 11th c., but the earliest preserved Norw. manuscript fragments are from the second half of the 12th c. A different criterion for periodisation, cultural in nature, is the end of the Viking Age, commonly put at 1066. This may be taken to mark the end of the expansion of the language area, with concomitant influence on other languages.

The later limit of the Old Nordic period is even harder to determine. It has been usual to draw a line for all of the individual languages somewhere in the period 1350–1375, but the criteria for doing so have varied, and so have the labels of the periods. A criterion specific to Sw. is the emergence of a unifying written norm. For Norw., the breakdown of the old scribal norms as a result of the Great Plague in 1349–50 has been used, as well as the onset of large-scale Sw. and Dan. influence on the language. Also specific sound changes, or a combination of them, have been important criteria, not least for Icel. The only criteria which are not too language-specific have to do with systematic language properties, primarily the radical simplification of the old morphological system, but also the strong Low German influence on the vocabulary. These criteria, however, are not applicable to Icel., which kept its morphological system essentially intact and never experienced LG influence in a degree comparable to the mainland languages. The case of Old Danish is special, in that morphological simplification was already at a rather advanced stage at the time of the oldest manuscripts in that language, and this process must have been well on its way early in this period. This is probably one of the main reasons why both Brøndum-Nielsen (1928–73) and Skautrup (1944) call the period from around 1100 *middeldansk*. They use *olddansk* interchangeably with *runedansk* for the period preceding 1100, while *gammeldansk* is used as a cover term for the whole period from the Viking Age to the Re-

formation. Within *middeldansk*, these scholars put the limit between *ældre* and *yngre middeldansk* at 1350, which is the approximate time indicated by the other criterion cited above, LG lexical influence, although that development emerges earlier especially in Jutland. Wessén (1968, 70) sees *yngre fornsvenska*, from 1375, as characterised by both morphological simplification and LG influence on the vocabulary. Indrebø (1951, 214–216) sees systematic morphological simplification as an essential characteristic of Middle Norwegian (from 1350) and dates the onset of that process to around 1375. The year 1350 is used as a convenient round number.

3. Delimitation in space: the language area

At the beginning of this period, much of the Viking Age expansion of the language area had already been reversed, but the period was marked by some expansion closer to home, especially in the northern Baltic area. The Åland Islands had a Sw.-speaking population in the early Middle Ages and then again from the 12th century onward (Hellberg 1987), and from the 13th c. onward, the southern and midwestern coast of present-day Finland were colonised, and the northwestern coast of Estonia around the same time. In the south, there was already pure Danish settlement down to Slien (G Schlei) and Dannevirke (except for Frisians on the west coast), and the uninhabited zone down to the Eider river became colonised partly by Danes during this period. Turning to the British Isles, Norw. is commonly assumed to have survived in some Irish towns until the early 13th c. or so (Barnes 1993, 75). On the Isle of Man and in the Hebrides the language probably died out towards or around the end of this period (Barnes 1993, 76–78). The Orkneys and Shetland, as well as Caithness at the northern tip of the Scottish mainland, had pure Norw. language communities throughout this period (Barnes 1993, 78–80). In addition to the Faroe Islands and Iceland, a mostly Icel. colony also remained in Greenland throughout the period.

4. The internal composition of the area

The Old Nordic language area constituted a dialect continuum. Given this, its division into languages must be somewhat arbitrary and

will be biased further by the restricted manuscript sources, in particular the lateness of the East Nordic manuscripts. One may assume that there were four Nordic languages around 1300: Old Norwegian-Icelandic, Old Gutnish, Old Danish, and Old Swedish, with the Old Scanian dialect at least as close to Swedish as it was to the other dialects in Denmark. In the 12th c., it may be more reasonable to posit only three languages, counting Danish and Swedish as one.

The views of the speakers to some extent confirm the picture one sees in the sources. Only some of the clearest evidence will be discussed here (Melberg 1952; Karker 1977). There is evidence, mostly from Icel. sources, suggesting that all the varieties of Nordic were seen by their speakers as one and the same language at the beginning of the period. At this stage, *dǫnsk tunga* ‘the Danish tongue’ is the only known language name and was used for all the Nordic languages. This use is documented in a scaldic poem by the Icelander Sigvatr Þórðarson as early as 1014–15, and the Icelandic law code *Grágás*, revised while being written down in 1117–18, often uses *dǫnsk tunga* in this way. It states that anyone who didn’t learn to speak *á danska tungu* ‘in the Danish tongue’ as a child must live in Iceland for three years before he can be a judge. *Grágás* also talks about the three kingdoms of Norway, Sweden and Denmark where *ór tunga* ‘our tongue’ is used. The First Grammatical Treatise from the mid-12th c. includes the phrase *lesa danska tungu* ‘read the Danish tongue’. *Dǫnsk tunga* (or *danska*) remained in use in Iceland for the native tongue throughout the Middle Ages, and the term seems also to have been used in that way in Norway, and was certainly used about the Norw. language in the Orkneys. It must be kept in mind that this use of the term *dǫnsk tunga*, although robustly documented in the 12th century, reflects an old tradition, which perhaps was reproduced without too much consideration for its appropriateness at the time. This tradition is challenged by the use of a separate name for Norwegian-Icelandic in the late 12th century, namely *norrónt mál* (and similar phrases), i. e. ‘the Norwegian language’. The new usage reflects a conscious choice at the time, confirming the perceived distinctness of West Nordic from East Nordic (or at least Danish), and of the perceived unity of the language in Iceland and Norway on behalf of the Icelanders. The earliest reliable evidence for this new view is found in a manuscript from around 1192 of

the Icel. calendar treatise *Rímbeḡla*, where the native tongue is called *norrónt mál*. There are a number of examples of the use of *norrónn* in Icelandic sources from the first half of the 13th c.; e.g. Snorri Sturluson (d. 1241) uses *norrónt mál* and *norrón tunga* a number of times in his Norwegian kings' sagas. Examples abound from the second half of the 13th c. and later, from Norw. as well as Icel. sources. Óláfr Þórðarson, in his *Third Grammatical Treatise* from the mid-13th c., mentions that the Danes use *v* before *r* (as in *vreiðr* 'angry') in cases where it is not used any more "in *norrónt mál*". The adjective *norrónn*, when referring to other things, usually means Norwegian, although in some cases the Norw. colonies may be included, and sporadically the word may refer to the whole of Scandinavia. When used about the language, it almost always refers to the language in Iceland and/or Norway rather than all the Nordic languages, and never to the language in Norway in contrast to Iceland. The more recent adj. *nornskr*, later *norskr*, 'Norwegian' does not appear to have been used about the Norw. language until the mid-15th c. There is no evidence that the Icelanders used the adj. *islenzkr* 'Icelandic' for their own language until the Reformation age. As for distinguishing Swedish from Danish, the term Swedish isn't mentioned specifically in sources from that country until the first half of the 14th c., but then examples abound, in poetry, Bible translations and laws. However, because earlier sources are so sparse, this cannot be taken as a suggestion that up to that time the Swedes saw their language as being the same as Danish.

Certain dialect differences may be assumed to have existed within the Nordic language area as early as the Proto-Nordic period. Additional differences emerged during the syncope period and in its aftermath, as umlaut and breaking did not result in the same changes in all of the Nordic language varieties. These early differences mostly separate the East and West dialects, and so do most of the other innovations up to the period under discussion. Although many of the changes during the ON period follow that same East-West distributional pattern, there is an increase in southern innovations during that period, in other words changes originating in Denmark, which distinguish Dan. from the northern bulk of the Nordic language area. The following overview of language differences, with an emphasis on the differences most conspicuous in the primary sources of this period, is based

on Noreen (1913, 1904) and Brøndum-Nielsen (1928–1973), unless otherwise stated. OIcel. is as a rule taken as a representative of WN, and OSw. of EN. Because of its special status with regard to the East-West dichotomy, OGu. is left out of consideration in the following general overview but will be treated separately towards the end of the article. Some apparent differences in the examples are purely orthographic: long vowels are marked with an accent in Icel. (*á*), a macron in EN (*ā*), and non-syllabic /i/ is written <j> in Icel. (*ja*) but not EN (*ia*). Furthermore, a double consonant is written as a single letter word-finally in EN (*mit*) but not in Icel. (*mitt*); for Icel. <þ/ð>, Sw. uses <þ>, and Dan. <th>, and EN but not Icel. denotes fricative *g* with <gh>.

Starting with differences which were present at the beginning of the ON period, one difference involves the so-called *a*-umlaut of /u/ > /o/. WN shows much more of this change, e.g. Icel. *brot* – Sw. *brutt* 'fragment', Icel. *boð* – Sw. *bub* 'offer', but Jutland often follows WN. *i*-umlaut is more widespread in WN than in EN and is most conspicuous in the verb morphology. Thus, in the past subjunctive, strong verbs and *ja*-verbs have *i*-umlaut in WN only, e.g. Icel. *væri* vs. Sw. *väre* from *vera* 'be'. *i*-umlaut is also generally absent in EN in the pres. ind. sg., e.g. Icel. *heldr* – Sw. *halder* 'holds', Icel. *skýtr* – Sw. *skiüter* 'shoots', but Sw. and especially Jutland Dan. show a number of residual forms with umlaut. There is also much less *u*-umlaut in EN, e.g. Icel. *lqnd*, *lqndum* – Sw. *land*, *landum*, nom./dat. pl. of *land* 'country', Icel. *sok* – Sw. *sak* 'charge'. There is somewhat more breaking in the East, e.g. Icel. *ek* – Sw. *jak* 'I', Icel. *stela* – Sw. *stjala* 'steal', with Jutland often following the West. Restricted to the East is so-called *w*-breaking, the change /i/ > /iu/ before *ngw*, *nkw*, *ggw*, where WN has /y/ or /ø/, e.g. Icel. *syngva* – Sw. *siunga* 'sing', Icel. *sokkva* – Sw. *siunka* 'sink', Icel. *bygg* – Sw. *biug* 'barley'. WN has *ú* word-finally and before a vowel where EN has *ō*, e.g. Icel. *brú* – Sw. *brō* 'bridge', Icel. *trúa* – Sw. *trō(a)* 'believe'. EN has the opening of *é* > *ǣ*, except before another vowel, e.g. Icel. *fé* – Sw. *fǣ* 'property', Icel. *réttr* – Sw. *rætter* 'right'. It also has the general opening of short *e* > *æ*, e.g. Icel. *drepa* – Sw. *dræpa* 'kill', Icel. *svelta* – Sw. *svæltā* 'starve' (intransitive), Icel. *með* – Sw. *mæþ* 'with'. Most WN also has the pre-literary merger of short *e* and *æ*, but the result is *e* in most dialects. The eastern monophthongisation of diphthongs is relatively late, e.g. Icel.

steinn – Sw. *stēn* ‘stone’, Icel. *reykr* – Sw. *röker* ‘smoke’, Icel. *auga* – Sw. *ōgha* ‘eye’. Turning now from vowels to consonants, the assimilation of *mp*, *nk*, *nt* to *pp*, *kk*, *tt* is more widespread in the West: Icel. *svoppr* – Sw. *svamper* ‘mushroom’, Icel. *ekkjja* – Sw. *ænkia* ‘widow’, Icel. *brattr* – Sw. *branter* ‘steep’. The change *vr* > *r* wordinitially is western: Icel. *reiðr* – Sw. *vrēþer* ‘angry’, Icel. *riða* – Sw. *vrīþa* ‘twist’. The loss of initial *h* before *l*, *n*, *r*, on the other hand, is eastern, although it includes Norway, e.g. Icel. *hlaupa* – Sw. *lōpa* ‘jump’, Icel. *hnakki* – Sw. *nakke* ‘back of the head’, Icel. *hringr* – Sw. *ringer* ‘ring’. Around the beginning of the ON period, *d* emerged between *nm* and *r* in all varieties of EN, while the West changed *nmr* > *ðr*; the parallel development *llr* > *ldr* was confined to Scanian and Sw. Examples are **annrir* > Icel. *aðrir* – Sw. *andrir* (Dan. *andræ*) ‘others’, Icel. *breðr* – Sw. *brinder* ‘burns’, Icel. *allr* – Sw. and Scanian *alder* ‘all’, Icel. *fellr* – Sw. *falder* ‘falls’. Morphological differences, in addition to those connected to *i*-umlaut, are seen e.g. in the mediopassive endings *-sk* vs. *-s*, e.g. Icel. *kallask* – Sw. *kallas* ‘be called’.

After 1100, additional East-West differences include the following. In WN, from around 1200 there was a tendency to contract the front vowels *é* and *i* in hiatus before the back vowels *a*, *o*, *u* to yield rising diphthongs, whereas EN tended to keep the hiatus: Icel. *sjá* – Sw. *sēa* ‘see’, Icel. *fjándi* – Sw. *fīande* ‘enemy’ (Hesselman 1948–53, 57–67; Bandle 1973, 42). Between a consonant and an *r*, word-finally or before a third consonant, a svarabhakti vowel became common in Dan. from around 1200, in Sw. from around the mid-13th c. (Skautrup 1944, 250f.), and thus almost universal from the time of the earliest manuscripts. The svarabhakti vowel is mostly *æ* in Dan., in Sw. mostly *e* or *æ*, e.g. *akær* ‘field’, *hæster* ‘horse’, *skiüter/skiütær* ‘shoots’, *böker/bøkær* ‘books’. In Norw. the svarabhakti vowel only becomes common after 1300, in the form of *e/æ*, *a*, or *u*, depending on the dialect, and only after this period in Icel., in the form of *u*. After postconsonantal *r*, *jū* > *ȳ* in EN early in this period: Icel. *brjóta* – Sw. *brȳta* ‘break’. After postconsonantal *l*, this change also occurs early in Dan., but not until around 1300 in Sw.: Icel. *fljúga* – Sw. *flȳgha* ‘fly’. From the earliest Sw. manuscripts onward, final *r* (or perhaps the voiced sibilant *ʀ*) disappears in most cases after *a*, in the minority of cases after *i*, *u*: *hæsta* ‘horses’, *kasta* ‘throws’, but *gōþi(r)* ‘good’ (pl.), *syndi(r)* ‘sins’, *dōmi(r)*

‘judges’, *gatu(r)* ‘roads’ (Wessén 1968, 48f.; Noreen 1904, 248–253; Noreen 1913, 158ff.). This *r*-drop is the strongest in southeastern Sweden (i. a. Östergötland). The Dan. manuscripts have preserved a somewhat similar distribution of *r*-drop even after the wholesale merger of unstressed vowels discussed below, albeit with a clearer influence of morphological analogy (Brøndum-Nielsen 1932, 354–364).

During the ON period, various changes occurred in Dan. which led to a marked difference between Dan. and Sw. at the end of the period. These changes are connected to the concentration of word stress in Dan. (“Dänische Akzentballung”, Bandle 1973, 67–76) which led to “stød”. One of these changes is the wholesale merger of unstressed vowels. In Dan. from the 1100s onward, all unstressed vowels presumably merged to schwa, most often written *æ* in the oldest preserved manuscripts. However, *i* is frequently preserved after *g*, *k*, e.g. *riki* ‘realm’, *ængi* ‘no one’, and *u* often before *m*, e.g. *hanum* ‘him’ (dat.). Full vowels are often retained in Scanian. Consonants were also affected, not least by the “weakening” of strong stops between and after vowels, first to the weak stops *b*, *d*, *g*, then to fricatives, e.g. *diyb* ‘deep’, *wadn* ‘water’, *iartægn* ‘sign’, *taghær* ‘takes’. The earliest examples of this change are from Zealand around 1200, and they are rather common in Dan. manuscripts around 1300 (Brøndum-Nielsen 1932, 76–96; Skautrup 1944, 228–231). Another connected change from around the same time is the weakening of fricative *g* to *w* after back vowels, e.g. *thawær* < *thaghar* ‘when’, *daugh* ‘day’, actually part of a complex of changes (Brøndum-Nielsen 1932, 149–166; Skautrup 1944, 232–235). Connected to the merger of unstressed vowels in Dan. is a simplification of the inflectional system. For noun inflections, even the oldest preserved manuscripts almost consistently have a two-case system, with gen. sg. in *-s* or *-æ*, generally following the old distribution of *-s* and *-ar*, e.g. masc. *daghs* ‘day’, fem. *iorthæ* ‘earth’. This contrasts with the stable four-case system in Sw. Nouns, adjectives and pronouns in Sw. have four cases, e.g. *staver* ‘staff’, gen. *stafs*, dat. *stavi*, acc. *staf*, pl. nom. *stava(r)*, gen. *stava*, dat. *stavum*, acc. *stava*. Scanian, however, only merges nom. and acc. for nouns, and retains all four cases for adjectives and pronouns. For verb inflections, all person forms in the indicative singular tend to merge early in both Dan. and Sw., e.g. *kallar* ‘calls’, *kallaþi* ‘called’, al-

though the 2nd sg. *-t* in the strong preterite remains, e.g. *vēkt* ‘yielded’. In the plural indicative, Sw. retains person inflection: 1st *vikum*, 2nd *vikin*, 3rd *vika*. Dan. merges the persons in the plural and thus mostly shows a number distinction only: *han hauæ*, *thē hauæ* ‘he has/they have’. The subjunctive is not even inflected for number in Danish: *kōpe* ‘buy’, whereas Sw. (and Scanian residually) shows person distinction in the pl. but not sg.: sg. *kōpe*, 1. pl. *kōpom*, 2. pl. *kōpin*, 3. pl. *kōpe*.

The characteristics of ODan. emerge from the preceding discussion. In addition to the features common to EN, it had morphological simplification, merger of unstressed vowels and consonantal changes connected to *stød* distinguishing it from OSw. Of the four Nordic languages at this time, Dan. has the most marked dialect differences (Noreen 1913, 62–64). Jutland is the most progressive in morphological simplification and reduction of unstressed vowels, but at the same time shows some old western traits (e.g. *a*-umlaut and breaking). Scanian stays closer to Sw. as it does not participate fully in the changes connected to the Danish stress concentration, e.g. in keeping three distinct unstressed vowels and retaining more of its morphology. OSw. was characterized by eastern features, including phonological ones such as monophthongisation, but also a limited degree of morphological simplification (esp. in the verb). Dialect differences are not very marked in the OSw. sources. The most distinct dialect is that of Västergötland, which shares some features with ONorw., such as more extensive *a*-umlaut and assimilation of *mp*, *nk*, *nt* (Noreen 1913, 48f.). This dialect also has vowel harmony similar to Norw., with unstressed *e*, *o* following (long or short) *e*, *o*, *ø*. Old Gutnish is characterised in some respects by an extreme position on a West-East scale, but it also shares some properties with WN in contrast to Sw. and Dan. In addition, OGu. shows some conspicuous special developments shared by neither WN or EN. Many of the special properties of Gu. are inherited from Proto-Nordic and the umlaut period. On balance, Gu. was more different from Sw. around 1100 than Sw. was from Dan. and must probably be seen as a language of its own by that time. Thus, in Gu., the so-called *a*-umlaut of *u > o* is absent in almost all environments: *skut*, *fulc*, Sw. *skot* ‘shot’, *folk* ‘people’, as is *u*-umlaut, e.g. *hagguin* – Sw. *huggin/hoggin* ‘cut’. *I*-umlaut, on the other hand, extends to environments (short syllables) where it is

found neither in Sw. nor WN: Gu. *slegr* – Icel. *slagr* ‘blow’, Gu. *steþ* (acc.) – Icel. *stað* ‘place’, Gu. *legþi* – Icel. *lagði* ‘laid’. Instead of *iū* (or *y* originating from it), Gu. has the triphthong *iau*: Gu. *niauta* – Sw. *niūta* ‘enjoy’, Gu. *briauta* – Sw. *brȳta* ‘break’. Unlike in Sw. and Dan., diphthongs are not generally contracted: *auga* ‘eye’, *droyma* ‘dream’, *stain* ‘stone’. Gu. has the change *vr > r* as in WN: *raiþi* ‘anger’. Long and short *æ* and *ø* are raised, *æ > e*, *ø > y*: *lengr* ‘longer’, *mēla* ‘say’, *yx* ‘axe’, *dȳma* ‘judge’.

West Nordic is characterized by stability in its morphological system during this period. The differences within WN remain minor compared to EN. There are differences inherited from the pre-literary period. Thus, Icel. is the only variety of Nordic to retain initial *h* before *l*, *n*, *r*. Norw., on the other hand, shows a clear form of vowel harmony, except in the southwest, where matters are less clear. This vowel harmony, roughly speaking, calls for the high unstressed vowels *i*, *u* after high stressed vowels in the preceding syllable, whereas the mid and low stressed vowels are followed by unstressed *e*, *o*. Later, during the 13th c., Icel. shows some conspicuous vowel mergers which do not occur in Norw., namely the merger of short *o*, as in *lōnd* ‘countries’, with *ø*, as in *gōra* ‘do’, and the merger of *ó*, as in *dóma* ‘judge’, with (long) *æ*, as in *mæla* ‘say’.

3. The second period
4. From parchment to paper
5. Epilogue
6. Literature (a selection)

1. Introduction

In his *Book of the Icelanders* (*Íslendingabók*), composed in the 3rd decade of the 12th c., Ari Þorgilsson (d. 1133) tells us that during the winter 1117–18 the Icelanders started to record their law in writing at Hafliði Másson's residence in Breiðabólstaður in Northwest Iceland (Ísl. Fornr. I, 1968, 23). This date has generally been considered to mark the beginning of secular writing in Iceland.

The *Book of the Icelanders* also informs us that Iceland adopted Christianity in the year 1000 (Ísl. Fornr. I, 1968, 17). With the legitimation of the new religion Christian literature must have followed; Christian learning was supported by written books in Latin. There exists no evidence of the use of Christian books in the first century of the new religion. They must, however, have been used. Without them Christianity could not have survived. Probably the first Latin books were brought to the country by the so-called Papar, probably Irish monks; however, they are said to have left the country when the heathen Norsemen arrived, and there is no evidence of Irish influence in the Icelandic church. The first missionary bishops, such as Bjarnharðr (Bernard) Vilráðsson the Book-wise are likely to

have had a more significant impact (Ísl. Fornr. I, 1968, 18; Bysk. I, 80; cf. Hreinn Benediktsson 1965, 37–38; Gjerløw 1980 I, 17; Ólafur Halldórsson 1989, 62). Ísleifr Gizurarson (1006–1080) was the first Icelander to be ordained as a bishop at the newly established see at Skálholt (1056). At the cathedral he taught young men to be priests. We can therefore be sure that in the 11th c. both liturgical books and schoolbooks existed at Skálholt. Of those books no remains exist, but fragments of liturgical books from the 12th c. (Lbs fragm 58) and from the beginning of the 13th c. (AM 98 I–II 8vo) have survived (Gjerløw I 1980, 27–31). Latin letters were probably already known in Iceland at the beginning of the 11th c., but scholars do not agree on whether runes were used for writing books (cf. Björn M. Ólsen 1883, passim; Hagland 1993, 166–169; Sverrir Tómasson 1993, 237).

1.1. The first Icelandic bishops, Ísleifr Gizurarson and his son Gizurr Ísleifsson (ca. 1042–1118), were educated on the Continent (Bysk. I, 75, 83; Bisk. I, 151, 153; Hreinn Benediktsson 1965, 37–39; Sverrir Tómasson 1988a, 20–21). Until 1103 the see at Skálholt was part of the archdiocese of Bremen; with the establishment of the archdiocese of Lund in 1103, Skálholt and then Hólar (established as the diocese of northern Iceland in 1106) belonged to a Scandinavian ecclesiastical province. They were part of the archdiocese of Niðaróss (Trondheim) from its foundation in 1152 until 1550. It is probable that Icelandic book production was initially modelled on

northern European writing habits. Later it was influenced by Danish and Norwegian schools of writing (Foote 1975, 58; Köhne 1972, 13–16). It should, however, be kept in mind that some of the nation's most learned men, e.g. Sæmundr the Wise Sigfússon (1056–1133), St. Þorlákr Þórhallsson (d. 1193) and Bishop Páll Jónsson (d. 1211) had been educated in France and England, so literary influence from those countries may be expected (Magnús Már Lárusson 1967, 358; 1969, 80; Foote 1975, 68–71; Helgi Guðmundsson 1997, 331; Sverrir Tómasson 1988a, 19–24; 1988b, 73).

1.1.1. The Life of St. Jón of Hólar, originally composed at the beginning of the 13th c., tells us that a school was founded at Hólar by St. Jón during his first years as bishop (1106–1121). There young clerics must have been educated in the fundamental clerical studies, in the arts of grammar, rhetoric, arithmetic and music (Sverrir Tómasson 1988a, 16). References to the writings of learned men in the lives of the Icelandic bishops from the 13th and 14th centuries point to the composition of religious books in Latin in the country already in the 12th c. (*Bysk.* I, 96, *Bisk.* I, 240; *Guðmundar sögur biskups* 1983, 61; *Bysk.* II, 409; cf. Ólafur Halldórsson 1989, 63). There must also have been some sort of a secular school for the native elite in Oddi, in Rangárvellir, southern Iceland, at the end of the 12th c. (Sverrir Tómasson 1988b, 78; 1997, 201).

1.2. The Latin alphabet alone was not sufficient for writing Old Norse texts. We can find indications in some manuscripts that scribes tried to do so. However, already in the 12th c. attempts were made to adapt Latin letters to the Icelandic phonemic system and to create an orthography more suitable for Icelandic (Holtmark 1936, 18–44; Hreinn Benediktsson 1965, 56). *The First Grammatical Treatise*, generally thought to be composed in the mid-12th c. but only preserved in a ms. of *Snorra Edda*, Codex Wormianus (AM 242 fol.) from the 14th c. is the oldest evidence of those attempts. However, the preface to all four of the grammatical treatises in Wormianus mentions the first mode of writing “hinn fyrsti lettrsháttur” which must allude to the orthography of Icelandic mss. before the rules of *The First Grammatical Treatise* were composed (Sverrir Tómasson 1993, 237). *The First Grammatical Treatise* also mentions the literary genres which were practised in the country

when the author was composing his work; he speaks (1972: 208) of “lög ok áttvísi eða þýðingar helgar eða svá þau hin spakligu fróði er Ari Þorgilsson hefir á bókr sett af skynsamligu viti” [laws and genealogies or sacred interpretations or also that wise lore that Ari Þorgilsson has put in writing with intelligent reason]. It is clear what the author means by laws and genealogies, but the meaning of *fræði* ‘lore’ in this connection is disputable. Scholars have considered *þýðingar helgar* ‘sacred interpretations’ to be some sort of interpretations of sacred texts similar to those in homilies or sermons. Of those genres mentioned by the First grammarian, there exist fragments of mss. of religious writings from the mid-12th c., such as AM 237a fol., and fragments of law codes from the latter half of the 12th c. (AM 315d fol.). However, no traces of mss. from this period containing genealogical material are now to be found, and the writings of Ari Þorgilsson are known only from late copies. If the word *fræði* is interpreted as meaning historical lore then, the oldest mss. of that genre are the fragments of *Veraldar saga* in the mss. AM 655 VII and VIII 4to, both from the beginning of the 13th c. (Morgenstern 1893, 52; Jakob Benediktsson 1944, XXVI–XXVIII, XXXIII–XXXV).

1.2.1. The oldest Icelandic ms. is an Easter table, AM 732a VII 4to, preserved on one leaf. It is a palimpsest and is considered to be from the first half of the 12th c. (Beckman/Kålund 1908–18 II, XII–XIV). It contains only Latin letters and is only of palaeographic and computational interest.

1.3. Few Icelandic mss. can be dated with absolute certainty. Only rarely do we find scribal names and dates such as those of Óláfr Ormsson, who tells us that he wrote AM 194 8vo (*Alfræði* I, 54) in the year 1387 in the small room at Geirröðareyri (now Narfeyri) in Snæfellsnes, West Iceland, or of Jón Þorláksson, who wrote his name and the date 1473 on one leaf of a missal (AM 80b 8vo) (*Smástykker* 1884, 128; cf. Ólafur Halldórsson 1966, 44). Only a couple of other mss. can be dated with such accuracy. For example, on one leaf in *Skarðsbók* of the law code *Jónsbók* (AM 350 fol.) it is stated that the ms. was written in 1363 (Jón Helgason 1958, 15; Ólafur Halldórsson 1981, 19).

It is, however, possible to date some mss. using other criteria. When the scribes are known by name and we know when they lived,

the dating seems to be an easy task; for example, the scribes of *Flateyjarbók* (GKS 1005 fol.), Jón Þórðarson and Magnús Þórhallsson, wrote their names in the preface of the manuscript. In some codices it is stated that the works they contain have been written at the request of famous chieftains. From such statements it is possible to find out when the works in questions were originally composed; however, the manuscripts themselves may be later copies, as is the case with the exegetical translations of the Old Testament in *Stjórn* I (AM 226 fol., AM 227 fol.). Originally this work seems to have been written during the reign of King Hákon Magnússon (d. 1319), but the main mss. are from the middle of the 14th c. Other mss. can be dated with some certainty if the same or similar handwriting can be found in a dated original charter or a letter. Unfortunately, very few original letters and documents older than the 14th c. have been preserved. Most Icelandic mss. can therefore only be dated by circumstantial evidence, whether palaeographic (Latin *f*/insular β), orthographic (*þ* at the front and end of words, *d* for δ) or morpho-phonological (the umlaut sign \acute{o} , later *ú*, the merger of *æ/ǣ*, the middle voice ending *sc/z*, *vó/vo* for older *vá*). Such evidence is then compared with materials whose provenance is secure (for example historical writings, documents and archeological findings), which can give some indication how the ms. in question should be dated. Owners' or readers' names or even place-names where the scribe stayed written in the margins of the mss. can also be of help in this respect.

1.4. It is difficult to divide the history of Icelandic ms. culture into periods. The first period is here considered to be from 1150 to 1250. The second is dated from the latter part of the 13th c. to the last decade of the 14th c. when *Flateyjarbók* was completed (1394). In Iceland the writing of vellum codices continued until the 17th c.

1.5. In a collection of translated exempla (*Gerling* 1882, 100) there is a mention of *ritklefi* 'writing closet', a translation of *scriptorium*. This translation indicated that working places of that kind must have existed. In one version of the Life of Guðmundr Arason by Arngrímur Brandsson, the word *ritstofa* is used with the same meaning. It is, however, uncertain whether that word occurred in the original version of that saga. *Skrifstofa* 'scriptorium' is also mentioned twice in sources from the

15th c. (Ólafur Halldórsson 1989, 86). It is not known for sure where the Icelandic scriptoria were or where most of Icelandic mss. were made. Scholars have thought it likely that most of them were written in cloisters or on estates in the neighbourhood of the ecclesiastic centers. A considerable number of mss. have been connected to those cultural centers by scholars (see 3.1.–3.2.2.).

As already mentioned, some scribes are known by name. Most of them were priests or monks; there were only a few laymen among them. It is, however, likely that Icelandic written culture also existed outside the religious houses and episcopal sees even though the main bulk of Icelandic mss. were certainly written at ecclesiastic institutions.

Icelandic mss. are for the most part written on vellum; sheepskin, but not goatskin, was also used for this purpose. The preparation of the Icelandic vellum is similar to the methods used elsewhere in Europe, and the techniques of binding are also similar. The gatherings were first sewn together on one or more leather strings which were fastened to wooden splints; these were put into small holes in wooden boards often made from driftwood, and sometimes afterwards covered with leather or sealskin. A simpler form of bookbinding was to sew all the gatherings or quires into a cover of leather or sealskin. Sources also mention writing on *rotulae* 'scrolls' (*Laurentius saga* 1969, 16). The formula used for Icelandic ink is not known (Ólafur Halldórsson 1989, 78). Drafts were sometimes written on wax tablets (*Laurentius saga* 1969, 101; cf. Margrét Hallgrímsdóttir 1991, 102–132).

2. The first period

Traces of Carolingian palaeography are very visible early in the first period of Icelandic ms. history, but later on Gothic features appear in the script. Under the influence from insular and/or Norwegian handwriting new letters like δ and β appear. Only a few codices from this period have come down to us, but some of the preserved mss. and fragments show good examples of Icelandic scribal culture at the end of the 12th c. and the beginning of the 13th c. In this connection the *Icelandic Homily Book* (Stock Perg nr 15 4to), the miracles of St. Þorlákr and other saints' lives in the older part of AM 645 4to, various fragments of religious matter in AM 655 4to, the fragments of the sagas of the Norwegian kings in AM 325 IV α (*Saga of St. Óláfr*) and AM

325 II 4to (*Ágrip*, a short saga of the Norwegian kings) should be mentioned.

2.1. It is a rather difficult task to find out how comprehensive the oldest vellum codices were because preserved mss. from this period are mostly fragments. For example, the ms. fragment AM 655 III 4to contains the end of the *Life of St. Nicholas* followed by some miracles which are known from Latin versions composed at the end of the 11th c. The text itself is not divided into columns and the size of the written surface on each leaf is approx. 23.7 × 16.4 cm., suggesting that it was part of a large ms. It is impossible now to find out whether the *Life of St. Nicholas* was the only text in this ms. or whether it originally contained other saints' lives as well.

The situation is different for the *Icelandic Homily Book* (Stock Perg nr 15 4to). This ms. now consists of 13 gatherings, not all of the same size, and it is unclear how many leaves some of them contained originally or how they were arranged (van Weenen 1993, 22–25). The codex has been sewn with strings of leather and bound in a sealskin cover. There are some signs (runes and letters) carved in the cover, some of them into the leather itself, others cut into remains of the hair. The codex has only one column and there are no illuminations or rubrication. The *Icelandic Homily Book* not only contains sermons but also theological material which could be of use to clerics, e.g. a small chapter on music and fragments from the rule of St. Benedict. The sermons are not arranged according to the church year. To judge from the greeting *góð systkin* 'good sisters and brothers' at the beginning of some of the sermons, the intended audience included laymen as well as monks belonging to the rule of St. Benedict. Scholars concur that the *Icelandic Homily Book* was a single codex, even though they do not agree either on the extent to which its contents were translated from Latin sources or on the number of hands it represents (i.e. whether it was written by a single scribe over a long period of time or by a number of scribes).

2.2. It is remarkable that some of the oldest ms. fragments contain subject matter which was used in both cathedral schools and other educational centers, e.g. *Elucidarius* (AM 674a 4to) and *Physiologus* (AM 673a I 4to). Among these early mss. are also interlinear glosses, Latin words translated by Icelandic ones. They are preserved in a compilation of

early and late texts, GKS 1812 4to, where maps of the T-O type can also be found (Gering 1878, 385–394; Scardigli/Raschellà 1988, 299–315). Of other educational hagiographical literature from that period, the *Dialogues of St. Gregory* in AM 677 4to can also be mentioned. Few secular writings from this period have come down to us; among mss. containing secular literature are the fragments AM 325 II 4to (*Ágrip*), AM 162 A fol 0 with the *Saga of Egill Skallagrímsson*, and AM 162 D 2 fol. containing *Laxdæla saga* (Hreinn Benediktsson 1965, xxxix).

2.2.1. We do not know of any scribal schools from this first period. However, certain palaeographic similarities between the oldest existing Icelandic ms. fragments in AM 237a fol. and the oldest part of *Reykjaholtsmáldagi* 'the inventory of Reykjaholt' (Pskj1) have been pointed out. (Stefán Karlsson personal communication, cf. Ólafur Halldórsson 1989, 67.)

3. The second period

As with the first period, the time limits of the second one are far from clear. The most noteworthy works of Icelandic literature, such as the Eddic lays and the sagas of the Norwegian kings in *Morkinskinna*, have been preserved in mss. from the second half of the 13th c. (*Konungsbók*, *Codex Regius*, GKS 2365 4to, and GKS 1009 fol. respectively). Other important mss. from the latter part of the 13th c. are those of the Icelandic law code *Grágás* (*Staðarhólsbók*, AM 334 fol., and *Konungsbók*, GKS 1157 fol.) and *Alexanders saga* (AM 519a 4to). From the first half of the 14th c. we have *Konungsbók* of Snorri's *Edda* (GKS 2367 4to) and *Jónsbók* (AM 343 fol.). From the middle of the century are *Kálfalækjarbók* with *Njáls saga* (AM 133 fol.), *Möðruvallabók* (AM 132 fol.) and a collection of saints' lives (AM 234 fol.). *Króksfjarðarbók* (AM 122a fol.) containing *Sturlunga saga*, *Skarðsbók* of *Jónsbók* (AM 350 fol.) and *Flateyjarbók* (GKS 1005 fol.) are from the second half of the 14th c.; *Bergsbók* (Stock Perg nr 1 fol.) containing the saga of the two Olafs (Óláfr Tryggvason and Óláfr Haraldsson) is considered to be from the early part of the 15th c. During the 14th century the export of mss. from Iceland to Norway began. It ended around 1400, when the difference in language between Icelanders and Norwegians had become too great for easy comprehension (Ólafur Halldórsson 1990, 339–47; Stefán Karlsson 1979, 1–17.).

3.1. The Life of Jón of Hólar mentions a priest at Hólar named Þorgeirr, and describes a seizure he had when he sat writing. That event must have taken place around 1200. Þorgeirr's handwriting is unknown. *Laurentius saga biskups* mentions one Þórarinn kaggi Egilsson (d. 1283) who lived and ran a school at Svarfaðardalur. He was “hinn mesti nytsemðamaðr til leturs ok bókaþjórða sem enn mega auðsýnaz margar bækr sem hann hefir skrifat í Hólakirkju ok svá Vallastað”, [extremely productive in writing and book-making, as the many books which he wrote at the churches of Hólar and Vellir still bear witness] (*Laurentius saga* 1969, 2–3; cf. Hermann Pálsson 1959, 18–24; Ólafur Halldórsson 1989, 86). Stefán Karlsson has suggested that Þórarinn was the scribe of the Kringla ms. of Snorri Sturluson's *Heimskringla*, of which only a single leaf, preserved in the National Library of Iceland/Landsbókasafn Íslands (Lbs. fragm. 82) survives (Stefán Karlsson 1976, 22). The handwriting of Kringla is also found in the main part of the Konungsbók ms. of *Grágás* (GKS 1157 fol.), where it is called the B hand, as well as in the Staðarhólsbók ms. of *Grágás*, the A hand (Stefán Karlsson 1976, 21–22). Sources from the 14th c. name the scribes Þórarinn pentr Eiríksson and the farmer Dálkr [Einars-son] who is said to have made a “graduale, samsetta með sequentiur ok þar með kyrjáll” [gradual, including sequences, and a kyriale with it] (DI III, 175–76; cf. Ólafur Halldórsson 1989, 86). No writings by these men are now known.

3.1.1. The works of several 14th c. scribes have survived. One is the lawman Haukr Erlendsson (d. 1334). A comparison with his autograph letters from Jan. 28, 1302 and Oct. 14, 1310 shows that he wrote part of the manuscript named after him, Hauksbók (Finnur Jónsson 1896, v–vii; Jón Helgason 1960, v–vii; Stefán Karlsson 1964, 114–121). The contents of this ms. range widely, including *Landnámabók*, *Vqluspá*, *Trójumanna saga* and *Breta sögur*. Haukr also had scribes in his service, and parts of the ms. were written by them. The compilation Hauksbók is now thought to have included the mss. AM 371 4to, AM 544 4to, and AM 675 4to. However, it is not clear whether all these mss. were originally part of a single codex.

3.1.2. With the exception of charters, *Lögmannsannáll* (AM 420b 4to) is the only auto-

graph ms. to be preserved from the Middle Ages. It was composed by Einarr Hafliðason (1307–1393), priest and *officialis* at Breiðabólstaður in northwest Iceland.

3.1.3. Magnús Þórhallsson and Jón Þórðarson wrote Flateyjarbók in the years around 1390; it was probably completed in 1394 (Ólafur Halldórsson 1990, 209). Magnús also illuminated the ms., which was owned by Jón Hákonarson of Viðidalstunga (b. 1350, d. before 1416). He also owned another famous ms., Vatnshyrna, a collection of sagas of Icelanders which was destroyed in the great fire of 1728 in Copenhagen (Guðbrandur Vigfússon 1860, xv–xvi; Stefán Karlsson 1970, 279–300). It is probable that he also had the ms. Hulda (AM 66 fol.), a collection of sagas of Norwegian kings, made for him. We do not know where Magnús Þórhallsson and Jón Þórðarson wrote Flateyjarbók, but the monastery at Þingeyrar has been considered a likely location, among other things because of its proximity to Viðidalstunga. However, Ólafur Halldórsson has also suggested that the volume could have been written in Skagafjörður, because one of the scribes, Jón Þórðarson, is mentioned in a letter written at Hólar in Hjaltadalur, and a Jón Þórðarson, probably the same man, is named as the steward of the convent at Reynistaður in 1383 (Ólafur Halldórsson 1990, 206–7).

3.2. In his study *Helgafellsbækur fornar* (1966), Ólafur Halldórsson showed that a manuscript of sagas about the apostles, AM 239 fol., had belonged to the monastery at Helgafell on Snæfellsnes. Among other sagas, the ms. contains incomplete the composite *Lives of St. John and James, Tveggja postula saga Jóns og Jakobs*. AM 239 fol. was written by two scribes (hand I and hand II), and hand I is the same as that found in Skarðsbók of the law code *Jónsbók* (AM 350 fol.). Ólafur Halldórsson argued that the texts of *Tveggja postula saga Jóns ok Jakobs* in Skarðsbók (SÁM 1 fol.) and in AM 653a 4to, in which there were 9 leaves of the same *Tveggja postula saga*, were copied from AM 239 fol. Written in the same hand as SÁM 1 fol. and AM 653a 4to were also AM 238 fol. fragm. VII (*Silvester saga*), AM 61 fol. (*Óláfs saga Tryggvasonar hin mesta*), AM 156 4to (*Jónsbók*), and hand II in AM 233a fol. However, hand I in AM 233a fol. is the same as Skarðsbók of *Jónsbók*, AM 350 fol. Ólafur Halldórsson concluded that SÁM 1 fol., and probably also Skarðsbók

of *Jónsbók* (AM 350 fol.), had been written for Ormr Snorrason (ca. 1320–1401/2), the landowner of Skarð on Skarðsströnd. Furthermore, AM 156 4to was in the possession of the family at Skarð in the 16th c. While it is conceivable that the mss. were written at Skarð itself, the fact that the majority of the mss. under discussion contained saints' lives, and the exemplars followed in SÁM 1, AM 653a 4to, and AM 239 fol. were owned by Helgafell monastery, suggests that they were copied at the monastery. Hand I in AM 239 fol. appears also to be found in the *Saga of St. Óláfr* in Bæjarbók (AM 73b fol.), and Unger (1874, xii) considered that AM 226 fol., a ms. of *Stjórn*, was written in the same hand. Stefán Karlsson added to this group of mss. AM 219 fol. and the fragments JS fragm 5, Lbs. fragm. 6 and Þjms. nr 176, originally belonging to the same ms., altogether 20 leaves which also contained the Lives of St. Jón of Hólar, St. Þorlákr and St. Guðmundr Arason. He considered that a single scribe had copied AM 383 IV 4to, consisting of 4 leaves from the Life of St. Þorlákr, AM 325 X 4to, 14 leaves from the sagas of Norwegian kings, Sverrir, Hákon Sverrisson, Hákon Hákonarson and Magnús lagabætir, and AM 325 VIII 3 a 4to, one leaf from the *Saga of King Sverrir*, probably belonging originally to the same book as AM 325 X 4to. Stefán Karlsson divided all those mss. into two groups. In the first group were the Skarðsbók of *Jónsbók* (AM 350 fol.), AM 226 fol. (*Stjórn*), AM 239 fol. and AM 233a fol. In the 2nd group were AM 219 fol., AM 73b fol. (Bæjarbók), AM 383 IV 4to and AM 325 X 4to. Stefán Karlsson argued that there was so much palaeographic difference between those two groups that they were probably written by two scribes (1967, 19–21). Stefán Karlsson's and Ólafur Halldórsson's research has shown that there was a productive scriptorium at Helgafell at the middle of the 14th c.

3.2.1. One of the best known mss. from the 14th c. is Möðruvallabók (AM 132 fol.), which is considered to have been copied sometime between 1330 and 1370. It contains eleven sagas of Icelanders, including *Njáls saga* (unfortunately incomplete), *Egils saga*, *Laxdæla saga* and *Bandamanna saga*. There were originally 26 quires in Möðruvallabók, each with 8 leaves and two columns per leaf. The first quire is lost, and a new one, consisting of 9 vellum leaves written in the 17th c., has been added. In a few places, primarily in the text of *Laxdæla*, the text had become difficult to

read by the 17th c. and an attempt was made to write over the original letters. There are no contemporary illustrations in *Möðruvallabók*.

Three scribes probably worked on the codex originally, although one of them was responsible for most of it. His hand is also known from the following mss.: AM 642a Ið 4to, a fragment of the *Life of St. Nicholas*; AM 325 XI 2b 4to, a leaf from the *Saga of St. Óláfr*; AM 240 V fol., miracles of the Blessed Virgin; AM 573 4to, fols. 46–63, the conclusion of *Breta sögur* and beginning of *Valvens þáttur*; AM 220 I fol., the *Priest's saga of Guðmundr Arason*; Lbs. fragm. 5, miracles of St. Guðmundr Arason; AM 173c 4to, containing the Christian Laws section of *Grágás* and the Christian Law of Bishop Árni; AM 229 II fol., *Stjórn*. A different scribe wrote the verses in *Egils saga*. His hand is known from other mss., including *Skálholtsannáll* (AM 420 4to) and the legal material in GKS 3268 4to and GKS 3270 4to. The third scribe wrote the rubrics with red ink (van Weenen 2000, 22–23). This description shows that Möðruvallabók must have been written in a scriptorium where at least three scribes worked on numerous mss. with varied contents. It is uncertain where Möðruvallabók was written, but references to a local use of words of direction suggest a location in the north of Iceland. It has been suggested that the scriptorium was at Möðruvellir monastery in Hörgárdalur in Eyjafjörður (Stefán Karlsson 1967, 26–29; cf. van Weenen 2000, 7.)

3.2.2. One of the best known mss. of Snorri's *Edda* is Codex Wormianus. It now consists of 63 leaves, and in addition to the *Edda* it contains the four grammatical treatises. It was written in the middle of the 14th c. Finnur Jónsson (1888, xvi) noticed that the fragment of *Egils saga* in AM 162 A β fol. was in the same hand as Wormianus, and Unger (1891, 182) pointed out that the same hand was to be found in the first part of AM 227 fol. (hand A) and the first part of AM 229 fol., both of which contain *Stjórn*. In his introduction to Hauksbók, Finnur Jónsson (1896, xxxvi) considered that *Völuspá* in Hauksbók (AM 544 4to, 20r–21r) was written by the same scribe. Jón Helgason (1960, xi) pointed out the similarity between these hands and added AM 657 a–b 4to to the group. Its contents include *Mikjál's saga* by Berg Sokkason, Abbot of Munkaþverá (d. probably before 1350) and *Clarus saga*, which is thought to have been composed by the Norwegian Dominican

Bishop of Skálholt, Jón Halldórsson (1322–1339) (cf. Jakobsen 1964, 109–111). Jakob Benediktsson (1980, 10–12) made a detailed analysis of these mss. in his edition of *Rómverja saga* from AM 595 a–b 4to, and concluded that the same scribe had written 11 mss. In addition to those just mentioned, he wrote *Jónsbók* (GKS 3269a 4to), part of *Jónsbók* in AM 127 4to (hand 2), a fragment of *Mariú saga* (AM 240 IV fol.), a fragment of *Jóns saga baptista* (AM 667 IX 4to) and part of *Karlamagnús saga* (NRA 62). Jakob Benediktsson agreed with Stefán Karlsson that these mss. were of different ages, in particular *Vqluspá* in Hauksbók and *Clarus saga*. Jakob Benediktsson believed that these mss. were from the north, because AM 657 a–b 4to had been owned by the church at Bólstaðarhlíð in Langadalur, Húnavatnssýsla, and GKS 3269a 4to contained a list of bishops of Hólar, the last of whom was Gottskálk Nikulásson (d. 1520). To this group may be added a leaf from a psalter, now in Sweden, written by the same man (Stefán Karlsson 1982, 320–22). Guðbjörg Kristjánsdóttir has pointed out that the illuminations of this fragment and the mss. appear to have been done by the same individual, and considered it likely that the men who made these mss. worked together, probably in a scriptorium in the north of Iceland, most likely the Benedictine monastery at Þingeyrar (1983, 65–73).

4. From parchment to paper

Icelandic book production does not cease with the creation of the impressive mss. of the 14th c., but the time of such ambitious volumes was over. The single exception is *Helgastaðabók* (Stock Perg nr 16 4to). Liturgical books, now lost, are, however, mentioned in contemporary sources (DI III, 175–76; cf. Ólafur Halldórsson 1989, 86). Up until 1550, parchment books were mostly written for Icelandic aristocrats; the beginning of the 16th c. saw the arrival of paper. Bishop Gissur Einarsson (ca. 1512–1548) was probably one of the first Icelanders to use paper for letters, and during his episcopate the first extant Icelandic books printed on paper were produced. Books printed on vellum were also known. Bishop Þorlákur Skúlason of Hólar (d. 1656) was probably the last Icelandic to have parchment mss. written, among them Snorri's *Edda* (Stock Perg nr 3 4to). Another example of a parchment ms. written in the 17th c. is the saga collection in GKS 1002–1003 fol.

5. Epilogue

The history of Icelandic vellum codices is rarely easy to trace. Árni Magnússon (1663–1730), the indefatigable collector of Icelandic mss. was in the habit of recording where he had obtained each ms. These notes of his often contain valuable evidence about previous owners, and it is sometimes possible to determine that a ms. has been in the possession of a single family, handed down from one generation to the next. At the end of the 16th and beginning of the 17th c. some of the best known Icelandic mss. were still in the possession of Icelanders, and it can often be deduced from the writings of Icelandic humanists like Arngrímur Jónsson the Learned (1568–1648) what mss. they used (Jakob Benediktsson 1957, 82–106). Nothing is known about the history of many mss. before they came into the hands of Árni Magnússon in Copenhagen. Some famous mss., such as Codex Regius (GKS 2365 4to) of the Eddic poems, Flateyjarbók (GKS 1005 fol.) and Codex Wormianus (AM 242 fol.) were given to scholars, noblemen and kings in the 17th c. Little is known about the owners of the mss. which Jón Rúgmán obtained or those which Jón Eggertsson collected and sold to the Swedes, although the prices of some of them were recorded.

5.1. The majority of medieval Icelandic mss. are now preserved primarily in two collections, the Stofnun Árna Magnússonar in Iceland and Det Arnamagnæanske Institut in Denmark. There are also significant collections in Sweden and Norway, and a scattering of medieval Icelandic mss. are to be found in Britain, Ireland, Germany, and the United States.

92. The history of Old Nordic manuscripts II: Old Norwegian (incl. Faroese)

1. Introduction
2. The making of a manuscript
3. The first writing in Latin letters
4. The Norwegian codices – age and contents
5. The Norwegian diplomas
6. The Faroese manuscripts
7. The scribes and their milieu
8. The audience
9. The history of the codices
10. The history of the diplomas
11. Literature (a selection)

1. Introduction

This article deals with manuscripts written in OWN in Norway (incl. the Faroe Islands) before about 1350. Manuscripts written in Latin are not included. The term “manuscript” is used for codices (a collection of pages stitched together in book form), fragments and diplomas (letters). The earliest written texts in OWN are runic inscriptions, but we have no Norwegian (or Faroese) manuscripts written with runes. Hence they are not included in this article.

2. The making of a manuscript

The Old Norwegian manuscripts were written on parchment made of calfskin. We do not know who prepared the vellums, but the skinners mentioned in Bergen’s town law might have done such work. And we do not know with certainty how ink was made or how pigments for the illuminations were obtained, although we assume that ink was made of an extraction from boiled gallnuts. Writing was done with a quill pen, mostly made from the feathers of geese and swans. The manuscripts were usually bound in wooden boards, often covered with leather, but only a few of the medieval bindings have survived. More general information about OWN manuscripts are given in Holm-Olsen (1990) and Kristjánsson (1993).

The scribes usually left an empty space at the beginning of each section of the text. Later the scribe himself or another artistic person filled this in, sometimes with pictures related to the text. This art of decorating a manuscript

is called “illumination”. Many medieval Icelandic manuscripts are beautifully illustrated. From Norway, only one illustrated manuscript older than ca. 1350 has been preserved, the so-called Codex Hardenbergianus. The first part of this codex was probably written in Bergen in the first half of the 14th century and contains King Magnús Hákonarson’s Norwegian Code from 1274.

3. The first writing in Latin letters

The first Norwegian texts were written in runes. The oldest preserved manuscripts written in Norwegian with Latin letters can be dated to ca. 1150–1200. They contain translated stories about saints, but only fragments remain. The oldest preserved book is the so-called *Book of homilies* from ca. 1200, written in Old Norwegian. It is evident that the first manuscripts came along with Christianity, which was introduced in Norway around 1000. In my opinion, the earliest Norwegian manuscripts were made in the first half of the 11th century (cf. Eithun/Rindal/Ulset 1994, 10–12).

4. The Norwegian codices – age and contents

The date a manuscript was created is normally not given in the manuscript itself, but there are a few exceptions. A part of AM 309 fol. contains King Magnús Hákonarson’s Norwegian Code. After this section is written: “Completo fuit liber iste. Anno domini m. ccc vicesimo quinto” [This book was completed Anno Domini 1325]. Usually the dating is based on palaeographic and linguistic criteria, and on the content and the history of the manuscript. Useful informations about the dating of OWN manuscripts are given in *Ordbog over det norrøne prosasprog* (1989), and of Norwegian manuscripts in Seip (1954; 1955). The first Norwegian manuscripts probably were made in the first half of the 11th century. But no manuscript has survived from this period, the oldest ones being more than 100 years younger. All the manuscripts in existence are copies of exemplars which with a few exceptions are now lost.

The oldest preserved fragments of manuscripts contain saints’ lives; AM 655 IX 4to, which can be dated to ca. 1150–1200, has fragments of an Old Norwegian translation from Latin of the saga of the apostle Matthew and

the saints Blasius and Placidus. From around 1200 comes the so-called *Book of homilies* which contains sermons, among them the famous sermon for the feast celebrating the dedication of a church (the so-called “Stavechurch Homily”). Throughout the Middle Ages manuscripts were produced containing religious prose. The bulk of these manuscripts are written in Old Icelandic, but there are good reasons to believe that this kind of literature also was created in Norway. We have many sagas of male and female saints, of the apostles, of Mary the mother of Jesus, of Archbishop Thomas Becket, of Barlaam and Josaphat. An important text is *Stjórn*, a translation of the Old Testament. In the prologue we learn that the Norwegian King Hákon Magnússon (1299–1319) instigated this work so that it could be read aloud for the edification of those at his court who did not know Latin.

The oldest fragments of law texts can be dated to ca. 1200–1250. They are AM 315f. fol. and NRA 1 B, which contain parts of the older Gulaping Code. Later come many manuscripts of King Magnús Hákonarson’s Norwegian Code from 1274, the so-called *Landslog*. There are thirty-nine fairly complete manuscripts of this *Landslog* in existence and thirty-one fragments.

A few of the existing manuscripts contain sagas of the Norwegian kings. The oldest preserved king’s saga in OWN vernacular, *Agrip*, is a Norwegian work from the end of the 12th century. The only manuscript is Icelandic, probably a copy of a Norwegian exemplar. The oldest Norwegian manuscript containing a king’s saga is DG 8 from ca. 1225–1250, in which we find the so-called *Legendary Saga of St. Óláfr*. We also have a fragment of *Fagrskinna* and manuscripts of Oddr Snorason’s saga of Óláfr Tryggvason.

The Norwegian didactic work from around 1250 called *Konungs skuggsjá* (‘the King’s Mirror’) is preserved in many manuscripts, the oldest being Norwegian from ca. 1250.

The Norwegian King Hákon Hákonarson (1217–1263) initiated the translation of courtly literature mainly from French. Some of the sagas, called *riddarasögur* (‘knights’ sagas’), are preserved in a Norwegian manuscript from ca. 1275. Some scholars also mention *Þiðreks saga af Bern* in this connection. This is a Norwegian compilation from ca. 1250 of tales of German origin about Dietrich of Bern (i.e. Verona). One of the main manuscripts is Norwegian, from around 1275–1300.

The OWN Eddaic poems have survived only in Icelandic manuscripts, and there are rather few Norwegian manuscripts containing skaldic verses. But the archaeological excavations after the conflagration in 1955 on Bryggen in Bergen have brought to light Norwegian poetry written in runes. These runic inscriptions show that the Eddaic and skaldic forms had not died out in Norway around 1200. Therefore it is reasonable to believe that earlier on there were manuscripts in Norway containing Eddaic poems.

5. The Norwegian diplomas

In our context, the term *diploma* signifies official medieval documents in the form of letters. In OWN documents of this type most often were called *bréf*. At the outset, the Scandinavian diplomas were written in Latin, and throughout the Middle Ages Latin was used alongside the vernaculars. The oldest Norwegian diplomas have been lost, but they probably were made before ca. 1150. The oldest preserved diploma written in Norwegian is a letter from King Philippus Simonsson (1207–1217).

With the exception of a few letters in runes, the Norwegian diplomas were written on parchment, as were other manuscripts. But there are some palaeographic differences between diplomas and codices. To certify the authenticity of a diploma, one or more seals were put on it. The seals were usually made of wax and were attached to the lower edge of the diploma by means of parchment straps. Sometimes these straps were cut off older diplomas and thus have text fragments on them, mostly from private letters. Another mark of authenticity was the so-called “chirographus”, for which a document was drawn up in duplicate. The text was written twice on the same piece of parchment, and along the line of division, usually dragged, was written the word “chirographus”.

Contrary to the book manuscripts, most preserved diplomas are original documents, but some of them were copied. The copy (transcript) was usually framed by a new letter with new seals, saying that the copy was accurate.

The contents of a diploma may be divided into three parts: protocol, text and eschatocol. The protocol contains the greeting formula and the names of the issuer and the addressee. The eschatocol normally lists the names of those who have attached their seals to the document and gives information on when and

where the document was made. Few of the oldest diplomas bear the date or place. After 1290 it was common practice to mention the exact time and place of the composition of the diploma. The year may be given either as dating from the birth of Christ or the accession of a king.

The diplomas were issued by kings, archbishops, bishops, priests, bailiffs, lawmen and private individuals such as farmers. The contents of the diplomas are varied. They are concerned with charters, contracts, conveyances, gifts, judgments, leaseholds, the purchase and sale of land, testaments etc. The diplomas provide our most important source of knowledge about medieval life in Norway (see fig. 92.1).

Almost all the diplomas that have been preserved are official documents; only very few are private letters. This is due to the fact that private letters were not used to guarantee legal property or rights. Therefore the valuable parchment could be used for other purposes, e.g. straps for seals attached to official documents (cf. Rindal 1982).

The Norwegian diplomas have been edited in the series *Diplomatarium Norvegicum*. The first volume was published in 1847, the last one in 1995, and the series is to be continued. A facsimile edition of the oldest diplomas is published in Hødnebo (1960), which also contains a useful introduction.

6. The Faroese manuscripts

There is no codex or diploma which we can say with certainty was written on the Faroe Islands before 1350. But we have one important law amendment about sheep (called the “sheep-letter”) on the Faroe Islands in a diploma issued in Oslo by Duke Hákon Magnússon 1298. This diploma is bound together with a Norwegian law codex (Holm perg 33 qu) from the first half of the 14th century. According to Mikjel Sørli (1965, 9–10) this diploma was written by a Norwegian on the Faroe Islands. Sørli (1965, 73) claims that another Norwegian law codex (LundUB Mh 15) from the first half of the 14th century, which also contains the “sheep-letter”, was written by a “Bergen-influenced Faroese clerk”.

7. The scribes and their milieu

We do not know much about the persons who wrote the medieval Norwegian manuscripts. With two exceptions, the scribes of the codices

Fig. 92.1: Diploma from ca. 1224, issued by King Hákon Hákonarson

are unknown: around 1300 Þorgeirr Hákonarson made three copies of King Magnús Hákonarson's Norwegian Code and another legal text, and at about the same time Eiríkr Þróndarson made a copy of the same code. Icelandic scribes wrote manuscripts in Norway as well as they were producing manuscripts in Iceland for export to Norway (cf. Karlsson 1979).

Diplomas issued by the king often give the name of the scribes. According to Vågslid (1938), we know the names of 35 royal scribes working up to 1350. They often call themselves *klerkr* 'clerk' or *notarius* 'notary'. In a later study, Vågslid (1989) tried to identify the

scribes in the Norwegian medieval diplomas, pinpointing about 800 persons by name and title. Around 90 per cent of them belonged to the clergy at churches and monasteries. Only four of them were women. (Cf. Vannebo 1994). The bulk of the medieval scribes probably were clerics, but laymen were also able to write manuscripts. There are good reasons to believe that they received their education at churches and monasteries in Norway. For members higher up in the clergy, it was fairly normal to have some kind of university education abroad. We also know that a few members of the Norwegian aristocracy studied law at the University of Bologna.

8. The audience

Vannebo (1994) discusses what we know about the knowledge of reading and writing in medieval Norway. Obviously members of the clergy and some laymen were able to read and write. We have no exact figures, but probably less than 10 per cent of the urban population was literate. At this time Bergen had around 7000 inhabitants, and Oslo around 3000. In the prologue to *Konungs skuggsjá* ‘the King’s Mirror’ from the 13th century, it states that people who listen to this book are welcome to suggest improvements. And the standard initial formula in the diplomas is “to all those who see or listen to this letter”. These examples show that the audience normally was illiterate, so that these manuscripts had to be read aloud.

9. The history of the codices

According to Seip (1954; 1955), more than 125 Norwegian codices and fragments of codices older than ca. 1350 have been preserved. Karlsson (1979) has found that there were 54 non-legal codices in Norway in the Middle Ages, some of them imported from Iceland. These are only a small part of the codices that existed in medieval Norway. Halvorsen (1982) has emphasized that there was a greater loss of manuscripts in Norway than in Iceland. This is primarily due to the different development of the languages in these two countries at the end of the Middle Ages.

Most of the Norwegian medieval codices were owned by monasteries and churches. In the first half of the 14th century there were about 1200 churches in Norway with close to 2000 priests, and around 30 monasteries with approximately 600–700 people. Hence there must have been thousands of religious books, most of them written in Latin. From the written sources we get a few glimpses of the size of the libraries. We know that the monastery on Tautra in the Trondheimsfjord had 70 medieval books, and one in Konghelle in Bohuslän held 21 books. The archdiocese in Nidaros owned 87 volumes at the end of the Middle Ages. A church in Western Norway had 19 books around 1320. The sources also tell us about private book collections. The biggest was a collection of 36 volumes, probably owned by Árni Sigurðarson, Bishop of Bergen from 1305–1314.

Books were valuable at that time. In 1317 the Church of St. Mary in Oslo lent 4 legal

codes to a man going abroad to study. These four books were valued at fourteen cows.

At the end of the Middle Ages, the Norwegian language changed so much that people could hardly understand the medieval texts. Some of the manuscripts were now collected by high ranking people and later taken out of the country. The rest were used for other purposes. Let us look at the destiny of two well-known codices (cf. Rindal 1983; Tveitane 1972).

Manuscript No. 1154 fol. in the Old Royal Collection of the Royal Library, Copenhagen (GKS 1154 fol.), also called Codex Hardenbergianus, consists of three originally independent parts. The first part contains King Magnús Hákonarson’s Norwegian Code from 1274 and is the most richly illuminated of the medieval Norwegian manuscripts in existence (see figure p. 806, 92.2). This manuscript probably was written and illuminated in Bergen in the first half of the 14th century. There is one mostly erased signature from the end of the 14th century, indicating that the owner then was a bishop. From the 16th century, there are three notes saying that Helvig Hardenberg owned the book. She was born in Denmark in 1540 and was married to Erik Rosenkrantz in 1558. He was a Danish nobleman who became governor of Western Norway, residing at the Royal Palace in Bergen (Bergenhús) from 1560 to 1568. Then he became the lord lieutenant of Odense in Denmark, where Helvig Hardenberg died in 1599. While in Bergen, Erik Rosenkrantz showed much interest in the history of Norway. It is therefore possible that his wife received this manuscript from him. It was probably brought to Denmark when they moved there in 1568. We know that the manuscript belonged to the Royal Library in Copenhagen in 1670, but we do not know how it got there. This manuscript bears the name of its former owner, Codex Hardenbergianus. A few codices acquired their names in this way (e. g. Codex Frisianus, Codex Rantzovianus), but very seldom does a manuscript bear the name of a woman.

The oldest and most important collection of so-called courtly literature in OVN translation is in the codex known as De la Gardie (DG) 4–7 in the library at the University of Uppsala. This manuscript probably was written in Western Norway around 1270. From 1652 to 1669 the codex belonged to the Swedish Count Magnus Gabriel De la Gardie. In 1669 he donated all his valuable collection of manuscripts to Uppsala Academy or Univer-

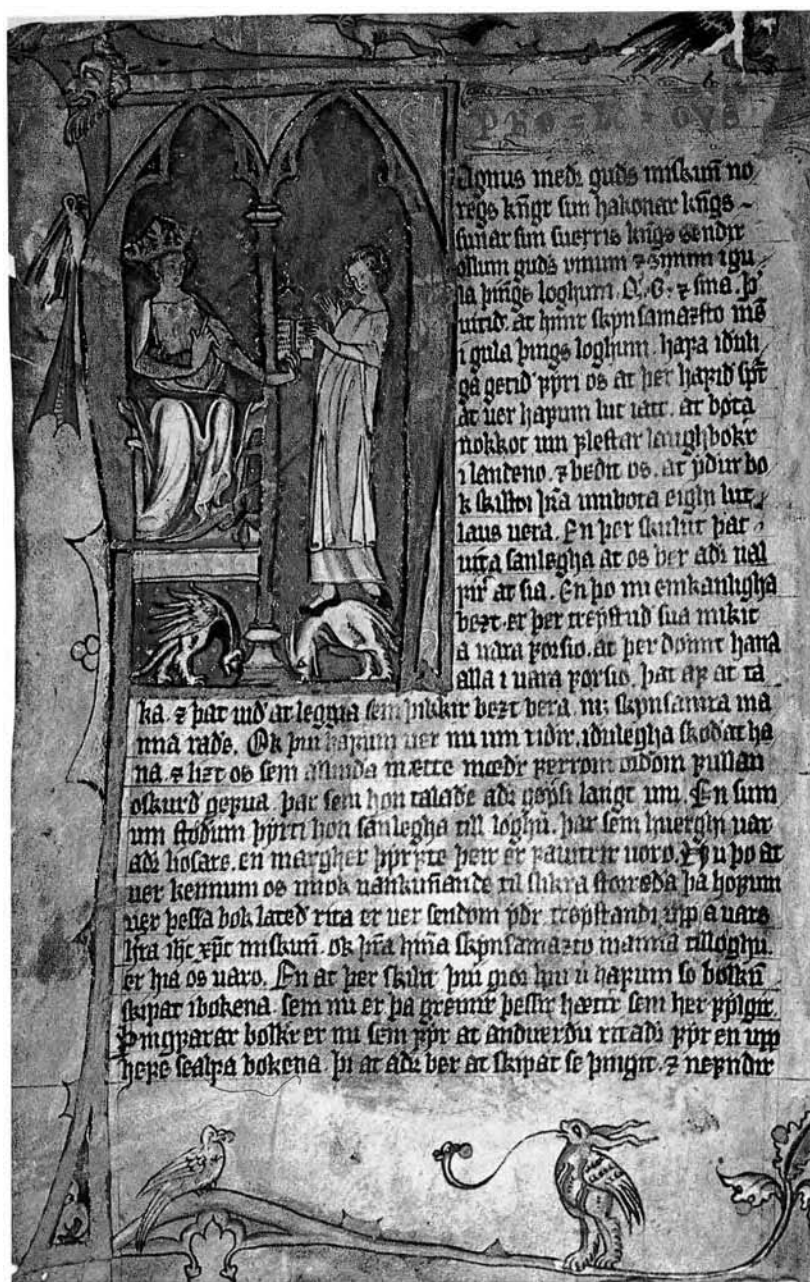

Fig. 92.2: Codex Hardenbergianus (GKS 1154 fol.) from 1300–1350. The prologue, where the king hands the law book over to a young man.

sity, and this is now part of the university library at Uppsala. Count De la Gardie bought this codex from the collection of the Danish historian Stephanus Johannis Stephanius after his death in 1650. The manuscript must have come to Stephanius from its last Norwegian owner, Laurits Samuelssøn Arctander, who wrote his name at the bottom of two leaves. He was born ca. 1600, studied at German universities, and was a tutor in Nordland when he wrote his name in the manuscript. From a letter from Stephanius to Ole Worm in 1642 we learn that Stephanius had had direct links with Arctander, but we do not know how he became the owner of the manuscript. Probably Arctander acquired the manuscript after the death in 1622 of Tollef Jonsson Benkestokk, who was a member of the noble family of Benkestokk in Nordland and wrote his name once in the manuscript. The oldest note of ownership says "Sir Snara Aslaksson owns me". Snara Aslaksson was one of Norway's leading men in the reign of King Hákon Magnússon (1299–1319).

Around 1500, four leaves from the end of DG 4–7 were cut out and subsequently inserted in a bishop's miter used at the cathedral church of Skálholt in Iceland. This is just one example of how medieval Norwegian manuscripts were dismembered and cut up after ca. 1500. The reason for this was partly the language change and partly religious changes. After the Lutheran Reformation in 1537 much Catholic liturgical literature was burned or mutilated.

From 1380, Norway was in union with Denmark. But Norway retained its own laws, and old Norwegian lawbooks had to be kept until the first authorized Danish translation in 1604. In 1846 the Director of the National Archives in Oslo discovered that the backs of certain provincial accounts from the 16th and 17th centuries had been reinforced by parchment scraps (cf. Eken 1963). These scraps had been cut out from medieval manuscripts and served to fasten the thread by which the sheets were stitched together to form a book. A smaller part of this collection of fragments represents nearly 100 manuscripts written in a medieval Scandinavian language. As recently as 1979, a fragment of the older Gulaping Code from the first half of the 13th century was found in the binding of a younger book.

The 16th century was the period of Humanism in Norway, and scholars took a great interest in early history. Sweden (1477) and

Denmark (1479) got their first universities just before that, whereas the first Norwegian university wasn't founded until 1811. Scholars used medieval manuscripts as sources for early Scandinavian history. The collecting of manuscripts started in the 16th century, mostly by Swedes and Danes. The most famous collector was the Icelander Árne Magnússon, professor in Copenhagen 1701–1730. He built up a large collection of Old Norse manuscripts, the Arnamagnæan Collection, which today is divided among the two Arnamagnæan Institutes in Copenhagen and Reykjavík.

As a result of the political situation in Scandinavia after the Middle Ages, most of the Norwegian medieval manuscripts are to be found in Danish and Swedish collections, mostly in Copenhagen, Stockholm and Uppsala. Apart from the fragments in the National Archives in Oslo, there are only two manuscripts older than 1350 in Norway, both in the National Library in Oslo. In 1961 and 1965 the Danish parliament agreed to return to Iceland a substantial part of the medieval Icelandic manuscripts which had been kept in Copenhagen. Norway never argued for the return of the Norwegian manuscripts. The only medieval Faroese manuscript, included in Holm perg 33 qu, was handed over by the Royal Library in Stockholm to the Faroe Islands in 1990.

10. The history of the diplomas

The Norwegian medieval diplomas number more than 20'000 when we include the Latin ones. From before 1350 there are 1108 original diplomas written in Norwegian. At the end of the Middle Ages there were archives including diplomas at the monasteries, the major churches and the king's chancery. Some diplomas have been privately owned. Normally the diplomas were important legal documents for the owners, and therefore preserved much better than the codices. Due to political developments, many archives were moved to Denmark. Some diplomas are also to be found in other countries, mostly in Sweden and in the Vatican Archives. After Norway left the union with Denmark in 1814, many diplomas were returned to the National Archives in Oslo.

Medieval letters are still being discovered. During the restoration of altar frontals at the University Museum in Bergen in 1960, fragments of letters from the 13th century under the painting were found.

93. The history of Old Nordic manuscripts III: Old Swedish

1. Introduction
2. The Old Swedish manuscripts
3. The making of Old Swedish manuscripts
4. The culture of Old Swedish manuscripts
5. Literature (a selection)

1. Introduction

Just a small number of manuscripts containing native texts has been preserved from the Old Swedish period (ca. 1225–1375). This doesn't mean that nothing was written in Sweden during this period, but rather that scribes usually wrote in Latin, not in the vernacular. The use of Latin script for writing Swedish during this period must be seen as quite extraordinary. Latin was the language of the Church and the language of knowledge. The vernacular was generally written with runes.

In spite of this, 28 manuscripts (and some fragments) containing Old Swedish texts are preserved in different archives. How represen-

tative these manuscripts are is hard to say; it is of course impossible to guess how many manuscripts were lost since we have no records of any numbers.

The native language was used to some extent only for one genre, namely for rules and regulations. Out of the 28 preserved manuscripts, a total of 24 contain laws (Åström 1993, 232).

It seems that laws and regulations were written down in Swedish as a result of a Norwegian influence before the 13th century. It has been asserted that laws were composed orally. The early laws state that it was the lawman's duty to interpret ("lagh skilia") and to recite the law ("lagh tälia") at the *thing* (Holmbäck/Wessen 1979a, xvii ff.). Therefore it has been claimed that the laws were promulgated, memorized and proclaimed by generations of lawmen (cf. Ståhle 1955, 39; and Haugen 1976, 186). Recent research hypothesizes, however, that the laws, too, were adapted throughout for the written medium under the influence of

Roman and canon law (cf. Lönnroth/Delblanc 1987, 53).

Sawyer/Sawyer (1993, 19) point out that the early laws' distinguishing features such as alliteration, rhythmic constructions etc. are not very effective mnemonic devices. Alliteration, for example, appears to reflect the influence of Latin literature rather than oral promulgation.

The oldest laws concern different Swedish provinces, not the whole country. Accordingly, they are called provincial laws ("landskapslagar"). All of the Swedish provincial laws were written over a period of ca. 100 years. During this period the Swedish monarchy was consolidated, and the Church's power and social position was strengthened. Social life was thus undergoing a huge change. Thus, these provincial laws, too, have a high historical value and are often used as important sources for understanding social life during the early Middle Ages.

The written documentation of the provincial laws can probably be seen as the first step in a process of centralisation. In the mid-14th century we have the first Swedish national law, viz. *Magnus Eriksson's national law (landslag)*. The consolidation of the monarch's power through a common Swedish law implied the drafting of law codices. From the period between 1370 and 1400 we have 35 law codices preserved; 31 of those contain the national law (Åström 1993, 235).

Among the non-juridical manuscripts from the early medieval period in Sweden is the so-called *Old Swedish Legendary*. It is a chronological survey of the most important saints, kings and emperors. The stories from this source were still popular in the late mediaeval period, since many texts from this collection are frequent in late 15th and early 16th century manuscripts (cf. Carlquist 1996, 48f.).

Besides laws and saints' lives, there are some fragments of chivalrous poetry, of economic tracts etc. The content of the preserved Old Swedish manuscripts is consequently rather homogeneous; thus the fragments provide hints about the awakening of a more varied writing culture.

2. The Old Swedish manuscripts

This section gives a short survey of the most important Old Swedish manuscripts (for Middle Swedish manuscripts, see article 120). First a couple of law codices are presented,

then the *Old Swedish Legendary* and the *Autographs of Saint Bridget*.

2.1. The *Old Västergötland law* (Cod. Holm B 59 and Cod. Holm B 193)

The Old Västergötland law is the oldest known Swedish law; it is also preserved in the oldest manuscript. The original lawmaker was Eskil, a lawman and brother of Earl Birger – the founder of Stockholm. Snorri Sturluson may have influenced Eskil to write down the law since Snorri visited him in 1219 (cf. Ståhle 1955, 42). The language of the law also shows West Scandinavian features. The preserved manuscripts are, however, just copies.

The oldest fragment is Cod. Holm B 193, which today contains only two leaves from the inheritance code, and it was found in Telemarken, Norway. According to von Friesen (1904) this fragment is written in the pure 13th century dialect of Västergötland. Von Friesen has also set the dating of B 193 to ca. 1250.

The most important manuscript of the *Old Västergötland law* is, however, Cod. Holm B 59. This is a rather complex manuscript with a mixed content. B 59 consists at least of two different parts. The first part contains, besides the Västergötland law, notes about "the juggler's right" (*lekareätten*), geographical and political notes, and some statutes. In this part there is also a copy of Bishop Brynjolf's statute from 1281, which gives us a terminus post quem. This part of the manuscript consists today of 47 leaves; one leaf has been lost. It is easy to see that it has been well used, since the first and the last leaves are very discoloured and seem to have been used as covers. All this gives the manuscript the appearance of a private codex.

The second part of B 59 contains three sections distributed over 29 leaves. The first section gives historical information about lawmen and bishops in Västergötland, i.e. the notes of the friar from Vidhem (*Vidhemsprästens anteckningar*). In the second section we find the so-called *Lydekini notes*. This section includes adaptations of the law from the *Young Västergötland law* made by the scribe Lydekinus. The third section is written in Latin and is about Church legislation. In this section we find the expression "de jure regio" which indicates a terminus post quem of 1280.

The second part of the manuscript must also be seen as a private book; for instance Lydekini notes end with "Explicit liber laurenii quem scripsit lydekinus". According to Beck-

man (1911, 79), there is a connection between “laurencii” and a Laurentius Dyakn from Vidhem in Västergötland whom the first part of the manuscript talks about.

2.2. The *Young Västergötland law* (Cod. Holm B 58)

The well-preserved manuscript Cod. Holm B 58 contains a revised version of the law of Västergötland, i.e. the *Young Västergötland law*, together with the *Bjärköarätt*. The latter is a city law made for Lödöse (cf. 2.8.). B 58 also contains a Latin translation of the *statutes of Tälje* from 1345. There are some defects at the beginning of the manuscript; maybe as many as three files are missing (24 leaves); 124 parchment leaves have been preserved.

An innovation in the *Young Västergötland law* is the division and numbering of the codes into different parts [“flockar”], probably due to influence from the Norwegian law of Magnus Lagaböter. But the order of the different law codes does not seem very systematic, and it differs considerably in comparison with other Old Swedish provincial laws.

B 58 does not represent the oldest version of the *Young Västergötland law*. That is found in Cod. Holm B 59, in the Lydekini notes (cf. 2.1.). You can also track the older version of the law in the marginal notes of the *Old Västergötland law* in B 59. It thus seems that the owner of B 59 tried to update his law book. An interesting fact is that some of the added regulations in B 59 are not found in B 58. This indicates that the composing of the law was a work in progress.

The drafting of the *Young Västergötland law* must have been done between 1281 and 1300, and the new editors of the version found in B 58 may have used a version of the old law which was quite different from the text in B 59 (cf. Holmbäck/Wessén 1979b, xliii). The new regulations are inserted at the end of the codes rather mechanically. It thus does not seem that the scribe has been the editor; he was probably just working for a more competent lawman. However, his writing was very carefully and aesthetically done.

2.3. The *Östergötland law* (Cod. Holm B 50 and Cod. Ups. B 22)

The complete text of the *Östergötland law* is only preserved in two manuscripts, Cod. Holm B 50 and Cod. Holm B 197. B 197 is from the end of the 16th century; so B 197 is

not an Old Swedish manuscript. However, B 50 is dated to ca. 1350. It is a rather large manuscript with 108 leaves (two leaves have no text). Many of B 50’s initial letters are beautifully illuminated. It is maintained that the scribe thought more about the appearance of the page than of the language since many mistakes appear in the text (cf. Stähle 1988, 17).

There are also five fragments of this law, all from the 14th century. The most important of these is Cod. Ups. B 22, a very defective manuscript. Olson (1911), who found 30 single leaves and 12 strips of this manuscript, maintained that B 2 in the original may have contained 87 leaves (cf. 1911, xii ff.). Later Jan Liedgren found another 61 additional strips, 56 with text. All the leaves and strips belonging to B 22 are found in folders of 15th century manuscripts from Vadstena Abbey. B 22 may have been disassembled here when the text was out of date.

The *Östergötland law* seems to have been composed around 1290, and at least before 1303 when a charter speaks about a codex to this law. The primary editor was most certainly Bengt Magnusson, lawman between 1269 and 1294 (Holmbäck/Wessén 1979a, 3).

2.4. The *Uppland law* (Cod. Ups. B 12)

Cod. Ups. B 12 is one of the manuscripts of the *Uppland law*. It was edited by Schlyter, who dated the manuscript to ca. 1300 (1834, i), which today we know is incorrect. A more reliable dating would be ca. 1350 (Henning 1967, i). B 12 contains 123 parchment leaves; two have been lost and replaced with empty leaves.

There are four additional manuscripts containing the complete text of this law, all from the 14th century. The two most important ones are Cod. Holm B 199 which, according to Henning (1967, xv ff.), stands closer to the archetype than B 12, and Cod. Holm B 52, which is a straight copy of Cod. Holm B 199. The relationship between B 52 and B 199 can be proved by some mistakes they have in common (cf. Henning 1967, v).

The remarkable thing about B 12 is that this manuscript contains, besides the law text, both a preface and a copy of King Birger Magnusson’s confirmation of the law on the 2nd January 1296. The confirmation tells us that the initiative for the *Uppland law* came from the dependants. It was prepared by the lawman of Tiundaland, Birger Persson (father

of Saint Bridget), together with 12 men. The law was thereafter proclaimed and confirmed by the King. The *Uppland law* is thus a more official law than other provincial laws. Consequently the *Uppland law* came to be important also outside Uppland. It is easy to track its influences in e.g. the *Law of Hälsingland* and in King Magnus Eriksson's national law. The Church legislation from the *Uppland law* was used, to some extent, until 1686.

2.5. The *Law of Dalarna* (Cod. Holm B 54)

Just a single manuscript has been preserved of the *Law of Dalarna*, viz. Cod. Holm B 54 (some parts of the law are preserved in the copybook of Nils Hansson Brask, Cod. Ups. B 113, 16th century). B 54 is a rather small manuscript. It contains 53 parchment leaves, but only the first 46 leaves contain the law. The writing on the last leaves consists of later notes. The manuscript contains many writing errors, which indicates that the scribe was not very accurate. One problem is that the manuscript lacks a title and information about where it has been used, mentioning only that "this law has been valid since Dalarna was built" (þæssum lagh hawa standit æ sīþan dala bygðus, cf. Wiktorsson 1981, 38f.). When Schlyter edited the law, he described it as the *older Västmanna law* due to the fact that the province of Dalarna never was a proper law region (*lagsaga*). Since the end of the 19th century when H. Schück (1891) proved that during the 1570s Mats Bengtsson's law book was seen as applying to Dalarna, almost nobody has questioned B 54's provenance (cf. Holmbäck/Wessén 1979c, xiv ff.). Only Wiktorsson (1981, 59ff.) persists in claiming that B 54 is a version of the *Older Västmanna law*, but used in Dalarna. He asserts that there was no official version of the law for the province of Dalarna; so there would be no reason to talk about a law of Dalarna.

The *Law of Dalarna* also shows many similarities with the *Uppland law*. This has led to a discussion of which law has borrowed from the other. The problem is that there are very few word-for-word similarities. Neither do the different codes follow in the same order. Recent research has maintained that the *Law of Dalarna* must be younger than the *Uppland law* because of a reference to King Birger Magnusson (Holmbäck/Wessén 1979c, xviii). The reference gives the year 1290 when Birger became king as *terminus post quem*. Probably the dating can be extended to 1298 when Bir-

ger reached lawful age. The *Uppland law* was, as mentioned above (cf. 2.4.), confirmed 1296.

The dating of the *Law of Dalarna* is thus not unchallenged. For example, why must the reference to King Birger date the whole law and not just a single regulation? Information in different laws that a certain regent has decreed a certain law is not uncommon, especially in older Norwegian laws. In the (*young*) *Västmanna law* there is also the same regulation with the same reference to King Birger. Thus it does not seem that this reference can be used as proof that the *Uppland law* must be older than the *Law of Dalarna*.

According to Hafström (1974, 43), the draft of B 54 must have been made before 1280. This is because B 54 lacks regulations about visiting (*gästning*) that was included in the *Alsnö stadga* from that year.

Probably neither the *Uppland law* nor the *Law of Dalarna* are dependent on each other. The similarities may very likely be understood as a result of the establishment of the king's power.

2.6. The *Södermanna law* (Cod. Holm B 53 and Cod. Havn., Ny kongelig Samling N:r 2237 4:o)

Both the preserved manuscripts of this law are from the 14th century. Wiktorsson (1976, 10) dates B 53 to ca. 1327, and NKS 2237 to 1335–1350. He also claims through analyses of different charters that NKS 2237 was written by a scribe who was active in Ärnäs, Kärnbo parish, Selebo hundred (1976, 53). Wiktorsson (1976, 32; 1981, 4) also shows that the master manuscript for NKS 2237 must have been Cod. AM 52 4:o, today a fragment containing just the Church legislation.

NKS 2237 contains, besides the law, a confirmation and a preface. Both additions seem to have been copied from the *Uppland law* and just marginally changed for the new context. NKS 2237 is a well-prepared and very beautiful manuscript.

Cod. Holm B 53 contains, besides the *Södermanna law*, also one leaf of the *Björköarätt*. One scribe has written both the laws but with different kinds of ink, possibly at different times.

Some important differences, especially in the Church legislation, between NKS 2237 and B 53 indicate that in the beginning of the 14th century there must have been at least two different laws for Södermanland. B 53 represents the older version that was edited around

1300. NKS 2237 is slightly more modern and was probably the result of a new editing process (cf. Holmbäck/Wessén 1979c, xvii ff.). According to Wiktorsson (1976, 19 ff.) this is incorrect; he claims that both B 53 and NKS 2237 were edited around 1326 but at different locations.

2.7. The *Gutnish law* (Cod. Holm B 64)

The language spoken on Gotland in the Baltic Sea during this period was quite different from the language of the Swedish mainland. Therefore a distinction is made between Old Swedish and Old Gutnish. Only one Old Gutnish manuscript is preserved, viz. Cod. Holm B 64 from about 1350. B 64 contains the *Gutnish law*. An older textual version of this law is found in a later manuscript, viz. Cod. AM 54 4:o from the 16th century (cf. Holmbäck/Wessén 1979d, lxy). In AM 54 there are regulations about children of priests and about thralls. These regulations are missing in B 64 because they were not suitable after the imposition of celibacy and the abolition of bondage. Accordingly the version of the *Gutnish law* found in AM 54 must have been written during the 13th century.

The *Gutnish law* includes the *Gutnish saga*, composed around 1220. The law does not seem to have a later dating. The law was probably written down by order of Archbishop Andreas Suneson who visited Gotland in 1207 (cf. Holmbäck/Wessén 1979d, lxxi f.). The *Gutnish saga* follows immediately after the law text in B 64. Both texts were written by the same scribe.

There are two mediaeval translations of the *Gutnish law*, one in Low German from 1401, and one in Danish from ca. 1550. Both these translations contain the regulations about thralls, but not the ones about the children of priests. Since they differ in the order of chapters (the *Gutnish law* is not organised in codes), it seems that there are four different preserved versions of the law (cf. Holmbäck/Wessén 1979d, lxxviii).

2.8. The *Björköarätt* (Cod. Holm B 58)

The Swedish *Björköarätt* survives only in one manuscript, Cod. Holm B 58 from about 1345. This manuscript also contains the *Young Västergötland law* (cf. 2.2.). The *Björköarätt* in B 58 was written for use in Lödöse, Västergöt-

land, but the original text was probably composed for the city of Stockholm since the *Björköarätt* mentions Stockholm and other place-names around Stockholm.

Two fragments of the *Björköarätt* are also preserved, one written for the province of Södermanland, possibly Nyköping, the other for the province of Östergötland, possibly Linköping or Skänninge.

The *Björköarätt* was not influenced by German city laws to any large extent. This is a quite unexpected fact, since many Germans lived in Stockholm during the time the Swedish *Björköarätt* was drafted (Holmbäck/Wessén 1979b, xcix).

2.9. *Magnus Eriksson's national law* (Cod. AM 51 4:o)

Around 1350 a new law was drafted. This law intended to replace the different provincial laws as a common law. It has been shown that this new national law is related to the royal regulations that had been promulgated in Skara in 1335, Skänninge in 1335, Uppsala in 1344 and Tälje in 1345. This connects King Magnus Eriksson to the national law (Holmbäck/Wessén 1962, xvi ff.). In itself the national law is rather anonymous; it lacks confirmations, prefaces and even Church legislation. It shows a close connection to the provincial laws of Uppland and Östergötland.

The reason that the national law lacks Church legislation is due to a protest made by clerks from five of Sweden's seven dioceses in 1347. The clerks protested against every attempt to decrease the church's legal rights (cf. Holmbäck/Wessén 1962, xxvii ff.). This explains why most of the manuscripts containing the national law also contain Church legislation from an older law, usually from the *Uppland law* or the *Södermanna law*.

In spite of this the national law was ready to be used in 1352. Charters tell us that the *Östergötland law* and the *Uppland law* were still in use 1351, but during the year 1352 we know that the national law was used in Västmanland and Östergötland (cf. Holmbäck/Wessén 1962, lvi ff.).

Today ca. 100 manuscripts of the national law have been preserved, mostly from the Middle Swedish period. One of the most important manuscripts of *Magnus Eriksson's national law* is Cod. AM 51 4:o from the middle of the 14th century. This manuscript contains the national law together with the Church legislation from the *Småland law*. A different

and probably later hand (Holmbäck/Wessén 1979b, lxxvi) wrote the Church legislation.

Another important manuscript of the national law is Cod. Ups. B 23. In this 14th century manuscript we also find that a 16th century scribe tried to restore the lost parts of the manuscript. B 23 has been edited and closely described by Wiktorsson (1989).

2.10. *Magnus Eriksson's city law* (Cod. Holm B 154 and Cod. Holm B 170)

Around the same time the national law was written, a new city law for Sweden was drafted. Just like the national law, the city law lacks Church legislation (cf. 2.9.). The national law and the city law are often in accordance, so it is quite obvious that the city law was written in connection with the national law. One of the big differences is that the city law gives a daughter the same right of inheritance as a son (cf. Holmbäck/Wessén 1966, xlix).

The city law must have been ready before 1357 when King Birger Magnusson's regulations about sheriffs, chief magistrates and councils were announced. These regulations are not found in the city law.

Magnus Eriksson's city law is preserved in more than 100 mediaeval manuscripts, but only five of these (and one fragment) are from the 14th century. In Cod. Holm B 154 the city law takes up 98 leaves and follows after the Church legislation from the *Uppland law*. It has beautiful initials, often very large. It is quite clear that this manuscript was in frequent use; for instance many different hands have written notes in B 154.

Cod. Holm B 170 gives a clear dating and a clear notification of province. It begins with "Her byrias sutherköpungs laghboch" 'Here begins the law book of Söderköping' and ends with "Completus est liber iste sub manu konradis scriptoris. Anno ab incarnatione domini M.CCC.LXXX septimo".

Another Old Swedish manuscript containing the city law is Cod. Linc. J 88 written by the same scribe who wrote the national law in Cod. Ups. B 6. There is also Cod. Holm B 5b, which contains the national law together with the Church legislation from the *Södermanna law*. Last there is Cod. Holm B 127a; a defective manuscript which lacks Church legislation. None of J 88, B 56 or B 127a can be connected with any specific city. Holmbäck/Wessén (1966, xlv) suppose that all three were written in Stockholm, but they give no clue as to where they were used.

Every mediaeval city in Sweden had to have its own law book since the law stated that the law book should be kept in a chest together with seals and charters, and every year it had to be read aloud (Holmbäck/Wessén 1966, xv). However, very few manuscripts can be connected with a specific city. Many of the preserved manuscripts of the city law seem to have been owned by laymen, but there is very little information about scribes, dating, owners etc. Usually the manuscripts are anonymous. We do, however, know that Cod. Holm B 154 from the second half of the 14th century was used in Stockholm, and Cod. Holm B 170 from 1387 was used in Söderköping (cf. Holmbäck/Wessén 1966, xv; about the dating of B 154, see also Jansson 1943, 122f.).

According to Beckman (1917, 17f. and 240f.; see also Holmbäck/Wessén 1966, xviii f.) there are four different groups of manuscripts of the city law: the Stockholm type, the Söderköping type, the Uppsala type and the Västerås type. The most important type is certainly the Stockholm one with its prototype Cod. Holm B 154. This type was used for the first printed version in 1617–1618 (the city law was confirmed in 1617 by King Gustav II Adolf).

2.11. *The Old Swedish Legendary* (Cod. Holm A 34)

As already mentioned, the main part of the vernacular manuscripts from the Old Swedish period contain law texts. An exception is Cod. Holm A 34 from 1340–1385 (cf. Jansson 1934, 21f.), which contains the *Old Swedish legendary*. Today A 34 consists of 60 parchment leaves, but it must have been a great deal larger since the manuscript has some rather large lacunae.

According to Jansson (1934, 21) the dialect of the manuscript points towards Östergötland. Earlier research has mentioned the Dominican monastery of Skänninge as its place of origin, but during the 15th century it may have been transferred to Vadstena Abbey (cf. Carlquist 1996, 27). The binding is typical for Vadstena, and on the inside of the cover we find a fragment of a text by Saint Bridget (Carlquist 1996, 42f.).

The so-called *Old Swedish legendary* is a rather free translation of *Legenda aurea*. The legendary is also found in two Middle Swedish manuscripts, Cod. Ups. C 528 and Cod. RA E 8900. Jansson (1934, 46ff.) maintains that C 528 contains the most original version of

the text, but later research has shown that the differences between the manuscripts can be explained by their being aimed at different audiences: C 528 was written for use in Vadstena Abbey, A 34 and E 8900 for different lay audiences (cf. Carlquist 1996, 82f.).

Another Old Swedish manuscript containing the same texts is Cod. Holm A 124. A 124 is a very defective fragment, slightly older than A 34 (cf. Carlquist 1996, 30).

2.12. The *Autographs of Saint Bridget* (Cod. Holm A 65)

Maybe one of this period's most striking manuscripts is Cod. Holm A 65, also called the *Autographs of Saint Bridget*. Toni Schmid and Erik Noreen in particular (Högman 1961, 9f.) have discussed the authenticity of Saint Bridget's own writing. Thanks to Högman's philological survey of A 65, we can say that it is most possible and highly probable that we have here Saint Bridget's own draft. He has shown that the text in itself has priority over all Latin manuscripts (1961, 30ff.). He also put forward historical statements, palaeographical evidence, and the fact that Vadstena Abbey held the *Autographs* as authentic in the 15th century as evidence for this (1961, 70f.).

Cod. Holm A 65 consists of three paper leaves; two contain autograph A, one autograph B. The leaves of autograph A are sewn together. The paper has slightly yellowed with age and is of three different kinds. All three leaves are filled up with letters on one side. It was written by the same scribe throughout with two exceptions. On the back of autograph A a 15th century scribe has noted "Sancta birgitta screef thæssa ordh medh sinne eghne hand som røre pawan oc cardenales" [Saint Bridget wrote these words with her own hand about popes and cardinals], and on the back of autograph B we can read another note: "fyrst vil iak þik seya huru þik æru andelik understandelse giuin" [Firstly I will tell you how spiritual understanding is given you].

3. The making of Old Swedish manuscripts

Sweden is still without any greater codicological survey of the older vernacular manuscripts. We know very little about the different scribes, their schools, early chancelleries etc., especially in comparison with Norway and

Denmark. We do know that Bishop Henric of Linköping decreed in 1272 that a new priest should stay two years at the cathedral so that he could learn clerical skills (Jansson 1943, 83), but that is just about all.

However, it is quite clear that there were many scribes in Sweden during this period. The by-name *skrivare* 'scribe' was rather common during the 14th century, and even people whose profession wasn't that of a scribe carried that name.

Except for the *Autographs of Saint Bridget*, all the Old Swedish manuscripts consist of parchment. Law texts continued to be written on parchment during the 15th century, even though paper grew more popular. There are a few charters written on paper from the 14th century but they are not common. It is quite obvious that during this period paper did not constitute a threat to parchment as writing material.

The script is usually Gothic, quite soon changing to Gothic cursive. Only the *Old Västergötland law* is written in Carolingian script, an influence from the Norwegian manuscripts (cf. Jansson 1943, 88ff.).

The ink was usually made from oak galls and from vitriol, as we know through medieval recipes found in manuscripts. The ink was often black or brown; only in rubrics and for important names was coloured ink used, mostly red, but sometimes blue and green. Illuminations are not common. When they occur during this period, it is in law manuscripts, and then often in the initials. Most important here are Cod. Holm B 50, containing the *Östergötland law*, Cod. Holm B 6 and Cod. Holm B 10, both containing *Magnus Eriksson's national law*.

A lot of writing seems to have been done on wax tablets, but of course, nothing of this has been preserved. For example, the very special style of writing in *Saint Bridget's Autographs* may be explained by the possibility that Bridget used to write on a wax tablet (Högman 1961, 16f.).

Very few studies have been carried out regarding the punctuation system. As far as I know, only Cod. Holm A 34 (cf. 2.11.) has been examined from this perspective. It uses a well thought-out punctuation system both to structure the content and as a support for reading aloud (cf. Carlquist 1996, 204ff.).

4. The culture of Old Swedish manuscripts

In the Old Swedish period, we seem to have a clear difference between a literate elite and an illiterate mass. Nearly all the writing during this period was in Latin. In the vernacular there are, above all, law texts. The laws were written down as an essential part of the consolidation of the kingship when Sweden was on its way into Europe. The most interesting fact is that the laws were composed in the vernacular – not in Latin. Another interesting fact is that many of the law manuscripts from this period are private compilations, not official law-codices. This explains why the same law can differ in the order of items, that many manuscripts can be seen as unsystematic, containing repetitions and contradictions, including out-of-date laws etc. Laws tended to be treated as recommendations to be taken into account rather than as rules to be obeyed (Gunneng 1987). This also made it important for the king to make an official law that could strengthen his power (cf. Sawyer/Sawyer 1996, 18).

There is also a great collection of Saints' lives translated into Swedish ca. 1300. This collection can not have had any liturgical function. The lives are not ordered after the church year, but chronologically (cf. Carlquist 1996, 46f.). Probably the legendary was composed as a source of edificatory stories for a lay audience (Carlquist 1996, 223ff.).

Neither are the *Autographs of Saint Bridget* any proof of a higher level of lay literacy in Sweden. Bridget was from one of the noblest families in Sweden, and she was an extraordinary woman, not just because she knew how to write using the Latin alphabet.

Besides these texts preserved in Old Swedish manuscripts, we know that there were more texts written in Swedish. For example, the Norwegian Queen Eufemia had some of Chretien de Troyes' works translated into Swedish. The political chronicle of duke Erik (*Erikskrönikan*) was composed in the early 14th century. Probably the royal speculum *Um styrilsi kununga och höfþinga* [How to govern for kings and leaders] also dates from this period, as does a paraphrased translation of the Pentateuch.

Together this indicates that there was an audience for written texts of different kinds outside the church and outside the legal administration. But this audience differed greatly from later textual audiences. In spite of the

fact that everyone came into contact with written texts, in church, at the *thing* etc., very few read texts, and even fewer owned manuscripts. People *listened* to texts, maybe memorized texts or had texts read aloud (cf. Jansson 1994, 106f.).

94. The history of Old Nordic manuscripts IV: Old Danish

1. Overview
2. Latin manuscripts
3. Vernacular manuscripts
4. Literature (a selection)

1. Overview

With regard to Danish manuscripts – a term here used to cover both manuscript books and handwritten documents of certain or probable Danish origin – the period from ca. 1100 to 1350 constitutes a well-defined whole: there are no extant Danish manuscripts dating from before ca. 1100 and only very few from the half century or so after 1350. In the following, attention is chiefly given to those manuscripts from this period which provide information pertaining to the history of the Danish language.

Historically speaking, the details surrounding these manuscripts are hazy; apart from the charters most can be dated and localised only approximately, if at all, and their scribes are anonymous, with the exception of a very small handful, who, when they provide titles, tend characteristically enough to be in religious orders. Scribal schools can be discerned only in conjunction with the largest religious institu-

tions (primarily Lund, but possibly also Sorø). Linguistically speaking, the manuscripts are sometimes solely or predominantly in Latin, sometimes solely or predominantly in Danish, the former case typically when they preserve texts which are part of the common European Latin-Christian tradition and/or can be presumed to have had interest principally for the local representatives of that tradition (diplomas, municipal laws, guild laws, necrologies, cadastres, annals and chronicles), and the latter case when they preserve texts that were the product of indigenous culture (chiefly the provincial laws), or common European texts which may be assumed to have had especial meaning for ordinary people (medical and religious works). Quantitatively speaking, the distribution of the manuscripts over the period is as could be expected: the largest number are from the first half of the 14th c., fewer from the 13th c., and only a very few from the 12th c. Given that it is known that texts have been written down in Danish since the end of the 12th c., it is more of a surprise that the great majority of vernacular manuscripts should come from the last part of the period – indeed, apart from one or two, all are dated to the period ca. 1300–1350.

2. Latin manuscripts

With the exception of the two law codices AM 37 4to and AM 11 8vo, which contain complete short texts in the vernacular, the chief interest of the Latin manuscripts from the point of view of the history of Danish lies in the vernacular material that appears sporadically in them. This material is principally in the form of Danish personal and place-names, although particularly in the charters and municipal laws Danish words, especially substantives, occasionally appear which for one reason or another are not translated. Most often this scattered material is found in purely Danish or slightly Latinised form (the latter is especially the case for personal names), and can therefore throw light on the history not only of the vocabulary, but also on orthography, phonology and to some extent morphology.

Despite being in Latin, the original charters (i. e. legal documents such as royal ordinances, deeds, testaments and so on) are one of the period's most important (and least studied) sources for the history of Danish. Owing to the nature of their content, they are full of names, are almost always precisely dated, unlike other sources, and are more evenly distributed chronologically over the period than are the vernacular Danish manuscripts.

Unfortunately there are only two or three original Danish charters (as opposed to copies) from the 12th c. dealing with Danish matters. The oldest is Erik Emune's privilege for Lund Cathedral from 6 January 1135, the scribe of which has been identified as one of the scribes of *Necrologium Lundense* and must therefore have been affiliated with the famous Lund scriptorium. From the 13th c. around 350 original Latin charters issued in Denmark have been preserved, and there are well over twice as many from the first half of the 14th c. The scribes of only a few of these have thus far been identified with named persons: one of the important figures in King Abel's chancellery is thought to have been Esger, Bishop of Ribe (d. 1273) (Skyum-Nielsen 1963, 225ff.), and the hand on a number of charters written in Ribe during the period 1289–1315 has been identified as that of Canon Astratus of Ribe, who is known from, among others, the cartulary referred to as the "Ribe Oldemoder". Scribes of charters, as far as can be seen, never identify themselves; despite what has been claimed to the contrary (Skautrup 1944, 206, cf. 197), the sporadically found

formula *Datum per manum/manus* + a name in the genitive hardly represents a scribal formula (cf. inter alia Skyum-Nielsen 1957, 111 with references).

On the borderline between charters and manuscripts proper lie the Latin municipal laws of the period, and a single collection of guild laws. The municipal laws contain officially confirmed rules for the legal system in the towns, and the guild law the rules for the mutual obligations between the members of a brotherhood. They are of interest linguistically principally for their vocabulary of Danish glosses; especially rich in this respect are the bylaws of Schleswig, which are thought to have been issued as early as the first half of the 13th c., but are only preserved in a version from the beginning of the 14th c. for use in Ebeltoft (DKB [Royal Library of Denmark] GKS 3168 4to). Preserved in the original are the municipal laws for Copenhagen from 1254 (DRA [Danish Record Office]) and 1294 (DRA), the municipal laws for Ribe from 1269 (fragm. DKB NKS 1880 fol.) and for Aabenraa from 1335 (Aabenraa Landsarkiv [Regional Archives]). The guild law is that of St. Erik's Guild in Kalvehave; it was confirmed in 1266, but the small parchment booklet containing it, which comprises a separate part of the manuscript AM 275 8vo, is thought to be a copy from ca. 1300.

The Latin manuscripts of the period are all miscellanies of varying degrees of heterogeneity. Here they have for purely practical reasons been separated into necrologia, cartularies, the anthology known as *Valdemars Jordebog*, legal anthologies, a collection of grammatical texts, and finally manuscripts that are only of interest for their historical content.

Necrologia have their origin in the obligation churches and other religious institutions had taken upon themselves – generally in exchange for donations – to commemorate the dead at a service on the anniversary of their death. They can comprise many different kinds of texts, but the Danish material they contain is limited to necrologies, occasionally with added information on donations made by the deceased, historical notices and short texts that have been added for practical or administrative reasons, for example copies of title deeds or lists of prebends (properties the revenues from which were used to pay priests, canons etc.). From the scriptorium of the Laurentius Church in Lund – where in the early 12th c. a number of manuscripts of an unsurpassed beauty were produced – come two

manuscripts of exceptional interest for historical linguists. With their age and the large amount of Danish vernacular material they contain, they help to fill a gap which the charters cannot. The elder and grander of the two is known as *Necrologium Lundense* (Lund Medeltidshandskr. 6). Its first necrologies are thought to have been taken over from an older necrologium in connection with the consecration of the new crypt at Lund Cathedral in 1123. It is unclear whether the introductory text of St. Knud's deed of gift from 21 May 1085 (and a prebend list written at the same time) was added even earlier or whether it is a copy of a forgery produced toward the middle of the 12th c. (Kroon 1989, 225). The obituary section (*Memoriale fratrum*) was continued regularly to about 1170, and thereafter sporadically until the beginning of the 14th c. In the first half of the 13th c. two boundary descriptions were added which are full of names (*Termini Balluncslef*). Only slightly younger than *Necrologium Lundense* and every bit as rich in names is the *Liber daticus Lundensis vetustior* (Lund Medeltidshandskr. 7), the oldest necrologies of which were taken from *Necrologium Lundense* before 1146; subsequently necrologies were added regularly until the beginning of the 15th c., in many cases with accompanying information on the donations of the deceased. Other surviving manuscripts of this type are considerably younger and scarcely as valuable as sources, at least as far as place-names are concerned; these are: the Næstved Calendarium (DKB E don. var. 52 fol.) which was begun about 1265, *Liber daticus Lundensis recentior* (DKB GKS 845 fol.), begun ca. 1268, *Obituarium Hafniense* (DKB Thott 805 fol.), begun ca. 1275, and the *Necrologium Ripense* (DKB GKS 849 fol.), in use from 1284. To this list might also be added the fragmentary Nysted necrologium (Den Haag, Mus. Meermanno-Westreenianum), which cannot be dated more precisely than to the 14th c.

Cartularies appear to have been put together solely in order to facilitate the juridical and economic administration of religious institutions. The texts contained in them are almost always sources of names, in that they consist of copies of charters of importance to the institutions in question, along with various inventories of sources of revenue – primarily prebend lists and cadastres (topographically arranged inventories of properties with information on the revenues deriving from them) – in other words texts which by necessity

contain names of various kinds. The earliest of these is the cartulary from Ribe, which owing to an enigmatic post-medieval inscription reading “Oldemoder” [grandmother], is generally known as the *Ribe Oldemoder/Avia Ripensis* (DRA). It contains entries for the Ribe bishopric and chapter for the entire period ca. 1290–1518, but over two thirds of them are the work of the oldest scribe, who was active from about 1290 to 1322 and identifies himself as master Astratus, canon of Ribe and the church's advocate (*tutor*); he is otherwise known from references in, and was presumably the writer of, a number of contemporary charters from Ribe (Skyum-Nielsen 1948–1949, 152–155). The cartulary and cadastre from the Århus chapter are dated to the period around 1315, and together with two 15th-c. sections of similar content make up the manuscript known as *Århusbogen* (DKB E don. var. 53 fol.).

The Latin manuscript of the period which has, alongside *Necrologium Lundense*, the greatest value as a source for the history of the Danish language, although dated to as late as ca. 1300, is known as *Valdemars Jordebog* (DRA). It too is a miscellany, comprising texts of varying kinds, some of interest to historians of the language, others not. Although the texts are copies which appear to have been added – primarily by two scribes – according to a preconceived plan, the book's exact purpose, in contradistinction to that of the necrologia and cartularies, is difficult to discern and has therefore been the subject of much debate. The most recent hypothesis, that the book was intended as an aid to the Franciscan mission in the Baltic area in the years around 1300 (Gallén 1993, 81–83), is irreconcilable with the generally accepted localisation of the manuscript to the Cistercian monastery at Sorø, a localisation based on the observation of two striking congruences: viz. that one of the manuscript's two main scribes, the writer of the cadastral sections, is apparently identical with the scribe of the law manuscript AM 455 12mo, who identifies himself as Frater Johannes Jutæ (“[the] Jute”) and shares his name – admittedly not a particularly rare one – with a monk from Sorø named in a title deed from 1298; and that the manuscript also has many striking features of layout in common with the leech-book DKB NKS 66 8vo, the main scribe of which identifies himself as Frater Kanutus Yuul, the name of another monk from Sorø mentioned in a deed from 1310. Of relevance for the history of the Danish language are

principally the lists of crown properties and the like, which although responsible for the book's name, make up only about one third of it. Here there are some 1200 name forms and a great number of Danish words, including some terms for measurements and the names of animals that could be hunted on the Danish islands, along with occasional purely Danish passages. Most important is the section known as the "Main List", which systematically covers the entire country, district by district. It was written, according to the manuscript itself, in 1231, i.e. during the reign of Valdemar Sejr. Danish names are also found among other places in the annals included in the manuscript, the *Valdemarsannaler* (1074, 1130–1219).

Of the legal anthologies, the manuscript AM 37 4to undoubtedly belongs to the period under discussion, since this collection, which is presumed to have originated in Lund, contains one section which is dated to the second half of the 13th c. AM 11 8vo may also stem from this period, but cannot be dated more precisely than to the 14th c. The main texts of the two manuscripts are indigenous vernacular texts that have been put into Latin in order to reach an international public: one is a copy of the paraphrase made, according to a colophon, by Archbishop Andreas Sunesen (d. 1228) of the *Skånske Lov* or Scanian Law; and the other is a copy of a translation of *Jyske Lov* or Jutish Law (see section 3.). Both these texts contain a small number of Danish glosses, but what is most interesting about the two manuscripts from the point of view of the history of Danish are their vernacular texts. In AM 37 4to there is a text of *Skånske Kirkelov* or Scanian Ecclesiastical Law (see section 3.) which is thought to be a copy of a copy made during the ecclesiastical conflict of the 1250s (cf. e.g. Brøndum-Nielsen 1975, 33–42), while AM 11 8vo contains a fragment of the preface to *Jyske Lov* and a prayer to Christ. In AM 37 4to there is also found, as a comment on the manuscript's particular version of the epilogue to the Ecclesiastical Law, a short verse which has been added in the margin, known as "skåningestrofen".

The whole of the small manuscript AM 202 8vo, which is possibly from Roskilde, is dominated by texts dealing with Latin grammar. The texts have been written by various 14th-c. hands, the oldest of which is dated to ca. 1300 and is thought to be responsible, along with several hands from the second half of the century, for the Danish elements, which consist

of sporadic Danish glosses, including several animal and fish names.

There are a number of Latin manuscripts from the period that are of interest for the history of Danish solely on account of their historical content, i.e. annals or chronicles which deal either solely or in part with Danish material and therefore include a number of Danish names, although in general significantly fewer than do the other Latin manuscripts discussed here. The earliest of the annals is the Colbaz Annal, which now forms part of the composite manuscript Ms. theol. lat. fol. 149 in the Staatsbibliothek zu Berlin – Preussischer Kulturbesitz. The entries it contains pertaining to the history of Denmark are from 1130 until the end of the 12th c. and were made presumably in Lund or the vicinity thereof, as the same hand is thought to have been at work here as was responsible for the rubrication in *Necrologium Lundense*. Sometime late in the 12th c. the manuscript was transferred to the Cistercian monastery of Colbaz in Pomerania. A rich source for names, including many from the south Jutish border region, is the only surviving witness of the Ryd Annal, actually a combination of chronicle and annal, which goes up to 1288. The witness is a copy from about 1300 (Hamburg Stadtbibliothek 98b) and is so full of errors as far as the Danish names are concerned that the scribe is presumed to have been a foreigner. The most important of the chronicle manuscripts is *Ømbogen* (DKB E don. var. 135 4to). That part of the manuscript dating from the period under discussion contains a considerable collection of mid- and east-Jutish names, in that it gives historical accounts from the monastery at Øm in East Jutland, entered successively from at least 1216 up to 1320. Other manuscripts containing annals or chronicles with relevance for the history of the language are the following: Kiel UB [Universitätsbibliothek] S. H. 8 A 8vo from the second half of the 13th c. (a copy of the Roskilde Chronicle, written for the most part around 1140); Uppsala UB C 70 from the 13th c. (a copy of the Danish-Swedish annals from 916–1263); a leaf containing original annal entries for the years 1202 to 1347 that has been added at the end of DKB GKS 450 fol. ("the younger Sorø Annal") – the manuscript may be a French Justinus manuscript from the second half of the 12th c. given by Archbishop Absalon (d. 1201) to the monastery at Sorø; the fragment AM 843 4to from ca. 1300 and the older part, also from ca. 1300, of the composite vol-

ume Erfurt Stadtbibliothek 23 8vo (copies of the Lund Annal, running up to 1267, with the interpolation of the Lejre Chronicle, written about 1170). Of Saxo's great historical work *Gesta Danorum* – which is thought to have been written in the period 1185–1219 and which contains a large and important collection of names, albeit ones that are difficult to assess due to their partly Latinised forms – only a very few leaves survive from the period: the Angers fragment, DKB NKS 869 g 4to, comprising four leaves, dated to the beginning of the 13th c. and thought to stem from Saxo's own working copy; three other fragments, DKB NKS 570 fol., are dated to the end of the century. Despite their limited scope, these fragments are of great historical-linguistic significance if for no other reason than their importance for evaluating the oldest complete witness of the text, the Paris printed edition of 1514.

3. Danish vernacular manuscripts

From the last century of the period under discussion, ca. 1250–1350, about 30 Danish vernacular manuscripts have been preserved, all in the form of codices or fragments thereof, and all, with one possible exception, containing copies rather than originals. Naturally these manuscripts provide a much greater amount of material for the study of the history of Danish orthography, phonology, morphology and lexicology than do the Latin manuscripts, and also allow for the study of the history of syntax, style etc. In the areas of lexis, syntax, style etc. the possibilities are somewhat restricted, however, by the fact that the types of texts preserved are relatively limited, being principally confined to laws, leech-books and translations of religious material.

The bulk of medieval Danish vernacular manuscripts are law books, whose principal content is the laws for the three provinces into which the Danish kingdom was divided in the Middle Ages: Skåne (Scania), Sjælland (Zealand) and Jylland (Jutland). By the word 'law' is meant both laws proper (*love*), i. e. those issued and authorized by the king, as is the case with *Jyske Lov* ('Jutish Law'), and books of laws (*retsboøger*), collections compiled without royal sanction, as is the case with other provincial laws.

The doyen of Danish manuscripts is the large and exceptionally skilfully produced part of the manuscript SKB [Royal Library

of Sweden] B 74 which comes from the relevant period. It is dated to the second third of the 13th c., but rather before than after 1250. Its principal text is *Skånske Lov*, thought to have been recorded between 1202 and 1216; it otherwise contains only the *Skånske Kirke-lov*, i. e. a settlement regarding details in the administration of justice agreed between the Scanians and the archbishop at some indeterminate point in the late 12th c. Two other law manuscripts date to the 13th c. but are presumably several decades younger than B 74. Dated to the end of the century is AM 24 4to, an eight-leaf fragment of *Valdemars sjællandske Lov*, which in its earliest form was perhaps drawn up under Valdemar the Great but is found here in a version from some time between about 1216 and 1241 (the so-called older redaction). The other manuscript is part of the composite volume SKB C 37 and contains *Jyske Lov*, which was issued in 1241 by Valdemar Sejr, along with two Latin ordinances. Given their location in the manuscript, these must have been added later than the text of the law itself, and since the scribe who wrote them has been recently identified as a scribe active in 1279 in the employ of a certain Thomas, curate to the powerful dowager queen Margrete Sambiria (d. 1282) (Skyum-Nielsen 1980, 531), the manuscript is now dated to around 1280, whereas it was previously assumed to be significantly younger.

There are four law codices from around 1300. Two contain only texts of *Jyske Lov*: AM 4 4to, which was also formerly regarded as significantly younger and has received scant scholarly attention, and the "Flensburg manuscript" (Stadtarchiv, Flensburg), which before the redating of C 37 was thought to be the oldest known manuscript of *Jyske Lov*, dated by some to the end of the 13th c. Its name derives from its earliest known provenance, the town hall in Flensburg, whereas the language cannot be precisely localised, despite the sporadic presence of elements which have been attributed to a south-Jutish scribe. The third of these manuscripts is AM 455 12mo, a veritable florilegium of Zealandic legal material. It contains the younger redaction (compiled presumably after 1241) of *Valdemars sjællandske Lov* (to which the preface to *Jyske Lov* has been added, as was subsequently common); *Sjællandske Kirke-lov*, a text which is largely identical to *Skånske Kirke-lov* with the exception that the contracting parties are here the bishop and people of Zealand and that the date is (plausibly) given as July 21, 1171;

and finally *Eriks sjællandske Lov*, the youngest and longest of the provincial laws, which was presumably first drawn up after 1241 and is associated with some otherwise unidentifiable Erik. The manuscript's sole scribe identifies himself twice as Frater Johannes Jutæ, who, as was mentioned (in sect. 2.), is presumed to have written large parts of *Valdemars Jordebog* and has been identified as a monk in the monastery at Sorø, as has the only other scribe of a Danish vernacular manuscript who identifies himself with name and title, Frater Kanutus Yuul. Both in terms of date and style, the two scribes are so close to each other that it has been suggested – perhaps rather boldly – that there was an active scribal school at Sorø around the year 1300. The fourth manuscript from around 1300 is AM 28 8vo. It contains *Skånske Lov* and *Skånske Kirkelov* written in one hand; written in another, possibly slightly younger, hand are two short historical texts (fragments of a list of Danish kings and a Danish chronicle beginning with the legendary king Hadding's son Frode to Erik Menved), a description of the drawing of the oldest border between Sweden and Denmark (“the Daneholm settlement”) and finally a verse with accompanying musical notation, the earliest preserved in Scandinavia to a vernacular text. What makes the manuscript truly exceptional, however, is that it is written entirely in runes (hence its name, *Codex runicus*). These are not the classical Viking-Age runes, but rather runic characters modified so that each corresponds to a letter of the Latin alphabet. Something of a similar kind is known only from the small fragment SKB A 120, and given that it stands close to AM 28 8vo in terms of the form of the runes and the language (Scanian), it has been suggested that the two manuscripts come from the same scriptorium; it has been further suggested, on rather meagre grounds, that this scriptorium may have been at the Cistercian monastery at Herrevad in Scania. This use of runes is normally regarded as a revivalist phenomenon. The two runic manuscripts in no way form an organic link between the runic script culture of the Viking Age and medieval Latin book culture, but are entirely products of the latter, and both must have had as their exemplars texts written in the Latin alphabet.

Most of the law codices stemming from the first half of the 14th c. are dated to around 1325. Only two are thought to be slightly older. One of these is a manuscript of *Jyske Lov*, AM 286 fol., which is dated to the early

14th c., or ca. 1320. It appears originally to have belonged to the Ribe chapter house, and judging from its large format – it is the only extant Old Danish law manuscript in folio – may have served as a reference copy in the library. That the first of the manuscript's two scribes appears, on linguistic grounds, to have been from the Ribe area, or at least south Jutland, also supports this notion of an origin in Ribe. The other early 14th c. law manuscript is part of the composite volume Ledreborg 12 12mo (from the beginning of the 14th c., sometimes, however, dated to ca. 1325 or the middle of the century). With the exception of the last two leaves (which contain short texts in Latin), the manuscript is entirely taken up with Scanian legal material: *Skånske Lov*, *Skånske Kirkelov*, the Scanian version of Erik Klipping's Vordingborg Decree of March 19, 1282 and Erik Klipping's Nyborg Decree for Skania of May 26, 1284. Primarily on the basis of its language, which differs slightly from that of the other early manuscripts of *Skånske Lov*, it has been suggested that the text of *Skånske Lov* preserved in Ledreborg 12 represents an adaptation for use within the area of Zealandic judicature, something a thorough investigation of first and foremost the unstressed vowels argues against, however (Frederiksen 1974, 367–370). Among the large group of legal manuscripts dated to ca. 1325 there are two that contain essentially only *Skånske Lov* and *Skånske Kirkelov*: SKB B 76 4to (known as the “Hadorphian manuscript” after the Swedish scholar Johan Hadorph, who edited it as early as 1676), which has the peculiarity that the epilogue to the *Sjællandske Kirkelov* is added to the text of the ecclesiastical law, and SKB B 69 4to, which appears to have connections with Malmö and was perhaps written there – a scribe from Malmö has at least been postulated to explain a number of linguistically eccentric passages. Four other manuscripts in the 1325 group contain primarily Jutish legal material: SKB C 44, which contains only *Jyske Lov*; part of SKB C 40, also containing only *Jyske Lov*; AM 453 12mo, containing in part *Jyske Lov*, the scribe of which identifies himself in a Latin verse as Johannes, born in Ørum (the name of various settlements), and in part the Jutish-Zealandic version of Erik Klipping's coronation charter of July 29, 1282 in Latin and Erik Klipping's Nyborg Decree for North Jutland of May 21–27, 1284 in Danish; and finally DKB NKS 295 8vo, the contents of which are identical to those of AM 453. The scribe of NKS 295

8vo is thought to be the same as that of one of the two large Jutish-Zealandic legal anthologies which is also part of the group of manuscripts dated to ca. 1325. This is SKB C 63, which contains both the same Jutish legal material as does NKS 295 8vo and the two Zealandic Laws (the younger redaction of *Valdemars Lov*) as well as *Sjællandske Kirkelov*. These same contents, but in a slightly different order and without the decrees, are also found in another large anthology, SKB C 39, which, on account of its text being closely related to that of AM 455 12mo, and because a variant of the first line of a Latin scribal verse in the manuscript is found in NKS 66 8vo, might tentatively be linked to the monastery at Sorø. Slightly younger than these are part of DKB GKS 3657, from ca. 1350, which contains most of *Jyske Lov* but ends defectively, and AM 41 4to, from around or slightly before 1350, which contains *Skånske Lov* and *Skånske Kirkelov*. At the front of the latter manuscript and almost to be regarded as a pen trial, or at least added in a different hand (ca. 1350) from the main hand of the manuscript, is a fragment in Scanian or Swedish of the East-Nordic translation of a “Debate between the body and the soul”, ultimately based on a Latin poem from the 13th c. commonly known as *Visio Philiberti*. Dating from some time in the first half of the 14th c. is a two-leaf fragment of the older redaction of *Valdemars Lov* (NRA [Norwegian Record Office]). Perhaps also dating from the period is the vellum part of AM 19 8vo, containing *Jyske Lov*. The manuscript cannot be dated more precisely than to the 14th c., but on the basis of its linguistic features it may be localized to the area where Danish and Frisian were in contact at the time.

A small manuscript in the Stadtarchiv, Flensburg, is possibly an original law book. With perhaps only a draft for an exemplar, its oldest hand is responsible for a Danish version of the Flensburg municipal law, issued in Latin in 1284, with a supplement from 1295 (cf. Diderichsen 1956, 96 ff.). This Danish redaction is dated by Diderichsen (*ibid.*) to ca. 1315. Yet another supplement has been added in two 14th-century hands (issued January 25, 1321).

Two manuscripts from the period, SKB K 48 and DKB NKS 66 8vo, both dated to ca. 1300, contain texts of the same leech-book/herbal. Although traditionally associated with the name of Erik Plovpenning's physician, Master Henrik Harpestreng (d. 1244), the

work has its roots in two Latin texts from the Salerno medical school (*De viribus herbarum*, probably by Odo Magdunensis, and *De gradibus liber* by Constantinus Africanus, both 11th c.). The text of the leech-book as preserved in K 48 is nearer the original than that of NKS 66 8vo and also incorporates some sections attributed to Harpestreng (but based on Latin sources) on bathing, blood-letting and so on. The two manuscripts are otherwise quite different in their composition. K 48 contains, in addition to the leech-book, a confessional prayer, otherwise unknown but presumably a translation from Latin. It is added in a different, but in all likelihood contemporary, hand. Moreover, the prayer is preceded by the end of one Marian miracle and the full text of another, both known from the so-called TS-series of Marian miracles. K 48 thus appears to be a fragment of a larger whole, one whose contents are thought to have included a complete collection of Marian miracles along with a collection of female saints' lives (*legenda*), and possibly also a lapidary (a work that explains where gemstones can be found and enumerates their mineralogical, medicinal and supernatural qualities). The evidence on which this conclusion is based is partly the so-called Cambridge fragment, which is in all likelihood another part of this original whole and contains the beginning of a collection of Marian miracles (apparently of the TS type) along with fragments of the life of the martyr Christina (for its closest Latin parallel, see Gad 1961, 207), and partly the late medieval manuscript SKB K 4, which among other things contains a collection of female saints' lives and a lapidary whose language is rather archaic; the text of the legend of Christina it contains suggests it is related to the Cambridge fragment (Larsen 1974, 447). NKS 66 8vo is also a miscellany, but with a clearer unifying principle underlying the texts it comprises, at least those written in the main hand. The scribe identifies himself as Frater Kanutus Yuul and is thought to have been part of the Sorø scriptorium (see sect. 2.). Following the medical text he presents first a lapidary, which is based on two Latin texts, *Liber lapidum* written ca. 1080 by Marbod of Rennes and a compilation from the early 13th c. by the otherwise unknown Arnoldus Saxo, and which at most shares certain sources with the lapidary in K 4. Finally there is a short cookery book, possibly translated from Low German but presumably based ultimately upon French recipes whose earliest preserved witnesses are significantly

younger, as is the case with most European culinary texts from the Middle Ages. In a now fragmentary gathering in front of the leech-book text a more or less contemporary hand has added a text of *Skånske Kirkelov* that is so close to the text of B 69 that the two must derive from a common exemplar, while on the final leaf of the gathering of the cookery book there has been added a piece on “julemærker”, omens regarding the weather and harvests on the basis of the day of the week on which Christmas falls, probably deriving from a widely disseminated Latin work ultimately of Greek origin, *Prognostica temporum*. A four-leaf fragment dated to the first half of the 14th c. (Linköping Gymnasibibliotek T 67 nr. 199) preserves the text of a leech-book which appears to be closely related to that found in NkS 66 8vo.

All the manuscripts from the period that exclusively preserve translated religious material have in common the fact that they are fragmentary, and apart from SKB A 120 all bear clear signs of having been reused in the way religious manuscripts from the Middle Ages frequently tended to be treated in the following centuries – cut up for use as parchment strips for seals, as lining in bindings, or as envelopes for archival material and so on. The oldest of these religious manuscripts is in all likelihood the Cambridge fragment (Cambridge University Library Add. MS. 3827¹), which has been identified as a small remnant – two conjugate leaves – of the same miscellany which K 48 is a more extensive remnant of, and has thus the same dating (ca. 1300). To the period around 1325 are dated two fragments whose language had previously been identified as (younger) Old Swedish but in the 20th c. was claimed to be early Old Danish, more precisely Scanian, and which represent as such newly claimed territory for the history of Danish language. One of these is the six-leaf fragment SKB A 120, which is written in the runic alphabet and whose place of writing has been tentatively identified as the Cistercian monastery at Herrevad in Scania. It contains part of a translation of a widely disseminated Latin tract concerning Mary’s lament at the Cross (*Planctus Mariæ*, early on attributed to the Cistercian Bernard of Clairvaux, 1090–1153, but probably written by Og(ler)ius of Trino, d. 1214). The other fragment is SKB *A 115, a bifolium which contains just over a hundred lines of a metrical version (in *knittelvers*) of the Latin apocryphal gospel *Evangelium Nicodemi* (on Christ’s descent into hell

and resurrection); the Danish text is possibly based on a lost German metrical version. Probably also from the period, but not more precisely datable than to after about 1300, come the remnants of two manuscripts containing *legenda* found in Uppsala UB C 871. One contains fragments of a translation of the life of Christina, but based either on another Latin source or simply another translation than the Cambridge fragment (Gad 1961, 243f.). In the other are preserved fragments of a translation of the life of the confessor Elisabeth of Thuringia (canonized 1235), apparently translated from an otherwise unknown Latin version of her life in the *Legenda aurea* (a work compiled in the second half of the 13th c. by Jacobus de Voragine, ca. 1226–1298) (Gad 1961, 245). From around 1350, or perhaps slightly later, there is a manuscript the only remnants of which are strips on seals attached to two 17th-c. documents from Romsdal in Norway, but whose contents can with some likelihood be assumed to have been a translation of the *Legenda aurea*; at least the remnants preserve a few lines of two *legenda* from that collection, those of the 5th-c. (?) ascetic St. Alexius and the martyr Cecilia. The text of the latter appears to be so close to the life of Cecilia preserved in the much younger K 4 that the two could well derive from the same translation.

8. Literature (a selection)

1. The introduction of Latin script

Norwegians encountered the Latin alphabet on Viking raids and on trading expeditions a long time before it was taken into use at home. Coins with Nordic names in the Latin alphabet (e.g. *Anlaf* = *Óláfr*, *Sihtric* = *Sigtryggr*) were issued in York before the middle of the 10th century and suggest that Scandinavian traders also knew how to employ the new al-

phabet. The fundamentals of an alphabetical script were, after all, well known, since the runes had by then been in use for many centuries in Norway and the other Scandinavian countries.

The introduction of Christianity brought the Latin alphabet to Norwegian shores, most likely as early as the 10th century. Several Norwegian bishops during the reign of King Óláfr Haraldsson (d. 1030) had learnt to write in England. One received the nick-name *inn bókvísi* 'the bookwise', and Bishop Grímkell or one of his companions is supposed to have written a mass for King Óláfr ca. 1050. Since the reign of King Óláfr inn kyrrri (1067–1093) we have every reason to assume that quite a few Norwegians knew how to write, not only in Latin but also in the vernacular. It is generally thought that the recording of provincial

laws started in the second part of the 11th century, but some scholars believe this took place as early as during the reign of King Óláfr (cf. article 92 by M. Rindal). The earliest extant manuscript in the vernacular, however, is AM 655 IX 4to, three leaves of an Old Norse translation of Latin legends, which are dated to the second half of the 12th century, possibly as early as ca. 1150. (Manuscript sigla and dates are given according to ONP *Registre* 1989.)

2. The corpus

A large number of Norwegian books and charters were written in Latin but, with a few exceptions, only fragments remain of the book manuscripts. The oldest fragments date back to ca. 1000, and were probably written in England and brought to Norway by English missionaries. Some manuscripts were later copied locally in Norway, but due to the highly fragmentary nature of the material, it is difficult to distinguish between foreign and local productions. Among the oldest extant manuscripts thought to be written in Norway are *Hieronimi Canones super Evangelia* (GKS 1347 4to; before 1200) and *Liber ritualis* (NKS 32 8vo). Also, many charters issued in Norway were written in Latin. The earliest extant ones are dated to the 1160s (cf. *Regesta Norvegica* vol. 1), and a fair number remain intact.

In a European context, the Nordic countries were late in introducing the Latin alphabet, but early in developing a vernacular literature. Norway has a considerable corpus of early vernacular manuscripts, larger than that of Sweden and Denmark, but smaller by far than that of Iceland. All but a few medieval Norwegian manuscripts date before ca. 1400, and the great majority of extant manuscripts were written in the comparatively short period ca. 1250–1350. There is a sharp decline in the production of book manuscripts around 1370. Seip has explained this, at least partly, as a result of the Black Death, which reached Norway in 1349–1350. Two decades later, a new generation had taken over from those who had survived the plague, and in political matters Norway was becoming increasingly dependent upon Sweden and Denmark. From a palaeographic point of view, there is no sharp division in the 1370s, but the almost complete lack of younger book manuscripts makes for a practical, corpus-based division around 1370.

There are 1108 Norwegian charters written in the vernacular up to 1350, of which about

80 date from the period up to 1300. Although there is a decline in the decades after 1350, by the end of the century the production of charters had resumed the level of the pre-plague years. From the period up to ca. 1350 there are more than 125 Norwegian book manuscripts, though many are fragmentary (the exact number depends on how the fragments are sorted and interpreted; cf. the list in ONP *Registre* and Seip 1955, 226ff.). The majority of these are law manuscripts, ranging from the early provincial laws (for Gulåping, Frostuþing etc.) to King Magnús's *Landslög* from 1274. In addition to the large group of law manuscripts there are about 20 Norwegian manuscripts, more or less complete, of other genres, such as historical works, courtly literature, religious works, legends etc. (cf. the list in Stefán Karlsson 1979, 4–6). A number of well-known works belong here, including The Old Norwegian *Book of homilies* (AM 619 4to, ca. 1200–1225), the legendary *Óláfs saga ins helga* (DG 8 II, ca. 1225–1250), *Strengleikar* (DG 4–7, ca. 1270), *Konungs skuggsjá* (AM 243 b a fol., ca. 1275), *Barlaams ok Josaphats saga* (Holm perg 6 fol, ca. 1275), *Þiðreks saga* (Holm perg 4 fol. ca. 1275–1300).

In addition to the unintended loss of manuscripts through the passage of time, many Norwegian manuscripts were deliberately destroyed in the 16th and 17th centuries. After the publication of *Missale Nidrosiense* and *Breviarium Nidrosiense* in 1519, a large number of Latin liturgical manuscripts were cut up and used for binding books. The National Archive (Riksarkivet) in Oslo has a collection of no less than about 5,000 Latin fragments, most of which are liturgical; it has been estimated that these fragments are the remains of ca. 1,200 codices. Vernacular manuscripts fared better for a while, since law books were still being used throughout the 16th century. However, after a translation of the Old Norwegian *landslög* was published in 1604, *Den Norske Lov-Bog* (authorised by King Christian IV), a number of vernacular law manuscripts encountered the same sad fate as the Latin ones. The National Archive has about 500 such fragments, many very small and few larger than 1/2–1 leaf. It has been estimated that they once made up about 100 manuscripts, of which more than two thirds were law books.

In a palaeographic context, there is no reason to distinguish between documents written in Latin and in the vernacular. However, unlike Latin documents, those written in the ver-

naacular can safely be assumed to be of Nordic origin, though not necessarily Norwegian. There are a number of manuscripts which were written by Icelanders, many of whom were staying in Norway. Other manuscripts were written in Iceland for the purpose of export to Norway, right up to ca. 1400 (Stefán Karlsson 1979). There are also a fair number of charters which may be classified as Swedish, and to a lesser extent, Danish. Although it is now generally accepted that perhaps too much interest has been invested in discussing the national provenance of medieval documents, especially between Norway and Iceland, it is impossible to avoid this question when trying to describe the national development of literature and script. However, the total number of medieval Norwegian manuscripts and charters is so high that one may disregard disputed manuscripts and charters and still have an ample corpus for a palaeographic study.

3. Typology

The earliest Norwegian script is a minuscule with a mixture of Carolingian and Insular letter-forms, as seen in AM 655 IX 4to, cf. fig. 95.1. It is generally thought that this script was brought to Norway from England, where the Carolingian minuscule of the Continent came up against the local Insular script in the 11th century, resulting in several types of intermediate scripts. The early Norwegian script is basically a formal script in which each letter is drawn separately. Up to the latter half of the 13th century, there seems to have been no distinction between the script in book manuscripts (*libraria*) and charters (*documentaria*), cf. e.g. the script in fig. 95.3, a book manuscript, and fig. 95.4, a charter. In fact, in the first half of the 13th century, the script in some of the charters is more formal than in some of the contemporaneous books.

From ca. 1280, a cursive script appeared in Norwegian charters and soon became dominant, cf. fig. 95.7. The influence may once more be sought in England. During the late 12th and early 13th centuries, the semi-cursive documentary script in England was developed into a fully-fledged cursive script, *cursiva anglicana*. This cursive script is characterized by linked letters, loops, decorative strokes and skeletal forms of initials. Although a cursive script also developed on the Continent, it is most likely that the Norwegian cursive was shaped by English influence; the cultural contact across the sea was still close, and

English scribes worked in Norway (possibly Gabriel klerkr, who wrote several charters ca. 1290).

For a while, the formal script of the books, especially the many law manuscripts, coexisted with the cursive hands of the charters. From ca. 1300, both types of script fall under the wide term Gothic, the book script a formal *textualis* (fig. 95.6) and the cursive script in the charters a much simpler, more rounded and fluent type (fig. 95.7). In the 14th century, however, a new, semi-cursive script developed and appeared in several book manuscripts (fig. 95.8). The Gothic semi-cursive is often somewhat condescendingly referred to as *bastarda*, since it has dual parentage: the formal *textualis* and the fluent *cursiva*. From a functional point of view, the semi-cursive was rather practical. It was quicker to write than the formal *textualis*, and more legible than the cursive script.

Beginning with a single, multi-purpose script in the 12th century, the introduction of the cursive in the 13th century and the semi-cursive in the 14th century thus led to three main types of script coexisting in the 14th century: the formal *textualis*, used in book manuscripts up to ca. 1370; the semi-cursive, increasingly used in books and from ca. 1370 generally replacing the *textualis*; and the cursive, used in charters throughout the period.

4. Periodisation

Following the division by Seip (1954) and the period names by Svensson (1974), Norwegian palaeography falls into a Carolingian-Insular period up to ca. 1300 and a Gothic period thereafter; the Carolingian-Insular period may be subdivided into an earlier period up to ca. 1225 and a younger period ca. 1225–1300. In the latter period, a gradual change began: the lines grew closer, the ascenders and descenders shorter and the letters closer. This process was brought to an end with the formal Gothic script of the 14th century.

4.1. Insular influence

Sweden and Denmark received their script from the Continent, and through the metropolitan sees in Hamburg, later Lund (1103/04) and finally Nidaros (present-day Trondheim, 1152/53) there must have been a Continental, Carolingian influence on the Norwegian script as well. However, the Insular character of

the oldest manuscripts strongly points to the British Isles.

Insular script supplemented the Latin alphabet with two new letters, ⟨þ⟩ (*thorn*, adopted from the Anglo-Saxon runes) and ⟨ð⟩. Although *þ* was also known from the Scandinavian runes, its use in Latin script is in all likelihood a result of English influence. Otherwise, the most characteristic Insular letter-forms are ⟨ȝ⟩, ⟨ŋ⟩, ⟨p⟩ and ⟨f⟩ (for *g*, *r*, *v* and *f* respectively). There are no traces of the Insular ⟨ȝ⟩ in Norwegian manuscripts at all, but ⟨ŋ⟩, ⟨p⟩ and ⟨f⟩ are known from the earliest extant manuscript, AM 655 IX 4to. The Insular ⟨ŋ⟩ is only found in NRA 73 in addition to AM 655 IX 4to, but ⟨p⟩ was widely used up to ca. 1300, and ⟨f⟩ to ca. 1420.

4.2. Older Carolingian-Insular script (up to ca. 1225)

From the earliest period, we have eight extant manuscripts, four written in Nidaros and four in Bergen. They are all fragments, except the Old Norwegian *Book of Homilies*, AM 619 4to, which was written in the Bergen area. The Nidaros manuscripts have a slightly stronger Insular flavour than those written in Bergen. From this period there are also three charters from Oslo and one from Nidaros; the oldest charter is the one issued ca. 1210 by Phillipus bōglungakonungr. The script in these charters does not differ from the contemporaneous book manuscripts. The individual letter-forms in this period show influence from both Carolingian and Insular script. Thus the Carolingian open-necked *a* is used consistently, not the Insular single-storey type, and the Insular ⟨ŋ⟩ was soon replaced by Carolingian ⟨r⟩. On the other hand, both Carolingian straight ⟨d⟩ and Insular ⟨ð⟩ are used, and Insular ⟨f⟩, and ⟨p⟩ were dominant. There is also great variation in the forms of ⟨r⟩ and ⟨y⟩.

AM 655 IX 4to, which contains only three disparate leaves, though probably by the same scribe, is the manuscript with the strongest Insular influence. As can be seen in fig. 95.1 it has consistent use of the Insular letter-forms ⟨f⟩, ⟨ŋ⟩ and ⟨p⟩ (for *f*, *r* and *v* respectively), and also the capital ⟨Ð⟩, another adaptation from English script. The dental fricative is denoted with *þ* in initial position and *ð* in medial and final position, in accordance with the English practice of the time. GKS 1347 4to (fig. 95.2) has the Insular letter-forms ⟨f⟩ and ⟨p⟩, but not ⟨ŋ⟩. The long-stemmed form of *r*, ⟨r̄⟩,

however, is known from Continental scripts and should not be regarded as an Insular form. Also of note here is the use of thorn, *þ*, in all positions, which was the norm in early Icelandic script, but rarely seen in Norwegian manuscripts. In AM 619 4to, fig. 95.3, the Insular influence is less pronounced; straight minuscule *r* is used, and the minuscule form of *f*, ⟨f⟩. A round form of *r*, ⟨r̄⟩, is found after the letter *o*, alternating with the straight *r*.

4.3. Younger Carolingian-Insular script (ca. 1225–1300)

The Insular influence was still present after ca. 1200, but decreased towards the end of the century. Icelandic script, which until the beginning of the 13th century was predominantly Carolingian, imported some Insular traits from Norway in this period, e.g. the distinction between *þ* and *ð*. The influence from Norwegian script can also be seen in early Swedish manuscripts, e.g. in a fragment of *Västgötalagen* (SKB B 193), which has several Insular characters. Towards the end of the period, the script of Norwegian manuscripts became increasingly Gothic. It is difficult to point to any definitive change; there was rather a general drift towards more compressed and angular letter-forms.

Around 1250 a closed, two-storeyed *a* appears for the first time, but Carolingian open-necked *a* was still used for several decades. Also, round *r* expanded its use, being found after curved letters other than *o*, such as *b* and *d*. The round *r* sometimes extends below the base line, so that it resembles the figure 3. Otherwise, the arms of the Insular *f* are reduced to two dots in some manuscripts (cf. fig. 95.5) or the upper arm becomes a bow (cf. fig. 95.6). The tall form of *s*, ⟨f⟩, is dominant, and seldom extends below the base line, while the low form, ⟨s⟩, in some manuscripts is terminated below the base line. The letter *ð* is widely used, but towards the end of the period it was replaced by ⟨ð⟩ in many manuscripts, especially charters. As mentioned above, the Insular *v*, ⟨p⟩, was used fairly regularly until ca. 1300.

Holm perg 6 fol. (ca. 1275), fig. 95.5, still employs the Carolingian open-necked *a*, and round *r*, ⟨r̄⟩, is used sparingly. The Insular *f* has an open form, and the Insular *v* is used exclusively. The letter *d* also has the Insular shape, ⟨ð⟩. The capital ⟨Ð⟩, however, has been replaced by ⟨P⟩. The script in this manuscript is basically the same as the one found

in AM 619 4to (fig. 95.3), although written more unevenly and with a broader pen.

4.4. Gothic textual and cursive script (from ca. 1300)

From ca. 1300, the script generally became Gothic in character: the letters are more compressed vertically, the ascenders and descenders shorter, the strokes more angular and the organisation of the script more regular. This is the script of the many law manuscripts of the 14th century; easily readable, stately and distinctly written. It is often referred to as textual script, *textualis*. The base line emerges clearly, and in some manuscripts the frame and rulings were drawn in ink (GKS 1154 fol., AM 309 fol.). The vertical strokes in letters such as *m*, *i*, *n* and *u* (the so-called *minims*) tend to look like single strokes, so that accents over the *i*'s are introduced as a distinctive mark. The two-storey *a* is now most common, though co-existing with older *a*-types. The Insular *v*, ⟨*p*⟩, is rarely seen, but the Insular *f* is still widely used, possibly due to the fact that it easily accommodates superscript abbreviation signs. The low *s* looks like the figure 8. The letter *w* is introduced, and long vowels are often noted as ligatures, e.g. ⟨*ā*⟩. In addition to the formal *textualis*, cursive script was used in charters, and with the introduction of the semi-cursive, also in books. In general, the cursive scripts have simplified letter forms, looped ascenders, and, in the true cursive, letters were joined.

AM 305 fol. (ca. 1300), fig. 95.6, written by Þorgeirr Hákonarson, is a good example of an early Gothic textual script. The letter *a* has two storeys, *s* has the typical 8-shape, the Insular *v* has been replaced by minuscule *v*, and there are accents over the *i*'s. There is also a tendency towards the fusion of bows, e.g. between adjacent *o* and *c*, *b* and *c*, etc. The script is clearly duolinear, i.e. there is a marked difference between heavy and light strokes.

The script in AM dipl norv fasc XXXIV 18 (1348), fig. 95.7, is cursive, typical of the charters from the beginning of this century. Here, lines are closely spaced, and most letters are joined by connecting strokes. Ascenders and descenders may be looped, such as in *b*, *þ*, *h* and *k*. Notably, the ascender of the letter *d* has acquired a loop which goes all the way down to the base line. The letter *a* has two storeys, but was later replaced by a simple form, which could easily be mistaken for *o*. The tall *s*, ⟨*f*⟩, extends below the base line,

and both arms of the Insular *f* are drawn as bows, ⟨*p*⟩. The letter *j*, originally a capital ⟨*I*⟩ from English cursive script, is introduced for the preposition *i* and in word-initial position. In general, accents and decorative strokes are semicircular. The script gives the impression of haste, fluency and elegance.

The script in Holm perg 35 4to, *Kristinréttr Jóns erkibiskups* (ca. 1350), fig. 95.8, is a typical example of early Gothic half-cursive. Unlike the full cursive script, few letters are actually joined, but many have looped ascenders, e.g. *b*, *l*, *h* and *k*. The *a* still has two storeys, but soon developed a simple, single-storeyed form. The tall *s* extends below the base line, ⟨*f*⟩, and the same applies to the finished strokes of *h* and sometimes *m*. The ascenders of the letters *d* and *ð* are drawn diagonally, and are often accentuated with a heavy stroke. Otherwise, the difference between heavy and light strokes is not strong in the Gothic half-cursive; it is rather as if the letters were written with a too broad pen.

5. Abbreviations

The system of abbreviation in Old Norwegian manuscripts was, like the script, imported from England. Abbreviations were used liberally, though much more sparingly than in many Icelandic manuscripts. The most common abbreviation sign is the horizontal bar, used primarily for the nasal consonants *m* and *n* (therefore often referred to as the nasal stroke), e.g. ⟨*honō*⟩ = 'honom'; at a later stage it could also be used to abbreviate a longer sequence, e.g. ⟨*mōm*⟩ = 'monnom' (expanded abbreviations are shown by italics). Two types of superscript abbreviations were frequently used: the zigzag-sign for front vowel + *r*, and any superscript vowel for *r* or *v* + the vowel; the letter *a* was usually written with an open, *u*-like letter-form. Baseline abbreviations include the usual tironian *notae* for *oc*, *us*, *per*, *pro* and *rum*. Also quite common was the semi-colon for *eð*. Frequently occurring names or words in the text were sometimes abbreviated with a dot, either contractions such as ⟨*kgr.*⟩ = 'konongr' or suspensions such as ⟨*O.*⟩ = 'Olaf^r'. The rune *m*, *Y*, was sometimes used for *maðr*.

6. Scribes

With a few exceptions the scribes of the earliest manuscripts are anonymous. An early example of a known scribe is Eiríkr Þróndarson,

who wrote part of a law book (Holm perg 34 4to, hand f) in the last quarter of the 13th century. From ca. 1300 we know of several scribes, especially of law manuscripts, e.g. Þorgeirr Hákonarson who wrote several state-ly manuscripts in a Gothic hand (AM 302 fol., AM 305 fol., AM 56 4to and 78 4to), cf. fig. 95.6 here. Also noteworthy is Páll Styrkársson who, in addition to 22 charters, probably wrote the manuscript AM 114 a 4to, which contains king Sverrir's *A speech against the bishops*. The Icelander Haukr Erlendsson (d. 1334), who mostly stayed in Norway from ca. 1300, wrote the manuscript now called *Hauksbók* (AM 371, 544 and 675 4to), a private collection of historical, mathematical and philosophical works; he has also left behind a few charters in his own hand. All told, around 120 scribes of law manuscripts can be identified in the 14th century, but only a minority are known by name.

The scribes of the charters are less anonymous, especially those writing on behalf of the king. In the period ca. 1280–1345, the scribes in these charters usually identified themselves with words such as “N.N. klerkr/notarius ritaði”. In his indispensable though controversial study, *Norske skrifvarar i millomalderen* (1989), Eivind Vågslid has tried to collect and identify each and every hand in Norwegian charters up to 1400, and sporadically up to 1580. Many scribes are anonymous (“serskild hand” in Vågslid's terminology), while others can be pinpointed to a specific milieu, or their identity can be derived from the names contained in the letter. In addition to the many anonymous scribes, Vågslid has identified well over 800 named scribes in the period up to 1400. Due to the sheer quantity of the corpus – 3,650 charters – it seems probable that Vågslid allocated charters to too many hands (cf. Bakken 1997, 4).

7. Reference books and study aids

Kålund's *Palaeografisk Atlas* (1905–07) is still very helpful; the quality of the facsimiles is admirably high and there are useful transcriptions. Each facsimile is of a single page from the chosen manuscripts, so that the Atlas gives a condensed overview of the development of Old Icelandic and Old Norwegian palaeography. Although the majority of facsimiles are of Icelandic provenance, the Atlas contains a surprisingly wide and representative selection of Norwegian manuscripts and charters (17

examples up to ca. 1300 and 11 ca. 1300–1500). The Atlas will for some time remain the most convenient – though not easily accessible – introduction to the study of Norwegian palaeography. For a fuller study of each manuscript, however, one has to turn to the separate facsimile editions. There is so far no Norwegian parallel to Hreinn Benediktsson's *Early Icelandic Script* (1965).

In 1947, Holm-Olsen and Seip published a facsimile of the Norwegian manuscripts of *Konungs skuggsjá*, which was presented as a gift to King Haakon VII on his 75th birthday. Since 1950 nearly a dozen facsimiles of complete Old Norwegian manuscripts have been published in the series *Corpus codicum Norvegicorum medii aevi* (CCN), such as the Old Norwegian *Book of homilies*, the legendary *Óláfs saga ins helga*, *Elis saga* and *Strengleikar*, *Barlaams ok Josaphats saga*, King Magnús Hákonsson's *Laws of Norway* and the oldest *Law of Gulathing* (the latter two in full colour); there are also editions of fragments and charters up to 1300. Several volumes are being planned, e.g. of *Piðreks saga*, *Thomas saga erkibiskups* and a number of provincial law manuscripts. These editions contain introductions which are important sources for codicology and palaeography.

As a general introduction to Old Norwegian palaeography, Seip (1954) is indispensable and still unsurpassed. His *Språkhistorie* (1955) also contains much palaeographical and codicological information. Otherwise, Svensson (1974) is a practical introduction to the whole field of Nordic palaeography up to modern times. Hreinn Benediktsson (1965) is a valuable supplement to Seip's palaeography, since Old Icelandic and Old Norwegian scripts are closely connected, especially in the 13th and 14th centuries.

Hødnebo (1960) is an excellent introduction to the earliest charters (up to 1300); there are good facsimiles of each charter, a transcription and a translation into Norwegian. Photographic facsimiles of younger charters are located at The National Archive in Oslo and The University of Bergen (Nordisk institutt).

Since the 1940s, a number of MA theses (“hovedfagsoppgaver”) have been written in Norway on the palaeography of individual manuscripts. The great majority are unpublished, but are accessible from the university libraries, though usually not on loan. Many are included in the bibliography in *ONP Registre* (1989). This volume can also be checked for the latest datings of Norwegian

manuscripts. Some of them have received new dates since the publication of Seip (1954), e. g. GKS 1347 4to, which was dated ca. 1200 by Seip (1954), but now ca. 1175.

Finally, Holm-Olsen (1990) should be mentioned. This is a general introduction to the field of Norwegian literary culture in medieval times, popular in approach, but well documented and richly illustrated.

96. The development of Latin script II: in Iceland

1. The introduction of Latin script
2. The corpus
3. The earliest Icelandic script
4. The development of the script
5. The shape and use of individual letters
6. Literature (a selection)

1. The introduction of Latin script

According to the Icelandic *Book of Settlements* (*Landnámabók*), a considerable part of the Norse population which settled in Iceland in the decades around the year 900 came from the British Isles; some of these settlers, at least, were Christians and may have brought with them books in Latin. Christian missionaries travelling to Iceland during the last decades of the 10th century must have relied on Latin texts, and such books no doubt existed in Iceland after Christianity was adopted in the year 1000 and in the 11th century with the organization of the Icelandic church.

The General Assembly (*Alþingi*) resolved in the summer of 1117 to put Icelandic civil laws into writing; this work was begun in the following winter, but the resolution would

hardly have been passed unless Icelanders already at that time had some experience in writing the vernacular in the Latin script.

2. The corpus

Remains of Latin medieval manuscripts in Iceland are for the most part confined to single leaves used in the binding of younger books, and it cannot be determined conclusively whether the oldest ones were written in Iceland or abroad. On such fragments, see especially Eggen 1968 and Gjerløw 1980. Only in very few cases has the same scribe been shown to have written in both Latin and Icelandic; see e. g. Louis-Jensen 1977, 19–20, and Stefán Karlsson 1982, 1986.

Relatively few Icelandic manuscripts from the Middle Ages have been preserved intact; in many cases we are left with only a few leaves, sometimes no more than a single leaf or a part of a single leaf. The earliest preserved manuscripts (and fragments of manuscripts) containing vernacular texts have been dated to the middle of or second half of the 12th century, and manuscripts from before 1300

number less than one hundred, but on the whole somewhere between 700 and 800 manuscripts, written in the period up to the middle of the 16th century, have survived to present times. Many of the manuscripts written after 1300 contain texts which are thought to have been copied from 13th century exemplars. With the exception of charters, only very few originals of Icelandic texts have survived. No charters from the period before 1300 have survived, and only 20 have been preserved from the first half of the 14th century, but after that they become more numerous, especially charters from the 15th century. Almost all charters include a date, but most manuscripts have been dated by scholars based on paleography and orthography, which only allows them to be dated within a period of half a century.

Specimens, in most cases a single page, from a vast majority of surviving manuscripts from the period before 1300 are produced in facsimile by Hreinn Benediktsson (1965), and his introduction provides a very thorough survey of the development of the Icelandic script and orthography at its earliest stages; the present article draws substantially on this account. The most detailed descriptions of the paleography of individual manuscripts are the ones by Buerger (1904), Lindblad (1954) and de Leeuw van Weenen (1993 and 2000). Facsimiles of select pages from manuscripts of this period and subsequent centuries have been reproduced by Kålund (1905, 1907) and Árni Böðvarsson (1974), and specimens of the script are found in Björn K. Þórólfsson (1950), Seip (1954), and Svensson (1974). A little over fifty manuscripts are available in their entirety in facsimile editions in the series CCI, MI, ÍH, EIM, and ÍM. Facsimiles of original charters down to 1450 are in IO. The latest datings of medieval Icelandic manuscripts are found in ONP Indices.

3. The earliest Icelandic script

3.1. The so-called *First Grammatical Treatise*, composed about or shortly after the middle of the 12th century, is a unique source of information about language and writing in Iceland at the time. It is only preserved in a single manuscript, AM 242 fol. (facsimile edition in CCI II), from the 14th century, and is available in several editions, the most recent one by Hreinn Benediktsson (1972), accompanied by an English translation and a very thorough

commentary and introduction, as well as facsimiles of the manuscript pages containing the treatise. The aim of the author of the treatise was to compose “an alphabet for us Icelanders”, i. e. adapt the Latin alphabet to meet the needs of the Icelandic language by, on the one hand, disposing of Latin letters deemed unnecessary by the author, and, on the other hand, adding letters that were essential for unambiguous interpretation of the written language.

The author argued that in addition to the Latin vowel symbols ⟨a⟩, ⟨e⟩, ⟨i⟩, ⟨o⟩, and ⟨u⟩, the Icelandic alphabet needed the symbols ⟨q⟩, ⟨ę⟩, ⟨ø⟩, and ⟨y⟩, i. e. symbols denoting the phonemes which arose as the result of the umlauts. For each one he provided a description of the pronunciation and explained the shape of every one of the new letters, for instance, ⟨ø⟩, he said, was composed of “the crossbar of *e* and the circle of *o*”. In his view, long vowels should be distinguished from their short counterparts by the writing of a superscript accent mark over the letter when it represented the long vowel; furthermore, nasal vowels should be indicated by a superscript dot over the vowel symbol.

The author of the *First Grammatical Treatise* found a few of the Latin consonant symbols to be unnecessary for writing the Icelandic language; for the short /k/ he proposed to use ⟨c⟩ exclusively, rather than ⟨k⟩ or ⟨q⟩ (in the combination /qv/), and instead of the letters ⟨x⟩ and ⟨z⟩ he preferred to write ⟨cs⟩ and ⟨ds⟩ (or possibly ⟨ts⟩), respectively. On the other hand, he favored the addition of ⟨þ⟩ to the Icelandic alphabet, and he also designed a new symbol intended to denote /ng/. Instead of doubling the minuscule letters to denote geminate consonants, the author proposed to use single majuscule letters, or small capitals, but since the small capital ⟨C⟩ looks almost identical to the minuscule ⟨c⟩, he thought it convenient to adopt the Greek *kappa* for the geminate /k/; the shape of this letter in the extant copy of the treatise and in manuscripts where it occurs is ⟨k⟩, i. e. like the type of ⟨k⟩ employed at least in the early stage of Caroline minuscule script (see, for instance, the alphabet in Bischoff 1986, 175).

For the influence of the *First Grammatical Treatise* on the development of the Icelandic script, see 4.1.

3.2. The script in the earliest extant Icelandic manuscripts is almost fully consistent with Caroline minuscule. In this respect there is a

clear difference between the Icelandic and Norwegian script in the earliest period, for at that time the Norwegian script already shows considerable Anglo-Saxon insular influence in vernacular writings. The letter ⟨þ⟩ was, however, used already in the earliest Icelandic manuscripts, and even if the letter was already familiar to Icelanders from the runic alphabet, where it was named *þurs*, its adoption in the Latin script in Iceland, as well as in Norway, is without much doubt due to either direct or indirect Anglo-Saxon influence, for in this function it had at least from the 12th century been known in Iceland under the Anglo-Saxon name *þorn*. The insular letters ⟨þ⟩, ⟨ð⟩, and ⟨f⟩, were adopted later than ⟨þ⟩ and used to varying degrees, as described in 4.1. (⟨ð⟩) and 5. (⟨þ⟩ and ⟨f⟩); their adoption is without doubt to be attributed to Norwegian, rather than Anglo-Saxon, influence.

4. The development of the script

4.1. The guidelines set forth in the *First Grammatical Treatise* were not followed in detail in any of the preserved Icelandic manuscripts. Its influence can, however, be detected in a great many manuscripts well into the 14th century, but the observance of its rules varies greatly, and consistency in orthography is extremely rare. An overview of the employment of various graphemes in almost 50 Icelandic manuscripts from the earliest period into the 14th century is provided by Lindblad (1954, 308–16). Considerable variation in script and orthography is to be expected in a sparsely populated country like Iceland, where there were many cultural centers but with few people; these were primarily the episcopal seats, the monasteries and the farmsteads of the most affluent families. Under these circumstances the homogeneity in language – and script – is more remarkable than the variation.

The umlaut phonemes /e/, /ø/, and /o/ were not only denoted with the symbols proposed by the author of the *First Grammatical Treatise*, but also in a variety of other ways, as described in section 5.; this variation was compounded by the fact that in Icelandic the short vowels /ø/ and /o/ began to merge around 1200 and long /e/ and long /ø/ around 1250. Nasal vowels appear to have merged with their non-nasal counterparts in the 12th century; there is, at any rate, no indication that the scribes of the earliest extant manuscripts distinguished them in their own language.

The distinction between long vowels and their short counterparts is entirely absent or only sporadic in some manuscripts, but when this distinction is made it is, until around 1300, done exclusively by means of a superscript acute accent mark; this same acute accent mark does, however, sometimes also appear over short-vowel symbols, especially over ⟨i⟩ in order to separate it from the minims of ⟨u⟩, ⟨n⟩, and ⟨m⟩. During the 14th century the employment of the acute accent mark to denote vowel length gradually decreased, and after 1400 it is rarely seen in this function until its revival in the second half of the 18th century (Lindblad 1952). Due to Norwegian influence during the 14th century this usage of the acute accent mark was gradually replaced by the doubling of vowel symbols, if the distinction of vowel length is observed at all; in those cases long /i/ is denoted ⟨íj⟩, and in the course of the 14th century ⟨a⟩ replaced ⟨aa⟩, and long /u/ was represented by ⟨w⟩. In addition, doubled vowel symbols (or ligatures) sometimes were written with double accent marks.

The author of the *First Grammatical Treatise* did not succeed in expelling those Latin consonant symbols which in his view were unnecessary. During the 13th century most scribes used the letter ⟨q⟩ in the sequence /kv/, but occasionally the velar was spelled ⟨c⟩ or ⟨k⟩ in this position. The predominant practice in the 14th century was to write ⟨ku⟩ (or ⟨kv⟩), except perhaps in the sequence /kve/, which was usually abbreviated ⟨q⟩ with a superscript horizontal stroke, consistent with the Latin custom. Almost every scribe used both ⟨k⟩ and ⟨c⟩ alternately to denote /k/; in some early manuscripts the so-called palatal rule was observed to a certain extent, i.e. the practice of writing ⟨k⟩ mostly before front vowels, but in the course of the 13th century ⟨k⟩ gradually took precedence over ⟨c⟩, which in the 14th century became rare, except in foreign words, loanwords, and in the digraph ⟨ck⟩ for long /k/. On the other hand there are examples of ⟨c⟩ for *ts* in a few manuscripts from around 1200. Generally, however, a sequence of a dental stop followed by a sibilant was, into the 16th century, denoted with the letter ⟨z⟩, but before the genitive ending *-s* the letter representing the dental was sometimes inserted before the ⟨z⟩, usually in analogy with other forms in the paradigm. The letter ⟨x⟩ is commonly found in word stems, but less frequently in genitive forms where *-s* directly follows stem-final *g* or *k*. A fair num-

ber of scribes in the first half of the 13th century employed a special symbol ⟨ŋ⟩, a kind of ligature of ⟨n⟩ and ⟨g⟩, but it was much less frequent in the second half of this century and appeared very rarely after 1300. In the earliest manuscripts the letter ⟨þ⟩ was the universal symbol for denoting the dental fricative, but before the middle of the 13th century the Anglo-Saxon insular ⟨ð⟩ appeared in this role in medial and final position. From around 1300 onwards, ⟨þ⟩ was somewhat rare in non-initial position and appeared in these positions only sporadically in abbreviations in some hands up to 1400. In initial position, ⟨þ⟩ has maintained its standing up to modern times, but ⟨ð⟩ was replaced by ⟨ð̇⟩; this process had already begun in the 13th century, around the mid-14th century ⟨ð̇⟩ took precedence over ⟨ð⟩ in these positions, and after 1400 ⟨ð̇⟩ does barely appear. Both the adoption of the letter ⟨ð̇⟩ and ultimately its abolition were due to Norwegian influence. (Around 1700 ⟨ð̇⟩ was retained in accurate copies of old manuscripts; it was used in a few printed books in the late 18th century, a practice which became more common in the first half of the 19th century, but ⟨ð̇⟩ did not become a standard feature of Icelandic writing and printing until the second half of the 19th century.)

The distinction between single and geminate consonants, if observed at all, could be accomplished in three ways: (1) Doubling the consonant symbol was practised from the very beginning but was not used exclusively, save for a very few of the earliest manuscripts. Long /k/ was frequently written ⟨cc⟩ in the earliest period (and sometimes ⟨cq⟩ before *v*), but later also ⟨kk⟩ or ⟨ck⟩, and after 1300 ⟨ck⟩ was the most common notation by a wide margin. (2) The practice proposed in the *First Grammatical Treatise* can be witnessed to varying degrees in a great many hands; it also varies considerably from one letter to another, since some of the capital letter forms differ only minimally from their minuscule counterparts. For this reason the letter ⟨k̇⟩ was adopted for long /k/ (see 3.1.) and used in a few manuscripts until around 1300; in this period, too, long /l/ could be denoted as ⟨l̇⟩, which is more likely a kind of a small capital rather than a ligature of ⟨ll⟩. The 13th century saw the sporadic use of uncial ⟨ṁ⟩ as a capital for long /m/, and the capital ⟨Ṫ⟩ never became widely used for long /t/, due to its resemblance to the minuscule ⟨ṫ⟩. The most frequent and longest lasting in their function denoting geminate consonants were ⟨Ṅ⟩, ⟨Ṙ⟩, ⟨Ġ⟩, and ⟨Ṡ⟩,

which were employed by some scribes well into the 14th century. The last of these four had, however, a weaker position than the others, since the “round *s*”, which is, in fact, the same letter, was used more and more frequently to denote short /s/ (see 5.); the predominant symbol for short /s/ was, however, the “tall *s*”, ⟨ſ⟩. (3) The third method of denoting geminate consonants was by means of a superscript dot; it is, like the use of capital letters in this function, characteristic of Icelandic writing. Even in the first half of the 13th century instances can be found of a superscript dot over ⟨ṫ⟩, ⟨ṙ⟩, ⟨ġ⟩, and ⟨ṗ⟩, and in the second half of this century also over ⟨ċ⟩, ⟨ṅ⟩, and the bowl of ⟨ḋ⟩ (⟨ð̇⟩) and ⟨k̇⟩. The first set of these dotted letters remained in use at least into the 16th century; the same applies to ⟨ṅ⟩, although here it was more common to express length by way of a superscript horizontal stroke over the vowel symbol preceding the ⟨ṅ⟩ or over the ⟨ṅ⟩ itself; this is also true of long /m/. The use of ⟨ċ⟩ with a superscript dot was abandoned in the 14th century, consistent with the decreasing use, in general, of the letter ⟨ċ⟩ at the time. ⟨ð̇⟩ with a superscript dot is very rare, but dotted ⟨k̇⟩ is somewhat more common and appears as late as around the middle of the 14th century. The two latter methods of denoting consonant gemination were sometimes united, i.e. by writing a capital letter with a superscript dot. This practice can be observed before the middle of the 13th century and lasted as long as capitals were employed for geminates.

Icelandic medieval script is characterized by extensive use of abbreviations. Common words or words that appeared frequently in the same text often were abbreviated by writing only the first one or few letters, but sometimes the ending was indicated by writing the last letter on or above the line. Individual superscript letters could also denote a sequence of letters, and various abbreviation symbols derived from Latin script were employed, cf. the thorough overview in Hreinn Benediktsson (1965), pp. 85–95, and the specimens accompanying the present article. The shape of some of the abbreviation symbols and their use evolved somewhat over time, for instance the way common words were abbreviated.

4.2. As noted above, the earliest Icelandic script is Carolingian in character. The individual letters are written separately and not

joined, and in addition to the straight vertical strokes, they are characterized by their curved shape. This was the prevalent script throughout the 13th century and remained in use to some extent into the first half of the 14th century. During the 13th century, Gothic traits became discernible, initially in that the bow of ⟨h⟩, ⟨m⟩, and ⟨n⟩ became angular; these characteristics became more pronounced at the beginning of the 14th century and culminated in book writing around the middle of this century.

There is usually a considerable difference between the script used in the 14th century for charters and the one used for books; in the charters (none of which are earlier than the 14th century) a cursive type of script predominates (see e. g. fig. 7), which in many cases was heavily influenced by Norwegian charter script; by contrast, the script used for books is as a rule much less cursive in character. The angular character of the Gothic script, replacing the curved (or even the straight) strokes of the Caroline script, is much more pronounced in books than in charters, while in the charter script letters more frequently were joined and also – more often than in book script, at least in the first half of the 14th century – a small loop was written on the right side of the topmost part of the ascenders.

The difference between book script and charter script is in most cases barely discernible after 1400, except that in service books containing Latin texts the script is more formal. Changes in script were quite insignificant up until the Reformation, which brought with it foreign influence, i. e. German influence by way of Denmark.

5. The shape and use of individual letters

⟨a⟩ of the Caroline type, with a bowl and a bow above it, was predominant in the 13th century. In the second half of the century a younger type of ⟨a⟩ appeared sporadically, with a bow bending down to the bowl, i. e. the so-called “two-storey *a*”; this type gradually prevailed in the course of the 14th century, but in addition a “single-storey *a*” started appearing, initially in charters, before the middle of the 14th century.

⟨d⟩ with an upright shaft was universal or predominant in a few of the very earliest manuscripts, but around 1200 a different type

of ⟨d⟩ made its appearance; in this type the shaft bends to the left and it is usually curved (⟨ð⟩, uncial ⟨d⟩). ⟨ð⟩ was predominant or universal in most manuscripts during the 13th century and probably became universal around 1300. The upper tip of the ascender of ⟨ð⟩ frequently was turned upward, but sometimes, especially around the middle of, and during the second half of, the 13th century, it was turned downward. During the 14th century – in the first half thereof mostly in charter script – it became common to draw a thin line from the upper tip of the ascender down to the right side of the bowl.

⟨ð̄⟩ was distinguished from ⟨ð⟩ in several ways, usually with a loop, much less frequently with a straight stroke, on the right side of the ascender. The end of the loop or the straight stroke sometimes extended through the ascender, but a straight cross-bar without a loop was used by a few scribes. For the use of ⟨ð̄⟩, see 4.1.

⟨f⟩ of the Carolingian type was universal in the earliest Icelandic manuscripts (3.2.), but the insular ⟨f⟩, ⟨ƒ⟩, started to appear in the first half of the 13th century, became predominant around the middle of the century and was practically universal towards the end of it, with the exception that many scribes used Caroline script ⟨f⟩ in words of Latin origin. The vertical stroke of ⟨ƒ⟩ always descended below the line, but the right-hand strokes varied in shape. Throughout the 13th century the upper shaft typically consisted of a short angular stroke, a dot or a short curved stroke and the lower one of a nearly horizontal stroke or a dot. In some hands in the first half of the 14th century the upper shaft developed into a larger curved stroke which bends down to touch the vertical shaft, and in charter script the lower shaft, too, forms a bowl which extends down below the line. This type, with two bowls, became predominant in Icelandic script, both in books and charters, in the second half of the 14th century and was used to a great extent up to the 17th century.

The upper half of ⟨g⟩ most often resembled the letter ⟨o⟩, but the shape of the lower half varied. The lower half frequently consisted of a second bowl which was joined with the upper bowl; this shape became predominant during the 14th century. Alternatively, the lower half was formed by a stroke from the upper half, extending below the line, either curving to the left or almost entirely vertically. Sometimes this leftward stroke was joined to the upper half by a fine hair-line, or, alternatively, it

could curve again to the right to form an oval-shaped bowl below the line. In some hands, especially in the second half of the 13th century, this stroke extended leftward below the letters preceding the <g>.

In some of the earliest manuscripts, the right stroke of <h> barely extends below the line, and usually its lower tip bends leftward. However, even in the early 13th century it usually descended below the line. When the right stroke of <h> has a sharp angular turn, it most often extends straight down below the line where it frequently bends to the left; this type of <h> was predominant in the 14th century.

<j> (always without a dot, but occasionally with acute accent mark) was rarely used in the 13th century, except sentence-initially for short and long /i/ and for /j/. In a few hands, however, the use of <j> is more extensive (for /i/ or /j/), but it was almost entirely limited to word-initial or final position, especially in final position in Roman numerals. The use of <j> in word-initial position increased after 1300, to begin with especially in charters; frequently, however, the capital letter <J> was used in this position. In addition, <ij> was used for long /i/ as a doubled vowel symbol.

The right half of <k> was formed by two strokes; the upper one formed a bowl, and the lower one extended rightward down towards the line. During the 14th century the lower stroke was almost vertical in some hands, but in a more common type of <k> this stroke and a serif on the right side of the lower tip of the main vertical stem nearly join to form a <k> which almost has two bowls.

In a few hands in the 13th century, the right minim of <n> sometimes extends below the line, especially in those cases where <n> (usually with a horizontal superscript stroke) denotes long /n/. This type of <n> and <m> was most common in word-final position. Its use culminated around or shortly after 1300, when it often was used irrespective of position within the word, but around the middle of the 14th century it had again become somewhat rare.

During the 13th century a few scribes wrote <r> with a vertical stroke that extended below the line; this mostly occurred in word-final position, and in some hands this was even a standard practice. This type of <r> became more common around 1300, but after the middle of the 14th century it was again rare. During the 14th century, starting in charter script, a line was sometimes drawn from the

lower tip of the stem upward to the shaft so that the <r> resembles the letter <v>. The “round *r*”, also known as “*r rotunda*”, <ɹ>, which developed out of the right half of the ligature of <o> and <R>, appeared sporadically following <o> (as well as <ø>, <ǫ>, <ð>, and <æ>) in almost all the earliest Icelandic manuscripts, and over the course of the 13th century it became almost the standard choice for *r* following these letters. Around the middle of the 13th century <ɹ> also started appearing after <ð> (and <ð>), and soon thereafter its use, too, became standard practice; at the same time <ɹ> also appeared following <þ>, <g>, <p>, and , albeit with less regularity. The use of <ɹ> following these letters was further established during the 14th century, and around the middle of this century and shortly thereafter the use of <ɹ> sometimes was extended to follow other letters, at least <a>, <y>, <v>, and <h>. During the 15th century, especially in the second half, <ɹ> was frequently used without any regard to the preceding letter, but it was rarely seen in word-initial position before 1500.

Two types of <s> were in use, the so-called “tall *s*”, or <ʃ>, and the “round *s*” <ʂ>. The first one was nearly universal up to 1300 as a symbol for short /s/. From around the middle of the 13th century and onwards, the <ʃ> extended below the line in some hands, and in the 14th century this variant of <ʃ> became predominant, except in very formal script. The use of “round *s*” (to denote short /s/) was in the beginning to a great extent confined to abbreviations where the abbreviation symbol was written above the <s>; its use increased during the 14th century, especially in word-final and initial position, but <ʃ> still remained the much more widely used type. The “round *s*” appeared in a number of variant shapes, especially in charter script: frequently the bows were closed so that the letter resembles the numerals <8> or <6> or a mirror image of the latter.

The stem of <t> usually extended only very slightly above the crossbar and sometimes not at all.

Short and long /u/, and /v/ were denoted by <u> and <v>; the insular <p> appeared around 1200 and it was employed by many scribes, especially or even exclusively in word-initial position, until around 1300, but it was only sporadically seen in the 14th century. <w> was infrequently used until the second half of the 14th century, but it appeared in a few hands much earlier, around 1200. It was

most often used word-initially for /v/, and, in the 14th century and later, in all positions for long /u/, cf. 4.1. The use of <u> and <v> varied from one period to another and also from one scribe to another. In many of the earliest manuscripts, they are used for /u/ and /v/, respectively, fairly regularly in word-initial position but at the same time inconsistently in medial position. Many scribes used one of the two letters mainly or exclusively without regard to the distinction between the vowel and the semi-vowel, and in the 14th century it had become standard practice in many hands to use <v> word-initially and <u> elsewhere.

In some of the earliest manuscripts, the left stroke of <y> was drawn down below the line with a slight leftward turn, while the right part, which did not extend below the line, consisted of a dot with a thin connecting line curving down to the left stroke. Other types of <y> in the 13th century and into the 14th century all had a <v>-shaped upper half with a curving right stroke. However, which of the two strokes extended down below the line varied; the descender bent leftward to varying degrees. Around the middle of the 14th century there sometimes was a crossbar through the descender right below the line. All the <y>-types usually were written with a superscript dot. In those cases where it was the left stroke that extended below the line, the letter resembles <p>, but the superscript dot serves to distinguish it from the symbol for /v/. From a little before the middle of the 14th century, the two strokes sometimes were nearly vertical above the line and the right one extended below the line, frequently bending to the left; in such cases the <y> was often distinguished from <ij> (with or without the accent marks) by means of the superscript dot.

<z> usually appeared without a crossbar in the earliest manuscripts, but the variant with the crossbar became more common during the 13th century and more so in the 14th century.

Long /ɛ/, when not written <e>, was usually denoted with <ɛ> or <æ>, sometimes with a superscript accent mark. <ɛ> was the more common symbol during most of the 13th century, but <æ> appeared in some of the earliest manuscripts, gaining considerable ground in the second half of the century and becoming predominant in the 14th century. The first member of the ligature <æ> frequently came close to being a “one-storey *a*”, even if as an independent symbol the <a> was written with a bow or as a “two-storey *a*”. A few scribes

in the 14th century employed <è>. When long /ɛ/ and long /ø/ began to merge into a single phoneme in Icelandic (through the derounding of long /ø/), around the middle of the 13th century, the long /ɛ/ sometimes was denoted with the symbol for long /ø/, even as late as after the middle of the 14th century, by scribes unsuccessfully attempting to archaize their orthography or imitate Norwegian spelling conventions.

A few of the very earliest manuscripts have a special notation for short and long /ø/, namely the digraph <eo> and the letter <ø> (beside <o>), but since the merger of short /ø/ and short /ɔ/ began around 1200 the resulting phoneme (/ö/) was symbolized in the same way, regardless of origin. To be sure, the digraphs <ev> and <ey> (which otherwise were used to denote the diphthong /ey/) appeared in a few manuscripts from the 13th and 14th centuries and even still younger copies of texts from the second half of the 13th century as symbols for original short /ø/, without original short /ɔ/ (or long /ø/) ever being denoted in the same fashion. During the 13th century and as long as scribes maintained, or tried to maintain, the distinction between the long vowels /ø/ and /ɛ/, the former was denoted with a number of graphemes or allographs. Most common among these were <ø> and <ɔ> which were also used for the short /ö/ resulting from the merger of short /ø/ and /ɔ/. These letters sometimes were written with a superscript accent mark; this is also true for the hybrid <ɔ̄>. Around the middle of the 13th century <ð> (along with the hybrid <ð̄>) also appeared and <ð> remained longest in this function, beyond the middle of the 14th century.

Long /ɔ/ had already around 1200 begun to merge with long /a/ (or, when nasalized, long /o/) and was, accordingly, subject to the same kind of notation as long /a/ (or long /o/), whereas in the earliest manuscripts a symbol for /ɔ/ was employed. In the earliest manuscripts, short /ɔ/ was denoted with <æ>, <ɔ>, or <o>. The first of these is, however, found in few manuscripts in the 13th century, but during that century new types of notation came into use for /ö/ (or, very rarely, for /ɔ/ only), the most common of which were <au>, <aʷ>, and <ø>. During the second half of the 13th century, the symbol <ð>, first mostly used for long /ø/, entered the ranks of the symbols for /ö/; it gained ground during the 14th century and gradually became the predominant symbol for /ö/ along with /o/ and <au>.

97. The development of Latin script III: in Sweden

1. Origin and earliest European contacts
2. Formal and informal script types
3. Individual graphemes
4. Ligatures
5. Numerals
6. Abbreviation signs
7. Old Swedish texts and manuscripts
8. Literature (a selection)

1. Origin and earliest European contacts

Latin script first appeared in Sweden on coins, struck on the patterns of English models, chiefly in Sigtuna under the kings Olof Skötkonung (ca. 995–1022) and Anund Jakob (ca. 1022–1050). The script is mainly majuscule, ultimately dating back to Roman capitals (Rasmusson 1982).

Handwritten Latin script came to Sweden with the Christian mission. In this country Christianity made its breakthrough in the 11th c., but handwritten documents are still extant only from the next century. The first monastic order to be established in Sweden was that of the Cistercians, who founded the first Swedish monasteries in 1143. Thus, the Cistercians are likely to have had the greatest influence on the development of the Latin script in the country. The first Swedish archbishop, Stefan, belonged to the order and was consecrated by the Pope in Sens in 1164. In the middle of the 13th c. the Cistercians in Sweden were superseded by the Dominicans, who were also closely connected to France. Consequently, it is from this country that Sweden received its earliest influences as far as Latin script is concerned (Jansson 1944, 82 f.; cf. Jansson 1952–54, 149 note 8).

The mediaeval history of the Swedish script has been divided by Jansson (1924, 108 ff.) into three periods, which are used here: (1) ca. 1150–1250, “the time of the round minuscule” or “the period of the Carolingian minuscule”, (2) “the time of the fractured minuscule and of the diplomatic cursive” or “the earlier Gothic period”, and (3) 1370–1526, “the time of the ornamented minuscule and of the half-cursive” or “the later Gothic period” (this division is followed by Svensson 1979, 46). The oldest extant documents written in Sweden, a few deeds issued in the second half of the 12th c., are said by Söderlind (1982) to represent a Carolingian script “in the first intermediate

stage of the transition into Gothic script”. The outside limits for the dates refer to historical events of indirect consequence to the history of the script. The year 1250 is the approximate date of origin of the oldest example of Swedish book production: the fragment of the Older Law of Västergötland (Cod. Holm. B 193). In 1370 the Order of St. Bridget was established, which, through its main convent in Vadstena, eventually came to exercise a great influence on culture in mediaeval Sweden. In 1526, The New Testament was first printed in Swedish.

Jansson’s classification of the script of period 1 as Carolingian can be disputed. Regarding some of the earliest deeds, Jansson speaks of “incipient Gothic features: a distinct difference between down-strokes and hair-strokes, the latter of which form sharp angles with the former, and a few broken angles instead of curves” (Jansson 1924, 109). In the oldest Swedish diplomas (e.g. Dipl. Sv. 51 and 63), the script presents clear Gothic features of the kind that appear in Belgium and France in the 11th c. (Bischoff 1986, 171 ff.): the height definitely exceeds the breadth in the letters without ascenders, and one can see clear tendencies to fracture the curves into angles. In other words, Jansson’s term “round minuscule” doesn’t seem quite accurate. Actually, the script in question doesn’t differ in any decisive way from the one which is called *gotische Buchschrift* by German palaeographers and which appears in contemporary French and German formal book script (see for instance Crous/Kirchner 1928, 9 f. with figs. 2 and 4). It can probably be stated that among the extant documents written in Sweden, none has a typical Carolingian minuscule of the type found in the Danish Dalby Book from the 11th c. (Cod. Hafn., GKS 1325 4:0).

2. Formal and informal script types

The main types of mediaeval script are (1) the formal one used chiefly in book production, and (2) the informal or cursive one, which results from an adaptation to faster writing and which appears above all in diplomas. Eventually, intermediate types were developed (2.2.).

2.1. Formal or book script

The formal or book script was executed slowly, with great care, so that every letter was written separately, without being conjoint to the next one. At first the formal script in Sweden was the only one in use, in diplomas as well as in codices (Öberg 1974, 11). The earliest extant deed written in Sweden is a letter issued by Archbishop Stefan in Uppsala during the period 1164–67 (Dipl. Sv. 51). The scribe was probably not a Swede but, perhaps, a Cistercian from France. The script is in a flowing formal hand with numerous decorative features in the form of long curved descenders for ⟨p⟩, ⟨q⟩, ⟨r⟩ and sigmatic ⟨s⟩ (see 3.2., ⟨s⟩), and loop ornaments on top of the ascenders for ⟨d⟩, ⟨l⟩, and ⟨t⟩.

An equally flowing book hand appears in two deeds issued by King Knut Eriksson sometime during the years 1167–85 (viz. Dipl. Sv. 63 and 64). Especially the former has the greatly prolonged ascenders, typical of the diplomas of the time. The hand of the latter can to a large extent be compared with contemporary book script of an early Gothic type; cf. for instance Crous/Kirchner, fig. 4.

The formal script continued to assert itself in Swedish diplomatic hands up to the 1240s; one late example is Dipl. Sv. 317 (1244), issued by Archbishop Jarler of Uppsala. The script here is markedly large: the letters without ascenders reach approximately 4 mm above the line instead of the normal 2–3 mm.

In the production of books, the style of the formal script underwent the same evolution that can be studied in an overwhelmingly large number of codices from, above all, Germany and France. The oldest Swedish book, Cod. Holm. B 59 from the 1280s, has a typical, though not extreme form of Gothic script, with letters of small width (the height of the letters without ascenders exceeds the breadth) and a clear tendency to fracture the curved strokes. The manuscript is referred to by Kirchner (1966, pl. 15) as an example of *textualis gothica*, also called *Gothic textura*. This script originated in northern France and Belgium and appears in a clear form in these areas during the 12th c. (Bischoff 1986, 171 ff.). All extant Swedish law codes from the first decades of the 14th c. are written in this kind of hand, e.g. the Laws of Västmanland (Cod. Holm. B 56), Uppland (Cod. Holm. B 199), and Södermanland (Cod. Holm. B 53), and the *Younger Law of Västergötland* (Cod. Holm. B 58).

The Gothic *textura* appears also in law codes from the middle and the second half of the 14th c., eventually in a more characteristic form, with a narrower script and fractures with sharper angles, e.g. in the Law of Östergötland (Cod. Holm. B 50 ca. 1350), The National Law of King Magnus Eriksson (Cod. Holm. B 107 1388), and The Law Code of Stockholm (Cod. Holm. B 154, first half of the 15th c.).

2.2. Informal or cursive script

An informal hand is characterized by the more or less conspicuous cursive character of the script. Cursive is generally defined as a script where the move from one letter to another is performed without lifting the pen, so that each letter is conjoined to the preceding one by a thin pen stroke. It should be emphasized that the earliest informal script is not typically cursive in this respect but acquired its informal features from the shapes and proportions of the letters. These are rounded, without any fracturing of the curves, the script is wider, that is, the breadth of the letter without ascenders exceeds the height, and the ascenders (⟨b⟩, ⟨d⟩, ⟨f⟩, ⟨l⟩) as well as the descenders (⟨f⟩; ⟨g⟩; ⟨p⟩; long ⟨s⟩, i.e. *f*, see 3.2., ⟨s⟩) often take the form of a loop. Two diplomas, one dated 1244 (Dipl. Sv. 317), the other written the same year or the year after (Dipl. Sv. 318), both issued by Archbishop Jarler of Uppsala, exhibit markedly different types of script, apparently in use at the same chancery. The former still is a typical book hand without conjoined letters, while the latter is a fairly cursive hand, regularly conjoining the letters. Shortly afterwards, e.g. in a diploma dated 1248 (Dipl. Sv. 355), the new cursive script emerged as fully developed. (Perhaps the scribe in this case was a foreigner: the document was issued by Bishop William of Sabina, at the time visiting Sweden). A little less than a decade later, a similar hand is found in a deed issued in Kungsåra, Uppland, in 1257 (Dipl. Sv. 445) by Birger jarl (Earl Birger). Clearly, the cursive script had by then, if not earlier, gained a foothold in the more important chancelleries. Here, the shapes of the letters are retained even when they are regularly written without the pen being lifted. Instances of such a formal cursive hand appear in two documents written in or near important chancelleries, one issued in 1275 by King Magnus Birgersson (Dipl. Sv. 586), the other issued in 1315 by Birger Persson, the principal officer of the provincial assembly of

Tiundaland in Uppland and the father of St. Bridget (Dipl. Sv. 2008).

The diplomatic script in Sweden from the end of the 13th to the middle of the 14th c. has been called “the arched script” (*valvbågsstilen*) by Jansson (1944, 10), who writes: “On a cursory view, it is characterized by wide arches on top, above the writing line and on its upper edge, and by wedge-shaped ascenders, that is, the upper part is thickened and the lower part is narrowed into a cusp.” The description is somewhat unclear, but it seems that the term “arches” refers to the looped ascenders of graphemes like , <d> and <l>. The wedge shape of the ascenders is accomplished by exerting stronger pressure on the pen at the beginning of the stroke. As the most characteristic grapheme, Jansson emphasizes the <a>, “the upper, now closed chamber of which rises like a dome above the line and is often larger than the lower one” (on <a> with two “chambers”, see 3.2., <a>). As far as can be judged, this description fits diploma Dipl. Sv. 2008 (1315) mentioned above.

The main features developed in the letter script during the period in question were retained for roughly one century, in Sweden as well as elsewhere. The most obvious change seems to be found in the design of one grapheme, <a>, which lost its “neck” and assumed the “one-chamber shape” (see 3.2., <a>).

Book script, especially in Italy and northern France, was at this time strongly influenced by the diploma hands, and a new kind of book hand called *bastarda* began to compete with the *textura* from the end of the 14th c. onwards (Bischoff 1986, 192 ff.; Crous/Kirchner 1928, 16 and fig. 18). Another term for this intermediate form between formal and cursive script is (*Gothic*) *semicursive* (G *Halbkursive*, Sw. *halvkursiv*; Jansson 1924, 113 f.; Kroman 1982a). It could most easily be described as a more carefully executed form of cursive script. When used in books, the cursive script appears more conservative than in the diplomas. An early instance of a letter hand in a codex is a copy of the Law of Uppland from ca. 1350 (Cod. Holm. B 52). Here, the pen used had a fairly pointed nib, as is the case in most diplomas. Elsewhere, when a scribe used a cursive script in a codex, he generally gave the nib of the pen a broader cut than when writing deeds. This produces a sturdier script as e. g. in Cod. Holm. A 110 (Cod. Oxenstiernianus) from 1385, and in a couple of copies of the National Law of King Magnus Eriksson, viz.

Cod. Holm. B 168 from 1428, and B 172 (Cod. Kalmar or Aboënsis), written shortly before 1450. From the end of the 14th c. onwards, the scribes of Vadstena monastery developed a script of their own, a kind of formal half-cursive called the *Vadstena cursive*, and most exhaustively treated by S. O. Jansson (1975, 417 ff.). The term is misleading since the script is formal rather than cursive. Above all, S. O. Jansson calls it *Vadstena script* (1975, 417). The Vadstena script has been characterized by Lindberg as “compact, but clear, large, and legible” (1982, 371). According to S. O. Jansson (1982, 417) it appears in two varieties, one a soft, more typically cursive, the other a more rigid half-cursive. The “softer” variety differs from contemporary German cursives by having more rounded shapes (Jansson 1924, 115). The Vadstena script soon was used by chancelleries all over Sweden. In its cursive form, it is considered to be present in a large number of Swedish manuscripts ever since the 1390s (Jansson 1924, 117). One early instance is a diploma from the year 1394 (RPB 2700). In books it can be found in a number of codices from the end of the 14th till the beginning of the 16th c., one of which is Cod. Holm. A 9. Facsimile editions of other Vadstena manuscripts are CCS 2, 10, 11, 13, 14, and 16. The script in certain literary 15th c. manuscripts is classified by Jansson (1924, 117) as belonging to the indigenous half-cursive, e. g. the 15th c. chronicle books such as the *Karl Chronicle* (Sw. *Karlskrönikan*, Cod. Holm. D 6) from 1452, the *Book of Spegelberg* (Cod. Holm. D 2) from 1457, and the *Eufemia songs* (Sw. *Eufemiavisorna*, Cod. Holm. D 4) from the second half of the 15th c.

Book production continued in Vadstena during the first three decades of the 16th c. When writing the formal half-cursive during this period, the Vadstena scribes used pens with exceptionally broad nibs, e. g. in Cod. Holm. A 37.

2.2.1. German cursive script

The mediaeval utility script eventually adopted an increasingly cursive character as the result of adaptation to faster writing. There was an obvious endeavour to write letters and whole words by using as few pen strokes as possible, that is, without any unnecessary lifting of the pen. The so-called German cursive soon was introduced into Sweden. One early example is provided by one of the hands in a codex from 1476: The book of Lady Elin (Sw.

Fru Elins bok, Cod. Holm. D 3). In its most extreme form the German cursive acquired an exceptionally great width, the arches of ⟨m⟩, ⟨n⟩ and ⟨u⟩ are low and pointed rather than curved, ⟨a⟩, ⟨c⟩, ⟨e⟩ and others are written in such a way that the first stroke is horizontal and slightly wavelike and constitutes a “floor” to which is added a convex “roof” (⟨a⟩) or a short stroke (⟨c⟩, ⟨e⟩). This kind of script has its strongest representation in the chancellery of Bishop Hans Brask of Linköping, the head of which was Hans Spegelberg, himself active as a scribe. Manuscripts produced there are Cod. A 6 and A 7 in the Swedish National Archives, Cod. D 2 in the Royal Library of Stockholm and Cod. Kh 53 and 54 in the Municipal Library of Linköping (Gunneng 1981).

2.2.2. Wax tablet script

A specific kind of script arose from writing in wax with a stylus. According to Jansson (1924, 115 note 1; cf. Jansson 1944, 85) this kind of script appears “here and there in diplomas and private records”. It is characterized by thin pen strokes – the pen was always pointed – absence of conjoined letters, and absence of any difference between down- and up-strokes. The autographs of St. Bridget (Cod. Holm. A 65, 1361, 1367) exhibit a typical wax tablet script (Jansson 1924, 115; CCS 10, XIII; Höggman 1951, 16 f.).

3. Individual graphemes

In Swedish mediaeval documents there are three graphemes that testify to influence from western Scandinavian, ultimately English script, viz. ⟨ð⟩, ⟨þ⟩, and ⟨ŷ⟩, and, furthermore, the insular allograph of ⟨f⟩. The letters ⟨ð⟩, insular ⟨f⟩, and ⟨ŷ⟩ are very rare; their presence is limited to Västergötland and the 13th c. The letter ⟨þ⟩ is more frequent; it appears all over the Swedish area during the greater part of the Middle Ages. The occurrence of ⟨ð⟩, insular ⟨f⟩, and ⟨ŷ⟩ in Västergötland could perhaps be taken as an indication of this region being a script province of its own, closely connected to the west.

3.1. Majuscules

The majuscules can be treated in brief. They can either be described as enlarged minuscules or, if they have a genuine majuscule shape, it is likely to be one that is common in mediaeval European script.

3.2. Minuscules

Here shall be treated all minuscule letters except ⟨b⟩, ⟨l⟩, ⟨m⟩, ⟨n⟩, and ⟨q⟩, the description of which would not provide anything of specific interest to Swedish palaeography.

⟨a⟩. This is one of the graphemes that show the clearest allographic variation during the Middle Ages. Minuscule ⟨a⟩ can be of the one-chamber or the two-chamber type. In the former case, a “neck” can be either present or absent. Minuscule ⟨a⟩ without a neck appeared about the middle of the 14th c., e.g. in a diploma written in 1352 in the chancellery of King Magnus Eriksson (Dipl. Sv. 4780). In Sweden the two-chamber ⟨a⟩, in which the neck is strongly curved, thus creating an upper closed chamber, began to appear towards the end of the 13th c. (Jansson 1944, 86; one instance from a French book hand in 1295 can be seen in Crous/Kirchner, fig. 7).

⟨c⟩. Most of the time this grapheme is written in two strokes. When the grapheme has its original shape, the first of the strokes is curved and the second one is short and added to the right and directed downwards (Jansson 1952–54, 94). Later on, the second stroke can be bent upwards and can thus obtain the shape of an angle (cf. ⟨e⟩). In markedly cursive writing, the first stroke is more or less straightened out; in extreme cases it is almost completely straight (e.g. in a diploma from June 29, 1455).

⟨d⟩. Minuscule ⟨d⟩ presents a clear example of allographic variation, with two main types: the Carolingian one with a straight ascender ⟨d⟩ and the uncial, rounded one ⟨ð⟩. In the early Swedish material both appear, but with a pronounced predominance for one of the types in the same document (Jansson 1952–54, 99). In the 12th c. material, the Carolingian variant is the most common and is always used when the ascender has an abbreviation sign in the form of a cross-bar (Dipl. Sv. 63). The uncial variant is always used in word-final position when it is followed by a *us*-abbreviation (Dipl. Sv. 64). The cursive script in letters prefers the uncial ⟨d⟩ with an ascender in the form of a loop. The diplomatic script appeared about the middle of the 13th c. and from then on Carolingian ⟨d⟩ is very rare in the documents (Jansson 1944, 90).

⟨ð⟩. This grapheme originates in English script (Seip 1954, 44). It denotes a voiced dental fricative and competes in this function with ⟨þ⟩. The extant manuscripts where ⟨ð⟩ occurs are all from the 13th c. In book script it has the shape of an uncial ð with the ascender

crossed by a diagonal hair stroke (Cod. Holm. B 193). Here, it can't be mistaken for an uncial δ with an abbreviation stroke. In cursive script used in diplomas, however, such a confusion is possible. Here $\langle\delta\rangle$ is shaped like an uncial δ of the diploma type with the ascending loop entirely or partly crossed by a broad pen-stroke, often shaped like a hook, quite like in Latin abbreviations (Jansson 1952–54, 100). Since $\langle\delta\rangle$ occurs only in Swedish words, it is easy to distinguish from $\langle d\rangle$ with an attached abbreviation sign even in diplomas. In Sweden $\langle\delta\rangle$ is extremely rare, and its appearance seems to be due to direct or indirect contact with the west. In the fragment of the *Older Law of Västergötland* (Cod. Holm. B 193, discovered in Norway) from about 1250, it varies with $\langle b\rangle$ but it is not found in the more complete manuscript of the same law code from about 1285, which has $\langle b\rangle$ consistently. According to Jansson (1952–54, 100), the letter is “so unusual that it can't be called a Swedish character”. In diploma hands, Jansson shows instances of $\langle\delta\rangle$ in six documents, the oldest of which is from 1283, the other ones from 1297–99. All of them are directly or indirectly connected with the Bishop of Skara (Brynolf), and here one could possibly see an element of western Scandinavian scribal customs.

$\langle e\rangle$. Like $\langle c\rangle$, $\langle e\rangle$ has the shape of a curve with an attached second stroke. In the earliest manuscript the second is a loop. In the cursive letter hands of the 15th c., the loop is simplified into a stroke which can be straight or bent upwards, in which case the grapheme can't be formally distinguished from $\langle c\rangle$ (Jansson 1952–54, 94).

$\langle f\rangle$. In book script $\langle f\rangle$ stands on the line, but in cursive script it extends below it (Jansson 1952–54, 101f.). The insular $\langle f\rangle$ originating from England is common in early Norwegian script (Seip 1954, 9f.) but appears in Swedish manuscripts only in the fragment of the *Older Law of Västergötland* (Cod. B 193). In all probability, it was taken over from Norwegian script.

$\langle g\rangle$. This grapheme has a number of variants, of which two main types can be discerned with respect to the descender, which can have the shape of a hook or a loop. In the oldest material both forms occur, but eventually the latter prevailed. The descending loop can be given a decorative design, e.g. with two “chambers” (Jansson 1952–54, 102).

$\langle h\rangle$. In $\langle h\rangle$ the second curved stroke may or may not extend below the line. The former variant is the one found in the earliest Swedish

material, e.g. in Dipl. Sv. 51 from 1164–67 and Dipl. Sv. 64 from 1167–85. Eventually the second variant prevailed; one early document in which it appears is Dipl. Sv. 240 from 1225 (Jansson 1952–54, 91 ff.). During the 15th c. the descender started to be shaped like a loop (Jansson 1952–54, 93). In the German cursive script the letter can be described as written in one stroke with two conjoined loops, one ascending and one descending (German $\langle h\rangle$, Jansson 1952–54, 93). In the chancellery of Bishop Hans Brask in Linköping in the 1520s, both the older and the younger variant are used (Gunneng 1981, 10, 12).

$\langle i\rangle$. Minuscule $\langle i\rangle$ has two main allo-graphs, one standing on the line, the other one extending below it. The latter one occurs only in word-final position. A diacritical super-script hair stroke is used when needed, e.g. if there is a risk of confusing $\langle ii\rangle$ with $\langle n\rangle$ or $\langle u\rangle$ (Jansson 1952–54, 107 ff.).

$\langle k\rangle$. This grapheme can generally be described as consisting of a vertical ascender, to the right-hand side of which is attached a loop or an open curve continued by a final diagonal stroke down to the line. A special variant occurs when the final stroke is more or less horizontal and does not reach the line. Jansson (1952–54, 94) cites this type from the second half of the 14th c. at the earliest. A $\langle k\rangle$ variant often found in the late Middle Ages has a long curved ascender bent to the right and continued below the line so that it reaches the normal depth of a descender.

$\langle p\rangle$. This grapheme appears in two main variants with respect to the “chamber” to the right of the descender. In one variant the chamber has a “floor”, while in the other one it does not. The floor-type is by far the most common one; only a few cases without a floor have been observed by Jansson (1952–54, 112f.), the earliest one from 1277. With respect to the *ductus*, $\langle p\rangle$ with a floor can be written either with two or more pen strokes, or with one. The latter type belongs to the German cursive and can be described as a loop lying on the line, closed on the left-hand side, after which the stroke is continued below the line as a descender. This variant has been cited by Jansson (1952–54, 115) from 1460 at the earliest.

$\langle r\rangle$. This grapheme is normally of a Carolingian type. In a few of the earliest extant manuscripts it has been continued below the line, ending as a descender, as in $\langle p\rangle$ (always in Dipl. Sv. 51 from 1164–67, a few cases in Dipl. Sv. 240 from 1225; both in book script).

The ⟨r⟩ *rotunda* appears after ⟨a⟩ and ⟨o⟩ when it is followed by an abbreviation sign for *um*, and after uncial ⟨d⟩ (ð). For ⟨r⟩, more than for any other grapheme, the reduced minuscule (R) is used as a minuscule. It occurs (irregularly) in words that should be emphasized (e.g. in Dipl. Sv. 51 and Dipl. Sv. 240). However, ⟨R⟩ and ⟨r⟩ can alternate freely in a document, although this is rare, e.g. in the early diploma Dipl. Sv. 137 from 1210–16 (book script).

⟨s⟩. Minuscule ⟨s⟩ has two main allo-graphs, the long one (which could be described as an *f* without a cross-bar) and the round (sigmatic) one. The distribution between the two follows the main rule in Latin script: round minuscule ⟨s⟩ is used only in word-final position. Long ⟨s⟩ appears in all other positions although there are exceptions (e.g. in Dipl. Sv. 64, which has some instances of word-final long ⟨s⟩).

⟨p⟩. In book script ⟨p⟩ often stands on the line. In such cases it can be described as an *l* with a closed curve on the right-hand side. In diploma script, however, ⟨p⟩ always has a descender, like ⟨p⟩. The grapheme has been imported from England by way of western Scandinavian script (Seip 1954, 44). Although not indigenous to Scandinavia, the use of ⟨p⟩ is likely to have been supported by the existence of the character Þ in the mediaeval runic alphabet. ⟨p⟩ denotes a voiced or voiceless dental fricative. In Swedish book hands it was for a long time the normal letter for those sounds. In Cod. Holm. B 193 it alternates with ⟨ð⟩, but in some later law codes it is used exclusively. In the second half of the 14th c. it eventually gave way to ⟨dh⟩/⟨th⟩. Thus, the Law Code of Söderköping from 1387 (Cod. Holm. B 127) always has ⟨th⟩, the Law Code of Stockholm from the first half of the 15th c. (Cod. Holm. B 154) has both ⟨dh⟩ and ⟨th⟩, whereas in Cod. Holm. B 112 from the end of the 14th c. ⟨dh⟩ alternates with ⟨p⟩.

In diploma script ⟨p⟩ appears also in Latin manuscripts, exclusively, however, in Swedish words (proper names). From the 13th c. Jansson (1952–54, 122f.) cites seven Latin diplomas that have ⟨p⟩. During the 14th c. their frequency increased, although ⟨p⟩ doesn't appear in more than a few tens of diplomas. Its use discontinued during the 15th c.

Thus, while being rather rare in diploma script, ⟨p⟩ seems to have had a strong position in Swedish scribal tradition, at least up to the middle of the 14th c. This assumption is sup-

ported by several facts. Although occurring rarely in the diplomas, it appears over a relatively long period of time and in several parts of the country. The oldest extant diploma in Swedish, dated 1330, almost exclusively uses ⟨p⟩ and the latest case observed by Jansson (1952–54, 122f.) dates from 1410 (SD 1304). Writing in Swedish was based on an orthographic tradition going back at least to the beginning of the 13th c., with the regular use of ⟨p⟩ for dental fricatives. It should be stressed that St. Bridget, who was probably used to writing Swedish (see 2.2.) but not educated in writing Latin, consistently uses ⟨p⟩ in the preserved autographs. Thus, the disappearance of ⟨p⟩ from Swedish orthography is evidently due to Latin influence.

⟨u⟩. From a graphemic point of view, *u*, *v*, and *w* in mediaeval script should be considered allo-graphs of the same grapheme. The allo-graph *u* mainly belongs to book script, where it alternates with *v*. According to Jansson (1952–54, 109) *u* is rare in letter script, where it is replaced by *w* and does not appear until the 15th c. It often has a superscript diacritic in the shape of a small *u*-like curve or *v*-like angle.

⟨â⟩. The approximate sound value of this grapheme is [o]. According to Seip (1954, 122) ⟨â⟩ appears in a few Norwegian diplomas from the 15th and 16th c. In Sweden it is not found in manuscripts written before the 14th of February 1526, the date of publication of *Een nyttwgh vnderwijsning*, which was the first printed matter to be published by the Swedish Reformation (Collijn, 1934–38, 321f.) and in which ⟨â⟩ is in regular use. In Swedish script ⟨â⟩ dates back to this publication and was spread by the reformers, through *Thet Nyia Testamentit på Swensko*, which was published in August 15th 1526 (Collijn, 1934–38, 331f.). If ⟨â⟩ appears in documents dated before 1526, it appears to have been created secondarily by a later addition of a superscript circle above an ⟨a⟩ (Jansson 1944, 134, note 45; 1952–54, 87, 146 note 5). The ⟨â⟩ was evidently modelled on early printed ⟨â⟩ and ⟨ô⟩, which originally had the shape of *a*, and *o*, with a small *e* printed on top.

⟨æ⟩, ⟨ę⟩. Originally a ligature, ⟨æ⟩ is an independent grapheme in Swedish mediaeval script. It denotes a low or middle-high non-rounded front vowel. It appears in diplomas during all the Middle Ages. In formal script in the Swedish language it is common from ca. 1250 (Cod. Holm. B 193) onwards. The fundamental form is always the same, i.e. an

⟨a⟩ with an additional stroke on the right-hand side which can vary considerably as to shape and placement. The ⟨ę⟩ called *e caudata*, has formally developed from the ligature ⟨æ⟩ and should be regarded as a variety of that character. It appears occasionally in diplomas from the 12th and 13th c., but here its graphemic status is doubtful. In Dipl. Sv. 51 from the 1160s it always denotes Latin *-ae*.

⟨ø⟩. To denote the phoneme /ø/, viz. a low or middle-high rounded front vowel, Swedish script originally used digraphic ⟨eo⟩, ⟨eu⟩ etc. under continental European influence. Not until ca. 1230 does ⟨ø⟩ with a diagonal cross-bar appear (Jansson 1952–54, 89). Like ⟨æ⟩, it thereafter existed throughout the Middle Ages.

⟨Ψ⟩. See sect. 6.

4. Ligatures

The term *ligature* should denote two graphs that are conjoined in such a way that they share a pen stroke which is distinctive for each grapheme. Two graphs that share a non-distinctive stroke do not fulfill this definition. (When describing the ligatures of Swedish mediaeval script, Jansson has taken up such cases as well: 1944, 129; 1952–54, 137). In Sweden the use of ligatures is scanty. Only the ligatures of ⟨r⟩ and a preceding grapheme occur regularly; in such cases ⟨r⟩ appears as the *rotunda* allograph. The preceding grapheme was originally ⟨o⟩ exclusively, eventually even uncial ⟨d⟩.

5. Numerals

Latin numerals are clearly predominant. Their shapes are the ones usually found in European script. For Latin I, V, X, C, and D, minuscules are used, for M a reduced majuscule of uncial type. Latin numerals are mostly, but not always, written within interlinear dots, e. g. ·iii· (= 3). Arabic numerals are found occasionally in the earliest material; the oldest one recorded by S. Jansson appears in a diploma from 1260 (Jansson 1944, 130; 1952–54, 143). In late letters from the 15th c. Arabic numerals are not uncommon. They appear in varying shapes (see Kroman 1982b). One early document with Arabic numerals of, on the whole, modern shapes is an autographic letter from March 1st 1504 by Hans Brask, then cathedral dean, later to become Bishop of Linköping.

6. Abbreviation signs

The abbreviation system is the Latin one (with one exception: Ψ). In Latin documents written in Sweden, nothing special is to be found. In documents in Swedish, the Latin abbreviation signs are used as long as they fit reasonably well with Swedish pronunciation. Thus, signs for contraction as well as signs for omitted ⟨m⟩ or ⟨n⟩ occur regularly. Both have the form of a superscript horizontal stroke. The sign of suspension varies a great deal in shape but often takes the form of a hook similar to a ⟨z⟩ which descends below the line: ꝛ; in this form it is especially common in the abbreviation of the preposition *mep* as *mꝛ*.

Abbreviation signs for individual vowels as well as vowels preceded or succeeded by /r/ (*er, ir, re, ri, ur* etc.) occur throughout the Middle Ages. They are especially common in late mediaeval chancellery script, as seen in the chancellery of the Bishop of Linköping during the 1520s (Gunneng 1981). A grapho-phonemic and grapho-morphemic analysis of the abbreviation system in Old Swedish remains to be done.

Ψ. In England the *m*-rune (ᛗ) was used as the abbreviation sign for *man, men*, and under that influence the Nordic *m*-rune Ψ appears in some early Old Norse manuscripts as a sign for *maðr* 'man' (Seip 1954, 30, 59, 81). In Sweden this habit is limited to the main manuscript of the law of Västergötland (Cod. Holm. B 59) from the 1280s. Here the abbreviation is written ·Ψ·, with an interlinear dot on each side of the rune. In this codex, it alternates with unabbreviated *maþar*.

98. The development of Latin script IV: in Denmark

1. The Carolingian minuscule
2. The older Gothic script.
3. Literature (a selection)

1. The Carolingian minuscule

1.1. In general

The oldest medieval manuscript from the kingdom of Denmark presumably is the evangeliary called *Dalbybogen*, now in the Royal Library of Copenhagen, GKS 1325 4°. It is written in the characters of the Carolingian minuscule. As the manuscript does not contain any date, the usual estimate of its dating from about 1050–1100 is based upon the script only. The characters of the minuscule are enclosed by the fourline system: the low characters, e.g. *a*, are written in the middle, the ascenders are bounded by the upper line, the descenders by the lower one. The Carolingian minuscule was developed about 800 at the court of Charlemagne. The main principle is that the characters should be written separately from each other and with a clear space between the words. The low characters should be of equal height, the ascenders and descenders being of the same shape. The use of ligatures should be reduced. The script used in *Dalbybogen* corresponds to this description. The low characters are of equal height, the back stroke of *a* is almost perpendicular or curves a little to the left, *e* has a raised loop with a small tip on the right, *i* has no dot above it, *d* in most cases ascends perpendicularly, but now and then curves backwards to the left. The long-stemmed *s* is in frequent use. Like *f* and *r* it breaks through the bottom line. At the end of words *s* and *r* now and then are replaced by the reduced capitals *S* and *R*. The use of capitals, majuscules, is the usual one, with both square and uncial characters. In *Dalbybogen* e.g. rustic *A* is without a crossbar; two of them written together form the *M*. The uncials *D*, *E*, *H*, *T* and *U* are fairly well represented. The right stroke of the *U* runs beneath the line. *E* may also be formed as an enlarged minuscule, the loop with its tip hanging on the top of the extended curve. The use of ligatures is moderate. *Dalbybogen* uses & for the conjunction *et*, but also for the letters *et* within and at the end of words, e.g. *dicer&*. Ligatures connecting *c* and *t*, and *s* and *t* occur. The endings *ns* and *nt* can be formed as a ligature connecting a capital *N* and *s* or *t*

by prolonging the last stroke of *N* above the line and continuing on to the curve of *s* or the crossbar of *t*. Now and then the diphthong *ae* is expressed by the ligature *æ*, but more frequently by the ligature *e* caudata, the tagged *e*, where the tail beneath is a remnant of *a*; *e* at the beginning of *ecclesia* and *evangelium* is often written in this way, perhaps influenced by *cælorum*. The tables of canons and the list of pericopes are modestly decorated columns and Romanesque arches. The four gospels are each introduced by a seated evangelist painting the initial letter in the style of the 11th century. The connection with Dalby in Scania is evident from some 14th century additions.

1.2. The manuscripts from Lund

From the archdiocese of Lund in Scania, established in 1104, and its institutions, several manuscripts have survived, all on parchments. The oldest one is an evangeliary, now in the Royal Library, Thott 22 4°, written in a Carolingian minuscule reminiscent of *Dalbybogen* with broad and low characters, and *f*, *s*, and *r* having the long stroke beneath the line, but with an increased use of the diminished capital *S*, i.e. “the round *s*”. The hairline stroke on the descender of *q* is perhaps a new feature. However, the most important manuscript is the *Necrologium Lundense*, a collection in three parts: (1) a tax list, the donation in 1085 by Holy King Knud, canonized before 1100, and the list of prebends, (2) the rules of Aachen, perhaps of foreign origin, surrounded by texts of the Fathers, written by the same hand as the following constitutions of the canons, and (3) the “Memoriale fratrum”, the book of the deceased. The different hands still use the Carolingian minuscule. The ligature *N + t* is still in use, and *æ* is written as *e* caudata. The place-names and personal names are written in Danish, showing interesting ligatures: e.g. *Øpi*, written with a majuscule *O* in ligature with a small *e* above it, and *Ætu* “sororis nostre”, written with an enlarged minuscule *a* in ligature with a small *e*, the following *nostre* ending with *e* caudata. In the list of prebends many place-names have a minuscule *a* with a small curl above on the right side representing *æ*. This list also has several examples of *o* with a crossbar, representing the Danish letter *ø*. In “Memoriale

fratrum” under January the 3rd, there is another example of *o* in ligature with an *e*, perhaps representing a second way of writing the Danish *ø*-vowel. It should be noted that the scribes use all majuscules in a very clever way. Two of them are enlarged ornamental initials with bands, animals and plants, one of which introduces the rules of Aachen, the other one the text of Father Basilios. Later two scribes used the last leaves in the *Necrologium* for entering two acts concerning the borders of Ballingslöv. The numerous names provide many examples of *o* with a crossbar, as well as one example of *y* in *-by*. There is one example of *v* with a crossbar = *y*. Furthermore, two epistolaries, now in Lund, Medeltidshandskr. no. 2 and 5, and two evangelaries, one in Thott 21 4° and one in Uppsala University Library C83, come from Lund. Presumably they are a little younger. The characters are slimmer, the curves more oval, and the letters *r*, *s* and *f* have a hairline stroke beneath. From about 1137, onward, the annals now known as the annals of Colbaz were written in the neighbourhood of Lund. After a drawing of the crucifixion of Christ came a calendar written by the main scribe. The initials were formed by the scribe who made the initials of *Necrologium Lundense*. When Lund Cathedral was consecrated, a new manuscript of 143 leaves in folio, the so-called *Liber daticus vetustior*, was made in the form of a martyrology with extracts of legends for every day of the year. The first day of every month, the *Kalende*, abbreviated as *KL*, is richly decorated; January the 1st is especially enlarged and profusely decorated. Two different hands have transferred some notes from *Necrologium Lundense* changing over on the 22nd of July.

1.3. Manuscripts from Zealand

From the rest of the Danish dioceses, nothing has been left. Only some small fragments of secular literature have been discovered, used as binding material in Rigsarkivet in Copenhagen, including an ornamental initial *P* from a manuscript of Justinus, whose script in some respects reminds one of the hand which wrote *Dalbybogen*: the ligature *NT* occurs and *&* is used inside words. Another undamaged manuscript of Justinus was given to Sorø Abbey about 1200, but the hand is older, though not as old as the hand which wrote the fragments. In it, the use of the round *s* has increased, the *e* caudata occurs, and *&* is used only for the word *et*. On the last leaf three

different hands have written the annals of Sorø; the oldest hand entered the notes until 1231. A manuscript of Plinius in two volumes, now in the Bibliotheca Laurenziana in Florence, probably dates from this time, and is introduced by a dedicatory picture with the superscription “*Petrus de Slaglosia me fecit*”, i. e. Slagelse in Zealand. The characters are of the same type as in the Justinus manuscript, but there are more initials of different sizes, richly decorated with acanthus, animals and figures. It was bought in Lübeck about 1430 for Cosimo de Medici. All these manuscripts are in Latin. No manuscript in Danish has survived, even though e. g. the *Scanian Law* was written before 1200.

2. The older Gothic script

2.1. In general

During the first decades of the 13th century the Carolingian minuscule was being gradually modified. The broad round characters grew smaller and slimmer. The round letters like *o* became oval, and letters were connected by means of hairline strokes at the foot of the stems of *i*, *l*, *m* and *n*. The crossbar of *f* and *t* also formed a connection with the following letter. Then a new convention arose whereby the curve on the right side of the backward-bent *d*, and gradually *b*, *e*, *o*, could be united at the scribe’s discretion with a contrary curve on an immediately following letter such as *e* and *o*. The curves of *o* and the perpendicular strokes of *i*, *m*, *n*, *u* and *t* were slightly angulated, later on still more so, at first above, later also below. The backward-bent *d* was used more frequently than the perpendicular one. An oblique stroke closed the lower curve of *g*; in addition to the orthodox *r*, the round *r* after *o* and later on also in other positions, and diminished majuscule *r* occur. The long-stemmed *s* was increasingly replaced by the round *s*, especially at the end of words. The crossbar of *t* was now put a little under the top of the perpendicular stem and later on only on the right side of the stem. The oldest Danish manuscript in this book-hand is the so-called Angers Fragment of *Saxonis Gesta Danorum* which was found in 1863 as lining in a book in Angers, France, now in the Royal Library as NKS 869 g in 4°. It has a total of four reduced leaves of parchment with extra large space between the lines, that is with room for additions and corrections to the main text, especially in the first folio. The script has a

mixture of old and new features. The long-stemmed *s* runs under the bottom line, and only a few examples of the round *s* are found at the end of words; *t* varies: the stem is sometimes perpendicular, sometimes curved, now and then going through the crossbar. The curves are slightly angulated. The majuscules are a mixture of slightly angulated uncials and enlarged minuscules. Many ascenders are forked, sometimes almost a “thorn”. Only slightly younger is *Liber monasterii Carae Insulae*, now in the Royal Library as E donatione variorum 135 4°. It consists of two parts, only the first of which was written in the 13th century. According to the prologue the most ancient part was written between 1207 and 1216. The scribe used reddish-brown ink, but the initials and the headings are red. He also wrote most of a charter from 1221 with the Abbot of Cara Insula (Øm) as mediator. The initials of the chronicle are decorated with palmettos, while those of the charter are not. The identification of the two hands is based upon the letters *e*, *g* and *x* and the abbreviations for the syllables *-bus* and *-que*. Both of them have the long-stemmed *s* at the end of words, now and then curved to the left beneath the line, but the round *s* on the line also occurs. The backward-bent *d* dominates the chronicle; the charter, however, has a few perpendicular *d*'s. Neither *æ* nor *e* caudata occur, and *o* is an *o* with a crossbar.

2.2. The manuscript of the *Scanian Law*

The oldest manuscripts in the Danish language were produced in the following decades. They are the manuscripts of the Danish laws, the *Scanian Law* and the oldest edition of *Valdemar's Zealand Law*, the originals of which, now lost, must have been written before 1216. The *Jutland Law*, the original of which is also lost, was passed in 1241. The oldest law manuscript is in Stockholm, Royal Library B 74, which contains the *Scanian Law* and the customs of the Scanian church. Every page has 22 lines indicated by dots in the very broad margin to the right. Some of the leaves have the edges cut so that the dots have disappeared. To the left the text column is bounded by two perpendicular lines. Between them the scribe inserted the initials in red, green and yellow, decorated with very modest palmettos. The headings of the sections were written in red by the same scribe as the text. The letters are rather broad and low and only slightly angulated, the foot-serif hardly represented.

The upper curve of *a* is open, *d* is mostly perpendicular, and *h* has its right line curved down under the bottom line. Besides the orthodox *r*, round *r* after *o* and the diminished majuscule *R* at the end of words occur. Both long-stemmed *s* and round *s* are used at the end of words. The perpendicular stroke of *t* does not break through the crossbar. The perpendicular strokes of *u* are seriffed. Besides the orthodox *e* with a tip there are about 30 examples of *e* caudata. The upper curve of *æ* is open like for the *a*'s, and the loop above on the right side is closed. The scribe used *e* caudata about 200 times. It is not possible to find any phonetic difference between *e* and *e* caudata or *æ* and *æ* caudata; the phenomenon must be only graphical. Another interesting feature only occurs in the first part of the manuscript up to f. 58v, where the consonants *l*, *ll*, *n* and *nn* are often, but not always, given a crossbar. This is commonly assumed to indicate a palatalized sound. Among the very few original charters from this period, it should be noticed that only the scribe of the Latin charter, issued by King Erik Plovpenning on the 6th of July 1241, twice wrote the ending *-sun* with a crossbar through *n*, one a minuscule, one a majuscule. After that time the cross almost disappears. Referring to the previous text described above, it seems possible to suggest an approximate date of about 1230–1250 for this manuscript, which contains no indication of year and scribe.

2.3. The years 1250 to 1300

Several manuscripts have survived from these years, both in Latin and Danish. A calendar originating from Skovkloster in Næstved, dated to about 1265, is now in the Royal Library as E donatione variorum 52, 2°. A section of its leaves containing, among other things, the whole of June has disappeared. On two leaves in front of the calendar a scribe entered the older *Annals of Næstved* covering the years 1130 to 1228. The scribe of the calendar itself uses gold, red, blue and green for the calendar scheme. The Sunday letters, *A* in red, *B-G* in blue, are a mixture of square letters and uncials. The names of the months and the saints are written with the letters of the older Gothic script; the curves and the stems are moderately angulated, and the upper curve of *a* is almost closed. The scribe uses *7* for *et*, the round *s* at the end of words, and backward-bent *d*. The ascenders are slightly forked. At about the same time, perhaps in

1268, the calendar called *Liber daticus recentior* was made in Lund, now in the Royal Library as GKS 845 2°. The main hand also entered the oldest death notices, mostly transferred from the old *Liber daticus*. Also about this time a copy of the poem *Hexaëmeron* by Andreas Sunesøn was written down, now in the Royal Library as E donatione variorum 155 4°, consisting of a total of 134 folios with lines in pencil. The column of Latin verses is bounded in both sides by two perpendicular lines. Between the lines on the left the scribe put the first letter of the verse, the perpendicular stems are moderately angulated, and the upper curve of *a* is alternately open and closed. Both perpendicular and backward-bent *d* occur. The uniting of curves and the use of 7 for *et* appear. About this time the original part of manuscript AM 37 4° containing the Latin paraphrase by Andreas Sunesøn of the *Scanian Law* together with the Danish customs of the Scanian church was probably written down in Lund, with the text set in two columns by two scribes. The script of the paraphrase itself is very angulated; the feet of the rather low letters end in a pressure or a serif to the right. There are many united curves, especially involving *d* which is sometimes perpendicular, sometimes backward-bent. The second hand has written the customs with more pointed and narrow letters. The vowel *æ* is almost like the *æ* in B 74. The vowel *o* is an *o* with a crossbar. At the bottom of the last leaf but one, running underneath both columns, a third hand wrote a two-line stanza (“Skåningeverset”) in a script which is barely angulated and which uses a rather old-fashioned *a* and *æ*. A manuscript of 65 folios of parchment, now in the Universitätsbibliothek in Kiel, S.H. 8, A 8, contains the *Office of Saint Kanute*, duke of Sleswig, killed 1131, canonized 1169, and, after a small space, a copy of the *Chronicle of Roskilde*, written after 1250 by a single scribe probably in Ringsted or Roskilde. The headings of the sections of the office are red, the initials red or blue, some of them being extra large and elaborately decorated with palmettos, such as the majuscule *A* at the head of the chronicle. Some of the lessons are followed by songs annotated with black notes in a red four-line system. The scribe used the old Gothic book-hand. Another scribe using this kind of script designed the *Obituarium Hafniense*, now in the Royal Library, Thott 805 2°, as the usual calendar with names of saints. He also entered the oldest death notices from 1208 to 1277 all at

one time. The death notice for 1277 has an extra large initial *P*. The notices continue till about 1450. – Only one complete leaf of a manuscript in folio of *Saxonis Gesta Danorum*, called the “Lassen Fragment”, written in the old Gothic script, has survived, now in the Royal Library as NKS 570 2°. The upper curve of *a* is still open, perpendicular and backward-bent *d* occur, and the perpendicular stem of *t* does not break through the crossbar, but the round *s* dominates at the end of words. The majuscules inside the text are accentuated by contour strokes. The letters *m*, *n*, *i* and *u* are slightly angulated, while *o* and *g* keep their round shape. The lowest curve of *g* is closed. Presumably the fragment consisting of 8 leaves of parchment containing *Valdemar's Zealand Law*, now AM 24 4°, was written during this period, but it is not known where. The text is in black, the headings in red ink. Each section has an initial square capital, rustic or uncial, painted in red or blue and variably decorated with palmettos. The very first one is adorned as a fleuroné-initial. Both perpendicular and backward-bent *d* occur, the upper curve of *a* is open, and the crossbar of *t* is mostly put on the right side of the stem. The long-stemmed *s* dominates, except at the end of lines, round *r* occurs only after *o* and *o*, the crossbar of *o* is inside the curves, *e* and *æ* have no tip to the right, and *z* has no crossbar; *y* is often expressed by *u* with a crossbar, but the orthodox *y* also occurs. Many of the ascenders are slightly forked, and the feet end with a serif. There is very little uniting of the curves.

2.4. The manuscripts from Sorø

Only a space of a few years separates the above manuscripts from another group of three manuscripts which presumably must have been produced in Sorø Abbey. The connection to this scriptorium is based on manuscript AM 455 12° containing *Valdemar's Zealand Law* combined with the preface of the *Jutland Law* and signed by Johannes Jutæ, but without a date. He, however, can be identified as one Jens Jyde, acting as a witness in 1298. His hand also occurs in the famous manuscript *Kong Valdemars Jordebog (Liber census Daniæ)* from 1231, now known only from this copy, which was formerly kept in the Stockholm Royal Library as A 41, but since 1929 in Rigsarkivet in Copenhagen. This manuscript is a collection of very different subjects, e. g. theological treatises, monastic rules for the Benedictines,

the so-called *Annales Waldemariani* from 1074 to 1219, a list of Danish kings, a list of popes, two itineraries and, last but not least, a cadastral survey of the kingdom of Denmark and two lists concerning Estonia. All of the cadastral survey, except the second list for Estonia, was written by Jens Jyde. All the other sections were written by an unidentified scribe. The third manuscript in this group was written by a scribe called Kanutus Yuul. He can be identified as the Knud Jul who acted on behalf of the abbey in 1310. The manuscript in question is in the Royal Library, NKS 66 8°, and contains three medical treatises by Henrik Harpestreng. The construction of this manuscript is very much like that of the others. The common features of the three manuscripts are a stronger angulation of the stems and also of the curves in *o*. The stem of *t* breaks through the crossbar, the round *s* is closed, and *z* has a crossbar. Jens Jyde closes the upper curves of *a*, but lets the upper curve of *æ* remain open. His *d* is mostly the backward-bent one, he uses *u* with a crossbar for *y*, e.g. in “by” and “syssel” but not without exceptions, and round *r* after *b*, *d* and *p* as well as after *o* and *ø*. Knud Jul on the other hand uses round *r* only after *o* and *ø* like the unidentified scribe. He uses very simple palmettos, while Jens Jyde only uses chapter marks in the cadastral survey, whereas the initials of AM 455 12° and NKS 66 8° are decorated with palmettos.

2.5. The manuscripts from Flensburg

In the town of Flensburg just to the South of the 1920 Danish-German border, a manuscript of the *Jutland Law* from about the same time is kept. It was written in the old Gothic script on parchment by one scribe and has red and blue initials decorated with palmettos. As well as the features mentioned in 2.4., the round *s* at the beginning, middle and end of words, the stem through the bar of *t*, *z* with a crossbar, the round *r* after *a* and *ø*, and the backward-bent *d* occur frequently. The use of *v* for *u* and *v* with a crossbar instead of *y* must be especially noted, though *y* also occurs. On the other hand, the upper curves of *a* and *æ* are open. A related hand can be seen in the manuscript of the Danish text of the *Town Law of Flensburg* dating from about 1300. The letters are rather angulated, the perpendiculars are forked, there are two kinds of *a* – one with the upper curve open, the other with a closed upper curve – and *æ* occurs with the upper

curve both open and closed and once with a closed curve to the left. *y* is in its orthodox form.

2.6. Manuscript C 37 of the Jutland Law

At one side of the end page of the index of sections of the *Jutland Law* in Stockholm Royal Library manuscript C 37, the scribe who wrote the original charter on the 24th of July 1279 entered the judgement of Odense 1245 and the 1276 ordinance of Nyborg just before the start of the text of the law, whose letters to some extent remind one of those in the Flensburg manuscript, e.g. the upper curves of *a* and *æ* are open, *æ* sometimes has a tip, but the round *s* is open. For these reasons C 37 must probably be considered one of the oldest manuscripts of the *Jutland Law*. The manuscripts Stockholm C 39 and AM 4 4° of this law are also from nearly the same time and are decorated with blue and red initials ornamented with palmettos. C 39 has very elaborated fleuroné-initials. In this manuscript both *u* with a crossbar and *y* with a crossbar occur for *y*; *x* also has a crossbar. The almost contemporary manuscript AM 286 2° was written in two columns with very elaborate initials in red, and blue. The letters are rather erect, the curves of *a* and *æ* are still open, and the *ø* is an *o* with a long crossbar. The Stockholm manuscript B 69 of the *Scanian Law* has initials of various colours, one of them a fleuroné-initial. The upper curves of *a* and *æ* are closed, both *z* and *x* have crossbars, and *ø* is an *o* with a crossbar. The Stockholm manuscript B 76 of this law is probably younger, perhaps from about 1325. The scribe uses *þ*, the forms of *æ* are unstable, the perpendicular stem of *t* is very high, *ø* has a carved stroke, *z* has a crossbar, and *h* and *þ* are followed by round *r*. The palmettos are very simple.

2.7. The manuscripts from Århus and Ribe

Very little has survived from the ecclesiastical institutions of this period. Only fragments exist as binding material in the archives from the 16th and the 17th centuries in Rigsarkivet in Copenhagen. Only the *Liber capituli Arusiensis* (Århusbogen) has survived, a manuscript of parchment containing 103 folios written in a large Gothic book-hand and furnished with red and green initials, the first part of which is dated to about 1315. As an introduction the scribe wrote out the statutes of the

Chapter of Århus Cathedral from the year 1312, adorned with many ornamental pen-rolls, followed by copies of papal bulls, royal privileges and title-deeds in systematic order, and finally by a cadastral survey of the estates of the Chapter in Zealand. Another scribe added after that a similar survey of its estates in Jutland. The vertical strokes and the curves are completely but modestly angulated. The upper curve of *a* and *æ* are as a rule closed, *e* is without a tip, the round *s* is closed, the perpendicular stroke of *t* breaks through the crossbar, *x* has got a vertical bar, and *d* is backward-bent. Both *A* and *E* are enlarged minuscules. About 1317 the town of Horsens sent to the town of Ebeltoft a sealed copy of the Latin customs of Slesvig in the form of a booklet containing 10 leaves of parchment, now in the Royal Library, NKS 3168 4°, accompanied by a testification all in one hand. The letters are only slightly angulated. The upper curve of *a* is still open, but varies very much. Both *e* and *æ* have a tip, *y* in “gyald” should be compared with *y* in “sysæl”, and the two *o*’s in “skoot” have a stress accent like several of the Latin words.

The manuscript called Avia Ripensis, containing 29 folios of parchment belongs to the archives of the Ribe Chapter, now in Rigsarkivet in Copenhagen. The text is set in two columns separated by frame strokes and is divided into main sections, each with a heading in red, the first three of which contain privileges, title-deeds and statutes, lists of the wealth of the church, its treasures etc. In the second list of the “fabrica” the scribe reveals his identity as Åstred (Latin Astratus), canon and church-warden. He wrote the many Latin entries during the years 1290 to 1322. His hand is identified on the basis of his way of writing the letters *g* and *x*, the Tironian notation for *et*, and the abbreviations for *-bus*, *-rum*, *-que*, *con-* and *-ur*. Besides this, he wrote 12 deeds concerning Ribe during the years 1289 to 1315. After his death in 1323 nothing was entered into the manuscript till after 1340. The above-mentioned headings and initials were made by the scribe who, at about the same time, designed the Necrologium of the Chapter of Ribe, now Royal Library, GKS 849 2°. He wrote the whole calendar in a Gothic book-hand with many red initials and the 12 oldest death notices till 1284. Unlike this scribe, the script of Canon Åstred is characterized by his intimate knowledge of writing a charter or a title-deed. He avoids the angulation of the curves. He very often ties together

characters with hairline strokes and extends the use of the uniting of curves, like in the cursive hands used for diplomas which exist from about 1230 onward. However, he neither followed the habit of bending to the right the long ascenders of *b*, *h*, *k*, *l* and the backward-bent *d*, nor of curving the long descenders of *f*, *s*, *p*, *q* and the final stems of *m* and *n* to the left under the bottom line. During the following decades till about 1340, the scribes of diplomas use minor variations, but they maintain the above-mentioned main principles.

1. Introduction: Old Nordic poetry and the Germanic poetic tradition

1.1. Germanic alliterative poetry: The earliest evidence

Classical authors testify to the presence of poetry in Germanic territory. As early as 98 A.D., Tacitus in his *Germania* (70) describes how the Germanic tribes celebrated the god of the earth, Tuisto, in ancient poems that were used as annals and historical sources, and in his *Annales* (Lib. II, ch. 88, p. 115) Tacitus mentions that they sang of the life and rule of the hero Arminius. Jordanes states that the Goths commemorated their heroic ancestors in poetry (ch. 5, p. 9), and Priscus describes how two barbarians appeared at Attila’s court and recited a poem they had composed to celebrate his victories and valiant deeds in war (60; 164). The practise of composing panegyric poetry in honor of ancient heroes and kings was also current among other Germanic tribes, such as the Bavarians and the Saxons (Paulus Diaconus, col. 476; Altfrid, Lib. II, i, p. 412). Thus it is clear that heroic poetry, extolling the lives, battles, generosity, and fame of dead and living rulers, as well as mythological and annalistic poetry, was part of Continental Germanic culture. However, as far as the metrical form of this early poetry is concerned, we are left in the dark, and concerning

the presence of early poetry in Scandinavian territory, the Classical sources are silent.

1.2. Old Nordic Eddaic and scaldic poetry

Old Nordic poetry is traditionally divided into the two categories Eddaic and scaldic on the basis of functional and formal criteria (Frank 1985, 159–60; Gade 1995a, 1–7). With the exception of isolated encomiastics, Eddaic poetry was devoted to events from a heroic and mythological past, such as the beginning and the end of the world, Þórr’s fishing expedition, the fall of the Burgundians, and the death of Ermanaric. In that respect, the subject matter of Eddaic poetry conforms to the categories of Germanic poetry described in 1.1. above. Scaldic poetry, with few exceptions, addressed contemporary persons and events. A scald could eulogize a living or deceased dignitary by praising his victories, valiance, and generosity (cf. Priscus’s description of the barbarians at Attila’s court, 1.1. above), but the stanzas could also be devoted to the poet’s individual experience; i. e., he could use his poetry as a tool to deride his enemies and to extol his own prowess as warrior, poet, or lover. Thus from a functional point of view, the extant corpus of Old Nordic poetry encompasses all the genres attested in early Germanic society.

2. Germanic alliterative poetry

2.1. Dating and chronology

Aside from possible metrical inscriptions in the Older Futhork (see 2.3. below), the earliest transmitted Germanic poetry comes from Anglo-Saxon England. Such poems as *Bede’s Death Song* and *Cædmon’s Hymn* can be dated

to A.D. 735 and A.D. 657–80 respectively (Fulk 1992, 368), and, according to the most recent and comprehensive study, the earliest longer poems that can be dated on linguistic and metrical criteria must have been composed in the late 7th or the early 8th century (Fulk 1992, 348–61; 390–92). As far as the Continental Germanic poetry is concerned, both the Old Saxon *Heliand* and the Old High German *Hildebrandslied* are traditionally placed in the first half of the 9th century.

The bulk of the extant Old Nordic poetry is West Nordic, i.e., Icelandic and Norwegian, and it is transmitted in mss. from the 13th century and later. From a linguistic point of view, the poetry is surprisingly uniform (Kuhn 1983, 44–47) and unlike in Anglo-Saxon studies, dialectal investigations are scant (but see Kuhn 1939). As far as the scaldic corpus is concerned, linguistic and metrical criteria allow us to establish a certain internal chronology (see 4.3. below). The earliest longer scaldic poems are usually believed to have been composed in the 9th century, but by far the largest corpus of poems whose dates can be established with some certainty because of their association with specific historical persons and events stems from the 10th–13th centuries. The dating of the poetry in the Eddaic meters, however, is notoriously difficult and has sparked considerable debate (Kristjánsson 1990). There are no studies devoted to the dating of Eddaic poetry from a metrical point of view.

2.2. Principles of alliteration

Like the earliest extant vernacular Anglo-Saxon, Old Saxon, and Old High German poetry, Old Nordic poetry is alliterative and conforms more or less to the rules governing the West Germanic alliterative long-line. The principles of alliteration are also the same: consonantal alliteration requires phonetic identity (the groups *sk*, *sp*, and *st* are treated as single phonemes), vocalic alliteration does not (all vowels can alliterate with each other). The most common Eddaic meter, *fornyrðislag*, which represents a tightening of the Germanic long-line, is divided into two half-lines joined by alliteration and divided by a metrical caesura. Each on-line contains one or two alliterating staves that alliterate with the first stressed syllable in the off-line. Consider the following stanza from *Völuspá* (st. 3; emphasis added):

- (1) *Ár var alda, þat er Ymir bygði,
vara sandr né sær né svalar unnir
iqrð fannz æva né upphiminn,
gap var ginnunga, en gras hvergi.*

[It was at the beginning of time, when Ymir settled, there was no sand nor sea, nor cool waves; there was no earth, nor a heaven above; there was the chasm of immense expanse, and grass nowhere.]

The following lines from *Beowulf* (ll. 1–3, [2]) and *Hildebrandslied* (ll. 1–3, [3]) serve to illustrate the similarities between the respective Germanic alliterative traditions (cf. the overview of metrical types in the Appendix):

- (2) *Hwæt, wē gār-Dena in gēardagum,
þeodcyninga þrym gefrūnon,
hū ðā æþelingas ellen fremedon!*

[Lo, we heard of the glory of the spear-Danes, the kings of people, in the days of yore, how the princes performed deeds of valor!]

- (3) *Ik gihorta ðat seggen ...
ðat sih urhettun ænon muotin
Hiltibrant enti Haðubrant untar herium
tuem.*

[I heard that told ... that the champions met alone, Hildibrant and Hadubrant, between two armies.]

The most significant difference between West Germanic alliterative poetry and poetry in Old Nordic *fornyrðislag* meter, namely the reduction of the syllabic inventory of the half-line, can be ascribed to the fact that the extant Old Nordic poetry represents a stage of the language that already had undergone the processes of syncope and apocope (for the runic evidence, see 2.3. below). Not only were there no unstressed prefixes (e.g., OE *gefrūnon* [2] = ON *frágum*; OHG *gihorta* [3] = ON *heyrd̥a*), but syncope and apocope had caused the loss of medial and final vowels (e.g., OE *æþelingas*, *fremedon* [2] = ON *qðlingar*, *fr̥m̥ðu*; OHG *Haðubrant* [3] = ON *Hqðbrandr*). These very linguistic changes also seem to have precipitated the development in Scandinavian territory of a variety of new alliterative meters, namely the scaldic meters, whose structure was governed by the principles of syllable and mora counting (see the discussion of the individual meters 3.–4. below).

2.3. The runic evidence

As it emerged from sections 1.1.–1.2. above, the poetic genres which, according to Classical historians, flourished in Germanic territory, are amply represented in both eddic and scaldic poetry. However, the extant Old Nordic poetry, which is transmitted in mss. from the 13th century on, is fairly late compared to West Germanic alliterative poetry; there is little dialectal variation to be detected in the texts; and the language has already undergone syncope, apocope, umlaut, and breaking, i. e., changes that occurred at various stages in the Scandinavian languages between 600 and 800 A.D. Hence the extant poetry yields no information about the structure of Scandinavian poetry prior to the syncope period. For that reason some scholars have turned to the runic inscriptions in the Older Fuþark in an attempt to recover the principles governing preliterary poetic composition (for an overview of research, see Kabell 1978, 22–31).

The oldest inscriptions are frequently characterized by alliteration, especially prominent in alliterating name formulas. There are, however, extremely few inscriptions in the Older Fuþark which with any certainty can be regarded as metrical (von See 1980a, 416; Hofmann 1991, 39). The famous inscription on the Gallehus horn (ca. 400 A.D.) is usually given as an example of an early alliterating poetic long-line. That inscription reads as follows (cf. Musset 1965, 352–53; emphasis added):

- (4) *ek hlewagastir holtijar horna tawido*
[I Hlewagastir, descendant of Holt [or: from Holt], made the horn.]

While it is certainly true that the inscription contains alliterating staves placed in accordance with later poetic practice, it is equally clear that, if it indeed represents an early version of the alliterative long-line, it was governed by metrical principles fundamentally different from those that have been established for the extant Northwest Germanic alliterative poetry. The alliterating section in the inscription on the Tjurkö bracteate (ca. 500 A.D.), on the other hand, seems to conform more closely to later poetic conventions. That inscription, which was carved on a bracteate found along with a coin minted in 443 under Emperor Theodosius II, also contains a poetic circumlocution, but it is prefaced by the extra-metrical names of the runecarver (“heldar”) and of the person who commissioned the in-

scription (“kunimudiu”) (cf. Musset 1965, 362; emphasis added):

- (5) *wurte runor an walhakarne heldar
kunimudiu.*
[wrought runes on the Welsh grain [= the bracteate], Heldar for Kunimund.]

It is clear, then, that whereas many of the runic inscriptions in the Older Fuþark do contain alliterating formulas, the alliteration in these inscriptions is free and, with few exceptions, does not appear to follow any systematic pattern (cf. Kabell 1978, 22–31). Furthermore, when the placement of alliterating staves conforms to later poetic practice (e. g., [4] and [5] above), the inscriptions may also contain nonalliterating segments [5], and the metrical structure is difficult to reconcile with the later attested types of alliterative long-lines [4]. Thus it is doubtful whether the earliest inscriptions can be used as evidence for alliterative lines or be regarded as representing a preliminary stage of alliterative poetry.

As scholars have pointed out, the dearth of alliterative metrical inscriptions prior to the 9th century is best explained by the technique and function of these inscriptions, and the milieu in which they originated (von See 1980a, 416). There is nothing to contradict the assumption that there existed an early oral tradition of alliterative poetry in Scandinavian territory (see Hofmann 1991, 39), a tradition that differed from the later attested poetry in terms of nonsyncopated and nonapocopated forms, but it is equally clear that the short runic inscriptions in the Older Fuþark hardly lent themselves to the reproduction of longer, narrative poetic units. It can be no coincidence that the first full-fledged metrical stanza recorded in runes not only contains vocabulary characteristic of later Old Nordic poetic diction, but also addresses a heroic subject matter. The stanza in question is carved on the Swedish Rök stone, and the inscription is dated to the first half of the 9th century. It reads as follows (cf. Musset 1965, 378–80; emphasis added):

- (6) *raiþ [b]iaurikr hin þurmuþi
stilir flutna strantu hraiþmarar
sitir nu karur a kuta sinum
skialti ub fatlaþr skati marika.*

[Þjóðrekr, the bold-minded [?], lord of sea-warriors, ruled the shore of Hreiðmarr; the lord of the Mæringar now sits ready on his horse, girded with the sword.]

This stanza falls into four alliterative long-lines governed by regularized alliteration, and the structure of the half-lines more or less corresponds to that found in later fornyrðislag. The fact that the inscription consists of four lines, divided into two syntactically independent units, shows that, as early as the beginning of the 9th century, Old Nordic poetry must have been stanzaic rather than stichic like West Germanic alliterative poetry. Linguistically the Rök stanza represents a transitional stage: it contains nonsyncopated, nonapocopated, and nonumlauted forms (*strantu* > *strǫnd*, *sitir* > *sitr*, *karur* > *gǫrr*), but breaking has occurred (*skialti*; for this dative form, see Jónsson 1901, 56). It is interesting that this Swedish inscription represents the first step in the development of the syllable-counting skaldic meter *kviðuhátt* (see Gade 1995a, 234–36, and the discussion in 4.1. below), a meter used by the 9th-century Norwegian poet Þjóðólfr ór Hvini in his genealogical poem *Ynglingatal* (*Skj IA*, 7–15), and otherwise attested only in Norway and Iceland.

To sum up: Whereas many of the earliest Scandinavian runic inscriptions (predating the 9th century) do contain alliteration, the alliteration is mostly irregular, and it is doubtful whether any of the inscriptions in the Older Fuþark (with the possible exceptions of [4]–[5] above) represents a conscious and systematic attempt at poetic composition. There is nothing to preclude the presence of an oral alliterative poetic tradition in early Scandinavia (and the stanza on the Rök stone certainly suggests that such a tradition existed), but we know nothing about the metrical principles that governed this preliterary form with nonsyncopated metrical types of fillers.

3. The Old Nordic Eddaic meters

3.1. Fornyrðislag

The earliest variant of this meter occurs in the Rök stanza discussed in 2.3. above, and it is also found in later Swedish memorial inscriptions in the Younger Fuþark from the 10th and 11th centuries (see Kabell 1978, 31–49). Aside from the Swedish runic corpus, the earliest datable poetry in fornyrðislag is a stanza attributed to the Norwegian king Haraldr Sigurðarson (d. 1066; *Skj IA*, 360) and longer posthumous panegyrics composed in honor of the Norwegian kings Magnús Ólafsson (d. 1103; *Skj IA*, 440–44) and Sigurðr Magnús-

son (d. 1139; *Skj IA*, 495–502). The main corpus of poems in fornyrðislag meter is recorded in a ms. from around 1270, the Codex Regius (GKS 2365 4to), while additional poems and fragments are contained in the mss. of Snorra Edda and in mythic-heroic sagas.

As the discussion in 2.2. above showed, lines in fornyrðislag meter represent a tightening of the alliterative Germanic long-line as attested in West Germanic poetry, and they follow the same principles of alliteration. The metrical structure of fornyrðislag served as a basis for the formulation of Sievers's metrical system, and that meter is most conveniently described in terms of his five types (Sievers 1893, 63–70; but see Heusler 1956 for an alternative approach). For the sake of consistency, the same framework will be used in the discussion of the eddic meters *ljóðahátt* and *málahátt* (4.2.–4.3. below). An overview of Sievers's Five-Type system applied to Old Nordic fornyrðislag and West Germanic alliterative lines (exemplified by Old English and Old Saxon poetry) is given in the Appendix.

Each fornyrðislag half-line consists of two fully stressed syllables (lifts) and two unstressed or weakly stressed syllables (secondarily stressed lifts or dips). The alliterating staves (one or two in the on-line; one in the off-line) always fall on syllables carrying full stress. The lifts tend to consist of phonetically long syllables, i. e., syllables with three or more morae (*land*, *land-i*; *sár*, *sár-um*; *silfr*, *silfr-i*; for a discussion of mora-counting and syllabification in Old Nordic poetry see Pipping 1903a, 1; 1903b, 113; 1937, 27; Kuhn 1983, 53–55; Gade 1995a, 29–34); when directly preceded by a long lift (with primary or secondary stress), a lift can consist of a short, bimoric syllable (“short lift”: *bú*, *vit*; see Sievers's Types A2k, C3, D2). In certain positions a long stressed syllable can be replaced by the sequence of a short, bimoric syllable followed by a syllable of optional quantity (“resolution”; e. g., Sievers's Type C2; see Sievers 1878, 455–56; Kuhn 1983, 55–56; 68–69; Gade 1995a, 60–61). As Kuhn (1983, 56) observed, both Old Nordic and West Germanic alliterative poetry were subject to the restrictions that no enclitic syllable can be resolved; no initial syllable of a polysyllabic word can form resolution with a preceding syllable; no medial or final syllable in a word with three or more syllables can be resolved. With the exception of Eddaic *ljóðahátt*, however, Old Nordic meters were more restrictive than West Germanic alliterative poetry, because

resolution could occur only on the first lift of the half-line.

As far as the placement of alliteration is concerned, it always falls on syllables carrying full stress, i.e., the most strongly stressed syllables in the line. However, as noted by Max Rieger (1876), words of different lexico-grammatical categories (nomina, finite verbs, proclitics) are treated differently in terms of whether they can carry alliteration. Rieger examined the interplay between alliteration, word order, and lexico-grammatical categories in Old English and Old Saxon poetry. Based on the assumption that the poetic line reflected the normal sentence stress of prose language, he argued that because a syllable carrying alliteration also must have received the strongest stress, an investigation of the placement of alliterating staves (in on-lines, where the alliterating staff was not fixed on the first lift) and the syntactic relations between the alliterating and nonalliterating lifts would necessarily yield information about the different levels of stress in a sentence (“natural sentence stress”). He divided the syntactic elements of a sentence into the lexico-grammatical categories “nomen” (nouns, adjectives, infinitives, present and past participles, numerals), “verb” (finite verbs), “adverbs” (adverbs), and “function words” (proclitic prepositions, particles, connectives). His results concerning the restrictions imposed by alliteration can be summarized as follows (Rieger 1876, 19–32; cf. Sievers 1893, 42–46; Heusler 1956, 108–113; Gade 1995a, 37: the untranslated sample lines are taken from the Appendix; emphasis added):

- (7) N + N: in a sequence of two nomina, the first must alliterate, or both can alliterate, but the second nomen cannot alliterate without the first:

- (7a) licit; $\acute{n} + n$: B 454a *hrægla sēlest*
 (7b) licit: $\acute{n} + \acute{n}$: HH 12 : 7 *grára geira*
 (7c) illicit: $n + \acute{n}$: *snarpra geira*.

- (8) V + N, N + V: in a sequence of verb + nomen or nomen + verb, the nomen must alliterate; a proclitic verb can also alliterate along with the nomen:

- (8a) licit: $v + \acute{n}$: Vsp 7 : 1 *hittuz æsir*
 (8b) licit: $\acute{n} + v$: Vsp 6 : 7 *morgin héto*
 (8c) licit: $\check{v} + \acute{n}$: B 742a *bāt bānlocan*
 (8d) illicit $\check{v} + n$: *hittuz æsir*.

- (9) ADV + V; V + ADV: prepositional adverbs in a verb-adverb collocation alliterate in proclitic position; in enclitic position they do not. Other adverbs do not normally alliterate in either position:

- (9a) $\check{v} + \text{adv}$: Prk 30 : 1 *berið inn hamar*
 [carry in the hammer]
 (9b) $\text{adv} + v$: Gðr I 14 : 1 *á leit Guðrún*
 [on looked Guðrún]
 (9c) $\text{adv} + \check{v}$: Od 14 : 1 *var ec up alin*
 [was I up raised].

Rieger’s observations allowed scholars to set up the following hierarchy of natural sentence stress in the different lexico-grammatical categories (cf. Sievers 1893, 41–46; Heusler 1956, 106–8; Kuhn 1933, 5; 1983, 113–24; Gade 1995a, 37–38):

- (10a) Nomina are more heavily stressed than other word classes;
 (10b) the finite verbs are less strongly stressed than nomina;
 (10c) qualifying adverbs and pronouns are more strongly stressed than finite verbs and intensifying and temporal adverbs;
 (10d) prepositions and connectives may stand in a lift, but rarely alliterate;
 (10e) proclitic particles are always unstressed.

Rieger’s hierarchy of sentence stress not only applies to West Germanic poetry, but to poetry in Old Nordic fornyrðislag meter as well, and it became the point of departure for Hans Kuhn’s work on word stress and word order in the Germanic poetic traditions. In accordance with Rieger, Kuhn (1933, 5; 1983, 199–200) divided syntactic elements into “sentence elements” (“Satzteile”), which consist of nouns, adjectives, infinitives, and verbal participles and always receive stress; “sentence particles” (“Satzpartikeln”), encompassing finite verbs, demonstrative adverbs, personal and demonstrative pronouns, sometimes conjunctions, which may or may not receive stress (if they are stressed, they are no longer treated as sentence particles); and “proclitics” (“Satzteilpartikeln”), e.g., prepositions, connectives, demonstratives, possessive pronouns, articles, and proclitic particles. Words belonging to the category of proclitics are never stressed. Based on his observations on the word order of Northwest Germanic alliterative poetry, Kuhn formulated the following

laws (Kuhn 1933, 8; 43; 1983, 199–202; cf. Gade 1995a, 21):

- (11) “The Law of Sentence Particles” or “Kuhn’s First Law” (“Satzpartikelgesetz”): sentence particles stand in the first dip of the sentence, proclitic to either the first or the second stressed word;
- (12) “The Law of Sentence Introduction” or “Kuhn’s Second Law” (“Satzspitzengesetz”): sentence particles must stand in anacrusis.

What these rules imply for Old Nordic poetry, then, is first of all that no sentence can be introduced by a proclitic [12]. Hence lines of Sievers’s Types B and C cannot introduce a sentence if the anacrusis is occupied by a proclitic particle, a preposition, a connective, or an article. Consider the following examples (emphasis added, metrical caesuras are marked by “||”):

- (13) Gǫr I 25 : 3–5 Veldr einn Atli || ǫllo
bǫlvi || *of borinn Buðla*
[Causes Atli alone all the grief, born to Buðli]
- (14) Od 29 : 1–3 Var ec enn farin || einu sinni ||
til Geirmundar
[I had again gone one time to Geirmundr]
- (15) Hym 4 : 1–4 Nè þat máttu || mærir tívar ||
ok ginregin || of geta hvergi
[Not could that the famous gods, and the powerful gods, know at all]
- (16) HH 1 : 5–3 Þá hafði Helga || *inn hugom-
stóra* || Borghildr borit
[Then had Helgi, the great-minded, Borghildr born].

Secondly, Kuhn’s first law allowed him to distinguish between different levels of stress in finite verbs, depending on whether these verbs occurred in independent or in bound clauses (i.e., clauses introduced by a conjunction or an adverb). His investigations revealed that finite verbs in independent clauses can always occur in a dip and tend to be treated as sentence particles, whereas finite verbs in bound clauses, with the exception of auxiliaries, may not occupy dipo and are usually placed toward the end of the sentence (Kuhn 1933, 51–52). The following stanza ([1]; emphasis added) serves to illustrate the difference between the placement of finite verbs in independent and bound clauses:

Ár var alda, þat er Ymir bygði,
vara sandr né sær né svalar unnir
iqrð *fannz* æva né upphiminn,
gap var ginnunga, en gras hvergi.

Based on his observations of the word order in fornyrðislag, Kuhn (1933, 57–58) concluded that, in preliterate Old Nordic, the position of finite verbs in independent and bound clauses was differentiated in a way similar to what we find in Modern German independent and subordinate clauses, and, furthermore, that finite verbs were more strongly stressed in bound clauses than in independent clauses. With some exceptions (cf. Kuhn 1933, 61), both of Kuhn’s laws would appear to be enforced in Old Nordic fornyrðislag.

The question is whether that circumstance is due to preliterate conditions connected with stress and intonation as Kuhn thought (1933, 101–2), or whether other syntactic factors could have played a role. Investigations of Old Nordic poetic word order within the framework of recent syntactic theory might shed new light on that issue (see e.g., Getty 1998; Durbin 1999).

We see, then, that as far as Old Nordic fornyrðislag is concerned, this meter is governed by the same metrical principles as the West Germanic alliterative long-line. The meter is attested in Scandinavian territory (Sweden and Norway) from the beginning of the 9th century, and the stanza on the Swedish Rök stone [6], which contains nonsyncopated and nonapocopated forms, displays all the features that characterize later Eddaic poetry, such as stanzaic form, regularized alliteration, and half-lines that conform to fixed metrical patterns. The Rök stanza shows that a tradition of alliterative poetic composition was in place in Scandinavia as early as the beginning of the 9th century, and furthermore, the formal features displayed by the stanza, as well as the poetic diction employed, suggest that we are dealing with a tradition that had been current for some time.

3.2. Ljóðaháttir

Unlike fornyrðislag, the meter ljóðaháttir is a unique Old Nordic verse form. The first poems that can be dated with some certainty are *Haraldskvæði* (*Skj* IA, 24–29), composed in honor of the Norwegian king Haraldr fairhair (end ninth century), and *Eiríksmál* (from around 950; *Skj* IA, 174–75) and *Hákonarmál* (from around 961; *Skj* IA, 64–68), commem-

orating Eiríkr bloodax and Hákon jarl of Hlaðir, respectively. These poems also contain stanzas in the eddic meter *máláhátr* (see 3.3. below). The bulk of the remaining *ljóðahátr* poetry is made up of the mythological and heroic poems in the Poetic Edda (ms. GkS 2365 4to). Poetry composed in *ljóðahátr* is stanzaic, with most stanzas consisting of six lines: each half-stanza contains two half-lines forming a long-line, followed by a single line with internal independent alliteration. The structure of the on- and off-lines corresponds to *fornyrðislag* in terms of placement of alliteration, whereas the third, full line may contain two or three alliterating staves that normally do not alliterate with the preceding two half-lines (cf. Sievers 1893, 79–90). Consider the following stanza (HHv 15; emphasis added):

- (17) *Atli ec heiti, atall scal ec þér vera,*
mjoc em ec gifrom gramastr;
úr gan stafn ec hefi opt búit
oc qvalðar qveldriðor.

[*Atli* I am called, grievous I shall be to you, I am to hags by far the most hateful; the wet prow I have often occupied, and tormented witches.]

Unlike other Old Nordic meters, *ljóðahátr* lines frequently contain resolved lifts in the second (and third) stressed position. In addition, the off-line and the full line usually end in a short bimoric syllable or in two resolved syllables (*vera*, *gramastr*, *búit*). The on-line scans either like a *fornyrðislag* line (Type A2: *Atli ec heiti*) or, more often than not, like a hypometrical line (*úr gan stafn*). The off-lines can be trisyllabic, tetrasyllabic, or hypermetrical, and resolution on a lift other than the first occurs frequently. If the off-line contains three or four syllables, alliteration falls on the first lift; if it is hypermetrical, alliteration can fall on the second. The full lines contain two or three alliterating staves and scan either as *fornyrðislag* lines or as hypermetrical lines. For that reason, scholars have debated whether the full line in *ljóðahátr* contains two or three lifts (Heusler 1889; Hollander 1931; 1931–32). The hypermetrical lines seem to have originated with the addition of one extra lift at the beginning of the line (in off-lines, this lift need not alliterate, and such lines do not appear to be governed by the same restrictions imposed by alliteration as do other Old Nordic meters). The remainder of the line can be scanned according to Sievers's Five-Type

System. Because trochaic line-endings are avoided, lines of Type A rarely occur in the final four metrical positions of hypermetrical lines. The following examples illustrate the scansion of hypermetrical lines (emphasis added):

- (18) AA2k: $\acute{x} \acute{x} \acute{x} \acute{x}$

Grm 35 : 6 *scerðir Níðhoggr neðan*
 [reduces *Níðhoggr* from below]

- (19) A2B: $\acute{x} \acute{x} \acute{x} \acute{x}$

Háv 140 : 3 *Bólþors Bestlo fōður*
 [Bólþorr's Bestla's father's]

- (20) AC3: $\acute{x} \acute{x} \acute{x}$

Grm 24 : 6 *míns veit ec mest magar*
 [mine know I the greatest kinsman's]

- (21) BB: $x \acute{x} \acute{x} \acute{x}$

Ls 48 : 3 *it ljóta líf um lagit*
 [the hideous life destined].

Poetry composed in *ljóðahátr* meter not only differs from *fornyrðislag* in terms of placement of alliteration and metrical structure, but this type of poetry also fails to adhere to Kuhn's two laws (Kuhn 1933, 40–43, 47, 49), and the difference Kuhn detected in *fornyrðislag* with respect to the placement of verbs in independent and bound clauses is not discernible (Kuhn 1933, 61, 67). The origin of *ljóðahátr* meter is obscure. The frequent occurrence of hypometrical on-lines coupled with hypermetrical off-lines would seem to suggest that the full line could have originated as a contraction of two half-lines. It is difficult to explain, however, why this meter is the only Old Nordic meter which regularly resolves the second lift, and the avoidance of trochaic line endings in off-lines and full lines is equally puzzling.

3.3. Máláhátr

The earliest stanzas composed in *máláhátr* occur in *Haraldskvæði*, *Hákonarmál*, and *Eiríksmál* mentioned above (3.2.). Otherwise the only poem to employ this meter consistently is the Eddaic *Atlamál* in the Poetic Edda (Neckel 1962, 248–63). Like *fornyrðislag* lines, *máláhátr* lines consist of two half-lines joined by alliteration, and metrically the half-lines represent an expansion of *fornyrðislag* lines, e. g., most lines have five metrical positions and thus approximate the expanded metrical types that Sievers established for West Germanic poetry (Types A*, B*, C*, D*;

see Sievers 1893, 70–79). Consider the following half-stanza from *Atlamá*l (1 : 1–4; emphasis added):

- (22) Frétt hefir *ǫld ófo*, þá er endr um gorðo
seggir samkundo, sú var nýtt fæstom.

[Heard has the world of the arrogance which long ago men made at a gathering, that was useful to the fewest.]

Since Sievers's 1893 study, this meter has received little scholarly attention. Kuhn did not conduct a separate investigation of málahátt, but grouped *Atlamá*l together with fornyrðislag stanzas with foreign subject matter (Kuhn 1933, 37). He does, however, note that *Atlamá*l contains violations of both of his laws (1933, 38–39; 46–47), and also that the poem contains a high percentage of finite verbs in independent clauses that occur toward the end rather than at the beginning of the sentence (1933, 61–62). In Kuhn's opinion these violations could be attributed to the fact that poems like *Atlamá*l drew on heroic poetry from the Continent and retained the word order of their models, including the tendency to place the finite verb in independent clauses further back in the sentence (1933, 106–7).

4. The Old Nordic scaldic meters

4.1. Kviðuhátt

The first longer poem in this meter is Þjóðólfr ór Hvini's genealogical poem *Ynglingatal* (usually dated to the 9th century; *Skj* IA, 7–15), a poem allegedly composed in honor of Rognvaldr of Vestfold, the uncle of King Haraldr fairhair. Kviðuhátt is a variant of fornyrðislag, but unlike the extant fornyrðislag it is syllable counting. The off-lines are tetrasyllabic and follow the metrical patterns of fornyrðislag, but the on-lines are hypometrical, e. g., each on-line consists of three syllables instead of four, as the following lines from *Ynglingatal* show (Yt 35 : 5–8; *Skj* IA, 15; emphasis added):

- (23) Réð Óláfr ofsa forðum
víðri grund of vestmari.

[Ruled Óláfr with might formerly the wide land across Vestmarr.]

Structurally most kviðuhátt on-lines can best be characterized as catalectic, e. g., they follow the same metrical patterns as fornyrðislag lines of Types A, C, D, minus the last, unstressed syllable (see Sievers 1893, 117–18):

- (24) A1: " x "

Yt 3 : 3 vitta vétt [witches' being]

- (25) C1: x " "

Yt 1 : 1 varð framgengt [was fulfilled]

- (26) D1: " " "

Yt 1 : 7 vágr vindlauss [sea windless].

Because lines of Sievers's Types B, D4, and E did not end in an unstressed syllable, there could be no catalectic lines conforming to those patterns. There are, however, two types of kviðuhátt on-lines which cannot be classified as catalectic, and whose structure Sievers (*ibid.*) was at a loss to explain:

- (27) Yt 14 : 1 varð Jǫrundr [was Jǫrundr]

- (28) Yt 2 : 11 jǫtunbyggðr [giant-fashioned].

Both [27] and [28] could technically be regarded as variants of Sievers's Type C2, i. e., they correspond to the fillers of positions 1–2 and 2–3 respectively. However, whereas position 2 in C2-lines was always resolved, the short syllables in positions 2–3 [27] and 1–2 [28] in kviðuhátt could not have been resolved, but must be regarded as short lifts: x " " [27]; " x " [28]. Thus such on-lines defy the principles of resolution that were adhered to by all other Northwest Germanic alliterative meters. As far as the syntax of kviðuhátt stanzas is concerned, Kuhn's "Law of Sentence Particles" [11] is strictly adhered to from the earliest poetry on (with minor irregularities in the poetry of Egill Skallagrímsson and in the 12th-century anonymous *Nóregs konungatal*), and there is a sharp distinction between the positions of finite verbs in independent and bound clauses (Kuhn 1933, 28–29; 61).

The catalectic nature of the majority of kviðuhátt on-lines suggests that these lines originated as apocopated versions of fornyrðislag lines. Furthermore, the Rök stanza would appear to represent a transitional stage in that development. In that stanza [6] all off-lines follow the pattern of fornyrðislag, but the first on-line is catalectic: *raip* [þ]iaurikr; cf. *réð Óláfr* [23]). The third on-line, however, has five syllables, but would have formed a catalectic A3-line after syncope: *sitr nu karur* > *sitr nú gorr*. It seems, then, that syncope and apocope not only prompted the development of syllable-counting meters in Scandinavian territory, but that these linguistic changes also were responsible for the unique metrical form of the catalectic kviðuhátt on-lines.

4.2. Runhent

This meter, which is first attested in Egill Skallagrímsson's *Höfuðlausn* ('head ransom'; traditionally dated to 936; *Skj* IA, 35–39), is the first Old Nordic verse form to combine the poetic devices of alliteration and endrhyme (see Sievers 1893, 114–16). Structurally runhent lines correspond to tetrasyllabic forn-yrðislag lines, with the exception that endrhyme has been added in final position. Consider the following two half-stanzas from *Höfuðlausn* (1 : 1–4; 7 : 1–4; emphasis added):

- (29) Vestr fórk of ver
en ek Viðris ber
munstrandar mar
svás mitt of far.

[I went west across the sea, and I carry
Óðinn's soul-beach's ocean; such is my
journey.]

- (30) Fremr munk segja
ef firar þegja
frágum fleira
til frama þeira.

[Further I will tell, if men are silent, I
heard of more, about their fame.]

Egill allegedly composed this poem in honor of King Eiríkr bloodaxe to redeem his life and presented it before the king at his court in York. The meter bears all the marks of being a conscious creation by one individual, possibly an imitation of endrhyming Latin poetry that Egill had heard in England, and it represents a foreign poetic adornment (endrhyme) superimposed on the poetic structure of native forn-yrðislag. Although there are examples of runhent being used sporadically in panegyrics during the 11th and 12th centuries (see e.g., *Skj* IA, 194, 473–75), the meter never really caught on until the demise of the more common scaldic meters in the 14th century. The reason could be that, unlike Continental West Germanic, where poetry with endrhyme at an early date replaced the older alliterative long-line, Old Nordic was characterized by strongly stressed root syllables and weakly stressed final syllables. That circumstance would certainly favor the alliterative tradition, with a strong emphasis on the onset of root syllables, over a tradition where the poetic adornment would involve syllables that carried little or no stress (von See 1980a, 403–5). The fact that such a hybrid meter could be invented by a Scandinavian 10th-century scald is, however, a testimony to those poets'

taste for metrical experimentation and to their keen awareness of the distinctions of sound.

4.3. Dróttkvætt

Dróttkvætt was considered the most prestigious scaldic meter and dróttkvætt stanzas constitute the bulk of the extant corpus of scaldic poetry from the 9th to the 14th century. It is also the Old Nordic meter that has attracted most scholarly attention (Sievers 1893; von See 1980b; Kuhn 1983; Fidjestøl 1985; Frank 1978; 1985; Gade 1995a). The earliest dróttkvætt poems, Bragi's *Ragnarsdrápa* and Þjóðólfr ór Hvini's *Haustlǫng* (*Skj* IA, 1–4, 16–20), are traditionally dated to the 9th century, that is, they are roughly contemporary with the Rök stanza, but neither *Ragnarsdrápa* nor *Haustlǫng* contains noncontracted forms. Like kviðuhátt, dróttkvætt is syllable counting. Each line consists of six syllables and ends in a cadence, e.g., a long syllable followed by a short enclitic syllable. Structurally dróttkvætt lines can best be defined as extensions of tetrasyllabic Eddaic forn-yrðislag lines plus the cadence at the end of the line. The placement of alliteration is regularized, with each on-line containing two staves (*stuðlar* 'props') that alliterate with the first syllable in the off-line (*höfuðstafr* 'main staff'). Because alliteration in off-lines is fixed on the first syllable, there are no regular dróttkvætt off-lines with anacrusis (Sievers's Types B and C). One of the most conspicuous innovations in dróttkvætt is the introduction of internal rhyme, the *hendingar* (see Kuhn 1977; 1981; 1983, 75–89). Each line contains two internal rhymes which begin with the vocalic onset of a syllable and involves one or more of the post-vocalic consonants. In on-lines these rhymes (*skothendingar* 'inserted rhymes'; e.g., át : *eikirótum*, *djúphugaðr* : *dræpi* [31]) require phonetic identity in the postvocalic environment only, whereas the internal rhymes in the off-lines (*aðalhendingar* 'noble rhymes': e.g., *ballastan* : *vallar*) require phonetic identity of vowels as well as of the following consonant(s). The second internal rhyme in both on- and off-lines is always fixed on the fifth long syllable in the cadence. Consider the following stanza from Þjóðólfr's *Haustlǫng* (*Haustl* 6, *Skj* IA, 17; emphasis added):

- (31) Ok slíðrliga síðan
[And greedily thereafter]
svangr vas þat fyr lǫngu
[hungry. Was that long ago]

- át af eikirótum
[ate from the oak-roots]
okbjörn faðir Mǫrnar.
[the yoke bear Mǫrn's father].
Áðr djúphugaðr dræpi
[Before the deep-minded hit]
dolg ballastan vallar
[the enemy strongest of the world]
hirði-Týr meðal herða
[guarding-Týr between the shoulders]
herfangs ofan stǫngu.
[war-booty's from above with the pole.]

In *Ragnarsdrápa* and, to some extent, in *Haustlǫng*, the internal rhymes are often irregular. Skothenningar may occur in off-lines, and sometimes the on-lines lack rhyme altogether. It would appear that, at least as far as *Ragnarsdrápa* is concerned, we are dealing with a tradition that was still in flux, but a particular license in aðalhendingar, which allowed nonumlauted /a/ to rhyme with its u-umlauted reflex /ǫ/ (*svangr*: *lǫngu*; *herfangs*: *stǫngu* [31]; see Hreinn Benediktsson 1963), indicates that the development of the system of skaldic internal rhyme most likely took place prior to the phonemization of /ǫ/. Scholars have debated whether the scaldic hendingar could have originated as imitations of Irish internal rhymes, but an indigenous development of such rhymes in Scandinavian territory, probably as the result of the same linguistic factors that prompted the creation of syllable counting meters, namely strong initial stress, syncope, and apocope, seems more likely (Gade 1995a, 7–11; 237–38).

Sievers noted that the structure of positions 1–4 in dróttkvætt lines closely resembled that of tetrasyllabic fornryðislag, and he accordingly grouped dróttkvætt lines under his Types A–E, with an additional foot consisting of the two syllables in the cadence (1893, 98–105). Consider the following lines from [31] above:

- (32) Type A1: át af eiki-|rótum
(33) Type A2k: okbjörn faðir|Mǫrnar
 herfangs ofan|stǫngu
(34) Type C3: ok slíðrliða|síðan
 áðr djúphugaðr|dræpi
(35) Type D1: dolg ballastan|vallar.

Only two lines (*svangr vas þat fyr* / *lǫngu*; *hirði-Týr meðal* / *herða*), although trochaic and conforming to the metrical patterns of Type A, contain syntactic fillers incompatible with those of fornryðislag lines. Sievers's system

was adopted by Kuhn (1983) in his studies on syntactic fillers of dróttkvætt lines. As [32]–[35] above showed, the structure of the first four positions of most dróttkvætt lines corresponds to that of tetrasyllabic fornryðislag lines. However, it would appear that the addition of the heavy disyllabic cadence, which more often than not forms a syntactic unit with the word immediately preceding it (cf. *fyr lǫngu*, *eikirótum*, *faðir Mǫrnar*, *djúphugaðr dræpi*, *meðal herða* [31]), also altered the stress patterns in such lines. As a consequence of this, dróttkvætt lines show a much greater sensitivity to the distinction between long and short syllables (i.e., the meter is not only syllable counting but also mora counting; cf. Craigie 1900), and new metrical types of on-lines were developed to accommodate the requirements imposed on the syntax when alliteration fell in position 5 (cf. Gade 1995a, 85–87, 97–99). Although Sievers's Five-Type System is certainly an adequate tool to describe the types of syntactic fillers of dróttkvætt lines, the distribution of stress and the levels of stress inherent in Sievers's metrical positions cannot be used as a measure for the stress patterns of dróttkvætt.

A dróttkvætt stanza was divided into two syntactically independent half-stanzas (*hellingar*) each consisting of four lines (see Kuhn 1969b). Owing to the strict formal requirements imposed by syllable counting, alliteration, and rhyme, the word order of dróttkvætt poetry can be extremely convoluted (cf. [31] above), and the syntax is characterized by sentence intercalation, embedded clauses, incomplete syntactic units, and tmesis. Several attempts have been made to establish laws and rules for the word order in dróttkvætt lines (see Reichardt 1928; Kuhn 1929b; 1983; Edwards 1983; and the overview in Gade 1995a, 12–21). Although no absolute rules can be established for dróttkvætt syntax, the interplay between the placement of alliteration, internal rhymes, and the distribution of long and short syllables must have served to delineate the syntactic structure of the lines and facilitated the comprehension of such poetry during recitation (Gade 1995a, 173–208). As far as Kuhn's laws are concerned, the "Law of Sentence Introduction" is strictly adhered to from the earliest poetry on (Kuhn 1983, 202), but already Þjóðólfr's poetry contains violations of the "Law of Sentence Particles," and by the end of the 10th century it had ceased to be operational (Kuhn 1983, 199–202). That circumstance can most likely be attributed to the fact

that the syntax and the distribution of stress in dróttkvætt lines were governed by principles different from those that governed the alliterative long-line.

With the exception of the licensed *a : q* rhymes, the language of the earliest dróttkvætt poetry shows no traces of forms predating the stages of syncope, apocope, umlaut, and breaking. It is, however, possible to establish a certain internal chronology within the extant corpus of dróttkvætt poetry on the basis of linguistic and metrical criteria. Over the centuries, new types of metrical fillers developed, sometimes in the attempt to incorporate proper names, tied to a specific historical event, that were not readily accommodated in dróttkvætt lines (Kuhn 1969a; Gade 2000). Linguistic features, such as noncontracted hiatus constructions (e. g., *dreyrfáar v. dreyrfár* ['gory,' masc.acc.pl.]), archaic name forms (e. g., *Ulfketill vs. Ulfkell*), and the presence and function of the expletive particle *of*, have also been used in the attempt to distinguish between older and younger layers of dróttkvætt poetry (Kuhn 1929a; Dal 1929; 1930; Einar Ól. Sveinsson 1966; Fidjestøl 1989; Gade 2000).

The origin of dróttkvætt meter has sparked considerable debate. Since the end of the 19th century, that debate has been dominated by two schools; namely, by those who trace the peculiarities of dróttkvætt back to Irish models, and by those who regard the meter as the result of an indigenous Scandinavian development (see the overview in Gade 1995a, 7–12). Whereas one cannot dismiss the possibility of foreign influence altogether, we have seen that another syllable-counting meter indeed did develop as a catalectic variant of tetrasyllabic fornyrðislag in 9th-century Scandinavia. We have also seen that the syntactic fillers of positions 1–4 in dróttkvætt are more or less similar to those of Eddaic fornyrðislag. It could well be, then, that the dróttkvætt line originated as a hypermetrical variant of the Germanic alliterative half-line (cf. the origin of the full line in ljóðaháttir suggested in 3.2. above), caused by a close syntactic relationship between the word occupying the end of the on-line and the alliterating lift in the following off-line (Gade 1995a, 226–38).

4.4. Hrynhent

Hrynhent was first used in an 11th-century panegyric composed in honor of the Norwegian king Magnús Ólafsson (d. 1047) by the

Icelandic scald Arnórr Þórðarson jarlaskald (*Skj* IA, 332–38). It is a variant of dróttkvætt in which each line consists of eight rather than of six syllables, and it appears to be a conscious creation by Arnórr (Whaley 1998, 79–80; 92–98). Hrynhent is governed by the same rules as dróttkvætt with regard to rhyme and alliteration. As the following half-stanza from Arnórr's *Magnússdrápa* (9 : 1–4; *Skj* I, 335: emphasis added) shows, the main difference between the two meters consists of the two syllables of optional quantity which are inserted in positions 5–6 in hrynhent:

- (36) Síðan vas þats *suðr með láði*
siklingr ýtti *flota* miklum
skíði vas þá *skriðar of* auðit
skorðu renndi *Visundr* norðan.

[Later the king set out with a great fleet south along the coast. Then the ski of the ship-prop was granted speed; Visundr swept from the north.]

As it is illustrated in the lines in [36], the first four positions in hrynhent lines correspond to positions 1–4 in dróttkvætt (and tetrasyllabic fornyrðislag), and their structure adheres to the same rules concerning syllabic quantity, mora counting, and resolution. The syllables in the cadence (always long + short) also follow the principles of dróttkvætt, but in positions 5–6, syllabic quantity is no longer metrically relevant. The syllable in position 5, which is always stressed, can be long (*suðr*), short (*flot-a*, *Visundr*), or resolved (*skriðar*). The stress pattern in positions 5–8, then, is always trochaic and not governed by the rules of mora counting, and it could well be that hrynhent was created in an attempt to achieve a regular, trochaic, stress-based meter, possibly under the influence of Latin hymns or trochaic tetrameter (Whaley 1998, 80).

5. The 13th-century renaissance and the demise of quantitative poetry

5.1. Clavis Metrica

As the discussion in 3.–4. above has shown, there existed an abundance of alliterative meters in Scandinavia, all of which seem to have evolved from the Germanic alliterative long-line. Given the Norsemen's acute awareness of the distinctions of sound and the principles underlying metrical composition, it comes as no surprise that some of the earliest *clavis metrica* in the vernacular were composed in Scan-

dinavian territory. Around the middle of the 12th century, the Orkney jarl Rognvaldr Kali Kolsson and the Icelander Hallr Þórarinnsson composed *Háttalykill enn forni* (the ancient metrical key), a poem whose extant version consists of 82 stanzas illustrating 41 different alliterative meters. There is no prose commentary accompanying the poem, but in a number of cases the names of the meters are recorded above the stanzas. Whereas many of the meters in *Háttalykill* are attested in Old Nordic poetry, the poem also contains stanzas that seem to be influenced by foreign models (Latin and Provençal; see *Háttalykill enn forni*, 118–42).

The first metrical treatise with an extensive prose commentary was written in Iceland around 1220 by Snorri Sturluson and was later incorporated into his Prose Edda. Snorri's *Háttatal* (enumeration of meters) is made up by 102 stanzas interspersed with prose. Each stanza exemplifies a metrical variant whose peculiarities are expounded in the prose. The opening sections of *Háttatal* address the fundamental characteristics of Old Nordic metrical prosody, which according to Snorri can be described in terms of numerical characteristics (number of meters, of lines, and of syllables) and distinction (placement of alliterating staves, arrangement of internal rhymes, and long and short, hard and soft syllables) (*Snorri Sturluson Edda*, 3). The remainder of the treatise is devoted to a list of sample stanzas that contain variations in the syllabic inventory and the placement and nature of internal rhyme, as well as peculiarities of syntax, diction, and metrical fillers. Snorri apparently knew *Háttalykill*, and he adopts both names of meters and metrical forms from that poem. The most common types of Old Nordic alliterative meters (discussed in 3.–4. above) are all incorporated in *Háttatal*, as are minor meters that are occasionally attested in extant poetic corpus of scaldic poetry (see Sievers 1893, 105–114). But many of the meters exemplified in Snorri's treatise either represent stylizations of certain metrical features or seem to be new creations. The structure of *Háttatal* and some of the terminology employed by Snorri suggest that he was working within the tradition of medieval rhetoric and grammar, but owing to the dearth of information about the availability of such literature in early 12th-century Iceland, it is difficult to gauge the influence these models could have had on *Háttatal*. More research in this area is certainly a desideratum (see Marold 1995; Tranter 1997).

5.2. The change from quantitative to stress-based meter

Snorri's *Háttatal* is not only descriptive, but also prescriptive; i. e., his aim was to establish norms for the correct composition of alliterative poetry. It can be no coincidence that his treatise was written at a time when the Old Icelandic language begins to show the signs of sound changes that were to have a profound impact on the structure of Old Nordic poetry. As early as 1150, scaldic rhymes present the first evidence of rhotacism in such words as *vera, er* (*Skj* IA, 457; emphasis added: *vara kost fara* 'wasn't possible to go'), a change that obviated such earlier contractions as *þat es > þats* and increased the syllabic inventory of the lines. However, it was the desyllabification of final *-r*, i. e., the development of an epenthetic *-u-* before the earlier syllabic final *-r* in consonant clusters ($r > ur | C \#$; see Jón Þorkelsson 1863), that appears to have had the greatest consequences for the quantitative poetic tradition (Gade 1995b). That change can be detected in Icelandic mss. from the end of the 13th century, and poetic lines with desyllabified forms are attested in scaldic poetry from the 14th century on. The addition of an extra syllable caused an upheaval in the structure of the types of metrical fillers that led to the collapse of earlier distinct metrical patterns (e. g., Types E and A2k), and to the creation of new types that not only allowed resolution in earlier prohibited positions, but also approximated a trochaic rhythm and no longer observed the quantitative distinction between long and short syllables. In the course of the 14th century, lines of Types A2k, B, C, D, and E gradually disappeared, and the meter *hrynhent* (4.4. above), with its regular trochaic stress-based rhythm, and new trochaic meters with endrhymes ousted the older quantitative meters. In that respect, the sound changes that took place in late 13th- and early 14th-century Iceland had exactly the opposite effect on the structure of Old Nordic poetry of those that had occurred seven centuries earlier. Whereas apocope and syncope, brought on by strong initial stress, facilitated the development of new syllable counting, quantitative meters in Scandinavian territory, such changes as desyllabification (and the later vowel lengthening in open syllables) caused the old system to collapse and paved the way for a new tradition.

6. Appendix: Sievers's Five Types in ON, OE, OSx. alliterative Poetry

Symbols: $\acute{}$: alliterating lift; $\grave{}$: nonalliterating lift; $\mathring{}$: alliterating short lift; $\mathring{\grave{}}$: nonalliterating short lift; $\grave{\text{˘}}$: secondary stress, long syllable; $\mathring{\text{˘}}$: secondary stress, short syllable; ↔ : resolved lift; x: unstressed syllable (dip). The sample lines are taken from *Edda* (Neckel/Kuhn 1962), *Beowulf* (B), and *Heliand* (H).

A1: $\acute{}$ x $\acute{}$ x	(on-lines only)
HH 12 : 7 grára geira	[of grey spears]
B 483a Grendles gūþe	[Grendel's attack]
H 2054a druncan drōmead	[drunken rejoice]
A2: $\acute{}$ x $\acute{}$ x	(on- and off-lines)
Vsp 6 : 7 morgin hēto	[morning [they] named]
B 454a hræglā sēlest	[of corselets the best]
H 645a uuāþnes eggium	[[with the] weapon's edges]
A2k: $\acute{}$ $\mathring{\text{˘}}$ $\mathring{\text{˘}}$ x	or: $\acute{}$ $\mathring{\text{˘}}$ $\mathring{\text{˘}}$ x (on-lines only)
Vsp 1 : 7 forn spiǫll fira	[ancient lore of people]
B 2110b rūmheort cyning	[large-hearted king]
H 630b slīðmōd cuning	[gruesome-minded king]
A3: $\acute{}$ x $\acute{}$ x	(on-lines only)
Vsp 7 : 1 hittuz æsir	[met the gods]
B 710a þā cōm of mōre	[then came from the moor]
H 2045a hēt is thero gesteo	[commanded of it of the guests]
B1: x $\acute{}$ x $\acute{}$	or: x $\acute{}$ x $\acute{}$ (on-lines only)
Vsp 3 : 3 vara sandr né sær	[wasn't sand nor sea]
B 511a nē lēof nē lād	[neither dear nor hated]
H 2001a an that hōha hūs	[to the high house]
C1: x $\acute{}$ $\acute{}$ x	or: x $\acute{}$ $\acute{}$ x (on-lines only)
Vsp 28 : 11 dreccr miǫl Mímir	[drinks mead Mímir]
B 921a of brýdbüre	[from the woman-chamber]
H 3135a uuas thar gard gōdlic	[was there dwelling glorious]
C2: x ↔ $\acute{}$ x	or: x ↔ $\acute{}$ x (on-lines only)
Vsp 9 : 7 ór Brimis blóði	[from Brimir's blood]
B 604a tō medo mōdig	[to mead brave]
H 549a an is seli sittien	[in his hall to sit]
C3: x $\mathring{\text{˘}}$ $\mathring{\text{˘}}$ x	or: x $\mathring{\text{˘}}$ $\mathring{\text{˘}}$ x (on-lines only)
Rm 17 : 5 fellr brattr breki	[falls the steep wave]
B 840a geond wīdwegas	[throughout distant-regions]
H 3401a an that fern faren	[to the hell to journey]
D1: $\acute{}$ $\mathring{\text{˘}}$ $\mathring{\text{˘}}$ x	or: $\acute{}$ $\mathring{\text{˘}}$ $\mathring{\text{˘}}$ x (on-lines only)

Vsp 33 : 7 vá Valhallar	[the destruction of Valhǫll]
B 436a mīn mondrihten	[my liegeland]
H 2007a gumon gladmōdie	[men merry-minded]
D2: $\acute{}$ $\mathring{\text{˘}}$ $\mathring{\text{˘}}$ x	or: $\acute{}$ $\mathring{\text{˘}}$ $\mathring{\text{˘}}$ x (on-lines only)
Hym 17 : 7 briótr berg-Dana	[crusher of the mountain-Danes]
B 742a bāt bānlocan	[bit the bone-locker]
H 2084a drōm drohtines	[joy of the Lord]
D4: $\acute{}$ $\acute{}$ x $\acute{}$	or: $\acute{}$ $\acute{}$ x $\acute{}$ (on-lines only)
Vsp 32 : 5 Baldrs bróðir var	[Baldr's brother was]
B 978a maga māne fāh	[man with crime guilty]
H 626a liof landes uuard	[dear country's guardian]
E1: $\acute{}$ $\mathring{\text{˘}}$ x $\acute{}$	or: $\acute{}$ $\mathring{\text{˘}}$ x $\acute{}$ (on-lines only)
HH 41 : 3 varglióðom vanr	[to wolf-howls accustomed]
B 512a sorhfullne sīð	[perilous journey]
H 2630a fisknet an flōd	[fishnet into the ocean]

XI. Old Nordic II: Grammatical system, lexicon, texts

100. The various Old Nordic dialects, their systems and their typology: A general survey of the classical Old Nordic of the High Middle Ages

1. Introduction
2. Basic research tools for Old Nordic
3. Designations of Old Nordic
4. The geographic range
5. Early dialectal differentiation
6. The various Old Nordic dialects
7. Conclusion: Old Nordic dialects and Pan-Scandinavian
8. Literature (a selection)

1. Introduction

The classical ON of the High Middle Ages (ca. 1100 to 1350) comprises various languages and dialects, i.e. standard languages as well as non-standard languages. In this article, a language variety which is standardized in its own right, and which functions as a spoken and written medium, is defined as a language, regardless of its linguistic distance from other varieties (cf. Vikør 1993, 28). This consideration concerns mainly OIcel. in relation to its parent language ONorw. (see 6.1.1.). Traditional research focuses basically on the two main branches of OIcel.-ONorw. and OSw.-ODan., and neglects OFar. and OGu. to some degree. Yet their linguistic value in a broad Pan-Scand. perspective is unquestionable, and they are paid due attention here. It is traditionally believed that the East/West split for Nordic is valid with regard to the ON period, whereas other (some more recent) isogloss bundles are known to constitute partially North/South divisions (cf. Bandle 1973, 19ff.). The main focus of this article rests on the phonological and morphological subsystems of the ON idioms, since they elucidate dialectal interrelations and contrasts most clearly. A historical perspective is adopted where this is useful. This basic overview is complemented by arts. 101–106.

2. Basic research tools of Old Nordic

2.1. Old Icelandic and Old Norwegian

OIcel. and ONorw. have been studied extensively. To begin with, Heusler's *Altisländisches Elementarbuch* (1962) contains a valuable survey of OIcel. syntax and lists Gothic correspondences to the OIcel. forms. But the classical study of ON syntax is Nygaard (1906). Boer (1920) provides a detailed account of phonological developments in NGmc and is supplemented by a handbook of PGmc (Boer 1924). In his *Historische Laut- und Formenlehre des Altisländischen*, Gutenbrunner (1951) includes older runic and Gothic equivalents to the Nordic forms in question, as does Heusler (1962). Jóhannesson (1923–24) and Jóhannsson (1924) give revealing insights into the OIcel. language from the points of view of two Icelanders. So does Þórólfsson (1925), focusing mainly on the developments of the 14th and 15th c. Andersen's (1954) historical grammar also deserves a mention, as its presentation of morphophonological changes of ON (basically OIcel.) is chronologically based and clearly arranged. Steblin-Kamenskij (1955) gives new structure-based explanations of phonological changes such as umlaut and breaking. Unfortunately, this work is only accessible to readers of Russian, as are many of Steblin-Kamenskij's contributions on phonology and morphology. The Icelander Benediktsson has also contributed to OIcel. phonology and morphology (e.g. Benediktsson 1959; 1962; 1982). His various linguistic contributions are now collected in one volume (Benediktsson forthcoming).

The standard grammar for ONorw. and OIcel. is still Noreen's *Altisländische und Altnorwegische Grammatik* (1923). It has been updated in accordance with the first parts of Hægstad's *Vestnorske maalføre* (1906–42) and Marstrander's *Bidrag til det norske sprogs historie i Irland* (1915). Marstrander's work was mainly concerned with phonological

questions, whereas Hægstad, who confined himself to Western Norw. (including the western colonies of Iceland and the Faroes), presented abundant excerpts from medieval Norwegian texts. Hægstad (1916 II, 63–173) evaluated later texts in order to shed light on (rarely attested) OFar. (cf. 6.1.2.). Mention must also be made of Krause's *Abriss der altwestnordischen Grammatik* (1948) and Iversen's *Norrøn grammatikk* (1973), both of which deal with OWN, as does Boer (1920). Basic historical-grammatical research on ONorw. has been done, e.g., by Seip (1955) in his *Norsk språkhistorie til omkring 1370* and in a number of separate articles (collected in Seip 1934; 1954). As the title of Seip's monograph indicates, his upper time limit is 1370 – the traditional demarcation line for classical ONorw. (cf. art. 122).

Classical works investigating the lexical stock of the oldest Icel. or Norw. manuscripts are Larsson (1891) and Holtsmark (1955). Among the standard lexica of OIcel. is Cleasby/Vigfusson (1957). Basic lexical resources for OWN are Fritzner (1886–1896; suppl. 1972) and Heggstad et al. (1990), but a new OWN dictionary is in preparation: *Ordbog over det norrøne prosasprog*, edited by Den Arnamagnæanske Kommission (1989 ff.). This project, which has been ongoing since 1939, is based primarily on manuscripts (several unpublished) and diplomatic editions.

2.2. Old Danish and Old Swedish

The first comprehensive historical grammar of ODan. was written by Brøndum-Nielsen (1928–1973). His *Gammeldansk Grammatik* does not focus on developments in ODan. as a (potential) standard language, but rather on regional variants as they show up in different manuscripts. Although it adheres to traditional philological methods, it is one of the indispensable reference grammars of ODan. Mention should next be made of Kristensen's *Folkemål og sproghistorie* (1933), which also addresses peculiar phonological and morphological features of OFar. (cf. 6.1.2.). Kristensen is bold enough to present views challenging those of Noreen, Brøndum-Nielsen and Kock. A major history of ODan. is that by Skautrup (1944–1947). More recent is the work of Hansen (1962–1971), which focuses on phonological developments in Danish from ca. 1300 onwards.

A classical reference grammar of OSw. is Noreen's *Altschwedische Grammatik mit Ein-*

schluss des Altgutnischen, which appeared in 1904. This work is firmly entrenched in the German linguistic tradition of that time, but it has never been revised or updated and is now obsolete. An outstanding grammar which, as the title indicates, focuses on the historical phonology of OSw. in different stages, is Kock's *Svensk ljudhistoria* (1906–29). Wessén's *Svensk språkhistoria* (1969–71) is a comprehensive work which has partially taken over the function of Noreen (1904), its textual basis being broader and its presentation more structured. Its third volume deals with the syntax of OSw. and Mod.Sw.

As for the lexica, Söderwall's OSw. dictionary from 1884 to 1918 (suppl. 1925–1973) corresponds to Kalkar's ODan. and early Mod.Dan. dictionary from 1881–1918, but clearly exceeds it in quantity and detail. Kristensen (1906) investigated the loanwords of early ODan. before 1300 (cf. art. 88).

3. Designations of Old Nordic – old and modern

In the Nordic sources from the 9th c. onwards, NGmc was commonly referred to as *dōnsk tunga* 'Danish tongue' (cf. Melberg 1951). This was primarily due to the closeness of Denmark to Northern Germany. Another reason might be that Danes were the main representatives of Scandinavian settlers in the so-called *Danelaw* of early medieval England (OE *danelage*, ODan. *danælovgh*; cf. arts. 24 and 88). The expression *dōnsk tunga* was also applied in the High Middle Ages, since ODan. had a central position within the Nordic language grouping (cf. also Vikør 1993, 32). The Icelandic historian Snorri Sturluson (1179–1241) conjoined all the earlier Nordic languages under the term 'Danish tongue' – his prologue to *Heimskringla* begins thus: "Í bók þessi lét ek rita fornar frásagnir um höfðingja þá, er ríki hafa haft á Norðrlöndum ok á danska tungu hafa mælt" [In this book, I had written down old narratives of the chieftains who ruled in the Nordic countries, and who were [native] speakers of the Danish tongue; transl. mine]. As late as the middle of the 14th c., another Icelander, Brother Eysteinn, referred to *dōnsk tunga* in the famous poem *Lilja*: "Fyrri menn ... sungu lof með danskri tungu" [Former men ... sang praises in the Danish tongue]. These quotations indicate that the Scandinavians of the early Middle Ages were conscious of the ancient

unity of all Nordic languages (cf. also the comments in Karker 1977 and in *KLNM*, s.v. *Dansk tunge*). Note however that the above-mentioned passages concern chieftains and earlier men and hence do not indicate the use of *ḍnnsk tunga* in the 14th c. It is a moot point whether the term *norróna* (OE *norþerne*, OHG *nordrôni*) specifically meant ‘ONorw.’ or more generally the entire grouping of OWN languages. Incidentally, the term *Norn*, which refers to the Nordic language of the Orkneys and Shetland, is derived from this word (cf. arts. 24; 88; 122).

In modern terminology, Old Nordic (or “Old Norse”, G “Altnordisch”) is often used in the narrow sense of OWN, including OIcel. and ONorw., but excluding ODan., OSw. and OGu. This terminological use corresponds to that of *norróna* in the broader sense of OWN (cf. Norw. *norrønt*, Icel. *norræna*). A subgroup of OWN is *islenzka* or *islenzk tunga*, which designates the ON language in Iceland. On the whole, OIcel. is more unified and normative than ONorw., and its huge literary corpus is of major importance (cf. art. 101). Therefore it is commonly called “Old Norse”, although OIcel. is the more precise term. Note that Old Norse in its normalized shape is a scholarly creation by normative linguists who took into consideration both OWN manuscripts and Mod.Icel. (for the problematical notion of “norm” in the ON context, cf. Hagland 1992). Nowadays, mainstream research makes use of the term ON in a broad sense – including all NGmc languages and dialects of the High Middle Ages (for a definition and delimitation of the ON period, see art. 90).

4. The geographic range

Early dialectal splits within Nordic led to the differentiation of an EN and a WN language grouping. WN comprises Insular Nordic and ONorw. Insular Nordic is mainly represented by OIcel., since only traces of OFar. can be found (cf. arts. 101 and 122). Furthermore, Insular Nordic included (partly unattested) idioms on the western isles, i.e. the Hebrides, the Orkneys, the Isle of Man, and Shetland, plus the coastal regions of Scotland and Ireland. The *Vinland sagas* inform us about ON colonies further westwards, i.e. in Greenland and on the American coast, and there is archaeological evidence to support this, including runic inscriptions from Greenland. EN, on the other hand, is represented by ODan., OSw. and OGu. Note that OGu. maintains a special

linguistic position within EN (see 6.2.3.). A variety of OEN (ODan.) was also spoken in the English *Danelag* (cf. art. 88).

Apart from OFar., which has to be reconstructed, all ON languages are attested in a corpus of literature and texts. This is especially true of OIcel., since it is amply attested in the Eddas, Sagas and Scaldic poetry. The Icelanders took the lead in the new literary culture of medieval Scandinavia. Of major linguistic importance is the so-called *First Grammatical Treatise*, which was probably written on Iceland about 1150 or earlier (on the dating, see Benediktsson 1972, 23–33).

5. Early dialectal differentiation

It is generally assumed that the dialectal splits within NGmc occurred relatively late. Therefore, a Common Scand. period, ca. 550–1050 with a common language history is envisaged (cf. Haugen/Markey 1972, 124). The EN monophthongization, for instance, is believed to have occurred as late as 900–1000 (see e.g. Bandle 1973, 116), a scholarly consensus which, however, rests on a questionable foundation (cf. Barnes 1997).

It is of major importance that runic inscriptions of the transitional period (ca. 450–600) indicate dialectal variation. Mention should first of all be made of the Stentofen and Björketorp inscriptions of the early 7th c. While Stentofen has the forms **hider** and **dud**, Björketorp shows the corresponding forms **haidr** and **daude** (< Gmc **haiðiz* ‘brightness of the sky’ and **dauþ-* ‘death’, respectively). What is more revealing, Björketorp has **haidera**, where Stentofen has **hedera** – both forms stemming from Gmc **hidran* with a monophthong as a root vowel (cf. ModE *hither*). Antonsen (1975, 14, 85ff.; 1998, 156) makes the point that the digraph **ai** in **haidera** is a reverse spelling based on EN monophthongization:

„What we have [in **haidera**] is clearly a reverse spelling that arose as the result of the confusion caused by the monophthongization of Proto-Germanic **/ai/* to **/æ/* in root syllables, which could no longer be distinguished from **/æ/* of other origins. This spelling indicates most forcefully that the East Nordic monophthongization has already occurred at the time of these inscriptions“ (Antonsen 1998, 156).

This southern (Danish) innovation must therefore be dated to the 600s at the latest. Given the evidence of runic spelling, this is indeed plausible (cf. Barnes 1997, 38f.).

Another dialectal runic form may be **tojeka** in the Noleby inscription from the 500s (see Antonsen 1975, 55). It is said to be an EN form stemming from AN **tauju* plus affixed *-eka*. The early monophthongization in **tojeka** (= [tøjeka]) may be due to its provenance from Västergötland in Sweden (cf. Krause 1971, 157). Last but not least, the famous Eggja inscription in Norway (ca. 650–700), which is as a rule included in the corpus of the older runic inscriptions, exhibits vowel harmony, i.e. a kind of progressive assimilation (cf. Grønvik 1985, 169–172). The endings of the forms **sakse**, **made**, **galande** are opposed to those of **wiltir**, **huni**, **misurki**. One basic rule is that high vowels in root syllables entail high final vowels, whereas low (non-high) root vowels entail non-high final vowels. Krause (1971, 143) tentatively suggested “Einfluß einer ostnordischen Sprache ... in gewissen Formen mit ostnordischer Vokalharmonie” [influence of an EN language ... in certain forms exhibiting EN vowel harmony], but this is far from proven. Vowel harmony occurs in manuscripts of both Eastern and North-western Norway, i.e. from Østlandet, Trøndelag and Nordvestlandet (Seip 1955, 128 ff.; Haugen 1982, 38). Hence it is not a distinctly EN phenomenon (see art. 101). Furthermore, the phonological evaluation of unstressed vowel systems in the manuscripts with regard to vowel harmony is a delicate problem, as has been shown by Haugen (1949) and Benediktsson (1962), both commenting on Seip (1943).

To sum up, the notion of dialectal diversification within early Scand. (ca. 550–700) seems to be appropriate. Dialectal traces of an East/West split are found in the so-called transitional inscriptions of the late 500s or early 600s at the latest. Later forms like **tuþr** (OWN *dauðr*) and **stin** (OWN *steinn*) in Dan. and Sw. runic inscriptions from the Viking Age are by no means the earliest attestations of EN monophthongization (on the traditional view, cf. e.g. Skard 1967, 58). Note that the monographic spelling <u> in **tuþr** directly corresponds to the above-mentioned older runic form **dud** on the Stentofte stone (ca. 600–625). It is indeed plausible that both spellings are indicative of the same phenomenon. As a consequence, the traditional language history of Common Scand. (ca. 550–1050) has to be rewritten in the light of modern linguistic and runological research (cf. Barnes 1997, 29).

6. The various Old Nordic dialects

It is generally assumed that a set of changes splits the language continuum of Common Scand. into two branches: a WN branch including OIcel., ONorw. (and OFar.), and an EN branch comprising OSw., ODan. and OGu. Haugen (1970, 49) emphasizes that this is an oversimplification: the evidence is based solely on written documents which follow certain scribal traditions and hence are unable to show the actual isoglosses of the spoken dialects (cf. the discussion of ONorw.-OIcel. relationships in 6.1.3.).

It is generally stated that WN tends to be more conservative than EN (cf. Haugen 1976, 92). Note however that Icel. and Far. also exhibit sound changes which have not occurred in the East – or have been levelled out. For a list of early East/West differences, see Haugen 1982, 34 ff.

6.1. Old West Nordic

OWN includes ONorw. and the Insular Nordic languages, i.e. OIcel. and (reconstructed) OFar. (cf. 6.1.2.). In addition, ON was spoken on the Orkneys and Shetland Islands, but no medieval texts of these ON idioms exist. Note, however, that these insular dialects also survived in later centuries; for the so-called Norn of the Orkneys and Shetland Islands, see Barnes (1998). It was traditionally assumed that these Insular Nordic varieties of OWN stemmed from a parent language in Southwestern Norway; but this has been questioned by Werner (1994, 123) with regard to Faroese (see 6.1.2.). One common development of Southwestern Norw. and Insular Nordic (i.e. Icel., Far., and even Norn) is a series of consonantal dissimilations /l:/ > /dl/, /n:/ > /dn/, /r/ > /dl/, /rn/ > /dn/ (cf. Chapman 1962, 61 ff. and art. 122).

As to the shortening of long vowels and diphthongs, it may be noted that OWN reduces two-moric (long) vowels in closed syllables followed by a long consonant or a consonant cluster; e.g. *Helgi* (proper name from the adj. *heilagr*), or *mestr*, *flestr* (superl., cf. the comp. *meiri*, *fleiri*). This structural change levelled overlong syllables. It was not related to EN monophthongization, which never reached Iceland and the Faroes.

Generally, OWN is characterized by more stasis than OEN (cf. 6.2.). Morphophonological characteristics of the OWN languages are: (1) retention of the old diphthongs /ai/, /au/,

/øy/; (2) more occurrences of *a*-umlaut; (3) more occurrences of *u*-umlaut; (4) higher frequency of *i*-umlaut (ind.pres. and subj.pret. of strong verbs); (5) *R*-umlaut; (6) *gi/ki*-umlaut; (7) restrictions on breaking (OIcel. *stela*); (8) development of rising diphthongs /io/, /iu/ (*jó, jú*); (9) regressive assimilation of the nasal clusters /nt/, /nk/, /mp/; (10) /v/-loss in the word-initial cluster /vr-/ (OIcel. *reiðr*); (11) retention of the final vowels <a-i-u>, or <a-e-o>; (12) retention of the old inflectional system; (13) medio-passive in /-st/ < /-sk/ as opposed to EN /-s/ (cf. Bandle 1973, 110; Torp 1998, 36f.). As for the feature of *i*-umlaut, it is highly probable that ODan. and OSw. non-umlaut forms such as subj.pret. ODan. *bruthe, gauæ, tokæ, hafthi*, OSw. *skuti, gāvi, tōki, valdi, kraffi* (as opposed to OIcel. *skyti, gæfi, tōki, velði, krefpi*) have been levelled. As argued above, these OEN forms are innovative in contrast to the conservative OEN forms with retained umlaut (Bandle 1973, 34; Schulte 1998, 75).

6.1.1. Old Icelandic

Iceland is traditionally considered to have been settled in the period 870–930, mainly from the southwestern coast of Norway. With time, OIcel. became the most typical representative of OWN. As OIcel. is a direct offshoot of its parent language ONorw., it is natural to assume close linguistic relationships (cf. Chapman 1962). But despite the OIcel.-ONorw. linguistic links, OIcel. must be viewed as a language in its own right. Vikør (1993, 56) points out that OIcel. is a so-called “Ausbausprache”, i.e. a language that gained its status by further development.

OIcel. is regarded as highly conservative. This is true for instance of /h/-retention before sonorants /l, r, n/, whereas /h/ was lost in ODan., ONorw. and OSw. from the 9th c. onwards. The orthographic evidence of early Icel. manuscripts has been investigated by Benediktsson (1965). A major change of Insular Nordic is the diphthongization of originally long vowels which probably occurred in the 14th c (cf. art 122). Note that this is not reflected in spelling; cf. OIcel. *bátr* [ˈbɑːtr] vs. Mod.Icel. *bátur* [ˈbɑʊtʏr]. Before this process was at work, ON /a:/ and /ɔ:/ (spelled as <ǫ>), the *u*-umlaut of /a:/ had already merged into /a:/ (e.g. OIcel. *spá* ‘prophecy’ < OWN *spó* < AN **spahu*). This transition was mirrored in Icel. manuscripts from the late 12th c. onwards and was probably completed in the

early 13th c. (cf. Benediktsson 1959, 291 ff.; 1965, 62). Similarly, short ON /ɔ/ (spelled as <ǫ>), the *u*-umlaut of /a/), merged with /ø/, the *i*-umlaut of /o/ in early OIcel. As indicated by the manuscript evidence, this merger occurred ca. 1200 (see Benediktsson 1959, 295). Another vowel change of prime importance is the merger of ON /æ:/ into OIcel. /æ:/ (OIcel. *ðéma* < AN **dōmijan*) which is datable approximately to the same time (Noreen 1923, 120). In Mod.Icel. the pronunciation of /æ:/ changed to a diphthong [aj(ɔ)]. This development went even further in Faroese (see 6.1.2.).

Among the OIcel. innovations, loss of /v/ in word-initial /vr/-clusters is salient (OIcel. *reiðr, rangr, rita*). This /v/-deletion occurred at the end of the 10th c. or even earlier. Bragi gamli and Egill Skallagrímsson have /r/-alliteration between (v)*reiðr* and words with initial /r/ (cf. Skard 1967, 59). On the other hand, /v/-alliteration is still to be found in the Eddaic lays (cf. e.g. Hávamál 32 *enn at virði vrecaz*). This might point to parts of the Eddaic lays being older, i.e. composed before 1000. But /v/-alliteration may at least in certain instances be due to old, fossilized formulas (Schier 1986, 379). In any case, the loss of /v-/ (OIcel. *reiðr*) is a distinctly Insular Nordic innovation, whereas /h/-loss (ONorw. *lutr*) is a clear Norwegianism, shared by ODan. and OSw. (cf. 6.1.3.).

6.1.2. Old Nordic in the Faroes

OFar. is an unattested language. At most there are ON manuscripts exhibiting traces of OFar. developments which have apparently been copied by Faroese scribes (see Sørliie 1936). Admittedly, there are only a small number of Faroese texts even from the later Middle Ages (see Hægstad 1916 II, 63f.; Haugen/Markey 1972, 98f.). Hence, a standard grammar of Far. is only available for later periods (cf. Hamre 1944). Common Far.-Icel. developments such as diphthongization and palatalization are probably interconnected (Rischel 1967/68, 89ff.; Werner 1996, 35ff.). In Faroese, some developments went further than in Icel. (cf. art. 122). Apart from palatalization, a characteristic feature of Far. (with ancient typological parallels such as ON *tveggja* and Go. *twaddjē*) is the so-called “sharpening” (G *Verschärfung*) after long vowels and diphthongs in open syllables. This sound change is also mirrored in the spelling, e.g. Mod.Far. *brúgv* vs. OIcel. *brú* ‘bridge’ (cf. Matras 1952, 177ff.). Due to scarce textual

evidence, it is extremely difficult to determine the starting-point of these changes. Werner (1996, 57) reckons with the possibility that “Old Norse on the Faroes around 1200 was already a West Norse dialect group, considerably distinct from (Classical) Old Icelandic.”

Like Iceland, the Faroes were settled mainly from Norway, partially via the British Isles (for the literary and archeological evidence, see Werner 1994, 123 ff.). Earlier scholars, e. g. Hægstad (1916), argued for a distinctly South-west Norwegian provenance of the Faroese settlement. Recently, this has been questioned by Werner (1994, 123). He stresses that it is hard to determine whether the characteristic features and the dialectal differences of Faroese arose on the Faroes or whether they were (at least partially) imported by the settlers, and whether the correspondences between insular and continental Norw. dialects arose only later through secondary parallel developments or through on-going language contact (cf. Chapman 1962):

„die Daten sind dazu noch nicht systematisch durchgeprüft; doch deutet vieles eher auf spätere parallele Entwicklungen und Konservatismen (vgl. Küspert 1988), als daß man aus den Übereinstimmungen auf ein einzelnes engeres Herkunftsgebiet schließen dürfte“; [the linguistic data have not yet been evaluated systematically, but many observations point to secondary parallel developments and conservatism (cf. Küspert 1988), so that there is no true indication of a single, clearly localizable area of origin; transl.mine] (Werner 1994, 123).

6.1.3. Old Norwegian

Until the middle of the 14th c., Norwegian scribes made use of a conservative ONorw. language, which did not differ a lot from the OIcel. manuscripts. However, local developments must already have existed, or were *in statu nascendi* (e. g. vowel harmony and vowel balance). In this context, the normative power of written ONorw. as a standard language must not be underestimated. It is highly probable that dialectal diversification had already gone much further than shown in the manuscripts.

A salient trait of East Norw. texts from the late 12th and early 13th c. are non-umlaut forms like *mannum*, *sakum* as opposed to OIcel. umlaut forms *mǫnnum*, *sǫkum* (cf. Skard 1967, 91). Benediktsson (1982, 29f.) points out that forms such as *mannum* do not necessarily indicate the absence of “younger” *u*-umlaut, but can be interpreted as “a consequence of the phonemic relationships within

the postumlaut vowel system”. Hence, the evaluation of spelling as direct evidence for *u*-umlaut in the ON dialects is bound to be circular (for *u*-umlaut as a dialectal feature, cf. Bandle 1973, 28 ff.). Somewhat clearer evidence is provided by forms with dropped *u* (“older” *u*-umlaut).

A major debate of ONorw.-OIcel. relationships concerns the origin of the Eddaic lays and other OWN texts (cf. Magerøy 1965). Seip (1945; 1951) believed that the prototype of the Edda was written down in Norway. He noted many Norwegianisms and argued that the two extant manuscripts, i. e. the famous Codex regius (GkS 2365, 4^o) and the fragmentary AM 748 I, 4^o, were Icelandic copies, stemming from a Norwegian source. The controversy is mainly due to the question of Norwegianisms such as the loss of /h/ in the clusters /hl-/, /hn-/, /hr-/ which occurred around 1150–1200 and thus predated the earliest Norwegian manuscripts (ONorw. *laupa*, *níga*, *rósa* vs. OIcel. *hlaupa*, *hníga*, *hrósa*). Seip (1951, 13) maintained that some of these /h/-less forms must have been old, since they were supported by alliteration: e. g. (*h*)*rás* : *rotom* (Hávamál 151). However, Kuhn (1952) argued strongly against a Norwegian Edda (cf. also Lindblad 1954). Neither Seip’s nor Kuhn’s arguments are decisive. As noted in 6.1.1., even alliteration is an untrustworthy feature, since fossilized formulas can be used. Incidentally, Seip (1954, 151) himself admitted that the question of origins is more complex: there might have been Norwegian scribes in medieval Iceland, or Icelandic scribes in medieval Norway with different scribal traditions (cf. also Haugen/Markey 1972, 115). In addition, scribes represent an educated, linguistically conservative group, which is the last of all groups in a speech community to internalize sound changes (cf. Chapman 1962, 79). To sum up, Norwegianisms in Icelandic manuscripts do not provide evidence of a Norwegian source. The most likely interpretation is that they embody individual (though interdependent) scribal practices (Karlsson 1978).

6.2. Old East Nordic

The OEN group of languages shares certain features, both innovations and archaisms, which contrast with OWN (i. e. *norróna*; cf. art. 101). Historically, a southern and an eastern centre of innovations can be discerned (Bandle 1973, 110f.). Hence the traditional East/West division is superseded by a North/

South division later in the Middle Ages (cf. Vikør 1993, 32). Some major innovations of southern origin (centred in Denmark) stand out in the manuscripts: (1) monophthongization of /ai/ > /e:/, /au/, /øy/ > /ø:/; (2) lowering /e(:)/ > /æ(:)/ in root syllables; (3) lenition of /p, t, k/ > /b, d, g/; (4) weakening of unaccented vowels (shown by the grapheme <æ>), or even Jutlandic apocope; (5) inflectional reduction (e.g. nom.acc. *thæn* < *sá – þann*); (6) extensive breaking output (e.g. OSw. *stíala*, ODan. *stíælæ* vs. OIcel. *stela*); (7) progressive *j*-umlaut (e.g. Mod.Sw. *hjärta*, Mod.Dan. *hjerter* vs. Mod.Icel. *hjarta*); (8) medio-passive in /-s/.

Partial stasis of the EN language group is evident in the following traits: (1) fewer cases of umlauts than in ODN; (2) no assimilation of NC-clusters (Mod.Dan. *enke*, *synke*, *svamp*, Mod.Sw. *änka*, *sjunka*, *svamp*); (3) no development of rising diphthongs with a long second element as in ODN (ODan. *biutha*, *siuk* vs. OIcel. *bjóða*, *sjúkr*); (4) retention of initial /vr/-clusters (OSw. *vræka* vs. OIcel. *reka*).

It is said that the breaking tendency is stronger in EN than in WN (e.g. Hoff 1949, 203; Haugen/Markey 1972, 125f.). Note also that special breaking phenomena occur in the East: EN *w*-breaking in OSw. *siunga*, ODan. *sjunge* vs. OIcel. *syngva*, and EN *r*-breaking in OSw. *giurþa* vs. OIcel. *gyrða* (cf. GG §§182f.). In ODN, the process could be impeded by preceding consonants, especially by the sonorants /l/, /r/, /m/, /n/, and /v/ (cf. OIcel. *bresta* ‘burst’, *verpa* ‘throw’). On the other hand, doublets such as OIcel. *bjarg/berg* or *fjall/fell* can be explained intra-paradigmatically. Unbroken forms such as *berg*, *fell* can be phonologically based on old datives of place-names (e.g. OIcel. *á Sandfelli*), where no breaking-inducing vowel existed (cf. Hoff 1949, 200f.). As in the case of monophthongization, this isogloss probably arose fairly early, i.e. in the 6th or 7th c. This is seen in the runic forms **haerama-** and **haeru-** in the inscriptions from Björketorp and Istaby. In all probability, the digraph <Ae> in the root syllables **herm-*, **her-* signals phonemic breaking diphthongs (Antonsen 1998, 157; Schulte 2000, 19f.).

6.2.1. Old Danish

The southern centre of ON innovations is Denmark. Not only the EN monophthongization but also other processes arose in the south. As for changes in syllable structure, the

lengthening of short vowels before a single consonant is a Common Scand. development which started in Denmark (e.g. ODan. *saak* < EN *sak*; cf. OIcel. *sqk*). Vowel weakening is also centred in the south, its extreme form being Jutlandic apocope. Phonological reduction is bound up with morphological reduction (Ringgaard 1989, 160ff.). According to Haugen (1970, 60), the different stages of vowel reduction in the ODan. dialects were as follows: (1) <a-i-u> > (2) <a-e-o> > (3) <a-e> > (4) [ə] (phonetically a schwa-variety) > (5) Ø (i.e. complete apocope). It may be noted that dialects that resisted vowel weakening the most underwent consonant deletion of final /-n, -t, -ð/ (cf. Hesselman 1948–53, 329). The intrusion of svarabhakti vowels, which occurred sporadically in ODan. before 1200 and later on also in OSw., ONorw. and OIcel., is a related phenomenon (e.g. ODan. *akær* ‘field’, *hagell* ‘hail’; cf. art. 122). In general, the chain-of-reduction phenomena are related to the intensified initial accent in ODan. But language contact to the south was a second factor of prime importance. As for Low German-Nordic contact, there are certain parallels to the situation in OE, where on-going language contact must have reinforced morpho-phonological reduction (cf. arts. 24 and 88). Note that the ODan. inflectional system was strongly reduced. For instance, the old gen. forms were replaced to some extent (e.g. *hestens* < *hests-ins* ‘of the horse’), and *s*-forms spread to other declensions, to feminines and to the plurals (e.g. *utæn skipmenz orlof* ‘without sailors’ permission’). In the middle of the 14th c., the nom.sg. ending *-r* was dropped in ODan. substantives and adjectives, whereas it was retained in OSw., OIcel. and OFar. (for ONorw., see art. 122). This yields an important inner-EN isogloss between ODan. and OSw. (e.g. ODan. *sun* vs. ON *sonr* ‘son’).

The first volume of Skautrup’s *Det danske sprogs historie* (1944–68) covers Runic Danish (ca. 800–1100) and early Middle Danish (ca. 1100–1350). Skautrup (1944) believed that ODan. sound changes had occurred earlier than previously assumed. According to his grammar, the voicing of medial and final /p, t, k/ > /b, d, g/ was completed by the end of the 1200s. The process of consonant weakening was able to go via spirants /b, d, g/ even further to frictionless continuants (e.g. ON *auga* > ODan. *oghe* > Mod.Dan. *øje* ‘eye’, with weakening of an original spirant). Skautrup’s model of the weakening of stops and spirants has been challenged by Hald

(1978). In Danish manuscripts, the transition /p, t, k/ > /b, d, g/ is traceable to about 1300, and Dan. words in Latin manuscripts, written in Denmark after 1200, already show the same trait (GG §§ 282f.). As early as 1000, the weakening of endings and morphological reduction must have been at work in the west of Denmark (its centre being Jutland). This line of reasoning fits well with the fact that the orthography tends to be conservative and stands in need of careful evaluation (on ONorw., cf. 6.1.3.). In all probability, the dialectal split in ODan. had already gone much further than is generally acknowledged (cf. Ringgaard 1989, 161). Initial stages of the Danish *stod* are probably as old as this (cf. Skautrup 1944 I, 238ff.). But this cannot be proven, since the glottal stop is not traceable in the texts (for tonal accents in Scandinavian, cf. art. 126).

6.2.2. Old Swedish

The beginning of the classical OSw. period (ca. 1225–1375) is marked by a literary event. Around 1225, the oldest extant long text was written down in Swedish – the Older Law of Västergötland (the extant manuscript is half a century later though). Latin was the dominant written language at the outset, but Swedish was used for popular literature and law texts. Among the distinctive East/West isoglosses is the nasal assimilation of /mp/ > /p:/, /nt/ > /t:/, /nk/ > /k:/ (e.g. OIcel. *svöppr* vs. OSw. *svamper*, ODan. *svamp*). Moberg (1944, 183ff.) argued that this assimilation occurred as early as 650–850 (cf. also Bandle 1973, 36ff.). In most of the OSw. dialects, original /e:/ was lowered to /æ:/ and merged with umlauted /æ:/ < /a:/ (e.g. OSw. *knæ*, ODan. *knæ* vs. OIcel. *kné*). Short /e/ was also lowered (e.g. *mæþ* vs. OIcel. *með*). The *ä/e*-isogloss between Götaland and Svea dialects (e.g. Götaland *grät* vs. Svea *gret*, pret. of *grāta*) is discussed by Bergman (1921). It has already been noted that there are fewer instances of *i*- and *u*-umlaut in OSw. than in OIcel. (e.g. OSw. *takær*, cf. ODan. *tager*, OSw. *takin* vs. OIcel. *tekr*, *tekinn*; OSw. *laghum* vs. OIcel. *logum*). Breaking, on the other hand, seems to be more frequent in OSw. than in OIcel. (cf. 6.2.). Gmc */eu/ is regularly represented by /iu:/ in OSw., e.g. *siūkær*, *spiūt* (cf. OIcel. *siúkr*, *spiót*). On the whole, vowel contractions occur less often in OSw. than in OIcel.; cf. OSw. *sēa*, *þrēa(r)*, *fiāndi* vs. OIcel. *siá* ‘see’, *þriár* ‘three’, *fiāndi* ‘enemy’ with no syllabicity shift (Norw. “ak-

sentomkasting”) in OSw. Incidentally, Dan. *ffjende* and OWN *fiāndi* are only equatable on a surface level (GG § 117,2).

As for the unaccented vowels, a common ONorw.-OSw. dialectal feature is vowel harmony (cf. 5.). In other OSw. dialects, the alternation <i/e> and <u/o> is due to vowel balance. Here the quantity of the root vowel, not its quality, is decisive (e.g. *faþir* : *mōþer*). For morphology, the OSw. medio-passive in /-s/ is a clear EN feature which differs from OWN /-sk/, Mod.Icel. /-st/ (e.g. OSw. *bēþas* vs. OIcel. *beiðask* ‘claim for oneself’). It is generally derived from a dat. form *sér* (instead of acc. *sik*), but other solutions are worth consideration, e.g. Balto-Slavic influence (cf. Geniusiene 1987 and Dahl/Koptjevskaja-Tamm 1992).

Due to the loss of intervocalic /ð/ in the 13th and 14th c., the old *ēn*-verbs (weak declension *tro* – *trōdhe* – *trōt*) are in need of a new tense-marker. Hence a new ONorw.-OSw. tense formation arose in the 14th c.: *tro* – *trodde* – *trott* on analogy with OSw. *fōda* – *fōdde* – *fōtt* (cf. Bandle 1973, 82f.). In ODan., the main line of development was different (cf. ODan. *naadhæ*, *trothæ*, but Mod.Dan. *nå* – *nåede* like *kaste* – *kastede*; cf. ON *kasta* – *kastaði*).

Another important East/West distinction is the OSw. dat.pl. in *-umin* (*-omen* etc.), in contrast to OIcel.-ONorw. *-unum* (*-onom* etc.); cf. OSw. *skipumin*, dat.pl. ‘the ships’. In the verbal paradigms, OSw. has *-in* (*-en*) in the 2 pl.ind. in contrast to OIcel. *-iþ* (e.g. OSw. *kallin* ‘you call’, *kallapin* ‘you called’ vs. OIcel. *kalliþ*, *kolloþoþ*), and the 2nd and 3rd pers.sg. is extended to the 1st pers. (e.g. OSw. *iak takær* ‘I take’ vs. OIcel. *ek tek*). Note that the OSw. dat.pl. *-umin* differs not only from OWN, but also from ODan. (the only exception being Scania; see GG § 582B, 1). The same is true of the 2 pl.ind. *-in* (GG § 814), whereas the type *iak takær* is common to ODan. and OSw. (GG §§ 785–789).

6.2.3. Old Gutnish

Laws and the *Gutasaga* were the first texts to be written down on the island of Gotland in the Baltic Sea. The position of OGu. within the ON family of languages and dialects is somewhat difficult to determine. OGu. deviates significantly from OSw. and ODan., and its marked linguistic status has long been acknowledged (Wessén 1969, 115–117; Haugen 1976, 190). On a surface level, OGu. shows a characteristic blend of EN and WN

isoglosses plus a number of single language developments (e.g. additional di- and triphthongizations). There is consensus that the special linguistic position of OGu. is due to the isolation of the island in early Nordic times, which must have temporarily separated it from the mainstream of developments in East Scandinavia. Scholars agree that OGu. and modern Gotl. have to be considered separately from the other branches (see Bandle 1973, 107–110; cf. also *KLNM*, s.v. *Forngutiniska*).

A characteristic feature of OGu. is the retention of /a:/ in root syllables (e.g. *bāt*). Breaking occurs even in cases such as OGu. *biera*, Gotl. *bjere* (ON *bera* ‘carry’). In the main, OGu. shows a blend of archaisms and innovations and does not share the typical EN isoglosses (Bandle 1973, 107f.). The standard example is provided by EN monophthongization of */ai/, */au/, */øy/, which is not shared by OGu. (cf. *stain*, *auga*, *droyma* and ON *steinn*, *auga*, *dreyma*). It may be noted that OGu. even had a tendency to develop triphthongs (cf. *biauþa* vs. OSw. *biūþa* ‘offer’). Another feature is the so-called Birka-diphthongization (OGu. *hier*, *ier*, Gotl. *heär*, *jär* ‘here’, ‘is’). As to EN monophthongization, Haugen (1970, 51) wisely points out that the old diphthongs are retained not only in Gotland, but also in the fringe areas of Sweden, Estonia, Finland and northern Sweden: “It is therefore misleading to say (with Skautrup 1944–68 I.133) that the ‘language of Gotland shows West Scandinavian features’; the diphthongs merely reflect a retention quite unrelated to West Scandinavian” (cf. also Bandle 1973, 106–109). Hence, OGu. is archaic in that it does not follow the mainstream of EN innovations. At the same time, it may be noted that a major innovation of early OIcel., i.e. /w/-loss, also occurred in OGu. (e.g. OGu. *raíþi*, cf. OIcel. *reiþi* ‘wrath’).

Umlaut in OGu. differs a great deal from that in other ON dialects. It is a fact that *i*-umlaut in OGu. even goes beyond OIcel. in light stems such as *slegr*, *steþr*, *telþa* vs. OIcel. *slagr*, *staþr*, *talþa* from AN **slagiz*, **staþiz*, **talidō* (cf. Pipping 1901; Carlsson 1921; Benediktsson 1982). This led some researchers to posit the maximum intensity of umlaut in the East. Syrett (1994, 197), for example, states “that *i*-mutation can be viewed as an innovation beginning in the East Norse area and spreading westwards in a wave motion with less rather than greater efficacy.” But this is untenable both from a historical and a struc-

tural point of view (cf. Schulte 1998, 74f.). As for light stems like *slegr* and *telþa*, a structure-based phonological explanation is needed. There are strong arguments to be put forward in favour of a single language development subsequent to the basic steps of Nordic *i/j*-mutation (Schulte 1998, 257f.). This is also true of *R*-umlaut in forms such as OGu. *bær*, *bēr* and *kær*, *kēr* (OWN *ber*, *ker*, OSw. *bar*, *kar*). Steblin-Kamenskij (1963, 367) offered an explanation for the fact that this kind of mutation is weakly represented in EN, and is distinct only on Gotland and in Dalarna.

7. Conclusion: Old Nordic dialects and Pan-Scandinavian

As has been argued, the ON dialectal landscape must have been more diverse than the textual evidence indicates. This is at least true of ONorw., OSw. and ODan. The inclusion of OGu. in the dialectal system of ON leads to a highly complex dialectal situation, especially within OEN. For the OWN languages, the dialectal landscape seems to be more homogeneous. This is especially true of the Insular Nordic domain, even if (mainly reconstructed) OFar. and Norn are included (cf. art. 122). ONorw. can be split into various dialectal zones which developed divergently. Eastern dialects of ONorw. exhibit EN traits. It may be said that no variety of ON is purely innovative or purely archaic. Even OIcel., which is regarded as highly conservative, shows innovations clearly distinguishing it from ONorw. (cf. 6.1.3.).

In this sketchy overview, the main focus rested on phonological and morphological features (cf. also arts. 101–104). The interrelations and contrasts between the different ON dialects are most forcefully reflected in these subsystems.

101. The phonological systems of Old Nordic I: Old Icelandic and Old Norwegian

1. Introduction
2. From Ancient Nordic to Old Nordic
3. The earliest post-umlaut vowel system
4. Outline of general Old West Nordic traits
5. Old Icelandic phonology
6. Old Norwegian phonology
7. Conclusion
8. Literature (a selection)

1. Introduction

The classical Old Norse of the High Middle Ages (1100–1350) has been basically identified with Old Icelandic due to its homogeneous manuscript tradition and the alleged absence of dialects as opposed to Old Norwegian. Not only has this apparent uniformity given rise to the scholarly creation of normalized Old Norse, but more importantly, it has been a constant factor of linguistic interest ever since Rasmus Rask (1811; cf. also Kuhn 1935). It should be noted from the outset that this traditional view oversimplifies the true state of affairs in at least one way. As evidenced by the Old Icelandic manuscripts, it can be reasonably argued that Old Icelandic possessed dialectal features like all the other Nordic languages. They were based on linguistic innovations which were later subjected to dialect

levelling either being neutralized or successively spreading over the whole island (see Benediktsson 1961/62; on Icelandic dialectology see Steblin-Kamenskij 1960; Werner 1968, 462–65; Bandle 1997).

The uniform character of written Icelandic through the ages is indeed striking. Diametrically opposed to this normative scribal tradition, Old Norwegian split up into a true dialectal continuum and developed divergently: its eastern varieties ran into Old East Nordic and bordered Old Swedish, whereas its western varieties were on a par with Insular Nordic, i. e. Old Icelandic, Old Faroese and Norn, which was spoken on the Orkneys and Shetland Islands (cf. arts. 100 and 122). Although Old Icelandic and Old Norwegian (particularly its western dialects) show striking parallels and common innovations in their phonological systems, they have to be regarded as distinct varieties on linguistic grounds (cf. art. 100). Their vowel systems in particular (including phonotactics and suprasegmental features) developed divergently at least from the 12th c. on. Due to the limitations of space, the main focus of this article rests on the phonology of Old Icelandic vowels. For the phonology of Old Faroese and Norn, see art. 122.

1.1. Sources of evidence

The grammatical works of the High Middle Ages provide the prime source of evidence for early Old Icelandic phonology (see 1.2.). Other main sources of evidence for Old West Nordic (i.e. Old Icelandic and Old Norwegian) are as follows: (1) poetry, especially Eddaic and Scaldic lays; (2) manuscripts; (3) diplomas and letters; (4) runic inscriptions; (5) loanwords in different target languages. Eddaic and Scaldic poetry is a tool for establishing the phonological systems of Old Nordic, although their evaluation faces particular problems such as dating and manuscript traditions. In general, poetry tends to preserve language in a more archaic form due to its strict metrical regulations, which include alliteration, rhyme, accentuation and the number of syllables (cf. Árnason 1991). Manuscripts provide another important source of evidence. Their evaluation also encounters serious difficulties, since almost all manuscripts are not originals but transcripts of lost sources. Consequently, these texts represent an orthographic mixture based on different chronological stages and dialects of Old Nordic. A long-lasting scholarly debate, partly blended with national pride, focused on the origin of Eddaic lays and other Old West Nordic texts (cf. art. 100). On the basis of Norwegian features in Icelandic manuscripts, Seip (e.g. 1945) favoured the general assumption of Norwegian provenance. Following Karlsson (1978), though, the situation must have been far more complex, as different (partly interdependent) manuscript traditions and scribal practices of Old Nordic were in use. As for Old Norwegian, the oldest vernacular manuscript dates back to 1150. The oldest Icelandic manuscript is probably a fragment of the homilies datable to the second half of the 12th c. An outstanding investigation of early Old Icelandic manuscripts of the 12th and 13th c. is Benediktsson (1965), who turns from graphemic surface representation to the underlying phonological system. Another source of evidence for Old Nordic phonology is furnished by original diplomas and letters. The Old Norwegian diplomas contained in the *Diplomatarium Norvegicum* play an important role for the investigation of 12th and 13th c. language history (cf. Hødnebo 1971). Old Icelandic diplomas from the early period are few, but include *Reichenauer Verbrüderungsbuch* from the 9th to 13th c. (cf. Naumann 1992) and *Reykjaholts máldagi*, the oldest part of which was written

before 1200 (see *Diplomatarium Islandicum* I, 25, 68, 94, 120 B). As with the manuscripts, evaluation of this kind of evidence is by no means unproblematic, since dialectal features of the spoken language undermined the scribal practices and led to all kinds of inconsistencies (e.g. inverted spellings and hybrid forms). Unfortunately, ignorance of this fact led to many deficient phonological analyses of the textual material (cf. Hødnebo 1971, 146f.). Among the direct sources of evidence, mention next be made of the runic inscriptions of Norway written in the younger futhark. They stem from Bryggen in Bergen, Trondheim, Tønsberg as well as Oslo and are datable to the 12th–15th c. (see e.g. Liestøl 1964; Spurkland 1998). A grapho-phonological investigation of this material from Bryggen has been undertaken by Spurkland (1991), who points at orthographic peculiarities not found in the manuscripts. As for Old Icelandic language history, runic inscriptions are of minor importance; the two oldest inscriptions on Iceland date back to the middle and the end of the 12th c. (see Bæksted 1942, 181 ff., 208 ff.; Snædal 2000). In addition to these direct sources of evidence, Old Nordic phonology is also reflected in loanwords of different languages, e.g. Old Irish (cf. arts. 24 and 88). Almost ninety years have passed since Marstrander (1915) investigated the phonology of Old Norse loanwords in Old and Middle Irish. Within the modern field of contact linguistics, phonological processes of sound substitution and phonemic filtering in different target languages deserve further investigation (as for Old Norse–Old Irish contact; see Schulze-Thulin 1996).

1.2. Grammatical works of the High Middle Ages

It has been well known for decades that structural linguistics of the 20th c. has a methodological forerunner in the High Middle Ages (cf. Braunmüller 1998). Two grammatical works, both anonymous, are outstanding: the so-called *First Grammatical Treatise* (FGT), which was composed as early as 1150 and is contained only in a copy, the *Codex Wormianus* (AM 242, fol., datable to 1350), and the so-called *Second Grammatical Treatise* (SGT) of the *Codex Upsaliensis* (DG 11 4°, from ca. 1250). Both treatises have been duly studied and edited (see Benediktsson 1961; 1972; Haugen 1972; Ulvestad 1976; Raschellå 1982). These medieval works of the 12th and

development is Nordic breaking, i.e. the fracturing of Gmc /e/ into rising diphthongs /ja/, /jə/ caused by unstressed /-a, -u/. Two competing theories account for this change: (1) the epenthesis theory, claiming an intermediate stage /ia/ which in its turn is affected by *u*-umlaut (/ia/ > /iə/); (2) the breaking-umlaut theory, operating with two separate processes, viz. *a*- and *u*-breaking (/e/ > [e^a] > /ia/, and /e/ > [e^u] > /iə/) (see the critical survey in Benediktsson 1982, 38 ff.). In his research, Dyvik (1978) connected Old Nordic breaking with breaking and back mutation in Old English. As for Nordic breaking, note the 7th c. transitional inscriptions from Björketorp and Istaby (Blekinge) which exhibit the innovative spellings **hAerAMΛ-** (OWN **hjarm-*) ‘rest’ and **hAeru-** (OWN *hjqr-*) ‘sword’ (see Schulte 2000, 19 f.). Diametrically opposed to this process, *i*-umlaut of /iu/ (< /eu/) resulted in monophthongization (cf. OWN *brýtr* ‘breaks’ < Gmc */breuti-/). Note the runic doublets **bariutip** and **barutr** in the Blekinge inscriptions from Stentofen and Björketorp (Antonsen 1975, 85 f.).

3. The earliest post-umlaut vowel system

Research on the immediate post-umlaut vowel system of Nordic invoked a variety of phonemic solutions, giving rise to two diametrically opposed models. An extreme position was held by Antonsen (1961; 1963; 1967) who claimed an umlaut-based vowel system consisting of twelve units (with the sounds /æ/, /θ/ and /ə/ corresponding to graphemic notations <ę>, <ø>, <ǫ>):

Antonsen’s post-umlaut vowel system

Front		Central	Back	
Spread	Rounded		Spread	Rounded
/i/	/y/		/u/	/u/
/e/	/ø/		/Λ/	/o/
/æ/		/θ/		/ə/
		/a/		

Antonsen favours a system of four distinct tongue-heights, where /a/ is markedly low. He posits two additional vowel phonemes to the ten units mentioned in 2., viz. a phoneme /Λ/, coming from /e/ by *u/w*-umlaut (ON *sökkva* ‘sink’ < */sekkwa-/ < */sinkwan-/), and a phoneme /u/, coming from /i/ by *u/w*-umlaut (ON *byggva* ‘build’ < */biggwijan-/). Thus, instead of the single phonemes /ø/ and /y/, An-

tonsen argued for two additional oppositions /ø/: /Λ/ and /y/: /u/. Both of them were rejected by Benediktsson, who operated with a less complex vowel system of only nine units (see Benediktsson 1959; 1961; 1964):

Benediktsson’s post-umlaut vowel system

	Front		Back	
	Unrounded	Rounded	Unrounded	Rounded
Close	/i/	/y/		/u/
Mid	/e/	/ø/		/o/
Open	/æ/		/a/	/ə/

The vowels /a, a:/ constitute a separate category with regard to tongue-height, but in terms of distinctive-feature structure, it can be argued that this is non-distinctive (cf. Benediktsson 1972, 126 f.). The problem of a possible distinction between short /e/ and /æ/ at an early stage of Nordic has been discussed by Benediktsson (1964). The later developments clearly point to /e/, i.e. a mid-high vowel corresponding in aperture to /ø/ and /o/. Benediktsson points out that, contrary to the common view (maintained e.g. by Haugen 1942, 66), a distinction between original /e/ and the umlaut product /æ/ is not confirmed by the FGT either: “the evidence set forth in the FGT is not sufficient to establish, for early-twelfth-century Icelandic, a phonemic distinction of short *e* vs. *ę*” (Benediktsson 1972, 143). To conclude, the merger of short /e/ and /æ/ clearly predated early Old Icelandic, bringing about an asymmetrical system with eight short and nine long vowel phonemes (cf. 5.3.). Otherwise, this post-umlaut vowel system can be identified with the system of the FGT (see Benediktsson 1972, 126 ff.; 144 ff.).

4. Outline of general Old West Nordic traits

Typical features of the western and eastern branch of Old Nordic, i.e. Old West Nordic and Old East Nordic, must have been present early on (Barnes 1997). As mentioned in art. 100, Old West Nordic reveals a blend of conservative traits and innovations in relation to Old East Nordic. In a traditional perspective, mention must be made of the following general characteristics, which have a bearing on the phonological and phonotactic structure of Old West Nordic (cf. Hødnebo 1967, 358 f.): (1) retention of the three standard diphthongs /au/, /ei/ (< /ai/) and /øy/ (< /ey/) (Oicel. *grautr*, *bein*, *ey*); (2) non-occurrence of lowering /e/ > /æ/ (Oicel. *lesa*, *verða* vs. OSw. *læsa*,

værþa); (3) more occurrences of *a*-umlaut (cf. OIcel. *botn, golf, holt*); (4) more occurrences of *u*-umlaut (including *u*-umlaut before preserved *u*: OIcel. *qlum mǫnnum* vs. eastern ONorw. *allum mannum*); (5) higher frequency of *i*-umlaut (ind. pres. and subj. pret. of strong verbs, e.g. OIcel. *tekr, stendr, gengr*); (6) *r*-umlaut (OIcel. *ker, gler* vs. OSw. *kar, glar*); (7) *gi/ki*-umlaut (OIcel. *degi, dreginn, tekinn*); (8) restrictions on breaking (OIcel. *stela, ek* vs. OSw. *stiala, iak*); (9) non-occurrence of *w*-breaking in Old West Nordic (OSw. *liung, siunka, biugg*); (10) development of rising diphthongs /io:/, /iu:/ < */eu/ (OIcel. *spjót, sjúkr* vs. OSw. *spiüt, siükær*); (11) high frequency of vowel contraction due to syllabicity shift (OIcel. *sjá, fjándi* vs. OSw. *sēa, fiandi*); (12) regressive assimilation of nasal clusters /nk/, /nt/, /mp/ (OIcel. *bekkr, klettr, soppr* vs. OSw. *bänker, klinter, svamper*); (13) dissimilation /-n:r/ > /-ðr/ (OIcel. *maðr, saðr*); (14) secondary diphthongization (ONorw. *siætti*, OIcel. *sétti*); (15) unrounding /y/ > /i/ starting in weakly stressed position (OIcel. *firir* < *fyrir*, ONorw. *ivir* < *yfir*); (16) aphaeresis of word-initial /v/ in /vr/-clusters (OIcel. *reiðr, rangr* vs. OSw. *vræþer, vranger*; cf. art. 113); (17) retention of a set of three unstressed vowels, represented as <a>-<i>-<u>, and <a>-<e>-<o>; (18) vowel harmony in ONorw., partly superimposed with vowel balance (see 6.5.). Most of these isophones are confirmed by the later language history of Nordic (cf. Haugen 1970; Bandle 1973; Holm 1980).

Traditionally, the maxima of umlaut and breaking are localized in two geographically opposed kernel areas, viz. the west and the east. It should be noted, however, that general statements, e.g. on umlaut intensity, are deficient when being solely based on written sources (for *u*-umlaut, cf. Widmark 1959). Thus, eastern Old Norwegian forms from the late 12th and early 13th c. such as *landum, mannum* are by no means conclusive proof of the absence of umlaut. They must be regarded as conventional spellings due to eastern Old Norwegian scribal traditions, irrespective of the underlying phonological representation. This means that there is no way to decide whether these spellings document the non-occurrence of (younger) *u*-umlaut, or whether they are the result of a phonological reanalysis of the post-umlaut vowel system of Nordic (cf. Benediktsson 1982, 28f.). For further discussion of these Old West Nordic traits, see 5. and 6.

5. Old Icelandic phonology

5.1. General remarks

The starting-point of Old Icelandic language history was the period of settlement (ca. 874–950), when the first settlers from Norway came to live permanently on Iceland. In all probability, Norwegian was split up into many dialects at that time. Being a direct off-shoot of its non-homogeneous parent language Norwegian, Old Icelandic was subjected to dialect levelling (cf. Benediktsson 1961/62, 103). (For the levelling of tonal patterns in Insular Nordic, see art. 122.)

The Icelandic tendency to relative stability and uniformity as compared to the mother country Norway is a striking feature (cf. Sandøy 1994). As shown by Faroese, the colonial status of a language alone does not necessarily account for this (cf. art. 122). Factors of more explanatory power are the geographical and socio-historical conditions in the past (cf. Kuhn 1935; Rafnsson 2000). One such conservative trait of Old Icelandic is /h/-retention before sonorants /l, r, n/ as opposed to aphaeresis in Old Norwegian, Old Danish and Old Swedish, which probably started in the 9th c. (cf. 6.2.).

5.2. Specific developments in Old Icelandic

As shown in 4., Old Icelandic exhibits a series of phonological developments, which are also found in Old Faroese and Old Norwegian (especially its western and southwestern varieties). It has been disputed whether and to what extent such parallelism is contact-based or due to independent parallel developments (cf. art. 100). Among the striking phonological similarities in question are: (1) dissimilations /r/l, l:/ > /dl/, and /rn, n:/ > /dn/ (cf. Sommerfelt 1952, 219ff.; Chapman 1962, 61ff.); (2) diphthongization of non-high long vowels /æ:, ə:, o:/ > /ai, au, ou/, and /e:/ > /je/ (cf. Rischel 1967/68); (3) consonant palatalization reaching furthest in Far. (cf. Werner 1996); (4) the change of initial /hv-/ > /kv-/ (cf. Werner 1968). Note, however, that the transition /hv-/ > /kv-/ is not evidenced in Icel. until the early 17th c. (see Karlsson 1965).

As for the spelling evidence, diphthongization of long mid-high /e:/ is reflected by the occasional spelling <ie> which occurs from the first half of the 13th c. onward (cf. Þórólfsson 1929a; Benediktsson 1961/62, 96). The Mod. Icel. continuation is [jɛ(:)]. Following Bandle (1956), Küspert (1988, 185) favoured the as-

sumption that the transition /e:/ > /je(:)/ was an isolated process of “breaking”, clearly pre-dating the diphthongizations of /æ:/, /ø:/, /o:/. Another common development in Icelandic and Norwegian is itacism due to the unrounding of the high rounded front vowel /y/ > /i/, in the short, the long and the diphthongal subsystem (/y/, /y:/, /øy/). Traces of itacism can already be found in the 13th c. in a number of weakly stressed words, e.g. OIcel. *firir*, *ifir* instead of *fyrir*, *yfir* (cf. Bandle 1956). Benediktsson (1961/62, 97f.) suggested that the distinction /y:/ /i/ was maintained for centuries in the northwest of Iceland, while it was neutralized elsewhere on the island much earlier.

5.3. The stressed vowel system of Old Icelandic

As argued in 3., the vowel system of early Old Icelandic, which underlies the analysis of the FGT, exhibits an asymmetrical system consisting of nine long vowels but only eight short ones. There is no indication of a phonemic distinction /e/ vs. /æ/ in the short subsystem (see 3.). In addition to this long and short subset of vowels, the FGT confirms a nasal correlation which was subordinate to the quantity correlation (Benediktsson 1972, 135f.). For the long and the short vowel system, see the following vowel chart:

Early ON stressed vowel system

a) long vowels

Front		Back	
Unrounded	Rounded	Unrounded	Rounded
Close /i:/	/y:/		/u:/
Mid /e:/	/ø:/		/o:/
Open /æ:/		/a:/	/ɔ:/

b) short vowels

Front		Back	
Unrounded	Rounded	Unrounded	Rounded
Close /i/	/y/		/u/
Mid /e/	/ø/		/o/
Open		/a/	/ɔ/

This early Old Icelandic vowel system represents that of classical Old Norse. In all probability, it is the point of departure for all the Old West Nordic languages, including not only Old Norwegian and Old Icelandic but also Old Faroese and the Norn (cf. Rischel 1967/68, 93f.). It is noteworthy that this complex post-umlaut vowel system with its nine/

eight contrastive units underwent several historical mergers leading to a system of reduced phonemic contrasts. This tendency of neutralization is clearly opposed to the earlier differentiation processes of umlaut and breaking in the transitional period (cf. 2.).

In the late 12th c., an important change affected the stressed vowel system of Old Icelandic: long /ɔ:/, the *u*-umlaut of long /a:/, merged with /o:/, when nasal. Consequently, early OIcel. *nótt* (< */na:t:u/ < */nahtu/) became *nött*; cf. Mod.Icel. *nött* ['nou^ht:] instead of *nátt* ['nau^ht:], which would be the regular equivalent of OIcel. *nótt*. The earliest sporadic evidence of the transition /ɔ:/ > /o:/ is provided by rhymes from the late 11th c. (e.g. *Óláfr* vs. *sólo* in *Óláfsdrápa*). It should be noted, however, that the distinction between nasal long /ɔ:/ and /o:/ is still maintained in the FGT of the mid-12th c. In the light of this contradictory evidence, Benediktsson (1961/62, 99) argued for a temporary dialectal opposition within OIcel.

A primary change which affected both the OIcel. and the ONorw. vowel system was the rounding /a:/ > [ɔ:], traditionally dated to 1200 (cf. OIcel. *spá* ‘prophecy’ < early OIcel. *spǫ* < AN */spahu/). The result of this merger probably was a back rounded vowel [ɔ:] which could be written <á> after the opposition between unrounded /a:/ and rounded /ɔ:/ had been neutralized (Skomedal 1969, 136; Küspert 1988, 181f.). In the early 13th c., another coalescence modified the long vowel system of OIcel.: the merger of front rounded and unrounded vowels /ø:/, /æ:/ > /æ:/ (cf. OIcel. *dáema* ‘judge’ < */do:mijan-/ and *rána* ‘rob’ < */rahnijan-/). As for the short vowel system, only one important merger took place in the first half of the 13th c.: front rounded /ø/ and back rounded /ɔ/ coalesced into /ø/ (cf. Jónsson 1919; Bergsveinsson 1955). Incidentally, the nasal correlation, which is evidenced by the FGT, had also disappeared in 13th c. OIcel. These neutralizations gave way to the following simplified vowel system consisting of seven long and seven short stressed units (for more detail, see Küspert 1988, 183; cf. also Benediktsson 1968, 56f.):

Late ON stressed vowel system

a) long vowels

Front		Back	
Unrounded	Rounded	Unrounded	Rounded
Close /i:/	/y:/		/u:/
Mid /e:/			/o:/
Open /æ:/			/ɔ:/

b) short vowels

	Front		Back	
	Unrounded	Rounded	Unrounded	Rounded
Close	/i/	/y/		/u/
Mid	/e/	/ø/		/o/
Open			/a/	

This 13th c. system of Old Icelandic can be identified with the vowel system underlying the SGT which possibly represents a later stage than the FGT (cf. Raschellà 1982, 84–92). In the late phase of classical Old Icelandic, i. e. from the 13th c. onward, /e:/ was fractured to /je(:)/. Only later, in the 14th and 15th c., were the other non-high long vowels diphthongized: /a:/ > [au], /o:/ > [ou], /æ:/ > [ai] (see Küspert 1988, 184). On further developments of the Icel. vowel system, see Skomedal 1969 and art. 126).

As for the inventory of Old Icelandic diphthongs, three structural types can be distinguished: (1) inherited diphthongs /ei/, /ey/, /au/; (2) breaking diphthongs /ja, jø/; (3) contracted diphthongs resulting from accent shift /e:a, i:a, i:u/ > /ja:, jo:, ju:/ (Heusler 1967, §§ 96f.). The fact that original diphthongs had no length distinction sets them off from the other groups of diphthongs, which had a quantity opposition (on the lengthening of diphthongs, see Benediktsson 1968; Árnason 1980). The breaking diphthongs /ja, jø/, for instance, developed long counterparts due to the process of secondary lengthening (cf. OIcel. *mjólk* vs. OSw. *miolk/miolk*, stemming from Gmc */meluk-/). New diphthongs resulting from accent shift were also long, as they contained a lengthened second segment (e. g. OIcel. *ljúga* 'lie' < Gmc */leugan-/ and *brjóta* 'break' < Gmc */breutan-/).

5.4. The unstressed vowel system of Old Icelandic

Basic research on the unstressed vowel system of early Old Icelandic and its further development has been carried out by Seip (1943), Haugen (1949) and Benediktsson (1962; 1965). The manuscript evidence clearly points to a subsystem of three unstressed units. In the FGT, the low vowel of the unstressed subsystem was identified in quality with stressed /a/, as shown by the pair *ísa* acc.pl. 'ice' vs. *í sá* 'saw in (it)' (see Benediktsson 1972, 147). What is more revealing, the second and third unstressed units were identified in quality with the mid-high long vowels /e:/ and /o:/ of the

stressed vowel system (cf. the pairs *framer* vs. *frá mér* and *höddo* vs. *hó dó* in the FGT). Phonologically, this yields the following unstressed vowel system for early Old Icelandic (ca. 1150):

ON unstressed vowels (phonological system)

	Front	Back
Mid-high	/e/	/o/
Low		/a/

In the orthography of the earliest manuscripts, these three phonemes were regularly represented as <a>–<e>–<o>. In the late 12th c. and in the 13th c., a shift in representation took place, first <e> → <i>, and subsequently <o> → <u>, hence the new notational system <a>–<i>–<u> (Benediktsson 1962; 1965). This orthographic change, however, was not linked to the phonetic properties of the unstressed vowels themselves. It was based on changes of the stressed vowels, which the unstressed vowels were identified with. Consequently, the phonetic features of the unstressed units /e/ and /o/ (involving laxness) remained stable throughout the Old Icelandic period; see the following vowel chart (cf. Benediktsson 1972, 148):

ON unstressed vowels (phonetic system)

	Front	Central	Back
Mid-high	[i]		[u]
Low		[a]	

There was a scholarly debate as to whether or not Old Icelandic had vowel harmony like Old Norwegian (see e. g. Flom 1934; Hesselman 1948–53, 203–9; cf. the comments in Haugen/Markey 1972, 109). In the light of the runic inscription from Eggja (Sogn, Norway) and the evidence from Old Norwegian manuscripts, it seems plausible that the language of the Icelandic settlers contained a rule (or divergent rules) of progressive vowel assimilation which ceased to work due to the operation of dialect levelling (cf. 5.1.). During the period of settlement, Icelandic must have included various Old Norwegian dialects with differing unstressed subsystems (cf. 6.5.). Traditionally, when vowel harmony occurs in Old Icelandic manuscripts, it is ascribed to Norwegian influence (cf. Seip 1943; on different aspects of OIcel.-ONorw. relationships, see art. 100). But in the light of Benediktsson's research, this pre-structural debate is probably out of date, since it relies heavily on the surface value of graphemic representation.

Another phenomenon tied in with the unstressed vowel system of Old Icelandic is svarabhakti intrusion (cf. art. 122). Although epenthetic vowels occur sporadically already in the older runic inscriptions (see e.g. Antonsen 1975, § 5.3), an innovation in Old Icelandic is the regular insertion of ⟨u⟩ (in early Old Icelandic also ⟨o⟩) between a consonant and final /r/ or a consonant cluster /rC/, e.g. *hestr* > *hestur* 'horse', *fegrð* > *fegurð* 'beauty' (cf. Þorkelsson 1863). Manuscripts from the 12th and 13th c. (e.g. AM 623 4^o) show both innovative spellings (such as *sonr* for *sonr* 'son') and inverted ones (such as *tungr* for *tungur* pl. 'tongues'). These particular Old Icelandic developments are shared by certain western varieties of Old Norwegian. Otherwise, Old Norwegian dialects differed markedly from Old Icelandic in their graphemic notation of svarabhaktis (cf. 6.5.).

6. Old Norwegian phonology

6.1. General remarks

In contrast to the normative character of Old Icelandic, Old Norwegian faced a situation of dialectal diversification (for Norwegian dialectology, see Bandle 1962). The general division of Old Norwegian into eastern and western varieties correlates with the geography of Norway, its central mountain range forming a natural line of demarcation (cf. Haugen 1942, 77). A range of language varieties must have existed in Norway in the High Middle Ages. In outlining general phonological systems of Old Norwegian, it seems reasonable to focus on well-established varieties such as western and eastern Old Norwegian. In his *Norsk språkhistorie*, Seip (1955) stressed the dominance of two geographical and chronological sectors: first Trondheim–Bergen (1150–1300), and subsequently Oslo (1300–1370). This displacement of the old center of linguistic innovations was mainly due to the shift of the administrative center to Oslo (as for the importance of this alleged move, cf. Hagland 1986).

6.2. Specific developments in Old Norwegian

Although the linguistic situation was more complex in Old Norwegian than in Old Icelandic, its common phonological developments can be briefly outlined as follows. (1) An important development for the whole

vowel system of ONorw. was the back-rounding of original /a:/, which entailed a merger with /ɔ:/ (written ⟨ǫ⟩ in normalized Old Norse). This change is confirmed by orthographic confusion of ⟨a⟩ and ⟨o⟩ in Old Norwegian manuscripts from 1200 onward. Both in Icelandic and in western Norwegian, the development went even further to a diphthong /au/ (cf. 5.3., 6.4.). (2) As for short mid-high front vowels, early Old Norwegian manuscripts continued to distinguish between ⟨e⟩ and ⟨æ⟩. But this graphemic distinction was only partly historically based (cf. Benedikts-son 1964; on the preliterate merger of /e/ and /æ/, see 3.). In Old Norwegian, ⟨æ⟩ basically represented *i*-umlaut of /a/ and the shortened diphthong */ai/ (e.g. *hæfir* 'has', *hælgir* m.pl. 'holy' vs. *gefa* 'give'). However, the distribution of ⟨æ⟩ vs. ⟨e⟩ partly depended on the consonantal environment. Due to orthographic confusion in later Old Norwegian, ⟨æ⟩ came to designate close /e/ (cf. also the inverted spelling ⟨e⟩ for open /æ/. In addition, ⟨æ⟩ represented the first element of diphthongs /ei/, /ey/ (conventional spellings ⟨æi⟩, ⟨æy⟩ beside ⟨ei⟩, ⟨ey⟩, ⟨øy⟩). (3) In contrast to Old Icelandic orthography, the rounded back vowel /ɔ/ was generally represented as ⟨o⟩ (not ⟨ǫ⟩) in Old Norwegian manuscripts (ONorw. *for* vs. OIcel. *fǫr* 'voyage'). Subsequently, /ɔ/ coalesces with the phoneme /o/ due to the process of raising. (4) A sporadic Old Norwegian development traceable in the manuscripts is unrounding /y/ > /i/ (cf. *firir* 'for', *ivir* 'above'). This process occurred in Old Icelandic too (cf. 4.). (5) In Old Norwegian the opposite process of rounding /i/ > /y/ is signalled by spellings such as *mykill* for *mikill* 'tall' (Indrebø 1951, 114). Note that inverted spellings due to the full merger of high front /i/ and /y/ can also be involved. (6) Among the consonantal developments peculiar to ONorw. is /h/-loss in the initial clusters /hl-, hr-, hn-/ (ONorw. *luter*, *reinn*, *nakke* vs. OIcel. *hlutr*, *hreinn*, *hnakki*). (7) Initial loss of /v/ in /vr/ clusters, on the other hand, is restricted to Old Icelandic and western varieties of Old Norwegian (cf. dial. ONorw. *reiðr* vs. OSw. *vræper* 'wrathful'). Incidentally, this kind of aphaeresis was used as a basic criterion in differentiating between ONorw. and OIcel. manuscripts (cf. 1.1.). (8) Another distinctly Old West Nordic innovation is the transition /hv-/ > /kv-/ (Seip 1949; Hoff 1965). In Norway, it must have taken place in the 14th c., whereas it occurred apparently much later in Iceland (see 5.2.). (9) Due to assimilation, the

fricative /f/ became voiced in intervocalic position and other environments (cf. ONorw. *hava, ulv* < OWN *hafa, ulfr*). (10) The fricative /ð/ (< OWN /θ/) underwent several changes in Old Norwegian including loss (e.g. in final position) and transition to /d/ (e.g. ONorw. *taldi, vandi* < OWN *talði, vanði*), later also /-mð/ > /-md/. (11) Among the consonantal assimilations, note the change /fn/ > /mn/ (e.g. ONorw. *hamn* vs. OIcel. *hǫfn* 'harbour'). (12) The assimilation /ld/ > /l:/ and /nd/ > /n:/ was investigated by Sørli (1969), who studied the local language of medieval Bergen. As for the dating, Sørli argued that some assimilated forms in the manuscripts were traces from the spoken language in Bergen which had entered the manuscripts. He concluded that the changes /ld/ > /l:/ and /nd/ > /n:/ had already started before 1300 (Sørli 1969, 37; cf. also Spurkland 1998, 597). (13) For the rise of tonal patterns in ONorw., see art. 122.

6.3. Dialectal diversification of Old Norwegian

In a general perspective, Old Norwegian can be subdivided into eastern-western as well as northern-southern dialect oppositions, the two main varieties being eastern and western Old Norwegian (cf. art. 113). On a careful evaluation of the manuscripts for dialectology, see Grøtvedt (1940). For instance, processes governing the unstressed syllables such as reduction and vowel balance differed in the north, east and west (see 6.5.). Traditionally, it is stated that southeastern Old Norwegian has developed further away from classical Old Norse due to a series of assimilatory processes (e.g. /tn/ > /n:/ in dial. ONorw. *vann, bonn*) and lack of *i*-umlaut in certain categories (e.g. 1sg.pres. of strong verbs *hogger, kommer*). Note that written sources from Bergen show the same traits, so that we are dealing with an oversimplification (Sørli 1969, 22–24). Nevertheless the southeastern variety of Old Norwegian (with Oslo as its centre) is closest to Old East Nordic of all the Norwegian dialects and, not surprisingly, shows typical traits of Old Swedish (cf. Grøtvedt 1939b). Western and southwestern varieties of Old Norwegian, on the other hand, are linguistically close to the Insular Nordic languages, i.e. Old Icelandic and (partly reconstructed) Old Faroese (cf. art. 122).

Grøtvedt (1938; 1939a) evaluated manuscripts from southeastern Norway using a dialectal perspective. Among the most significant

features of diplomas from this area in the period 1300–1350, he mentioned the following (cf. Indrebø 1951, 138f.): (1) monophthongization of original diphthongs */ai/, */au/, */ey/; (2) weak representation of the so-called “younger” *u*-umlaut (e.g. <markum> vs. <morkum>); (3) progressive *j*-umlaut /ja/ > /jæ/; (4) vowel reduction of unstressed /u/, /a/ > /ə/ (basically written <æ>); (5) consonantal assimilations (especially /ðl/, /tl/ > /l:/, /rn/ > /n:/); (6) itacism, i.e. /y/ > /i/; (7) lowering of short stressed vowels (e.g. /i/ > /e/, /e/ > /æ/); (8) secondary diphthongization (e.g. *sæitti, læiggia*); (9) svarabhakti intrusion (e.g. *gudes, gudæs, gudas*); (10) vowel harmony (cf. 6.5.). Recall that many of these traits are characteristic of Old East Nordic. Innovations with a markedly eastern (or southeastern) centre are monophthongization, lowering /e/ > /æ/, and progressive *j*-umlaut. For a broad linguistic analysis of monophthongization in Nordic, see Faarlund (1975).

On the basis of these linguistic data, Grøtvedt (1939b) and other scholars argued for close linguistic relationships between southeastern Norway and Bohuslän, maintaining that this was a transitional area between Old West Nordic and Old East Nordic. More recently, Holm (1980) argued in a similar vein that West Nordic traits in northern Swedish dialects reflected long-term contact between the two languages through the Middle Ages, possibly based on Norwegian immigration.

6.4. The stressed vowel systems of Old Norwegian

A starting-point for the restructuring of the Old Norwegian vowel system was the rounding /a:/ > [ɔ:], which is traditionally dated to 1200 (Indrebø 1951, 116; cf. 5.3.). After this change, the feature of lip-rounding was non-distinctive for the long low back vowels (cf. Halvorsen 1984, 242). Note that /a:/ was diphthongized in late ONorw. as in Icel. (see Küspert 1988, 240ff.; cf. 5.3.). Weinstock (1975) pointed to the high number of lengthening processes of short ON /a/ to ONorw. /a:/ which subsequently underwent the same developments as original /a:/, i.e. velarization, rounding and diphthongization (cf. Norw. *åker* < OWN *akr*; Indrebø 1951, 116f.). Weinstock inferred that lengthening of short /a/ antedated the above-mentioned coalescence of /a:/ and /ɔ:/. In the 13th c., the so-called quality shift affected the whole vowel system

of Old Norwegian (cf. Küspert 1988, 352 ff.). The divergent developments of long and short vowels have been perceived as a natural process of differentiation involving changes in quantity and quality. For an Old Swedish perspective, cf. Widmark (1998); Sandøy (1999). Thus, open /ɔ:/ moved to /o:/, which in its turn was raised toward /u:/, /ø:/, while /u:/ approached /y:/, and /y:/ in its turn gave way to /i:/. As a consequence of this quality shift, the long vowels diverged qualitatively from their short counterparts (e.g. /a/ : /ɔ:/). It is a moot point in Nordic language history whether these interlinked developments involved a push-chain or a drag-chain (cf. Rajić 1984, 351). In any case, this structural remodeling had far-reaching consequences for the phonology of Norwegian (cf. art. 122). Other changes were clearly dialectally based, e.g. progressive *j*-umlaut (cf. eastern ONorw. *jæfn*, *gjelda* < OWN *jafn*, *gjalda*; cf. 6.3.). For a detailed historical study of western Norwegian vowel systems, see Küspert (1988, 214 ff.).

6.5. The unstressed vowel systems of Old Norwegian

The unstressed vowel systems of Old Norwegian differed from the corresponding Old Icelandic system (cf. 5.4.). First, some Old Norwegian dialects tended to reduce the standard three-unit system toward a two- or one-unit system. Traces of vowel reduction (especially /a/, /u/ > /ə/) can be found in manuscripts from both eastern and western Norway from the 12th c. onward (cf. Indrebø 1951, 134). Sørliie (1969, 24–30) argued that “the local language of Bergen represented a transitional stage around 1200. Vowel weakening was an ongoing process at that time” (Sørliie 1969, 26; my transl.).

Second, there was an additional rule of progressive assimilation, so-called “vowel harmony”. Many Old Norwegian dialects (including eastern and northwestern Norway as well as the area of Trøndelag) have a regular distribution of <i/e> and <u/o> in unstressed syllables (cf. Indrebø 1951, 136; Haugen 1982, 38). This assimilatory process was dubbed vowel harmony ever since Kock (1882, 145). The standard rule for Old Norwegian is that unstressed /i/ and /u/ occurred as <i> and <u> after high /i, y, u/, but as <e> and <o> after low and mid-high /a, e, ø, o/ (cf. *ungi* vs. *orðe* and *ungum* vs. *orðom*). Surprisingly, the short umlaut vowels /æ/ (i.e. *i*-umlauted /a/) and /ɔ/ (i.e. *u*-umlauted /a/) were also followed by <i>

and <u> (e.g. *hofði*, *ollum*). Although this deviation has been observed by several scholars, it defies a proper solution (cf. Christiansen 1947, 100; Hagland 1978b, 142 ff.; Grønvik 1998, 580). The evidence from the Eggja inscription from Sogn (ca. 700) points to a great age for this kind of phonological rule; cf. **gAlande, mAdE, sAkse vs. huni, misurki, wiltir** with <i> after high vowels, but <e> after non-high ones (Grønvik 1985, 169–172).

Vowel harmony is traditionally regarded as a dialectal feature which is absent in southwestern Norwegian (cf. Indrebø 1951, 138). However, as shown by the Stavanger diplomas (datable before 1330), this rule must have been firmly established in the southwest, too: “Most of the diplomas exhibit a clear form of vowel harmony, much more so than one would expect to find” (Housken 1954, 17; my transl.). This runs counter to the categorical statement that vowel harmony was absent in southwestern Norway. It must be inferred that this phonological rule was at work in the whole of Norway (including the area of Stavanger), although it was partly undermined by vowel balance, which is found in northern and eastern Norway and in the north of Sweden (cf. Haugen 1970, 58–60). To account for Scandinavian vowel harmony in northern Norway and Sweden, Kusmenko/Riessler (2000) invoke Sami-Nordic language contact. Interference between different phonetic processes led to an intricate interplay which renders the Old Norwegian written sources hard to interpret (cf. Knudsen 1936, 198 f.). Hagland (1978a, 84–94) was also aware of the fact that vowel harmony interacted with other processes such as vowel weakening and vowel balance (cf. Larsen 1913).

As for svarabhakti intrusion, the rules were less restricted and uniform in Old Norwegian than they were in Old Icelandic (cf. Indrebø 1951, 118 f.). Old Norwegian dialects show considerable variation in denoting epenthetic vowels. The most frequent graphemes are <e>, <æ> (e.g. *riker maðer* ‘rich man’), but <a> occurs in certain western dialects such as Vestfold and Telemark (e.g. *vetar* ‘winter’, *bækar* ‘books’). Western varieties of Old Norwegian, especially from Hardanger and Voss, regularly exhibit <u> as does Icelandic (cf. 5.4.). On the whole, epenthesis in Old Norwegian is less restricted than in Old Icelandic. Apart from the general development before final /-r/, a svarabhakti intrudes into the cluster /-Cs/ in Old Norwegian dialects (e.g. gen.sg. *Noreges*, *guðes* < *Noregs*, *guðs*).

7. Conclusion

This sketch focused on the basic phonological systems of Old Icelandic and Old Norwegian, especially their stressed and unstressed vowel systems. Due to its uniformity and normative character, Old Icelandic appears clearly less diverse and complex than Old Norwegian. As for Old Norwegian, a dialectal split into eastern–western and northern–southern varieties is evident (Indrebø 1951, 131–39). But as far as the dialectal phonology of Old Norwegian is concerned, some of our standard knowledge has to be revised according to the investigations by Housken (1954) and Sørli (1969). In general, the analysis of unstressed vowel systems of Old Norwegian encounters several intricate problems, owing to the interaction of different processes such as vowel weakening, vowel harmony and vowel balance (cf. 6.5.). Therefore, the feature of vowel harmony is less suitable in a dialectal perspective than is commonly assumed.

On the whole, different manuscript traditions do not allow for a precise reconstruction of the dialectal phonological systems of Old Norwegian. It is self-evident that the different sources of evidence mentioned in 1.1. are only partially sensitive to phonological change. Diplomas are much closer to the spoken language of their time than the manuscripts. Runic inscriptions can also show peculiar, sometimes archaic traits (cf. Indrebø 1951, 110; Spurkland 1998). As a matter of fact, writing systems (both the adapted Latin alphabet and the runic futhark) are imperfect (cf. Indrebø 1951, 106ff.). It follows that the interpretation of the written medium encounters severe problems. It is generally acknowledged that the conservatism of orthography can be misleading. As most clearly seen in the case of Icelandic, innovations can partly be hidden under the guise of a stable graphemic system. Nedrelid (2000) stresses the divergent orthographic teleologies of Icelandic and Faroese: continuity vs. reconstruction.

Finally, it has to be stated that strict methodological principles have neither been established nor applied in the analysis of the written medium within the whole field of Nordic philology (cf. Hødnebo 1971). But it should now be possible to found a sound theory and methodology of internal reconstruction on the basis of American structuralism (cf. Fox 1995).

102. The phonological systems of Old Nordic II: Old Swedish and Old Danish

1. The vowel system of Old East Nordic
2. The Danish quantity shift
3. Further vowel changes
4. The consonant system of Old East Nordic
5. Tonal prosodies
6. Literature (a selection)

The languages from the period 1100–1350 will be referred to with a common name, Old East Nordic (OEN), since at the outset, they share most phonological properties. By the end of the period, three distinct phonological systems had emerged, Old Danish (ODan.), Old Swedish (OSw.), and Old Gutnish (OGu.). The term used for the period preceding the Old East Nordic period is Proto-Nordic (PN). The later PN period, about 800–1100, includes the end of processes like syncope and the loss of umlaut as a productive process and several developments defining a western-eastern split in North Germanic.

1. The vowel system of Old East Nordic

In the transition from PN to OEN, the vowel system became richer by virtue of three umlauts, and more streamlined as the eight stable vowels all came to have long and short variants. The three old diphthongs were monophthongized in most dialects, with OGu. as a notable exception, as one of several features defining an East Nordic variety.

In Table 102.1, the OEN vowel system is described with monovalent distinctive features. The feature (rounded) is distinctive only in the (front) series, and the phoneme /a/ is specified solely by the height feature (low), as can be established from its behaviour and effects in umlauts.

Tab. 102.1: OEN vowel system

	front			back
		rounded		
high	i ~ i:	y ~ y:		u ~ u:
	e ~ e:	ø ~ ø:	ə	o ~ o:
low	æ ~ æ:		a ~ a:	(ɔ) ~ ɔ:

Different symbols are used for long /a:/ and short /a/ in order to make it easier to keep

track of them in the discussion of the OSw. vowel shift (art. 124).

1.1. The Old Danish vowel system

Danish did not undergo a vowel shift comparable to OSw. and OGu. All that happened was that a new low back phoneme was created by the lengthening of OEN /a/ to ODan. /a:/ (quantity shift, cf. Table 102.2.) and subsequent backing of OEN /a:/ to ODan. /ɔ:/. A short counterpart of /ɔ:/ arose e.g. by later shortening and in forms like s[ɔ]rt ‘black’ from former *swart-*.

Tab. 102.2: ODan. vowel system (ca. 1350)

	front			back
		rounded		
high	i ~ i:	y ~ y:		u ~ u:
	e ~ e:	ø ~ ø:	ə	o ~ o:
low	æ ~ æ:		a ~ a:	(ɔ) ~ ɔ:

ODan. obtained a schwa by reduction (3.3.). A diphthong [iu] developed from /y:/ in both ODan. and OSw. dialects during the period (Skautrup 1944, 250; Wessén 1969, 54). This mimics PN breaking, but occurred much later. Examples include ODan. *G[iu]rth-* (name) and OSw. *g[iu]rþa* ‘gird’ (OSw. *siuker* ‘sick’, *biudha* ‘to bid’ are of a different origin). The post-vocalic context for diphthongization of /y:/ is prototypical for breaking: [rþ], [rt] and [rn] (Dyvik 1978). The diphthong later underwent prominence shift and lowering (Mod. Dan. *skjorte* ‘shirt’, Mod.Sw. *omgjorda* ‘gird’), or rounding and lowering (dial. [høwər], for Mod.Dan. *hyrde* ‘shepherd’).

1.2. The Old Swedish vowel system

The OSw. vowel system around 1350 was very similar indeed to the ODan. one. There was a new low vowel phoneme /a:/ (from OEN /a/ in certain quantitative environments), and OEN /a:/ became back /ɔ:/, the beginnings of the later vowel shift (art. 124). A short counterpart of /ɔ:/ arose e.g. from the backed originally short instances of /a/ (s[ɔ]lde ‘sold’, etc.).

Tab. 102.3: OSw. vowel system (ca. 1350)

	front			back
		rounded		
high	i ~ i:	y ~ y:		u ~ u:
	e ~ e:	ø ~ ø:		o ~ o:
low	æ ~ æ:		a ~ a:	(ɔ) ~ ɔ:

Reduction in unstressed syllables was much less extensive in OSw. than in ODan. For this reason, no schwa has been inserted in the vowel system. The quality of the epenthetic vowel, which shows up even in some runic inscriptions, might however have had a schwa-like quality in several dialects. In orthography, that vowel is usually rendered as ⟨e⟩ or ⟨æ⟩, occasionally as ⟨a⟩. When the Swedish vowel shift was completed, perhaps three centuries later, all members of the back series had moved over one cell (cf. art. 124).

1.3. The Old Gutnish vowel system

OGu. exhibits a quite different development from OSw. and ODan., especially with regard to the vowels. Söderberg (1879) bases his presentation of OGu. on a 14th century manuscript of the Guta Law and the Guta Saga. By this time, OGu. already displayed several distinct properties. Compare Table 102.4 with the OEN vowel system given in (1).

Tab. 102.4: OGu. (ca. 1350)

	front			back
		rounded		
high	i ~ i:	y ~ y:		u ~ u:
	e ~ e:			o ~ o:
low			a ~ a:	

One salient feature of early OGu. is that there were hardly any traces of *u*-umlaut (OSw. *gora* ‘do’ is *gera* in OGu.). Another feature which sets OGu. aside from the other East Nordic dialects is a vowel shift which removed some of the effects of *i*-umlaut (Pipping 1905–07, 73). Thus, /æ ~ æ:/ and /ø ~ ø:/ were not present in the OGu. vowel system. Söderberg (1879, 17) assumes that the umlaut vowels were there earlier, but that they were subsequently removed by the OGu. vowel shift (cf. art. 124). One supporting argument for this

is the fact that the vowel shift can be established at least for one other non-umlaut vowel, /e:/.

1.4. Diphthongs in Old Gutnish

The old diphthongs /ai/, /au/ were both retained in OGu.: *st[ai]n* ‘stone’, *b[ai]n* ‘bone’, and *[au]ga* ‘eye’, *l[au]pa* ‘run’. PN /eu/, however, developed differently than in the other East Nordic languages, and shows up as OGu. /iau/, a triphthong, e.g. *d[iau]pr* ‘deep’, *b[iau]ða* ‘bid’, *n[iau]ta* ‘enjoy’ (OSw. *d[ju:]per*, *b[ju:]ða*, *n[ju:]ta*). Much evidence seems to point to the development of /iau/ being particular to OGu. from the outset. Pipping (1902) proposed that it resulted from a special case of *u*-breaking within /eu/. There is circumstantial support for such a reconstruction (Ralph 1998). Several questions regarding the phonological environment of breaking generally remain, however (cf. Dyvik 1978 for the argument that it is a postvocalic liquid rather than an /u/ which conditions breaking). Later, Mod.Gu. developed a new set of diphthongs in the final stage of the vowel shift (cf. art. 124).

2. The Danish quantity shift

In Denmark, the quantitative changes relating to the quantity shift generally took place earlier than further north, beginning about 1250 according to Haugen (1976, 258). A few examples of lengthened vowels (the most common case in the south) in CVCV disyllables include *gl[a:]de* ‘happy’ pl., *sk[æ:]re* ‘to cut’, *st[e:]der* ‘places’, *v[i:]de* ‘know’. In CVC monosyllables lengthening could also take place, analogically according to Skautrup (1944, 236), but the phenomenon appears more regular (hence phonological) in the general Scandinavian context. The quantity shift actually began in monosyllabic forms, at least in Swedish. Examples of vowel lengthening in CVC monosyllables include *fl[a:]d* ‘flat’, *sk[i:]b* ‘ship’, *r[u:]g* ‘rye’. In manuscripts, vowel length and consonant length are often represented with double letters (except in word-final consonants): ⟨gaat⟩ ‘street’, ⟨guul⟩ ‘yellow’, ⟨rymmæ⟩ ‘contain’, ⟨ussel⟩ ‘wretched’. Orthographic double vowels are particularly common in manuscripts displaying Jutlandish features, such as *Flensborg stadsret* and manuscripts by Jens Jyde and Knud Jul (Skautrup 1944, 217).

Consonant lengthening, which is quite limited in Danish, occurs when the postvocalic consonant is /m/ or a stop + /j/, viz. *ko[m]e* > *ko[m:]e* ‘come’, *sæ[t]jæ* > *sæ[t:]jæ* ‘put’. It also happens in (original) compounds where the first member ends in a long vowel, which shortens, e.g. *La:-[l]and* > *Lo[l:]and* (place name), *fa:-[t]økr* > *fa[t:]ig* ‘poor’. Forms of the *sætjæ* type are variably treated as heavy or light in different dialects. The reason for this is the different syllabifications available: *sæt.jæ* (heavy) or *sæ.tjæ* (light). In the latter case, the sequence /tj/ might be phonetically near an affricate of a palatalized /t/. In one view, the separation of /t/ and /j/ by a syllable boundary creates unstable syllable contact, by virtue of the rising sonority across the boundary (Murray/Vennemann 1983). This may favour change. Consonant lengthening (gemination) would solve all problems (heavy weight and good syllable contact) by making the lengthened /t:/ straddle the syllable boundary; /j/ is often lost in the process.

2.1. Danish degemination

The logical end point of the quantity shift is that the tendency for stressed syllables to be heavy (sometimes called Prokosch’s law or the bimoraic condition) becomes an obligatory constraint. However, depending on how the simplification of the quantity system is implemented, this state is not reached in all Germanic languages. At the critical cross-roads, Danish sides with the West Germanic languages, all of which generalize distinctive vowel quantity and lose distinctive consonant quantity (cf. art. 124). Neutralization of the consonant contrast is manifested as degemination of long consonants. In ODan., this happened around 1300 (Skautrup 1944, 254), while in the West Germanic languages, the whole development is at least a century older.

Tab. 102.5: ODan. and WGmc degemination

ODan.	<i>vi[l:]e</i>	>	<i>vi[l]e</i>	‘wild’ pl.
	<i>hje[m:]e</i>	>	<i>hje[m]e</i>	‘home’ adv.
	<i>fa[t:]ig</i>	>	<i>fa[t]ig</i>	‘poor’
MHG	<i>Ku[m:]er</i>	>	<i>Ku[m]er</i>	‘grief, trouble’
	<i>Ta[p:]e</i>	>	<i>Ta[p]e</i>	‘awkward person’
	<i>wa[k:]en</i>	>	<i>wa[k]en</i>	‘hesitate’
ME	<i>bi[t:]er</i>	>	<i>bi[t]er</i>	‘bitter’
	<i>ae[p:]el</i>	>	<i>ae[p]el</i>	‘apple’
	<i>fre[m:]an</i>	>	<i>fre[m]an</i>	‘stranger’

The Danish quantity shift is intricate in its details, but the general pattern is clear. To begin with, Danish showed all signs of a full and uninhibited quantity shift: vowels lengthened in open syllables, certain consonants lengthened. The dating of these events can be made quite precise due to ODan. degemination and consonant shift (gradation, cf. 4.4.) which affected short consonants only. The choice of distinctive vowel quantity means that consonants could no longer be used for lexical marking of quantity, and many heavy stressed syllables thus became light. Degemination goes against Prokosch’s law, and so the tendency to make stressed syllables heavy came to a halt in Danish.

3. Further vowel changes

3.1. Progressive *i*-umlaut

Progressive *i*-umlaut applies in the contexts [ja ~ ja:] and [jo ~ jo:] (Wessén 1969, 53 f.; Skautrup 1944, 248 f.), and constitutes one of the isoglosses separating West Nordic from East Nordic (Bandle 1973, 55; Haugen 1976, 200). The feature (front) is assimilated to a following vowel. The fronting of short /a/ is attested in the 11th century runic inscriptions (*hjalpi* > *hjælpi* ‘help’ subj.). Fronting of long /a:/, /o/ and /o:/ took place during the 14th and early 15th century, in that order: *s[ja:]l* > *s[jæ:]l* ‘soul’, *b[jo]rn* > *b[jø]rn* ‘bear’, *s[jo:]r* > *s[jø:]* ‘sea, lake’. In OGu., progressive *i*-umlaut only applies in the context [ja ~ ja:], and primarily in the northern part of Gotland (Pipping 1901). In later language stages the rule expanded, lexically and geographically (Gustavson 1940–42, 244), but the context [jo ~ jo:] remained unaffected (OGu. *b[jo]rn* ‘bear’ vs. OSw. *b[jø]rn*). The palatal element has been represented here as a glide (Bandle 1973, 55), the assumption being that it is part of the syllable onset rather than part of a nuclear diphthong (Skautrup 1944, 219).

3.2. Vowel changes in stressed syllables

Other OEN changes relating to vowel quality include the lowering of short /i/ and /y/ to [e]/[æ] and [ø]/[œ], respectively, beginning in the late 13th century. This development was inhibited in palatal environments (*j[y]sk* ‘Jutlandish’, not *j[ø]sk*) and had a limited impact on the Danish written language (Skautrup 1944, 247). Some examples are *þr[i]þia* > *þr[e]þia* ‘third’, *m[i]kin* > *m[e]gen* ‘much’,

$s[y]nir > s[\emptyset]nir$ 'sons', $b[y]lgia > b[\emptyset]lge$ 'wave'. A similar change took place in OSw., first in the context of a following cluster whose first member is an [r] or a velarized [l]: $h[i]rþe > h[e]rðe$ 'shepherd', $[y]rt > [\emptyset]rt$ 'herb'. The change also included /u/ > [o]: $d[u]lde > d[o]lde$ 'hid' (Wessén 1969, 54). The rule occurred in a more general form in MSw., where words that had escaped *a*-umlaut now could be lowered context-freely, e.g. $b[u]þ > b[o]þ$ 'message', $dr[u]pi > dr[o]ppe$ 'drop'. Swedish lowering was much more general in the Göta dialects than in the Svea dialects.

A reverse change, raising of /e/ to [i], took place in palatal environments, again more generally in ODan. than in OSw./MSw. Dan. examples include *sige* 'say', *kilde* 'source', *tie* 'be silent'.

3.3. Vowel weakening

Swedish, Norwegian and Danish all underwent a general weakening in unstressed syllables over the first half of the second millennium. It was by far most general in Danish, where it shows up regularly in runic inscriptions and in diplomas from around 1100 and onwards (Brøndum-Nielsen 1928, 390; Skautrup 1944, 219, 225). In Swedish and Norwegian the weakening occurred much later, and was not as extensive. OGu. exhibits no weakening of vowels in unstressed syllables, but at later stages weakening was extensive, sometimes resulting in apocope. In Danish, the full vowels /a/, /i/ and /u/ of endings reduced to a schwa [ə], orthographically represented as <æ> or (less often) <e> in the early written records, today as <e>. In Swedish, /a/ is preserved in the central and northern dialects, while /i/ and /u/ have lowered to mid vowels, but never to schwa, except in the very south (Scania). In many places throughout Scandinavia, unstressed vowels in final position are subject to apocope, but nowhere is this process more general than in Jutland (cf. Bandle 1973, map 16).

Danish weakening, though early, was not immediate and wholesale. In some dialects, e.g. Bornholm, /a/ was unaffected. The vowel /i/ also generally tended to be preserved when it followed a velar consonant (*riki* 'realm', *ængi* 'no one') or when followed by /t/ or /n/ (*haldit* 'held', *dræpin* 'killed'). The vowel /u/ was retained in some dative forms (*hanum* 'him', *logum* 'laws'). An interesting preservation pattern was conditioned by vowel harmony.

3.4. Vowel harmony I

Vowel harmony operated from the Old to Modern stages of Scandinavian dialects. We shall refer here to the older occurrence as Vowel harmony I and the later process as Vowel harmony II (Sw. *tilljämning*). Segmentally, they have much in common, but they apply under different prosodic conditions. The sensitivity to quantity gave rise to various patterns and also to different geographic foci (cf. Brøndum-Nielsen 1928, 382, for basically this view). Scandinavian vowel harmony may be seen as a broad response to the combination of two prosodic factors, namely a rich quantity system (allowing both light and super-heavy syllables beside regular heavy syllables) and tonal accent 2. The precise nature of the connection remains unclear (Sandøy 1987; Kristoffersen 1990; Bye 1996; Riad 1998b), but it is clear that harmony occurred after the introduction of tonal accent 2 and that it went away when a dialect implemented the quantity shift (cf. 2. and art. 124). The fact that the stress and quantity systems developed at different paces in different areas is a major cause for the phonological differences between dialects which emerged after the Old stage. Vowel harmony I became a southern and western (viz. East Norwegian) early phenomenon, while Vowel harmony II looks like a broadly northern and later phenomenon, and is still extant today. It appears quite likely, however, that harmony operated continuously, in some dialects until today. For instance, Älvdalska has as yet not implemented the quantity shift and exhibits Vowel harmony II, but only in accent 2 words. It might be added that Scandinavian vowel harmony does not exhibit the usual phonological and morphological constraints which obtain in better-known harmonic systems like Turkish, Finnish and Italian metaphony (cf. Riad 1998b for a brief review). Further study of the general connections between older and younger vowel harmony and the precise prosodic conditioning is warranted. For practical purposes, the two will be discussed separately here. Vowel harmony II is organically tied to persisting vowel balance and is discussed in art. 124. Vowel harmony I occurred in East ODan., East ONorw. and in southern and western OSw. Thus, it shows up in e.g. *Skånske lov*, *Necrologium Lundense* and other ODan. texts, and in the manuscripts of the OSw. *Västgöta laws*, but it is also manifest as far north as in the *Södermanna law* (Kock 1882; Larsson 1891; Brøn-

dum-Nielsen 1928, 382ff.; Ralph 1975, 25ff.), although manuscripts of this law exhibit both Göta and Danish influence (Wiktorsson 1976, 77; 145). Vowel harmony I lasted from around 1100 until after 1400, and seems to have spread from a center in Scania (Hesselman 1948–53, 281; Haugen 1976, 207) or East Norwegian (Wessén 1969, 61), or both.

This vowel harmony was progressive, where the height of the vowel in the root syllable harmonically regulated the height of the vowel in the following syllable. Brøndum-Nielsen (1928, 385) and Skautrup (1944, 227) report e.g. the following forms:

Tab. 102.6: Vowel harmony I, high and mid vowels

/i/ [i]		[e]	
sigir	‘says’	bethes	‘bid’
fulli	‘full’	bonden	‘the farmer’
lyftir	‘lifts’	gøre	‘do’
/u/ [u]		[o]	
finngu	‘received’ pl.	eno	‘one’ obl.
skulu	‘shall’ pl.	brothor	‘brother’ obl.
tyltum	‘dozen’ obl.	dømdo	‘deemed’ pl.

A low vowel in the root could also lower a following high vowel, but the distribution here appears to be controlled by the quantity of the root vowel (Brøndum-Nielsen 1928, 382); thus *dr[æ]pin* ‘killed’, *b[a]ni* ‘slayer’, *st[æ]fnu* ‘assembly’, *[a]ndru* ‘other’ vs. *m[æ:]ler* ‘tells’, *m[a:]le* ‘language, speech’, *r[æ:](t)to* ‘direct’, *s[a:]re* ‘wound’.

There was also a separate harmonic process changing /a/ to [æ], discussed e.g. by Kock (1882), Larsson (1891, 56ff.) and Ralph (1975, 25ff.). The examples below are taken from the *Södermanna law*.

Tab. 102.7: Vowel harmony I, low vowels

/a/ [a]		
aflat		‘conceived’ p.part.
gamla		‘old’
hundraþa		‘hundreds’ gen. pl.
hiona		‘servants’ gen. pl.
iorþa		‘lands’ gen. pl.
[æ]		
bindæ		‘to bind’
gerningæ		‘deeds’ acc. pl.
letæ		‘to search’
fæmtæ		‘fifth’ obl.
lösæn		‘ransom’

There are many exceptions to both of these harmonic patterns, often because of competing generalizations. For instance, so-called

vowel balance, where the quantity of the root syllable (indirectly) determines the quality of the post-tonic vowel, tends to require [i] in forms containing a light root syllable in the *Södermanna law*, even when vowel harmony I would dictate [e] (Larsson 1891, 69ff.). Also, [i] is generally favoured in closed syllables, a tendency that may compete with both vowel balance and vowel harmony I.

Vowel harmony I with the high vowels /i/ and /u/ has wide attestation, while harmony involving /a/ occurs in a smaller area. Ralph (1975, 28ff.) shows that harmony with /a/ is in fact a separate process from harmony with /i/ and /u/, and hence not to be captured by the same rule. In most records, the vowels triggering harmony with /a/ are the umlaut vowels, that is /y/, /æ/ and /ø/ (from earlier /i/, /a/ and /o/), but these do not form a natural class phonologically (Ralph 1975, 31ff.). The original conditioning factor of /a/ > [æ] is instead the /i/ of the unstressed /-ia/-endings (progressive *i*-umlaut). This was a regular process in OSw. and applied first after velar consonants, later in any unstressed syllable. An umlaut vowel in the root syllable will thus tend to co-occur with an [æ] in the ending, the qualitative relationship between the nuclear vowels of both syllables being indirect, conditioned by /i/. At some point, a reinterpretation of the context for harmonic /a/ > [æ] was made such that speakers came to associate the [æ] of the ending with root vowels of the umlaut type (hypercorrection). This measure in turn extended the application of harmony to many new instances of /a/, in forms etymologically lacking the directly preceding /i/. Note, however, that one must also allow for generalization of the phonological conditioning, beyond the umlaut vowels, in view of forms like *bindæ* and *gerningæ*, where the root does not contain an umlaut vowel.

Despite the fact that the two harmonic rules subsumed under Vowel harmony I are not organically related, /a/ > [æ] harmony occurs in a proper subset of the dialects displaying vowel harmony with /i/ and /u/. To explain this fact, Ralph (1975, 35) suggests that regular harmony provides the necessary psychological association between vowels of the root and ending for the hypercorrection /a/ > [æ] to occur.

3.5. Vowel epenthesis

Late PN syncope in closed syllables or word-medially put a potential strain on phonotactic

conditions. Word-internally, syllabic structure was fairly simple, and medial syncope usually resulted in an acceptable cluster (**katilo:z* > *kattlar* ‘kettles’) or a geminate (**satide:* > *satte* ‘set’). In final closed syllables, the target vowels for syncope occur before /z ~ R/, viz. **fiskaz* > **fiskz* > *fiskr* ‘fish’. The /z ~ R/ here developed in different ways (cf. 4.2.), one of which was merger with /r/. Where /r/ occurred after a stop, as in *fiskr*, epenthetic vowels began to develop (OSw. *fisker*). This process began with /r/ but soon showed up with the other coronal sonorants /l/ (*segl* > *segel* ‘sail’) and /n/ (*sokn* > *soken* ‘parish’) as well. The process primarily belongs to the 12th and 13th centuries, and is still a synchronic rule of Swedish (e.g. Rischel 1963; Telemann 1969; Hellberg 1974).

The epenthetic vowel is orthographically represented as <e>, sometimes as <i> or <æ> or <a> in OSw. In OGu. it is predominantly <i>, sometimes <a>, but very often it is left out, apparently an orthographic convention, since occasional omissions of etymological <i> and <a> are not infrequent (Söderberg 1879, 46).

4. The consonant system of Old East Nordic

Regarding the consonant phoneme system, there are important isoglosses to reckon with. One runs through the Sound between mainland Sweden and Zealand. Some of the Danish innovations did not reach the Danish parts of southern Sweden (Scania, Blekinge, southern Halland, parts of Småland, and Bornholm) or were less fully implemented there. This area is commonly referred to as East Danish. Other innovations such as apocope separate West Danish (Jutland) from the rest of the area.

Tab. 102.8: Late PN consonant system

		place			voice
		labial	coronal	dorsal	
obstru- ents	stop	p(:) --	t(:) --	k(:) --	voiced
	continuant	f β/b(:)	θ ð/d(:)	χ/h γ/g(:)	
	continuant sibilant		s(:) z ~ R		
sono- rants	retroflex lateral		r(:) l(:)		voiced
	nasal	m(:)	n(:)	--	
	voiced	w		j	

The late PN consonant system is given in tab. 102.8. Discussions of the consonant system are given in e.g. Skautrup (1944, 220), Pamp (1971, 95ff.) and Haugen (1976, 154ff.).

The features are monovalent and used with some redundancy for clarity. To distinguish /s/ and /z ~ R/ from the interdental fricatives, the feature [sibilant] is used. The phoneme /z ~ R/ is often referred to as the ‘palatal r’. In a diachronic perspective, the assumption that /z ~ R/ is the voiced counterpart of /s/ seems to reflect the evidence best.

The stops, the sonorants except the glides, and /s/ could occur as geminates (=long). Note that the voiced fricatives participated in allophonic alternation with voiced stops. The stop realization originally occurred in the homorganic clusters /nd/, /mb/ and /ŋ/ and in the small set of geminates (Pamp 1971, 95; Skautrup 1944, 221). During the PN period the voiced fricatives became stops in word-initial position: PN **[β]eran* > OSw. [b]æra ‘carry’, **[ð]auðar* > [d]ø:ðer ‘dead’; and after a nasal: **dø:m[ð]i* > *dø:m[d]i* ‘deemed’, **maŋ[y]R* > *maŋ[g]er* ‘manifold’. Examples of geminate voiced stops are OSw. *Sibbi* (name), *fodder* ‘born’, *rygger* ‘back’.

Several changes took place in the consonant system between late PN and the systems of OSw. and ODan. around 1350. The OGu. developments were by and large as in OSw. Some changes streamlined the system such that most consonants came to have a long and a short variant. This came about as the segmental quantitative distinction expanded and loss or change affected some of the fricatives. In general, one could say that OSw. perfected this line of development. In ODan., two processes had far-reaching consequences for the consonant system. The ODan. quantity shift led to the loss of age-old distinctive quantity in the consonants (cf. 2.1.), and consonant weakening (diachronic gradation) took place, resulting in several new segmental specifications.

4.1. The Old Swedish consonant system

The bilabial fricative /β/ in its [β] realization and the glide /w/ both developed into a labiodental voiced fricative /v/, probably in the 11th century. However, /w/ was retained in postconsonantal position throughout the period, cf. forms like *swæria* ‘swear’, *hwat* ‘what’, *swa* ‘so’. /β/ also underwent nasal assimilation to a following /n/ in Swedish and East Danish. Thus, we find /m/ in forms like [hamn] ‘harbour’ (< [haβn]), [jamn/jæmn] ‘even’

(< [jaβn] < [eβn-]). In West and Central Danish we find [hawn] (< [havn] < [haβn]). The [β] phone thus removed, the stop allophone [b] became a full phoneme /b/. The other voiced fricatives remained with largely the same allophonic alternations.

Two of the voiceless stops, /t/ and /k/, underwent allophonic voicing (and sometimes further reduction) in the prosodically weak word-final and intervocalic positions (Pamp 1971, 107). Examples are *no[k]on* > *no[g]on/ no[ɣ]on* 'someone', *ta[k]a* > *ta[g]a/ta[ɣ]a* 'take', *skipi[t]* > *skipi[d]/skipi[ð]* 'the ship'. Final stops were sometimes lost entirely. Their presence in present-day Swedish (except Finland-Swedish) is due to restitution. In the southern and western dialects voicing was general in post-vocalic position and included the bilabial stop /p/. This process is obviously related to Danish gradation (cf. 4.4.). Examples include *ga[p]a* > *ga[b]a* 'hold one's mouth open', *ta[k]* > *ta[g]* 'roof'. These processes led to some positional neutralizations as the voiced stops [d] and [g] came to occur as allophones of two phonemes each: /t/, /ð/ and /k/, /ɣ/, respectively.

The voiceless dental fricative /θ/ only occurred word-initially, and was orthographically represented as <þ>. In OSw. it was subject to voicing in unstressed forms, primarily pronouns ([ð]u: 'you', [ð]ænni 'this one') and pronominal adverbs ([ð]a: 'then', [ð]ær 'there', [ð]i:t 'thither'). In late OSw. this phoneme merged with /t/, and to some extent with /ð ~ d/.

Tab. 102.9: OSw. consonant system

		place			voice
manner		labial	coronal	dorsal	
obstru- ents	stop	p(:) b(:)	t(:) --	k(:) --	voiced
	continuant	f v	θ ð ~ d(:)	h ɣ ~ g(:)	voiced
	continuant sibilant		s(:) z ~ R		voiced
sono- rants	retroflex lateral		r(:) l(:)		
	nasal	m(:)	n(:)	ŋ:	
	voiced	(w)		j	

The phoneme /h/, which resulted from a context-free transition from the remaining instances of PGmc /χ/, had a severely circumscribed distribution in Proto-Nordic. By early

OSw., /h/ was retained only before a stressed vowel or glide plus vowel (*halda* 'hold', *horn* 'horn', *hjarta* 'heart', *hwat* 'what').

A novelty of OSw. is the (inherently long) velar nasal /ŋ/. Through a somewhat abstract analysis, this sound can be derived from a consonant cluster /ng/, but we will treat it here as a phoneme in its own right. Two processes give us this phoneme. The voiced fricative/stop /ɣ ~ g/ became a velar nasal before /n/, and the stop /g/ of /ng/ clusters ceased to be pronounced, hence [vayn] > [vaŋ:n] 'cart' and [løn:g] > [løn:] 'long'. This process is partly visible in orthography (Wessén 1969, 45 mentions spellings like <vang> in VgL I and <ræng> in Cod. Holm. A 1) and is otherwise reconstructed on the basis of dialect differences and corresponding (orthographically visible) assimilations of [mb] and [nd] to [m:] and [n:], respectively, in late OSw. and early MSw. (Wessén 1969, 88).

4.2. Development of R

The segment /z ~ R/ developed into /s/ in East Germanic (Go. *dags* 'day'), was lost in West Germanic (OE *dæg*), and rhotacised in North Germanic (PN *dagr*). Also, /z ~ R/ was not in contrast with a voiced sibilant in the Germanic dialects, a fact that indirectly indicates that /z ~ R/ might have been a sibilant as indicated in Tab. 102.8. The relationship between the two r-sounds, /r/ and /z ~ R/, inherited from Proto-Nordic, has attracted the attention of several scholars (e.g. Noreen 1904, 220; Hultman 1931; Tjäder 1961; Steblin-Kamenskij 1963; Ronge 1966; Peterson 1983; Teleman 1985). Proto-Germanic [z] developed into an r-sound, represented by its own rune (Ŷ), transliterated as <R>, and referred to as palatal r in the Scandinavian tradition. As Steblin-Kamenskij (1963, 363) points out, this would mean *palatalized r*. What seems clear is that it could not in fact be a sonorant, unlike the trilled /r/, since it could not support its own syllable.

The <R>, which primarily occurred in endings, underwent assimilation when preceded by any of the simple (i.e. non-geminate) sonorant coronals (*ketilR* > *ketill* 'kettle', *hamarR* > *hamarr* 'hammer', *steinR* > *steinn* 'stone') or /s/ (**i:SR* > *i:ss* 'ice'), in PN (Wessén 1969, 41). In the position after a stop it became a trill, first after the dentals (10th century), later after other consonants (ca. 900–1100). Scholars have usually assumed that it thereby merged articulatorily with original /r/

(but see Teleman 1985, for a different view). There are still several inscriptions from the 11th century which have ⟨R⟩ following dentals (Peterson 1983, 211). The result of these processes is that ⟨R⟩ occurred in complementary distribution with ⟨r⟩ by the beginning of the 12th century at the latest. This development is substantiated by the fact that original /r/ is represented by ⟨R⟩ in words like *fādīr* 'father', *moðīr* 'mother', *æftīr* 'after'. We find ⟨R⟩ after unstressed vowels and ⟨r⟩ after consonants (Peterson 1983, 205).

Epenthesis before /r/ occurred sporadically as early as the 11th century. However, at this time [R] was arguably still phonetically distinct from [r], as indicated by it occasionally being written with ⟨s⟩ (Peterson 1983, 211). It seems safe to assume that the R-segment became syllabic fairly early on. Wessén (1969, 60) assumes that this was an immediate consequence of syncope, and the early (and late) cases of epenthesis support this view. Voice assimilation in the direction of voicelessness was common in the earliest OSw. records, and if this process could be substantiated for an earlier period, it would further support the sonorization of [R] (into a trill) since it does not devoice.

The development of epenthetic vowels before syllabic sonorants /r/, /l/, /n/, in that diachronic order (Ralph 1975, 43ff.), broke the complementary distribution. According to Widmark (1975), the merger of the allophones took place after this time. This would place the complete merger of the *r*-sounds in the late 12th century or early 13th century. The picture is further complicated by the fact that ⟨r⟩ in endings was often lost, quite generally in ODan. and OSw., and some scholars have tried to connect this fact with the qualitative difference between the *r*-sounds. However, Peterson (1983) demonstrates that the weak articulation in this position is the crucial factor causing loss, rather than place of articulation, and that any analysis based on the difference between the two *r*-sounds lacks material support. The loss of ⟨r⟩ thus belongs to a later period, roughly the 13th century (Tjäder 1961, 11).

It might be added as a final note that the development of [z] > [R] > [r] is not a common form of rhotacism. The classical context for rhotacism in many and unrelated languages is intervocalic position (Solé 1984). In the PN to OSw. case, the driving force seems instead to be first syllabicity, and later merger in unstressed positions. Thus, ⟨R⟩ appears not to represent what we normally mean by an

r-sound, i.e. a sonorant, but rather something like a voiced fricative, perhaps [z].

4.3. Stop epenthesis in Old Swedish and Old Gutnish

Several of the diachronic processes encountered above can be analysed as synchronic rules of OSw. and OGu. Here we shall look at a synchronic rule interaction, as we introduce the phonotactically motivated process of stop epenthesis, e.g. *ormr* > *ormber* 'snake'. The synchronic analysis is adapted from Sigurd (1966; 1967, 52ff.). Stop epenthesis took place in ODan., too, but will not be discussed separately here (Skautrup 1944, 133). Consider first the inflections of masculine *a*-stem nouns in OSw. and OGu.:

Tab. 102.10

	sg.	pl.
nom.	-r	-ar
gen.	-s	-a
dat.	-i	-um
acc.	-Ø	-a

Stems with different segmental properties obey this morphological paradigm. The stem corresponds to the accusative singular:

Tab. 102.11: Stem = acc. sg.

fisk-	'fish'	aptan-	'evening'
dag-	'day'	sko:-	'shoe'
dal-	'valley'	ste:n-	'stone'
i:s-	'ice'	hamar-	'hammer'
orm-	'snake'	himil-	'heaven'
munn-	'mouth'	hund-	'dog'

The rules are numbered in a mostly non-trivial order of application and are summarized in Table 102.12.

(1) Place assimilation. The nominative /-r/ assimilates to a preceding coronal liquid or fricative. We get *dalr* > *dall*, *ste:nr* > *ste:nn*, *aptanr* > *aptann*, *i:sr* > *i:ss*, but not *ormr* > *ormm*. Assimilation only takes place if the preceding coronal is short, hence no assimilation in *munnr* (not *munnn* or *munnn*). The quantity of /n:/ shows in the accusative. (Historically this assimilation took place before the merger of /z ~ R/ with /r/, the latter being unaffected by this rule. As a synchronic rule, it relies on place of articulation and quantity rather than a differentiation of /r/).

(2) Syncope A affects unstressed vowels of disyllabic roots when inflected with a syllabic ending: *aptani* > *aptni*.

(3) Stop epenthesis A applies between a nasal (/m/, /n/) and a liquid (/r/, /l/). The inserted stop is homorganic to the preceding segment and assimilates with respect to voicing. This yields *himlum* > *himblum*, *hamri* > *hambri*, *ormr* > *ormbr* (later *ormber*) and *munnr* > *mundr* (later *munder*). Consonant quantity is neutralized in the coda position before an onset consonant of a following syllable, hence *munnder* = *munder*. Stop epenthesis A must follow place assimilation, witness *ste:nn* and *aptann* (not *ste:ndr* and *aptandr*).

(4) Stop epenthesis B. A stop is inserted between long /n:/ and /s/: *munns* > *munnds*. Notice that it is consonant quantity, not vowel quantity, that controls this rule (no epenthesis in *aptans* or *ste:ns*). The quality of the inserted stop is determined as in stop epenthesis A, but the stop is later subject to devoicing (i.e. *munnts*). Stop epenthesis B also has a narrower environment than stop epenthesis A (it avoids producing *ormbs* and *ste:nds*).

(5) Vowel epenthesis occurs in the environment of an obstruent (in effect a stop) and /r/: *fiskr* > *fisker*, *dagr* > *dager*, *ormbr* > *ormber*, *mundr* > *munder*, *hundr* > *hunder*. Place assimilation has already applied, hence *i:sr* > *i:ser* is avoided. Stop epenthesis A precedes vowel epenthesis, viz. *munder* not *munner* (because of the assimilations, there is no way of knowing whether /-nr-/ would be subject to this rule).

(6) Devoicing. Obstruents are devoiced before /s/, e. g. *dags* > *da[g]s*, *hunds* > *hund[d]s* and *munnds* > *munn[d]s*. (Spelling varies between <g>, <d> and <k>, <t>.)

(7) Syncope B deletes an unstressed vowel following a vowel-final stem: *sko:ar* > *sko:r*.

The diagram below indicates the synchronic rule orderings (>> = 'precedes').

As seen, rules 1 and 2 apply before rule 3, which in turn must precede rule 5. Rule 4 is ordered before rule 6, while rule 7 is not ordered with respect to any of the other rules.

4.4. Danish consonant shift

Beside the ODan. vowel reductions, there was also pervasive consonant weakening affecting stops and voiced fricatives in the 12th and 13th centuries. This is a gradation known in Danish as *klusilsvækkelse* 'stop weakening' and *lydåbning* 'sound opening, vocalization' which affected short segments in word-medial and word-final position (i.e. foot-internally). Distributionally it is thus not unlike British English deaspiration and American English flapping (Gussenhoven 1986). In the onset of stressed syllables no changes occurred. Beyond Denmark, the southern parts of present-day Sweden and Norway were also affected by gradation, the voiceless stops in particular. Thus, the phonemic system was largely preserved, but the lexical distribution of the sounds changed radically. Tables 102.13 and 102.14 contain information about the segmental gradation and the consonantal effects of the quantity shift. Table 102.13 plots the interaction of quantitative changes and gradation, while Table 102.14 provides a more detailed view of the last part of gradation, i.e. vocalization. There is no organic relationship between gemination and degemination on the one hand, and gradation on the other hand, and so the interaction yields a motley result. If we add dialectological variation to this, it is easy to understand that the result is quite variable at different ends of the language area. However, each process is straightforward on its own terms.

Tab. 102.12: Synchronic phonology of OSw. (ca. 1300)

Tab. 102.13: Gradation and gemination

	quantity	gradation	quantity	gradation	quantity
	gemination 12th c.	voicing 12th c.	gemination 12th c.	spirantization/vocalization 13th c.	degemination ca. 1300
/p: ~ p/	ho[p:]e	[p] > [b] ga[b]e lø[b]e		[b] > [β] (> [w]) ga[β]e lø[β]e	[p:] > [p] ho[p]e
/t: ~ t/	[t] > [t:] fa[t:]ig ni[t:]en	[t] > [d] ga[d]e fo[d]	[d] > [d:] fø[d:]er e[d:]er	[d] > [ð] (> [j]) ga[ð]e fo[ð] le[ð]ing	[t:] > [t] fa[t]ig fø[d]er
/k: ~ k/	hi[k:]e	[k] > [g] le[g]e bo[g]		[g] > [ɣ] (> [w]/[j]) le[ɣ]e bo[ɣ]	[k:] > [k] hi[k]e

Tab. 102.14: Vocalization

	gradation
	vocalization, beginning of 13th century
[β]	[β] > [v] > [w] (Ø) ga[β]e > ga[v]e > ga[w] (e) ja[β]n > jæ[v]n > jæ[w]n ha[β]n > ha[v]n > ha[w]n
[ð]	[ð] > [j] (Ø) væ[ð]er > ve[j]r ty[ð]er > tøj]r ske[ð] > ske[Ø] le[ð]ing > le[j]ing
/k/	[ɣ] > [j]/[w] (Ø) E[ɣ]il > E[j]il ma[ɣ]e > ma[w]e sti[ɣ] > sti[Ø] le[ɣ]e > le[j]e bo[ɣ] > bo[w]

Glosses in alphabetical order: *bog* 'book', *edder* 'poison', *Egil* (name), *fattig* 'poor', *fod* 'foot', *fodder* 'feet', *gabe* 'open one's mouth', *gade* 'street', *gave* 'gift', *havn* 'harbour', *hikke* 'hiccup', *hoppe* 'jump', *jævn* 'even', *leding* 'maritime raid', *lege* 'play', *lobe* 'run', *mave* 'stomach', *nitten* 'nineteen', *ske* 'spoon', *sti* 'path', *tøjr* 'tether', *vejr* 'weather'.

Spirantization of the voiced stops (by gradation) is geographically more limited than voicing. It is easier to establish for [ð] and [ɣ] which have a clear orthographic expression, <th> beside <d>, and <gh> beside <g>. [β] is invariably and is also mostly restituted as [b] in the later language. The oldest loans participate in the gradation, viz. *kube* 'bell-glass, hive', *sæbe* 'soap', *plade* 'plate', *bæger* 'cup, mug', *klog* 'wise'. Later loans (after 1300) are

unaffected: *kaper* 'privateer', *prædike* 'preach', *køter* 'mongrel'. Together with degemination, these loans secured the place of the phonemes /p/, /t/ and /k/ in the language. Degemination and loans also gave rise to a new set of voiced stops. These would seem to contrast positionally with the output of spirantization: *fø[d]er* 'feet' vs. *fø:[ð]e* 'feed'. The prosodic environment, however, allows the analysis of this contrast as allophonic. The stop follows a short vowel, the spirant a long. The segmental results of the quantity shift in an individual form, i.e. whether the vowel or the postvocalic consonant undergoes lengthening, are determined by phonetic factors but to different degrees according to dialect geography. The shift was an ongoing process during this period, and the chart in tab. 102.13 only shows the central flow of that process, found in Zealand and Funen (taken to be the innovation center, cf. Skautrup 1944, 229).

Gradation is weakening (lenition) and is limited to medial and final position, possibly with a slight temporal difference. The process affected stops and spirants, each separately but with some overlap. The stops were affected twice, first by voicing, later by spirantization. The old spirants shifted into glides which could occur as syllable onsets (*øje* 'eye') or as second elements of diphthongs (*skov* [skow] 'forest'). The old spirants were largely kept apart from the new spirants, indicating a time difference, and presumably also a system-driven chain effect. Thus, the new spirants tended to remain spirants (*bage* [baɣə] 'bake', *ude* [uðə] 'out') while the former vocalized or disappeared (*loβ* > *lov* > [low] 'permission', *bide* > *bie* [bi:ə] 'bide'). As has been seen, some of the voiced stops (by gradation) also underwent spirantization, especially forms from the

dental and velar categories. This suggests a slight time difference with respect to vocalization of /β/ (indicated in Table 102.14). Vocalization, then, must have started before the original stops had become spirants. The interaction between the quantity shift and gradation can be seen in the fact that consonant gemination affected stops both before and after voicing by gradation, yielding contrasts like *fattig* vs. *edder* (not *etter*), both originally going back on voiceless stops.

4.5. Development of palatal fricatives

Beginning in OSw., a process involving the velars /g/ and /k/ resulted in voiced and voiceless palatal fricatives in Mod.Sw., viz. /j/, /ç/ and /ʂ/. A glance at the Scandinavian dialects shows that the processes involved are far from simple. Nevertheless, the standard approach has been to linearize the developments as in Table 102.15, here adapted (and slightly expanded) from Ralph (1977, 487), who makes a critical assessment of the problem and the traditional approach. The other clusters in Table 102.15 indicate points at which constellations of consonants other than the one given on the first line in each group could join the development towards palatal fricatives.

Tab. 102.15: stage

		i	ii	iii	iv	v
a. sk	/ __ + front V >	skj	> stj	> [ʃtj]	> [ʃj]	> [ʃ]
		skj				
		stj				
		sj				
b. k	/ __ + front V >	kj	> tj	> tg (> tç)		
		kj				
		tj				
c. g	/ __ + front V >	gj	> dj	> j		
		gj				
		gj				

This schematization implies processes of palatalization, coronalization, fricativization and affrication, deaffrication and cluster simplification. The central problem is empirical. Table 102.15 implies that for [gj] and [j] to merge, [dj] should also merge. This is not true for, e. g., Finland-Swedish and is also not the case in OSw., judging from confusion or non-confusion in the orthography. Similarly, *stj*-words

generally became fricatives later than original *sk*- and *skj*- words (Hesselman 1911). Furthermore, the voiced/voiceless correspondence in tab 102.15(b, c) is not evident, the voiced clusters merging much earlier than the voiceless. Thus, these developments cannot be seen as a simple sound shift picking up clusters along its route. Ralph (1977, 489f.) calls the very notion of palatalization into question, and concludes that *j*-insertion seems a more reasonable assumption. One argument is the fact that /j/ tends to show up sooner before non-high front vowels than before high vowels, the typological trend of palatalization predicting the opposite. Also, “fronting” of a velar stop often resulted directly in an affricate, rather than a palatalized stop. Looking at present-day dialect systems, one finds unpredicted word-initial oppositions like /j/ vs. /dj/ in Finland-Swedish, /ʂ/ vs. /stj/ and /ç/ vs. /stj/ in Norwegian dialects, and /ʂ/ (from /sj/) vs. /skj/ and /stj/.

The picture becomes even more complex when the resulting articulations are taken into account. For instance, putative [stç] (from [stj]) became a coronal fricative [ʂ] earlier than [tç] became [ç]. The latter development is usually taken to be the cause of the further development of [ʂ] to [fi], in some positions, whereby the two fricatives became more dissimilar. The ensuing distribution of allophones is positionally controlled (Bloch 1998b). Obviously, several issues relating to the history and dialectology of the palatal fricatives remain unclear. Synchronic and diachronic analyses of this problem are given in Wessén (1969, 65); Sigurd (1970); Ohlsson (1972); Hellberg (1974); Ralph (1977) and Lindblad (1980).

5. Tonal prosodies

Norwegian, Swedish and Danish all display tonal prosody which goes beyond regular intonation. In Sw. and Norw. there is a lexical tone accent known as accent 2 (toneme 2, grave), which contrasts with plain intonation, called accent 1 (toneme 1, acute). In Danish, we find a prosodic pattern known as *stød* beside lexical tone in a dwindling number of dialects. In many simplex forms, the lexical distribution of *stød* corresponds to accent 1 in the tonal dialects of Scandinavia. A historical relationship between the two types of system is not in doubt, but the nature of it is disputed, as is the grammatical status of each system.

The origin of tone accent is discussed in art. 81. The issues of the origin and relationship between tone and *stod* are further elaborated in Riad (1998a; 1999a; 1999b; forthcoming).

5.1. *Stod* from tones

The development of *stod* must be later than the development of tonal dialects (Ringgaard 1980; 1983). Geographically, the spread of *stod* has the contours of innovation, and tonal dialects remain in Denmark only in the southern and eastern peripheries. *Stod* is expanding even today (Fischer-Jørgensen 1989b, 13). Below, some basic facts about the diachronic development of Danish *stod* will be recapitulated, primarily following Skautrup (1944). Thereafter, an account of how *stod* has developed from a tonal system is given.

Skautrup (1944, 138) states that *stod* must have developed in Denmark during the period of vowel weakening and consonant gradation, beginning in the 12th century. The Danish *stod* area is contained within the weakening area (Skautrup 1944, map p. 226), and Skautrup sees a clear connection between the two phenomena. The idea is that for *stod* to be present in forms like Mod.Dan. *ager* 'acre' (< *akr*) and *odder* 'otter' (< *otr*) the formerly voiceless stops must have become voiced by gradation before the inception of *stod*. The reason is that *stod* can only be realized in syllables containing two voiced moras in the rhyme part of the syllable (so-called "*stod* basis"). The argument is not entirely compelling since, as Skautrup himself argues, once *stod* is in the system it will extend analogically (or logically) according to its distributional rules. At the same time, there are some idiosyncrasies regarding the distribution of *stod*, just as with accent 2 in the tonal dialects. Orthographic indications of the presence of *stod* may obtain from the beginning of the 13th century and onward, manifest as written epenthetic vowels in *stod* words containing a diphthong before *n*, e.g. <vagen> (for *vagn* 'cart'), <haføn>, <hauæn> (for *havn* 'harbour'), <gaghin>, <gaghæn> (for *gavn* 'benefit'), etc. If Skautrup is right, this very diachrony makes *stod* younger than tonal accent. A reliable description of *stod*, however, is not offered until the descriptions by the Danish grammarian Jens Pedersen Høysgaard (1743; 1747).

Other proposals, notably Liberman (1982), reconstruct *stod* as much older and as a predecessor to tonal accent. However, such proposals rely completely on a functionally mo-

tivated origin, which cannot be substantiated and which seems very dubious indeed in view of the completely marginal role which both *stod* and lexical tones have in the Scandinavian languages (several dialects make do without either kind of prosody). The degree of functional load is epiphenomenal to other developments such as vowel reduction (Elert 1972). This is not to say that *stod* or tone cannot provide cues e.g. to morphological structure (cf. Basbøll 1998, 51 ff.), only that such considerations are unlikely to have anything to do with their origin.

On the phonetic side, *stod* is similar to creaky voice and glottal stop, phenomena known to occur in connection with tonal systems elsewhere in the world. Also, *stod* is accompanied by a sharp tonal movement which can go in either direction (Fischer-Jørgensen 1989a; 1989b; personal communication). Several researchers have connected the origin of *stod* with quick tonal movement (Verner 1878; Jespersen 1897; 1913; Ekblom 1939, 176 f.), and some consider the tonal movement more important than the glottal activity (Forchhammer 1942). Nevertheless, the research tradition has tended to reify the latter, focussing on the distribution of the glottal catch rather than the tonal movement. This entails an increase in the number of basic phonological categories and fails to make the obvious historical and geographic connections to tonal systems. A tonal analysis should therefore be the null hypothesis. This immediately explains the notion of "*stod* basis", since only sonorant sounds can carry tone. There is a recent tonal analysis of *stod* in Livonian (Kiparsky 1995) which has been carried over to Danish by Itô/Mester (1997).

Standard Danish *stod* exhibits a sharp fall in the *stod* syllable (in present-day Copenhagen, a rise), which is tonally represented as two tones associated with one syllable, HL. This is typologically a marked structure (Goldsmith 1976), a fact that is also clear from a Scandinavian perspective, where in some dialects too many tones in too few syllables give rise to complex tonal configurations and quantitative effects. This is known as circumflex. The glottal effect of *stod* can be seen as the result of forcing two tones onto one syllable. In Standard Danish, "*stod* basis" equals two sonorant moras, while in West Jutlandish *stod* can occur in just a single mora, a short vowel (Ringgaard 1960). In Swedish and Norwegian, a stressed syllable can generally only carry one tone.

Tab. 102.16

The tonal analysis of *stod* allows for a comprehensive treatment of the Scandinavian prosodic systems, both with regard to synchrony and diachrony (H = 'high tone', L = 'low tone'). The diachronic issue involves understanding how it came to pass that two tones were associated with one syllable. Several facts point to a related but partly less advanced development in present-day Central Swedish dialects. The Eskilstuna variety exhibits a prosodic feature which looks like incipient *stod* and which is known as *knorr* 'curl' or *knarr* 'creak'. This Eskilstuna "curl" is a steep tonal fall followed by an audible, often voiced, release. The fall may be accompanied by creaky voice phonation and other laryngeal activity. Curl is pragmatically conditioned and occurs in focussed position, as part of a general hyperarticulation which includes Central Swedish diphthongization (Bleckert 1987; Lindqvist 1972, 13). Olof Gjerdmán (1918, 183–185), in his study of city dialects in Södermanland, notes the phonetic resemblance of curl to *stod*, and the fact that it tends to occur before a pause (i.e. phrase finally) and in particular after certain long vowels ([a:], [u:], [ɯ:]). Phonologically, these observations mean that the utterance-final L boundary tone tends to be pronounced within the last stressed syllable of the final phrase, where the H focus tone is also associated. The F0 tracings in Bleckert (1987, 116ff.) show this very clearly. This yields a phonological structure just like that for *stod* in tab. 102.16. Indeed, the realization of this structure sometimes results in *stod* (Gjerdmán 1918; Nordberg 1972; Pettersson/Forsberg 1970). Eskilstuna thus provides evidence of all the phonetic properties of *stod* in what is still a tonal dialect. Regarding distribution, a disturbing feature of the Scandinavian accent typology is the fact that what is marked in a tonal dialect (accent 2) is unmarked in the *stod* dialects (*no-stod*) and vice versa. This seeming markedness reversal can be fully explained by considering the distri-

bution of Eskilstuna curl and imposing the constraints of phonological *stod*, known from Danish. Crucially, phonologization of curl has not taken place in Eskilstuna. "*Stod* basis" delimits tonal realization to voiced segments (phonetically the only possible situation) and to stressed syllables. In accent 2 words, there are too many tones between the boundary tone and the stressed syllable, since accent 2 contains lexical tone in addition to focus and boundary tones. Therefore, curl will be less prominent and unable to associate with a stressed syllable, inhibiting phonologization as *stod*. In accent 1 words, however, there is no lexical tone, and the boundary tone can be pulled into the stressed syllable, allowing prominent curl and phonologization as *stod*. The same situation obtains in compounds, which pattern with accent 1 words, in Eskilstuna as well as in Danish. In compounds, the first tone is in the first stressed syllable, while the last stressed syllable contains the same tonal material as the only stressed syllable of an accent 1 word.

The phonologization of curl means that pragmatically motivated hyperarticulation yields to systematic patterning, basically such as schematically indicated in tab. 102.16, which is not a distinctive tonal pattern, however. Both word types contain the same tonal information but different numbers of syllables. A side effect of the development of *stod*, then, is the loss of distinctive accent, and so there is no real markedness reversal. This is not to flatly deny the existence of minimal pairs, but rather the existence of *lexical* tone in Danish. (The idiosyncratic presence of *stod* is better analyzed as the presence of underlying feet to which regular tone structure is sensitive, cf. Kiparsky 1995 regarding Livonian.) The argument for the loss of distinctive accent comes, again, from the Central Swedish dialect area. Eastern Mälardalen, between Eskilstuna and Stockholm, has developed in the same direction as Danish with regard to the loss of distinctive tones. Crucially, it is the accent 2 contour – which corresponds to unmarked *no-stod* in Danish – that has generalized as the unmarked pattern in polysyllables. Any word containing a post-tonic syllable gets accent 2 in Eastern Mälardalen, while all others get accent 1 (cf. Nyström 1997 for a presentation of this, and Bloch 1998a for the phonology).

Tab. 102.17: Accent contours in Eastern Mälardalen (EMä, no tonal contrast) and Central Swedish (CSw, tonal contrast).

example	CSw	EMä	gloss
a. 'bok ka'nel	1	1	'book' 'cinnamon'
b. 'bil-ar prin'sessa	2	2	'cars' 'princess'
c. 'fött-er-na 'spring-er	1	2	'feet' 'runs'
d. jag ska 'ta den 'mellan, mål	1	2	'I will take it' 'snack'
e. 'mid, sommar, dans	2	2	'midsummer dance'

The development into this system takes place in several steps, which will only be mentioned here. Secondary stresses are reinstalled on many previously unstressed syllables. This causes connective accent 2 assignment to generalize. Subsequently, the tonal contour is re-analyzed as dependent on the number of syllables. The impetus for these changes comes from curl prosody, which obscures the evidence for lexical tone when phonologized. For a detailed discussion and further correlations with Danish, cf. Riad (1999b; 2000). The basic point is that two obviously related dialects in Central Sweden together exhibit all phonetic, distributional and grammatical properties of Danish *stød*.

103. The morphology of Old Nordic I: Old Icelandic and Old Norwegian

1. Introduction
2. Nouns
3. Adjectives
4. Adverbs
5. Pronouns
6. Numerals
7. Verbs
8. Literature (a selection)

1. Introduction

This article deals with the inflectional morphology of Old Nordic (ON) nouns, adjectives, adverbs, pronouns, numerals and verbs. As there are no systematic inflectional differences between Old Norwegian (ONorw.) and Old Icelandic (OIcel.), apart from a few cases commented on below, these two dialects will be treated together under the name Old Norse.

2. Nouns

ON nouns have inherent gender, and inflect for case, number and definiteness. There are four different cases: nominative (nom.), accusative (acc.), dative (dat.) and genitive (gen.). There are two numbers, singular (sg.) and plural (pl.). Finally, nouns may appear in indefinite (indef.) or definite (def.) form.

2.1. Gender

There are three genders in Old Nordic: masculine (masc.), feminine (fem.) and neuter (neut.). Which gender a noun belongs to is shown by the inflectional forms of adjectives and pronominal elements agreeing with the noun:

<i>stórr fiskr</i>	sg.nom.masc. 'big fish'
<i>stór fjǫðr</i>	sg.nom.fem. 'big feather'
<i>stórt land</i>	sg.nom.neut. 'big country'

Furthermore, the gender of a noun can to some extent be identified on the basis of the set of suffixes (and stem modifications) expressing case, number and definiteness. The following example, all sg. indef., illustrate this point:

	masc.	fem.	neut.
nom.	<i>fiskr</i>	<i>fjǫðr</i>	<i>land</i>
acc.	<i>fisk</i>	<i>fjǫðr</i>	<i>land</i>
dat.	<i>fiski</i>	<i>fjǫðr</i>	<i>landi</i>
gen.	<i>fisks</i>	<i>fjǫðrar</i>	<i>lands</i>

2.2. Definiteness

The following two paradigms illustrate the contrast between the indefinite and definite form of a noun:

		Indef.	Def.
Sg.	nom.	<i>fiskr</i>	<i>fiskrinn</i>
	acc.	<i>fisk</i>	<i>fiskinn</i>
	dat.	<i>fiski</i>	<i>fiskinum</i>
	gen.	<i>fisks</i>	<i>fisksins</i>
Pl.	nom.	<i>fiskar</i>	<i>fiskarnir</i>
	acc.	<i>fiska</i>	<i>fiskana</i>
	dat.	<i>fiskum</i>	<i>fiskunum</i>
	gen.	<i>fiska</i>	<i>fiskanna</i>

The historical source of the definiteness suffixes are the various forms of the demonstrative pronoun *hin* 'that', which first developed into an element cliticized to the preceding noun, and later was reinterpreted as an inflectional suffix. Due to its origin as an adjectively inflected pronoun (cf. 5.2.2. below), these suffixes are in many ways similar to pronominal suffixes.

2.3. Inflectional classes

2.3.1. Masculine nouns

Masculine nouns fall into five inflectional classes, below designated as classes I–V. The first four classes, traditionally called strong inflections, can be distinguished according to their pl.acc. suffix (cf. Haugen 1995, 112): Class I nouns have *-a* in the pl.acc. (e.g. *fiska* 'fishes' from *fiskr*), class II nouns have *-i* (e.g. *gesti* 'guests' from *gestr*), class III nouns have *-u* (e.g. *vǫllu* 'fields' from *vǫllr*), and class IV nouns have *-r* (e.g. *fætr* 'feet' from *fótr*). The first three pl.acc. endings (vowels) reflect the so-called stem-suffixes of Ancient Nordic (AN) and form the basis for the traditional distinction between *a*-stems, *i*-stems and *u*-stems.

Class V nouns, traditionally called weak, are similar to class I in the pl., but inflect differently in the sg.

2.3.1.1. Class I (pl. nom. *-ar*; pl. acc. *-a*)

Class I nouns correspond to AN nouns of the *a*-stem class; the AN stem suffix *-a-* can in ON be seen in the pl. acc., e.g. *fiska* 'fishes' (< AN **fiskann*). *Fiskr* 'fish', see paradigm above, and *himinn* 'heaven' belong to class I:

Sg.	nom.	<i>himinn</i>
	acc.	<i>himin</i>
	dat.	<i>himni</i>
	gen.	<i>himins</i>
Pl.	nom.	<i>himnar</i>
	acc.	<i>himna</i>
	dat.	<i>himnum</i>
	gen.	<i>himna</i>

Most monosyllabic masculine nouns with a long root syllable inflect like *fiskr*. Furthermore, words ending in one of the derivational suffixes *-angr*, *-ingr*, *-ungr* and *-leikr* inflect like *fiskr*. Nouns having one of the following inflectional suffixes inflect like *himinn*: *-an/-in/-un*, *-al/-il/-ul* and *-ar/-ur*. Note the syncope of the unstressed vowel of the second syllable in these words.

Note the following two deviations from the main pattern in sg.dat. and gen.: (i) sg.gen. may have *-ar* instead of *-s*. *-ar* is the sg.gen. suffix for classes II and III, which according to Noreen (1923, 249) were the original inflectional classes of many of these words; (ii) sg.dat. often lacks the suffix *-i*, a characteristic of class II for masculine nouns.

Furthermore, note that some of these nouns exhibit so-called "j-insertion" and "v-insertion" (Haugen 1995, 86ff.), the *-j-* and *-v-* being reflexes of AN stem suffixes beginning with one of these sounds, cf. the paradigms for *sqngr* 'song' and *niðr* ('relative'):

		-v-	-j-
Sg.	nom.	<i>sqngr</i>	<i>niðr</i>
	acc.	<i>sqng</i>	<i>nið</i>
	dat.	<i>sqngvi</i>	<i>nið</i>
	gen.	<i>sqngs</i>	<i>niðjar</i>
Pl.	nom.	<i>sqngvar</i>	<i>niðjar</i>
	acc.	<i>sqngva</i>	<i>niðja</i>
	dat.	<i>sqngum</i>	<i>niðjum</i>
	gen.	<i>sqngva</i>	<i>niðja</i>

One subclass of class I nouns exhibits a stem change from sg. to pl. In the sg. the second (unstressed) syllable contains an *i*, which disappears in the pl. The inflectional suffixes,

however, do not deviate from the main pattern for class I, cf. the paradigm of *hersir* ‘chief’.

Sg.	nom.	<i>hersir</i>
	acc.	<i>hersir</i>
	dat.	<i>hersir</i>
	gen.	<i>hersis</i>
Pl.	nom.	<i>hersar</i>
	acc.	<i>hersa</i>
	dat.	<i>hersum</i>
	gen.	<i>hersa</i>

2.3.1.2. Class II (pl.nom. *-ir*; pl.acc. *-i*)

Class II nouns correspond to AN nouns of the *i*-stem class; the AN stem suffix *-i-* can in ON be seen in the pl.acc., e.g. *gesti* from *gestr* ‘guest’. Two different inflectional variants can be observed, the first has the sg.gen. ending in *-s*, like *gestr*, the other has sg.gen. in *-ar*, like *vinr* ‘friend’:

Sg.	nom.	<i>gestr</i>	<i>vinr</i>
	acc.	<i>gestr</i>	<i>vin</i>
	dat.	<i>gest</i>	<i>vin</i>
	gen.	<i>gests</i>	<i>vinar</i>
Pl.	nom.	<i>gestir</i>	<i>vinir</i>
	acc.	<i>gesti</i>	<i>vini</i>
	dat.	<i>gestum</i>	<i>vinum</i>
	gen.	<i>gesta</i>	<i>vina</i>

Some class II nouns have pl.nom. and acc. *-ar/-a*, following the pattern of class I nouns. Class II nouns ending in a velar consonant, e.g. *bekkr* ‘brook’, *elgr* ‘moose’ or *drengr* ‘man’, have *-j*-insertion:

Sg.	nom.	<i>bekkr</i>
	acc.	<i>bekkr</i>
	dat.	<i>bekkr</i>
	gen.	<i>bekkrjar/bekks</i>
Pl.	nom.	<i>bekkir</i>
	acc.	<i>bekki</i>
	dat.	<i>bekkjum</i>
	gen.	<i>bekkjja</i>

2.3.1.3. Class III (pl.nom. *-ir*, pl.acc. *-u/i*)

Class III nouns correspond to AN nouns of the *u*-stem class; the AN stem suffix *-u-* can in ON be seen in the pl. acc., e.g. *völlu* from *völlr* ‘field’. The stem vowel can be modified by *i*-umlaut or by *u*-umlaut; in some paradigms we thus find three different stem vowels, as in *völlr*. Other class III nouns are *fagnaðr* ‘happiness’ and *fjörðr* ‘fjord’.

Sg.	nom.	<i>völlr</i>	<i>fagnaðr/fögnuðr</i>	<i>fjörðr</i>
	acc.	<i>völl</i>	<i>fagnað/fögnuð</i>	<i>fjörð</i>
	dat.	<i>velli</i>	<i>fagnaði</i>	<i>firði</i>
	gen.	<i>vallar</i>	<i>fagnaðar</i>	<i>fjarðar</i>

Pl.	nom.	<i>völlir</i>	<i>fagnaðir</i>	<i>firðir</i>
	acc.	<i>völlu</i>	<i>fagnaði</i>	<i>fjörðu</i>
	dat.	<i>völlum</i>	<i>fögnuðum</i>	<i>fjörðum</i>
	gen.	<i>valla</i>	<i>fagnaða</i>	<i>fjarða</i>

Sg.dat. may in certain words (cf. Noreen 1923, 274) lack the suffix *-i*. Furthermore, pl.acc. *-u* was replaced by *-i* in many words, as in class II.

Nouns ending in *-aðr*, like *fagnaðr*, have two alternative forms in sg.nom. and acc., one with *u*-umlaut (*fögnuðr*) and one without (*fagnaðr*). Of these two forms the one without *u*-umlaut is the most common. Note that these words always have the pl.acc. suffix *-i*.

The vowel alternations in *fjörðr* and *völlr* are caused by breaking (*e > jø ja*), *u*-umlaut (*a > ø*) and *i*-umlaut (*a > e*).

2.3.1.4. Class IV (pl.nom. = pl.acc.)

Class IV masculine nouns are characterized by having identical forms in pl.nom. and acc. Viewed historically, nouns of this class have developed from three different AN stem classes: monosyllabic stems (> e.g. *nagl* ‘nail’), *r*-stems (> e.g. *faðir* ‘father’), and *nd*-stems (> e.g. *bóndi* ‘farmer’). Class IV nouns vary considerably in the sg.; thus, the rationale for putting them together lies in their common inflection in the pl. Consider first ON reflexes of members of the AN monosyllabic stem class, which fall in two groups: those having sg. forms identical with the sg. forms of class I, e.g. *nagl*, and those having sg. forms identical with the sg. forms of class III, e.g. *fótr* ‘foot’.

Sg.	nom.	<i>nagl</i>	<i>fótr</i>
	acc.	<i>nagl</i>	<i>fót</i>
	dat.	<i>nagli</i>	<i>fæti</i>
	gen.	<i>nagls</i>	<i>fótar</i>
Pl.	nom.	<i>negl</i>	<i>fætr</i>
	acc.	<i>negl</i>	<i>fætr</i>
	dat.	<i>nøglum</i>	<i>fótum</i>
	gen.	<i>nagla</i>	<i>fóta</i>

Two ON nouns have their origin in the AN *r*-stem class: *faðir* and *bróðir* ‘brother’:

Sg.	nom.	<i>faðir</i>
	acc.	<i>föður</i>
	dat.	<i>feðr/fjöður</i>
	gen.	<i>fjöður</i>
Pl.	nom.	<i>feðr</i>
	acc.	<i>feðr</i>
	dat.	<i>feðrum</i>
	gen.	<i>feðra</i>

Finally, the so-called *nd*-nouns belong to class IV; these are nominalized present participles, inflecting like masculines of class V (weak masculines) in the sg.:

Sg.	nom.	<i>bóndi</i>
	acc.	<i>bónða</i>
	dat.	<i>bónða</i>
	gen.	<i>bónða</i>
Pl.	nom.	<i>bændr</i>
	acc.	<i>bændr</i>
	dat.	<i>bóndum</i>
	gen.	<i>bónða</i>

2.3.1.5. Class V (weak masculines)

Class V comprises the so-called weak masculine nouns, which in the pl. inflect like class I masculines. Characteristic of the sg. forms is the syncretism resulting in a two-way distinction between nom. on the one hand and one common form for the three oblique cases, acc., dat. and gen., on the other.

Sg.	nom.	<i>granni</i>
	acc.	<i>granna</i>
	dat.	<i>granna</i>
	gen.	<i>granna</i>
Pl.	nom.	<i>grannar</i>
	acc.	<i>granna</i>
	dat.	<i>grønnum</i>
	gen.	<i>granna</i>

Note the following deviations from this pattern: (i) Some borrowings from Old English, e.g. *herra* 'lord', have *-a* in all cases in the sg.; (ii) *uxi* 'ox' has the following paradigm in the pl.: *yxn-yxn-yxnum-yxna* (which makes it inflectionally of the same type as class IV nouns); (iii) one feminine word belongs to this class, *Skadī* (name of a goddess).

2.3.2. Feminine nouns

Feminine nouns can be classified according to their pl.nom. and acc. suffix, and thus fall into five inflectional classes, below called classes I–V (cf. Haugen 1995, 121). The first three classes constitute the so-called strong feminines. Class I has the pl.nom. and acc. suffix *-ir*, class II has *-ar*, class III has *-r*.

2.3.2.1. Class I (pl.nom./acc. *-ir*)

Most ON feminine nouns belong to class I. These nouns have the pl.nom. and acc. suffix *-ir*, and have a common origin with class II masculines in the AN *i*-stem class. The sg. in-

flexion is identical to that of class II feminines; *bæn* 'prayer' and *skipan* 'order' belong to this class:

Sg.	nom.	<i>bæn</i>	<i>skipan/skipun</i>
	acc.	<i>bæn</i>	<i>skipan/skipun</i>
	dat.	<i>bæn</i>	<i>skipan/skipun</i>
	gen.	<i>bænar</i>	<i>skipanar</i>
Pl.	nom.	<i>bænir</i>	<i>skipanir</i>
	acc.	<i>bænir</i>	<i>skipanir</i>
	dat.	<i>bænum</i>	<i>skipunum</i>
	gen.	<i>bæna</i>	<i>skipana</i>

2.3.2.2. Class II (pl.nom. and acc. *-ar*)

Feminine nouns of class II fall in two subclasses. Members of the first subclass had the stem suffix *-ō-* in AN, cf. *mōn* (< AN **manō*), whereas members of the second subclass had the AN stem suffix *-ijō-*. The paradigms of *mōn* 'mane' and *ermr* 'sleeve' exemplify the suffixes of these two types:

Sg.	nom.	<i>mōn</i>	<i>ermr</i>
	acc.	<i>mōn</i>	<i>ermi</i>
	dat.	<i>mōn</i>	<i>ermi</i>
	gen.	<i>manar</i>	<i>ermar</i>
Pl.	nom.	<i>manar</i>	<i>ermar</i>
	acc.	<i>manar</i>	<i>ermar</i>
	dat.	<i>mōnum</i>	<i>ermum</i>
	gen.	<i>mana</i>	<i>erma</i>

Nouns ending in *-ing/-ung* always inflect like *mōn*. Note that these deviate from the main pattern by having the sg.dat. suffix *-u*: e.g. *dróttningu* 'queen'. Also a few other words in class II may take this ending in the sg.dat., cf. Noreen (1923, 261 f.). Furthermore, proper names ending in *-bjǫrg*, *-hvít*, *-leif*, *-lǫð*, *-rún*, *-veig*, *-vǫr* have the suffix *-u* also in the sg.acc.

Characteristics of the second type of the class II feminines are their long root syllable and *i*-umlaut in all forms. Note that in the sg., nouns of this type differ significantly from other feminine nouns.

Some class II feminines have *-j-* or *-v-*insertion, cf. the paradigms in 2.3.1.1. above showing *-j-* or *-v-*insertion in masculine nouns. See Haugen (1995, 124) for a list of these nouns.

2.3.2.3. Class III (*r*-nouns)

Feminine nouns of class III exhibit many inflectional similarities with class IV masculines (with which they to some extent have a common origin). Members of this class have their pl.nom. and acc. ending in *-r*. There are three inflectional subtypes: two historical reflexes of

AN monosyllabic stems, e.g. *bók* ‘book’ and *kýr* ‘cow’, and one reflecting the AN *r*-stem class, e.g. *móðir* ‘mother’.

Sg.	nom.	<i>bók</i>	<i>kýr</i>	<i>móðir</i>
	acc.	<i>bók</i>	<i>kú</i>	<i>móður</i>
	dat.	<i>bók</i>	<i>kú</i>	<i>mæðr/móður</i>
	gen.	<i>bókar/bækr</i>	<i>kýr</i>	<i>móður</i>
Pl.	nom.	<i>bækr</i>	<i>kýr</i>	<i>mæðr</i>
	acc.	<i>bækr</i>	<i>kýr</i>	<i>mæðr</i>
	dat.	<i>bókum</i>	<i>kúm</i>	<i>mæðrum</i>
	gen.	<i>bóka</i>	<i>kúa</i>	<i>mæðra</i>

2.3.2.4. Class IV (weak feminines)

Members of the feminine class IV have the pl.nom. and acc. suffix *-ur*. They are reflexes of the AN *ōn*-stem class. The *-n*- of the AN stem suffix can in ON be observed in the pl.gen., cf. *sagna*. There are two distinct forms in the sg., nom. ending in *-a*, and acc., dat. and gen. ending in *-u* (resulting in *u*-umlauted forms). *Saga* ‘story’ illustrates this pattern:

Sg.	nom.	<i>saga</i>
	acc.	<i>sögu</i>
	dat.	<i>sögu</i>
	gen.	<i>sögu</i>
Pl.	nom.	<i>sögur</i>
	acc.	<i>sögur</i>
	dat.	<i>sögum</i>
	gen.	<i>sagna</i>

2.3.2.5. Class V (weak feminines)

Class V of feminine nouns consists of a few abstract nouns with no pl. and full syncretism in the sg.; in AN their stem suffix was *-īn*. *blindi* ‘blindness’ belongs to this class:

Sg.	nom.	<i>blindi</i>
	acc.	<i>blindi</i>
	dat.	<i>blindi</i>
	gen.	<i>blindi</i>

2.3.3. Neuter nouns

ON neuter nouns fall into two inflectional classes: Members of class I, traditionally called strong neuters, had the stem suffix *-a*- in AN, like masculines of class I. Members of class II, traditionally called weak, had the AN stem suffix *-an*-.

2.3.3.1. Class I (strong neuters)

Members of class I of neuter nouns had in AN the stem suffix *-a*-, like class I masculines;

both in the sg. and the pl., nom. acc. have identical forms, pl. differing from sg. by having *u*-umlaut wherever possible. Pl.nom. and acc. have no suffix. *bak* ‘back’ belongs to class I:

Sg.	nom.	<i>bak</i>
	acc.	<i>bak</i>
	dat.	<i>baki</i>
	gen.	<i>baks</i>
Pl.	nom.	<i>bøk</i>
	acc.	<i>bøk</i>
	dat.	<i>bøkum</i>
	gen.	<i>baka</i>

Some neuters of this class also have *-v*- and *-j*-insertion, e.g. *högg* ‘blow’ and *egg* ‘egg’:

		<i>-v-</i>	<i>-j-</i>
Sg.	nom.	<i>högg</i>	<i>egg</i>
	acc.	<i>högg</i>	<i>egg</i>
	dat.	<i>höggvi</i>	<i>eggi</i>
	gen.	<i>höggs</i>	<i>eggs</i>
Pl.	nom.	<i>högg</i>	<i>egg</i>
	acc.	<i>högg</i>	<i>egg</i>
	dat.	<i>höggum</i>	<i>eggjum</i>
	gen.	<i>höggva</i>	<i>eggja</i>

Some class I neuters exhibit a stem change from sg. to pl. In the sg. the second (unstressed) syllable contains an *i*, which disappears in pl.dat. and gen. The inflectional suffixes, however, do not deviate from the main pattern, cf. the paradigm of *kvæði* ‘poem’.

Sg.	nom.	<i>kvæði</i>
	acc.	<i>kvæði</i>
	dat.	<i>kvæði</i>
	gen.	<i>kvæðis</i>
Pl.	nom.	<i>kvæði</i>
	acc.	<i>kvæði</i>
	dat.	<i>kvæðum</i>
	gen.	<i>kvæða</i>

2.3.3.2. Class II (weak neuters)

Class II neuters, of which there are only a few, have the same form in all cases in the sg.; pl. nom. and acc. end in *-u*, which triggers *u*-umlaut where possible.

Sg.	nom.	<i>auga</i>
	acc.	<i>auga</i>
	dat.	<i>auga</i>
	gen.	<i>auga</i>
Pl.	nom.	<i>augu</i>
	acc.	<i>augu</i>
	dat.	<i>augum</i>
	gen.	<i>augna</i>

3. Adjectives

3.1. Morphosyntactic categories

Old Nordic adjectives inflect for degree, definiteness, gender, case and number. The degree category forms the basis for making a distinction between three inflection classes. The difference between definite and indefinite adjectives corresponds to the traditional distinction drawn between the weak and strong inflection of adjectives in the Germanic languages.

Historically the gender, case and number inflectional endings are derived partly from nominal inflections and partly from pronominal inflections (cf. Noreen 1923, 288ff.).

3.1.1. Degree and inflection classes

There are three adjectival degrees: positive, comparative and superlative, cf. the following forms of *fullr* 'full' in sg.nom.masc.indef.:

Positive	Comparative	Superlative
<i>fullr</i>	<i>fullari</i>	<i>fullastr</i>
'full'	'fuller'	'fullest'

Adjectives of all three degrees also inflect for gender, case and number (although there are many syncretisms). Furthermore, positive and superlative adjectives inflect for definiteness (see 3.1.2.).

With references to the category of degree, a distinction can be made between three inflection classes (termed class I, II and III below) of ON adjectives.

3.1.1.1. Class I (inflection by affixation)

Most ON adjectives belong to this class. They show regular formation of the comparative and the superlative by adding two different suffixes to the positive stem: The comparative is formed by adding the suffix *-ar-*, the superlative by adding *-ast-*. In neither case does the stem vowel change, cf. the following sg.nom.masc. forms of *spakr* 'wise':

Positive	Comparative	Superlative
<i>spak-r</i>	<i>spak-ar-i</i>	<i>spak-ast-r</i>
'wise'	'wiser'	'wisest'

In this partial paradigm, the positive stem is *spak-*, the *-r* being the sg.nom.masc.indef. suffix. To this stem is added *-ar-* to form the comparative stem, to which the suffix expressing gender, case, number and definiteness (in this case *-i*) is added.

3.1.1.2. Class II (inflection by affixation and stem change)

Class II adjectives form the comparative and the superlative by a combination of inflectional suffixes and stem change, e.g. *langr* 'long':

Positive	Comparative	Superlative
<i>lang-r</i>	<i>leng-r-i</i>	<i>leng-st-r</i>
'long'	'longer'	'longest'

The historical source of the stem change in the comparative and superlative is *i*-umlaut. Quite a few adjectives belong to this class, e.g. *ungr* 'young' (comp. *yngr*), *stórr* 'big' (comp. *stærri*), *fagr* 'beautiful' (comp. *fegri*) etc. (cf. Noreen 1923, 299).

Some adjectives can appear with both class I and II suffixes (Noreen 1923, 300), e.g. *djúpr* 'deep'; note that class II suffixes are accompanied by *i*-umlaut of the stem vowel:

Positive	Comparative	Superlative
<i>djúp-r</i>	<i>djúp-ar-i</i>	<i>djúp-ast-r</i>
	<i>dýp-r-i</i>	<i>dýp-st-r</i>

Furthermore, some adjectives of this class have comparative and superlative forms only. These are words denoting temporal or locational direction, e.g.:

Comparative	Superlative
<i>efri</i> 'upper', 'later'	<i>efstr</i> 'last'
<i>eptri/aptari</i>	<i>epztr/aptastr</i>
'further behind'	'further behind'
<i>nyrdri</i> 'northern'	<i>nyrztr</i> 'most northern'

3.1.1.3. Class III (inflection by suppletion)

Class III adjectives inflect by suppletion, where the positive is expressed by one stem while the comparative and the superlative are expressed by another. The comparative and superlative forms have inflectional characteristics of class II adjectives, i.e. they inflect by the suffixes *-r/-st-* and *i*-umlaut of the stem vowel.

Positive	Comparative	Superlative
<i>gamall</i> ('old')	<i>ellri</i>	<i>elztr</i>
<i>góðr</i> ('good')	<i>betri</i>	<i>beztr</i>
<i>illr</i> ('bad')	<i>verri</i>	<i>verstr</i>
<i>litill</i> ('small')	<i>minni</i>	<i>minnstr</i>
<i>margr</i> ('many')	<i>fleiri</i>	<i>flestr</i>
<i>mikill</i> ('large')	<i>meiri</i>	<i>mestr</i>

3.1.2. Definiteness

Traditionally, adjectival (as well as nominal and verbal) inflection has been classified as either strong or weak. With respect to ON ad-

jectives this terminological distinction refers to a morphological category, viz. definiteness. Thus, instead of speaking of an opposition between strong and weak adjective forms, I shall refer to definite as opposed to indefinite forms of the adjective.

Adjectives in the positive and the superlative may have either definite or indefinite form, depending on the syntactic context they appear in. The general rule is that the definite form of the adjective is used when the phrase it appears in is definite, either by containing a demonstrative pronoun (*h*)*inn* ‘that’, *sá* ‘this’, *þessi* ‘this’, cf. (i), or by containing a head noun which is semantically definite, cf. (ii):

- (i) inn góði konungr
that- sg.nom.masc.
good- sg.nom.masc. def.
king
- (ii) Hákon góði
Hakon- sg.nom.masc.
good- sg.nom.masc.def.
Hakon the good

In all other contexts adjectives in the positive or superlative appear in the indefinite form. Adjectives in the comparative invariably appear in definite form.

For the adjectives *spakr* ‘wise’ and *heiðinn* ‘heathen’ the following forms illustrate the difference between indefinite and definite adjectives in sg.nom.masc.:

Indef.	Def.
<i>spakr</i>	<i>spaki</i>
<i>heiðinn</i>	<i>heiðni</i>

3.1.3. Gender, Case and Number

As a general rule, adjectives agree with the nouns they modify in gender, case and number. The gender distinction is illustrated by the following forms, all sg.nom.indef.:

masc.	fem.	neut.
<i>spakr</i>	<i>spøk</i>	<i>spakt</i>

Historically, the masc. and neut. forms are derived from *a*-stem adjectives in AN (which in turn reflect *i*- and *a*-stems in Proto-Germanic), whereas the fem. forms are derived from AN *ō*-stem-adjectives, which reflect PGmc *ō*- or *u*-stem adjectives (Noreen 1923, 289).

Second, there is agreement in case; below is the sg.masc. section of the paradigm for *spakr*, showing case inflection:

		Indef.	Def.
Sg.	nom.	<i>spakr</i>	<i>spaki</i>
	acc.	<i>spakan</i>	<i>spaka</i>
	dat.	<i>spøkum</i>	<i>spaka</i>
	gen.	<i>spaks</i>	<i>spaka</i>

Finally, adjectives agree in number with the nouns they modify; thus, we can extend the table immediately above as follows:

		Indef.	Def.
Pl.	nom.	<i>spakir</i>	<i>spøku</i>
	acc.	<i>spaka</i>	<i>spøku</i>
	dat.	<i>spøkum</i>	<i>spøkum</i>
	gen.	<i>spakra</i>	<i>spøku</i>

3.1.4. Complete paradigms

To sum up, ON adjectives inflect for degree, definiteness, gender, case, and number. The following three tables illustrate the various forms:

Positive degree, all genders, cases and numbers; indefinite/definite:

		masc.	fem.
Sg.	nom.	<i>spakr/spaki</i>	<i>spøk/spaka</i>
	acc.	<i>spakan/spaka</i>	<i>spaka/spøku</i>
	dat.	<i>spøkum/spaka</i>	<i>spakri/spøku</i>
	gen.	<i>spaks/spaka</i>	<i>spakrar/spøku</i>
Pl.	nom.	<i>spakir/spøku</i>	<i>spakar/spøku</i>
	acc.	<i>spaka/spøku</i>	<i>spakar/spøku</i>
	dat.	<i>spøkum/spøkum</i>	<i>spøkum/spøkum</i>
	gen.	<i>spakra/spøku</i>	<i>spakra/spøku</i>

		neut.
Sg.	nom.	<i>spakt/spaka</i>
	acc.	<i>spakt/spaka</i>
	dat.	<i>spøku/spaka</i>
	gen.	<i>spaks/spaka</i>
Pl.	nom.	<i>spøk/spøku</i>
	acc.	<i>spøk/spøku</i>
	dat.	<i>spøkum/spøkum</i>
	gen.	<i>spakra/spøku</i>

Comparative degree, all genders, cases and numbers; no distinction between indefinite and definite.

		masc.	fem.	neut.
Sg.	nom.	<i>spakari</i>	<i>spakari</i>	<i>spakara</i>
	acc.	<i>spakara</i>	<i>spakari</i>	<i>spakara</i>
	dat.	<i>spakara</i>	<i>spakari</i>	<i>spakara</i>
	gen.	<i>spakara</i>	<i>spakari</i>	<i>spakara</i>
Pl.	nom.	<i>spakari</i>	<i>spakari</i>	<i>spakari</i>
	acc.	<i>spakari</i>	<i>spakari</i>	<i>spakari</i>
	dat.	<i>spøkurum</i>	<i>spøkurum</i>	<i>spøkurum</i>
	gen.	<i>spakari</i>	<i>spakari</i>	<i>spakari</i>

Superlative degree, all genders, cases and numbers; indefinite/definite. (Note that in the pl., dat. def. and indef. forms are identical.)

	masc.	fem.
Sg. nom.	<i>spakastr/</i> <i>spakasti</i>	<i>spøkust/</i> <i>spakasta</i>
acc.	<i>spakastan/</i> <i>spakasta</i>	<i>spakasta/</i> <i>spøkustu</i>
dat.	<i>spøkustum/</i> <i>spakasta</i>	<i>spakastri/</i> <i>spøkustu</i>
gen.	<i>spakasts/</i> <i>spakasta</i>	<i>spakastrar/</i> <i>spøkustu</i>
Pl. nom.	<i>spakastir/</i> <i>spøkustu</i>	<i>spakastar/</i> <i>spøkustu</i>
acc.	<i>spakasta/</i> <i>spøkustu</i>	<i>spakastar/</i> <i>spøkustu</i>
dat.	<i>spøkustum</i>	<i>spøkustum</i>
gen.	<i>spakastra/</i> <i>spøkustu</i>	<i>spakastra/</i> <i>spøkustu</i>
	neut.	
Sg. nom.	<i>spakast/spakasta</i>	
acc.	<i>spakast/spakasta</i>	
dat.	<i>spøkustu/spakasta</i>	
gen.	<i>spakasts/spakasta</i>	
Pl. nom.	<i>spøkust/spøkustu</i>	
acc.	<i>spøkust/spøkustu</i>	
dat.	<i>spøkustum</i>	
gen.	<i>spakastra/spøkustu</i>	

3.1.4.1. Two subtypes

Many ON adjectives with a monosyllabic stem inflect like *spakr*. However, for adjectives with polysyllabic stems there are two deviations to make note of. First, polysyllabic adjectives ending in *-al/-il/-ul-* and *-ig/-ug/-ag-* have their unstressed vowels syncopated before suffixes beginning with a vowel, cf. *gamall* (sg.nom.masc.indef.), *gamals* (sg.gen.masc./neut.indef.), but *gamlan* (sg.acc.masc. indef.).

Second, adjectives with bisyllabic stems ending in *-in-* have sg.acc.masc.indef. just like its nom. counterpart, e.g. *heiðinn* and not *heiðnan*, as expected from the pattern of *spakr*.

3.1.4.2. Nominal vs. pronominal inflection

If the adjectival paradigms presented in this section are compared to the nominal paradigms of the preceding section, it will be clear that the definite inflections of adjectives are of a nominal type, corresponding to the masculine nouns of class V (2.3.1.5.), the feminine nouns of class IV (2.3.2.4.), and the neuter nouns of class II (2.3.3.2.), cf. the following expressions:

	sg.masc.	sg.fem.
nom.	<i>inn spaki bóndi</i>	<i>in spaka kona</i>
acc.	<i>inn spaka bónda</i>	<i>ina spöku konu</i>
dat.	<i>inum spaka bónda</i>	<i>inni spöku konu</i>
gen.	<i>ins spaka bónda</i>	<i>innar spöku konu</i>
	sg.neut.	
nom.	<i>it spaka hjarta</i>	
acc.	<i>it spaka hjarta</i>	
dat.	<i>inu spaka hjarta</i>	
gen.	<i>ins spaka hjarta</i>	

Turning to the indefinite paradigms, it is clear that there are still some remnants of common inflections for nouns and adjectives, e.g. in the sg.nom.masc. *-r* and the pl.nom. and acc.fem. *-ar* (corresponding, though, only to class II feminines). However, several of the indefinite adjectival suffixes derive from demonstrative pronouns, e.g. *spakan* sg.acc.masc. (Cf. Noreen 1923, 89f. for details.)

4. Adverbs

Many ON adverbs are indeclinable, e.g. *eigi* ‘not’. Some adverbs, however, inflect for degree. Just like adjectives these adverbs fall into three inflection classes. Adverbs of the first inflectional class form the comparative and superlative by adding *-ar* and *-ast* to the positive stem, cf. the following forms of the adverb *opt* ‘often’:

Positive	Comparative	Superlative
<i>opt</i>	<i>opt-ar</i>	<i>opt-ast</i>

A few adverbs in this class optionally have the suffixes *-arr* and *-arst* instead of *-ar/-ast*, e.g. *aptr* ‘back’:

Positive	Comparative	Superlative
<i>aptr</i>	<i>aptarr</i>	<i>aptarst</i>

Adverbs of the second inflectional class form the comparative and superlative by *i*-umlaut of the stem vowel and by adding the suffixes *-r* and *-st*, cf. these forms of *fagrt* ‘beautifully’:

Positive	Comparative	Superlative
<i>fagrt</i>	<i>feg-r</i>	<i>fegr-st</i>

Finally, a few adverbs inflect by suppletion, for example *illa* ‘badly’.

Positive	Comparative	Superlative
<i>illa</i> ‘badly’	<i>verr</i> ‘worse’	<i>verst</i> ‘worst’

5. Pronouns

5.1. Pronominal inflection

5.1.1. Personal pronouns

For ON personal pronouns a three-way distinction is made for first and second persons: singular, dual and plural:

	Sg.	Dual	Plural
1st pers. nom.	<i>ek</i>	<i>vít</i>	<i>vér</i>
acc.	<i>mik</i>	<i>ok(k)r</i>	<i>oss</i>
dat.	<i>mér</i>	<i>ok(k)r</i>	<i>oss</i>
gen.	<i>mín</i>	<i>okkar</i>	<i>vár</i>
2nd pers. nom.	<i>þú</i>	<i>it, þit</i>	<i>ér, þér</i>
acc.	<i>þik</i>	<i>yk(k)r</i>	<i>yðr</i>
dat.	<i>þér</i>	<i>yk(k)r</i>	<i>yðr</i>
gen.	<i>þín</i>	<i>ykkar</i>	<i>yðar, yðvar</i>

The following table shows the system for 3 sg. and 3 pl., in which there is a gender distinction. The reflexive pronouns are also included in this table:

	masc.	fem.	neut.	Reflexive
3 sg. nom.	<i>hann</i>	<i>hon</i>	<i>þat</i>	
acc.	<i>hann</i>	<i>hana</i>	<i>þat</i>	<i>sik</i>
dat.	<i>honum</i>	<i>henni</i>	<i>því</i>	<i>sér</i>
gen.	<i>hans</i>	<i>hennar</i>	<i>þess</i>	<i>sin</i>
3 pl. nom.	<i>þeir</i>	<i>þær</i>	<i>þau</i>	
acc.	<i>þá</i>	<i>þær</i>	<i>þau</i>	<i>sik</i>
dat.	<i>þeim</i>	<i>þeim</i>	<i>þeim</i>	<i>sér</i>
gen.	<i>þeir(r)a</i>	<i>þeir(r)a</i>	<i>þeir(r)a</i>	<i>sin</i>

The 3 sg. neut. forms and all the pl. forms are identical to the corresponding forms of the demonstrative pronouns *sá*, see 5.1.2. below.

5.1.2. Demonstrative pronouns

Two demonstrative pronouns, *sá* and *þessi* 'this, that', have pronominal inflection:

	Sg.		
	masc.	fem.	neut.
nom.	<i>sá</i>	<i>sú</i>	<i>þat</i>
acc.	<i>þann</i>	<i>þá</i>	<i>þat</i>
dat.	<i>þeim</i>	<i>þeir(r)i</i>	<i>því</i>
gen.	<i>þess</i>	<i>þeir(r)ar</i>	<i>þess</i>
	Pl.		
	masc.	fem.	neut.
nom.	<i>þeir</i>	<i>þær</i>	<i>þau</i>
acc.	<i>þá</i>	<i>þær</i>	<i>þau</i>
dat.	<i>þeim</i>	<i>þeim</i>	<i>þeim</i>
gen.	<i>þeir(r)a</i>	<i>þeir(r)a</i>	<i>þeir(r)a</i>

	Sg.		
	masc.	fem.	neut.
nom.	<i>sjá/þessi</i>	<i>sjá/þessi</i>	<i>þetta</i>
acc.	<i>þenna</i>	<i>þessa</i>	<i>þetta</i>
dat.	<i>þessum</i>	<i>þessi</i>	<i>þessu</i>
gen.	<i>þessa</i>	<i>þessar</i>	<i>þessa</i>
	Pl.		
	masc.	fem.	neut.
nom.	<i>þessir</i>	<i>þessar</i>	<i>þessi</i>
acc.	<i>þessa</i>	<i>þessar</i>	<i>þessi</i>
dat.	<i>þessum</i>	<i>þessum</i>	<i>þessum</i>
gen.	<i>þessa</i>	<i>þessa</i>	<i>þessa</i>

In some cases there is more than one variant: *þessar(r)ar* instead of *þessar* in sg.gen.fem., *þessar(r)i* instead of *þessi* in sg.dat.fem., *þvísa* instead of *þessu* in sg.dat.neut., *þeima* instead of *þessum* in sg.dat.masc. and in pl.dat.

5.2. Adjectival inflection

5.2.1. Possessive pronouns

The possessive pronoun *minn* 'my, mine' inflects like an indefinite adjective, and has the forms given in the table below. *þinn* 'your(s)' and *sinn* 'his', 'her(s)', 'its', 'their(s)' (reflexive) inflect similarly.

	Sg.		
	masc.	fem.	neut.
nom.	<i>minn</i>	<i>mín</i>	<i>mitt</i>
acc.	<i>minn</i>	<i>mína</i>	<i>mitt</i>
dat.	<i>minum</i>	<i>minni</i>	<i>minu</i>
gen.	<i>míns</i>	<i>minnar</i>	<i>míns</i>
	Pl.		
	masc.	fem.	neut.
nom.	<i>minir</i>	<i>minar</i>	<i>mín</i>
acc.	<i>mína</i>	<i>minar</i>	<i>mín</i>
dat.	<i>minum</i>	<i>minum</i>	<i>minum</i>
gen.	<i>minna</i>	<i>minna</i>	<i>minna</i>

várr 'our(s)-pl.' inflects like an indefinite adjective, cf. 3.1.3. above, the only difference being the sg.acc.masc. form *várn*.

Okkarr 'our(s)-du.', *yðvarr* 'your(s)-pl.' and *ykkarr* 'your(s)-du.' inflect like the adjective *gamall* (indefinite forms), cf. 3.1.3. Note the sg.acc.masc. forms *okkarn*, *yðvarn* and *ykkarn*.

5.2.2. Demonstrative pronouns

The demonstrative pronouns *hinn*, *inn* and *enn*, all meaning 'that', inflect like the possessive pronoun *minn* 'my, mine', see 5.2.1. above. They differ from *minn* in having a short root vowel in all forms.

5.2.3. Indefinite pronouns

Indefinite pronouns in ON are:

(1) *hverr* (in ONorw. also *hvarr*) ‘each, anyone’, *hvárr* ‘both’, *einnhverr* ‘someone’, and *sumr* ‘some’, all inflecting like indefinite adjectives ((*einn-*)-*hverr* with *-j*-insertion), except for the forms *hvern*, *hvárn* in sg.acc.masc., cf. 3.1.3.

(2) *hvergi* ‘anyone (of more than two)’, *hvárgi* ‘anyone (of two)’ have developed from *hverr*/*hvárr* and the particle *-gi*. Both pronouns have many variants, some of which are given here (see Noreen (1923, 324) for an overview of all the forms):

Sg.			
	masc.	fem.	neut.
nom.	<i>hvergi</i>	<i>hvergi</i>	<i>hvertki</i>
acc.	<i>hverngi</i>	<i>hveriga</i>	<i>hvertki</i>
dat.	<i>hverigum</i>	<i>hvergri</i>	<i>hverigu</i>
gen.	<i>hverskis</i>	<i>hverigrar</i>	<i>hverskis</i>

Pl.			
	masc.	fem.	neut.
nom.	<i>hverigir</i>	<i>hverigar</i>	<i>hvergi</i>
acc.	<i>hveriga</i>	<i>hverigar</i>	<i>hvergi</i>
dat.	<i>hverigum</i>	<i>hverigum</i>	<i>hverigum</i>
gen.	<i>hverigra</i>	<i>hverigra</i>	<i>hverigra</i>

(3) *nøkkurr* ‘something, somebody’ has the following inflectional forms (note that other variants exist, cf. Noreen 1923, 322):

Sg.			
	masc.	fem.	neut.
nom.	<i>nøkkurr</i>	<i>nøkkur</i>	<i>nøkkur</i>
acc.	<i>nøkkurn</i>	<i>nøkkura</i>	<i>nøkkur</i>
dat.	<i>nøkkurum</i>	<i>nøkkurri</i>	<i>nøkkuru</i>
gen.	<i>nøkkurs</i>	<i>nøkkurrar</i>	<i>nøkkurs</i>

Pl.			
	masc.	fem.	neut.
nom.	<i>nøkkurir</i>	<i>nøkkurar</i>	<i>nøkkur</i>
acc.	<i>nøkkura</i>	<i>nøkkurar</i>	<i>nøkkur</i>
dat.	<i>nøkkurum</i>	<i>nøkkurum</i>	<i>nøkkurum</i>
gen.	<i>nøkkura</i>	<i>nøkkurra</i>	<i>nøkkurra</i>

(4) *engi* ‘no one’ inflects as follows (but also for this pronoun, other variants exist, cf. Noreen 1923, 322f.):

Sg.			
	masc.	fem.	neut.
nom.	<i>engi</i>	<i>engi</i>	<i>ekki</i>
acc.	<i>engi</i>	<i>enga</i>	<i>ekki</i>
dat.	<i>engum</i>	<i>engi</i>	<i>engu</i>
gen.	<i>enskis</i>	<i>engrar</i>	<i>enskis</i>

Pl.

	masc.	fem.	neut.
nom.	<i>engir</i>	<i>engar</i>	<i>engi</i>
acc.	<i>enga</i>	<i>engar</i>	<i>engi</i>
dat.	<i>engum</i>	<i>engum</i>	<i>engum</i>
gen.	<i>engra</i>	<i>engra</i>	<i>engra</i>

(5) *einn* ‘one’ inflects like adjectives ending in *-inn*, cf. 3.1.3. above.

(6) *báðir* ‘both’ inflects as follows:
masc. fem. neut.

	masc.	fem.	neut.
nom.	<i>báðir</i>	<i>báðar</i>	<i>bæði</i>
acc.	<i>báða</i>	<i>báðar</i>	<i>bæði</i>
dat.	<i>báðum</i>	<i>báðum</i>	<i>báðum</i>
gen.	<i>beggja</i>	<i>beggja</i>	<i>beggja</i>

5.3. Relative pronouns

The most common complementizers of ON relative clauses are the particles *er*, *en* (restricted to ONorw.) and *at*. In translations from Latin, and in works based on foreign sources (i.e. works written in “learned style”, cf. Nygaard 1896), the interrogative pronouns *hverr* and *hvílikr* (cf. 5.4) are used as relative pronouns.

5.4. Interrogative pronouns

Hverr (in ONorw. also *hvarr*) ‘who’, *hvárr* ‘who-du.’ and *hvílikr* ‘of what kind’ inflect like a regular indefinite adjective, though with the forms *hvern*, *hvarn* and *hvárn* in sg.acc. masc.; cf. 5.2.3.(1.).

6. Numerals

6.1. Cardinals

(1) *einn* ‘one’ inflects like an adjective ending in *-inn*, cf. 3.1.4.2. above.

(2) *tveir* ‘two’, inflects as follows:

	masc.	fem.	neut.
nom.	<i>tveir</i>	<i>tvær</i>	<i>tvau</i>
acc.	<i>tvá</i>	<i>tvær</i>	<i>tvau</i>
dat.	<i>tveim(r)</i>	<i>tveim(r)</i>	<i>tveim(r)</i>
gen.	<i>tveggja</i>	<i>tveggja</i>	<i>tveggja</i>

(3) *þrír* ‘three’ has the following forms:

	masc.	fem.	neut.
nom.	<i>þrír</i>	<i>þrjár</i>	<i>þrjú</i>
acc.	<i>þrjá</i>	<i>þrjár</i>	<i>þrjú</i>
dat.	<i>þrim(r)</i>	<i>þrim(r)</i>	<i>þrim(r)</i>
gen.	<i>þriggja</i>	<i>þriggja</i>	<i>þriggja</i>

(4) *fjórir* ‘four’ inflects in the following way:

	masc.	fem.	neut.
nom.	<i>fjórir</i>	<i>fjórar</i>	<i>fjögur</i>
acc.	<i>fjóra</i>	<i>fjórar</i>	<i>fjögur</i>
dat.	<i>fjórum</i>	<i>fjórum</i>	<i>fjórum</i>
gen.	<i>fjögurra</i>	<i>fjögurra</i>	<i>fjögurra</i>

(5) The cardinals 5–20 are indeclinable.

(6) In the expressions *þrír tigir* ‘30’, *fjórir tigir* ‘40’ etc. up to ‘110’, the element *tigir* (pl.) ‘ten’ is a masculine noun of class III (cf. 2.3.1.3.) and inflects accordingly.

(7) *hundrað* ‘hundred (i. e. 100 or 120)’ inflects like a class I neuter noun (cf. 2.3.3.1.).

(8) Finally, *þúsund* ‘thousand (i. e. 1000 or 1200)’ is a feminine noun of class I (cf. 2.3.2.1.).

6.2. Ordinals

(1) *fyrstr* ‘first’ inflects like a regular indefinite adjective (cf. 3.1.3.); *fyrsti* ‘first’ inflects like a regular definite adjective (cf. 3.1.3.).

(2) *annarr* ‘second’ inflects like an indefinite adjective.

(3) The remaining ordinals have definite inflection only.

7. Verbs

We shall follow traditional grammars of ON in making a distinction between strong and weak verbs. The two groups differ on two points. First, weak verbs form the past tense by means of a dental suffix (*t*, *d* or *ð*) (for the distribution of this suffix, see Noreen (1923, 174ff.; 343ff.) and Haugen (1995, 173f.)), while strong verbs form the past tense by changing the root vowel (which is a reflex of Indo-European ablaut):

<i>kasta</i> , inf. ‘throw’	<i>kastaði</i>	(past ind. 3 sg.)
<i>bíta</i> , inf. ‘bite’	<i>beit</i>	(past ind. 3 sg.)

Second, also illustrated by the forms immediately above, weak verbs have polysyllabic forms in the past ind.sg., while strong verbs always have monosyllabic forms.

This section starts with a brief overview of the morphosyntactic categories of ON verbs. Next, the various inflectional classes are presented. Finally, the section is summarized by tables showing the various inflectional characteristics associated with each class.

7.1. Finite and non-finite verb forms

In this section only the morphological properties of finite verb forms will be discussed. However, Old Nordic also has two participles present and past and an infinitive. The infinitive does not carry inflections. The past participles, on the other hand, inflect like normal adjectives like *spakr* and *heiðinn*, cf. 3.1.4.1. Present participles inflect like definite adjectives, cf. 3.1.3.

7.2. Inflectional categories

ON verbs carry inflections for the following five categories: tense, mood, number, person, and voice. First, ON verbs may express two different tenses, present and past (in addition the language has a set of analytically formed tenses; these will not concern us here):

pres.ind. 2, 3 sg.	past ind. 3 sg.
<i>kastar</i>	<i>kastaði</i>
<i>bítr</i>	<i>beit</i>

Second, ON verbs inflect for three moods: indicative, subjunctive and imperative, cf. the following forms of *telja* ‘count’ and *bíta* ‘bite’:

imp. (2 sg.)	ind. (past 3 sg.)	subj. (past 3 sg.)
<i>tel!</i>	<i>taldi</i>	<i>teldi</i>
<i>bít!</i>	<i>beit</i>	<i>biti</i>

Third, verbs appear in the sg. and pl., and fourth, in first, second or third person:

	<i>kasta</i> (pres.ind.)	<i>bíta</i> (pres.ind.)
Sg. 1	<i>kasta</i>	<i>bít</i>
2	<i>kastar</i>	<i>bítr</i>
3	<i>kastar</i>	<i>bítr</i>
Pl. 1	<i>køstum</i>	<i>bitum</i>
2	<i>kastið</i>	<i>bitið</i>
3	<i>kasta</i>	<i>bita</i>

Finally, there is a morphological distinction in the category of voice between an active form and a form which expresses grammatical meaning elements like passive, inchoative, reflexive, and middle. This latter form, often called the reflexive form or the middle voice, is characterized by (variants of) the ending *-sk*:

	Active	Middle
Sg. 1	<i>kasta</i>	<i>køstumk</i>
2	<i>kastar</i>	<i>kastask</i>
3	<i>kastar</i>	<i>kastask</i>
Pl. 1	<i>køstum</i>	<i>køstumsk</i>
2	<i>kastið</i>	<i>kastizk</i>
3	<i>kasta</i>	<i>kastask</i>

7.3. Inflectional classes

In what follows, ON verbs will be categorized into eleven inflectional classes: three weak classes, seven strong classes, and one class having inflectional characteristics of both strong and weak verbs. In addition there are a number of verbs with more or less irregular inflections.

7.3.1. Weak classes

The three classes of weak verbs in ON (termed class I, II, and III below) differ with respect to their suffixes in the pres.ind. 2, 3 sg.: In class I this suffix is *-ar*; in class II it is *-r*, and in class III it is *-ir*. There are also other differences, which will be commented upon below.

The characteristics of each class will be illustrated by the following forms: the infinitive, the pres.ind. 2, 3 sg., the past ind. 3 sg. and the supine.

7.3.1.1. Class I

Weak verbs of class I had the stem suffix *-ō-*; in AN *kasta* 'throw' and *fá* 'paint' belong to this class:

inf.	pres.ind. 2, 3 sg.	past.ind. 3 sg.	supine
<i>kasta</i>	<i>kastar</i>	<i>kastaði</i>	<i>kastat</i>
<i>fá</i>	<i>fár</i>	<i>fáði</i>	<i>fátt</i>

To this class belong most ON verbs, among them inchoatives with infinitives ending in *-na*, like *vakna* 'wake up'. The forms in the pres.ind.sg. have the suffix *-a-*, which also appears in the supine; this vowel has become contracted in verbs like *fá* 'paint', cf. *fár* (pres.ind.3 sg.), *fátt* (supine).

A few verbs in this class have *-j-* or *-v-*insertion, e.g. *eggja* 'incite' and *bqlva* 'curse':

inf.	pres.ind. 2, 3 sg.	past.ind. 3 sg.	supine
<i>eggja</i>	<i>eggjar</i>	<i>eggjaði</i>	<i>eggjat</i>
<i>bqlva</i>	<i>bqlvar</i>	<i>bqlvaði</i>	<i>bqlvat</i>

7.3.1.2. Class II

Weak verbs of class II had the stem suffix *-ja-*; in AN *telja* 'count' and *flytja* 'move' belong to this class, which is the class of weak verbs in ON having fewest members:

inf.	pres.ind. 2, 3 sg.	past.ind. 3 sg.	supine
<i>telja</i>	<i>telr</i>	<i>taldi</i>	<i>talt</i>
<i>flytja</i>	<i>flytr</i>	<i>flutti</i>	<i>flutt</i>

Characteristic of verbs of this class is (i) their short root syllable, (ii) inflection by vowel change (present to past), a result of *i*-umlaut

of the original root vowel in the present, (iii) pres.ind. 3 sg. suffix *-r*, in contrast with class I suffix *-ar* and class III *-ir*; and (iv) no vowel in the supine suffix.

Note the following exceptions to these characteristics: (i) Some verbs have an *i*-umlauted vowel also in the past, cf. *selja* 'sell' *seldi* (past ind. 3 sg.); (ii) some verbs have *-i-* in the supine suffix, which reflects an original *-i-*, e.g. *framit* of *fremja* 'promote'.

7.3.1.3. Class III

Members of class III of ON weak verbs correspond to two different AN classes; the first had the stem suffix *-ija-*, giving *i*-umlauted forms in the present as well as in the past, cf. *dæma* 'judge':

inf.	pres.ind. 2, 3 sg.	past ind. 3 sg.	supine
<i>dæma</i>	<i>dæmir</i>	<i>dæmdi</i>	<i>dæmt</i>

The second AN source of class III verbs had the stem suffix *-ē-*. The ON verb *trúa* 'believe' belongs to this class:

inf.	pres.ind. 2, 3 sg.	past ind. 3 sg.	supine
<i>trúa</i>	<i>trúir</i>	<i>trúði</i>	<i>trúat</i>

Class III verbs have the pres.ind. 2, 3 sg. suffix *-ir*. The subclass with an *i*-umlauted stem vowel has the supine ending in *-t*, while the other subclass has the supine ending in *-at*.

A number of weak class III verbs have *-j-*insertion, like *stengja* 'close', and a few also have *-v-*insertion, e.g. *slongva* 'throw':

inf.	pres.ind. 2, 3 sg.	past ind. 3 sg.	supine
<i>stengja</i>	<i>stengir</i>	<i>stengði</i>	<i>stengt</i>
<i>slongva</i>	<i>slongvir</i>	<i>slongði</i>	<i>slongt</i>

Some verbs also appear with either type of insertion. (See Noreen 1923, 346f.)

7.3.1.4. Remaining patterns

The following verbs have inflectional properties in common with weak class III verbs, i.e. (partial) *i*-umlaut, pres. ind. sg 2, 3 suffix *-ir*, and supine suffix *-t*. However, they have certain inflectional irregularities which set them apart from regular class III verbs:

inf.	pres.ind. 2, 3 sg.	past ind. 3 sg.	supine
<i>sækja</i>	<i>sækir</i>	<i>sótti</i>	<i>sótt</i>
<i>þykkja</i>	<i>þykkir</i>	<i>þótti</i>	<i>þótt</i>
<i>yrkja</i>	<i>yrkir</i>	<i>orti</i>	<i>ort</i>
<i>hafa</i>	<i>hefir</i>	<i>hafði</i>	<i>haft</i>
<i>segja</i>	<i>segir</i>	<i>sagði</i>	<i>sagt</i>
<i>þegja</i>	<i>þegir</i>	<i>þagði</i>	<i>þag(a)t</i>
<i>kaupa</i>	<i>keypir</i>	<i>keypti</i>	<i>keypt</i>

7.3.2. Strong classes

The seven classes of strong verbs in ON differ with respect to the alternations their stem vowels undergo (i. e. which Proto-Indo-European ablaut series they reflect.) The characteristics of each strong class will be illustrated by the following forms: the infinitive, the pres. ind. 2, 3 sg., the past ind. 1, 3 sg., the past ind. 1 pl., and the supine.

7.3.2.1. Class I

Strong verbs of class I instantiate the vowel series $i - ei - i$ (< PGmc $\bar{a}ii$). *bita* 'bite' is a member of this class:

inf.	pres.ind. 2, 3 sg.	past ind. 1, 3 sg.	past ind. 1 pl.	supine
<i>bita</i>	<i>bítr</i>	<i>beit</i>	<i>bitum</i>	<i>bitit</i>

Other members of this class are *drífa* 'drive', *grípa* 'seize', *líta* 'see', *rífa* 'tear', *ríða* 'ride'. Note the following alternative forms in the past ind. 1, 3 sg. in verbs whose stem ends in -g-; *hníga* 'bend over' – *hneig* or *hné*; *síga* 'sink down' – *seig* or *sé*.

7.3.2.2. Class II

Strong verbs of class II instantiate the vowel series $j\acute{u}/j\acute{o}/\acute{u} - au - u/o$ (< PGmc $eu - au - o$), cf. Noreen 1923, 94f. for details about the variation - $j\acute{u}/-j\acute{o}-$ in the infinitive; *krjúpa* 'crawl', *brjóta* 'break' and *lúka* 'close' are members of this class.

inf.	pres.ind. 2, 3 sg.	past ind. 1, 3 sg.	past ind. 1 pl.	supine
<i>krjúpa</i>	<i>krýpr</i>	<i>kraup</i>	<i>krupum</i>	<i>kropit</i>
<i>brjóta</i>	<i>brýtr</i>	<i>braut</i>	<i>brutum</i>	<i>brotit</i>
<i>lúka</i>	<i>lýkr</i>	<i>lauk</i>	<i>lukum</i>	<i>lokit</i>

Most verbs in this class are like *krjúpa* and *brjóta*. The difference between the two stem diphthongs is predictable from the place of articulation of the following consonant: - $j\acute{o}$ - before alveolar consonants, - $j\acute{u}$ - elsewhere (cf. Noreen 1923, 94f.).

Only a few verbs inflect like *lúka*. The stem vowel \acute{u} (< PGmc. eu) has not been explained in the literature (Iversen 1972, 101).

If the stem ends in a -g-, there are two alternative forms in the past ind. 1, 3 sg., e. g. *fljúga* 'fly' has *flaug* or *fló*.

Two verbs, *kjósa* 'choose' and *frjósa* 'freeze', have aberrant forms in OIcel.; instead of the expected *kaus/kusum* and *fraus/frusum*, which are attested in ONorw., we find *kora*, *kori/*

korum and *fróra*, *fróri/frorum*, which for number and person inflect like weak verbs.

7.3.2.3. Class III

Strong verbs of class III instantiate the vowel series $e/ja/i/y/\emptyset - a - u - o/u$ (< PGmc $e - a - u$); *bresta* 'break', *bjarga* 'save, help', *spinna* 'spin', *slyngva* 'hurl' and *sökkva* 'sink' are members of this class:

inf.	pres.ind. 2, 3 sg.	past ind. 1, 3 sg.	past ind. 1 pl.	supine
<i>bresta</i>	<i>brestr</i>	<i>brast</i>	<i>brustum</i>	<i>brostit</i>
<i>bjarga</i>	<i>bergr</i>	<i>barg</i>	<i>burgum</i>	<i>borgit</i>
<i>spinna</i>	<i>spinnr</i>	<i>spann</i>	<i>spunnum</i>	<i>spunnit</i>
<i>slyngva</i>	<i>slyngr</i>	<i>slong</i>	<i>slungum</i>	<i>slungit</i>
<i>sökkva</i>	<i>sökkv</i>	<i>sökk</i>	<i>sökkum</i>	<i>sökkit</i>

7.3.2.4. Class IV

Strong verbs of class IV instantiate the vowel series $e - a - \acute{a} - o$ (< PGmc $e - a - \bar{x} - u$); *bera* 'carry' is a member of class IV:

inf.	pres.ind. 2, 3 sg.	past ind. 1, 3 sg.	past ind. 1 pl.	supine
<i>bera</i>	<i>berr</i>	<i>bar</i>	<i>bárum</i>	<i>borit</i>

Several strong verbs of class IV have root vowels which in the infinitive/present or in the past deviate from that of *bera*, e. g. *sofa* 'sleep', *koma* 'come', and *svíma* 'swim':

inf.	pres.ind. 2, 3 sg.	past ind. 1, 3 sg.	past ind. 1 pl.	supine
<i>koma</i>	<i>kemr/komr</i>	<i>kom</i>	<i>kvánum</i>	<i>komit</i>
<i>sofa</i>	<i>sefr/søfr</i>	<i>svaf</i>	<i>sváfum</i>	<i>sofit</i>
<i>svíma</i>	<i>svimr</i>	<i>svam</i>	<i>svámu</i>	<i>sumit</i>

7.3.2.5. Class V

Strong verbs of class V instantiate the vowel series $e - a - \acute{a} - e$ (< PGmc $e - a - \bar{x}$); *gefa* ('give'), *biðja* 'ask', *liggja* 'lie', *fregna* 'ask', *vera* 'be' and *sjá* 'see' are members of this class:

inf.	pres.ind. 2, 3 sg.	past ind. 1, 3 sg.	past ind. 1 pl.	supine
<i>gefa</i>	<i>gefr</i>	<i>gaf</i>	<i>gáfum</i>	<i>gefinn</i>
<i>biðja</i>	<i>biðr</i>	<i>bað</i>	<i>báðum</i>	<i>beðit</i>
<i>liggja</i>	<i>liggr</i>	<i>lá</i>	<i>lágum</i>	<i>legit</i>
<i>fregna</i>	<i>fregn</i>	<i>frá</i>	<i>frágum</i>	<i>fregit</i>
<i>vera</i>	(er)	<i>var</i>	<i>várum</i>	<i>verit</i>
<i>sjá</i>	<i>sér</i>	<i>sá</i>	<i>sám</i>	<i>sét</i>

7.3.2.6. Class VI

Strong verbs of class VI instantiate the vowel series $a - \acute{o}$ (< PGmc $a - \bar{o}$); *fara* 'go' is a member of this class. The verbs in this class can

be divided in several subclasses. First, verbs whose stem ends in *-g-* or *-k-*, e. g. *taka* ‘take’, have the root vowel *-e-* in the supine. Second, some verbs, e. g. *hefja* ‘lift’, have *-j-* insertion in the infinitive/present; these verbs have the root vowel *-e-* in the mentioned forms. Third, four verbs, *flá* ‘flay’, *klá* ‘scratch’, *slá* ‘beat’ and *þvá* ‘wash’ have a long vowel in the infinitive and the present.

inf.	pres.ind. 2, 3 sg	past ind. 1, 3 sg	past ind. 1 pl.	supine
<i>fara</i>	<i>ferr</i>	<i>för</i>	<i>förum</i>	<i>farit</i>
<i>taka</i>	<i>tekr</i>	<i>tók</i>	<i>tókum</i>	<i>tekit</i>
<i>hefja</i>	<i>hefr</i>	<i>hóf</i>	<i>hófum</i>	<i>hafit</i>
<i>flá</i>	<i>flær</i>	<i>fló</i>	<i>flógum</i>	<i>flegit</i>
<i>þvá</i>	<i>þvær</i>	<i>þó</i>	<i>þógum</i>	<i>þvegit</i>
<i>draga</i>	<i>dregr</i>	<i>dró</i>	<i>drógum</i>	<i>dregit</i>
<i>hlæja</i>	<i>hlær</i>	<i>hló</i>	<i>hlógum</i>	<i>hlegit</i>

7.3.2.7. Class VII

Historically the verbs in class VII are derived from a PGmc. class of reduplicating verbs. There are four subclasses, represented below by *leika* ‘play’, *hlaupa* ‘run’, *blanda* ‘mix’, *blása* ‘blow’.

inf.	pres. ind. 2,3 sg.	past ind. 1,3 sg.	past ind. 1 pl.	supine
<i>leika</i>	<i>leikr</i>	<i>lék</i>	<i>lékum</i>	<i>leikit</i>
<i>hlaupa</i>	<i>hleypr</i>	<i>hljóp</i>	<i>hljöpum</i>	<i>hlaupit</i>
<i>blanda</i>	<i>blendr</i>	<i>blett</i>	<i>blendum</i>	<i>blandit</i>
<i>blása</i>	<i>blæss</i>	<i>blés</i>	<i>blésum</i>	<i>blásit</i>

7.3.2.8. Verbs with both weak and strong inflection

Several ON verbs have inflectional properties of both strong and weak verbs. Members of the first group have present forms like the past of regular strong verbs, and past forms like the past of regular verbs, i. e. with the dental

suffix. ON has 10 verbs of this type, all listed below:

7.3.3. The middle voice

Finally, the inflectional forms of reflexive ON verbs are given, illustrated by the paradigms of *kallask* ‘be called’ and *lúkask* ‘close, be closed’:

Infinitive		<i>kallask</i>	<i>lúkask</i>
Present Indicative	sg. 1	<i>køllumk</i>	<i>lúkumk</i>
	2	<i>kallask</i>	<i>lýksk</i>
	3	<i>kallask</i>	<i>lýksk</i>
	pl. 1	<i>køllumsk</i>	<i>lúkumsk</i>
	2	<i>kallizk</i>	<i>lúkizk</i>
	3	<i>kallask</i>	<i>lúkask</i>
Present Subjunctive	sg. 1	<i>køllumk</i>	<i>lúkumk</i>
	2	<i>kallisk</i>	<i>lúkisk</i>
	3	<i>kallisk</i>	<i>lúkisk</i>
	pl. 1	<i>kallimsk</i>	<i>lúkimsk</i>
	2	<i>kallizk</i>	<i>lúkizk</i>
	3	<i>kallisk</i>	<i>lúkisk</i>
Past Indicative	sg. 1	<i>kølluðumk</i>	<i>lukumk</i>
	2	<i>kallaðisk</i>	<i>lauksk</i>
	3	<i>kallaðisk</i>	<i>lauksk</i>
	pl. 1	<i>kølluðumsk</i>	<i>lukumsk</i>
	2	<i>kølluðuzk</i>	<i>lukuzk</i>
	3	<i>kølluðusk</i>	<i>lukusk</i>
Past Subjunctive	sg. 1	<i>kølluðumk</i>	<i>lykumk</i>
	2	<i>kallaðisk</i>	<i>lykisk</i>
	3	<i>kallaðisk</i>	<i>lykisk</i>
	pl. 1	<i>kallaðimsk</i>	<i>lykimsk</i>
	2	<i>kallaðizk</i>	<i>lykizk</i>
	3	<i>kallaðisk</i>	<i>lykisk</i>
Imperative	sg. 2	<i>kallask</i>	<i>lúksk</i>
	pl. 1	<i>køllumsk</i>	<i>lúkumsk</i>
	2	<i>kallizk</i>	<i>lúkizk</i>
Pres. Part.		<i>kallandisk</i>	<i>lúkandisk</i>
		<i>kallazk</i>	<i>lokizk</i>

Table 1.

inf.	pres. ind. 2,3 sg.	pres. ind. 1. pl.	pret. ind. 3. sg	supine
<i>vita</i> (‘know’)	<i>veit</i>	<i>vitum</i>	<i>vissi</i>	<i>vitat</i>
<i>eiga</i> (‘own’)	<i>á</i>	<i>eigum</i>	<i>átti</i>	<i>átt</i>
<i>unna</i> (‘love’)	<i>ann</i>	<i>unnum</i>	<i>unni</i>	<i>unt/unnat</i>

104. The morphology of Old Nordic II: Old Swedish and Old Danish

1. Introduction
2. Synchronic aspects
3. Diachronic aspects
4. Literature (a selection)

1. Introduction

This article is a survey of the morphology of Old Swedish (OSw.), Old Danish (ODan.) and Old Gutnish (OGu.) for the period 1100–1350. In some cases Old Scanian is sufficiently different from other variants of ODan. to be distinguished from it here, mostly in cases when Old Scanian patterns with OSw. The article has two parts. The first one is mainly synchronic, giving an overview of the morphology of OSw. and ODan. The second part is diachronic, presenting some major changes in the morphological system and their causes.

2. Synchronic aspects

In the beginning of the ON period, written Dan. and Sw. are only found in (short) runic inscriptions. However, some manuscripts do exist, mainly from the period 1250–1350. The oldest longer texts are from late 13th c. A description of OSw. and ODan. morphology from the beginning of this period must therefore be a reconstruction of what we can deduce from the earliest texts and the morphology of related languages. The main sources for this study are: for ODan., GG (1928–1971); and for OSw. and OGu., the main sources are Noreen *Aschwed.* and Wessén *Språkh. I*. These works are of course supplemented by other works. The survey has also benefited from searching computer files of the Scanian Law (SkL) and some OSw. provincial laws.

The grammatical categories expressed for nouns, pronouns, adjectives and verbs can be divided into three groups. First, some catego-

ries denote inherent properties of a word, a specified and invariable property of the single lexical item. For instance, all proper names are definite and lexically specified for either sg. or pl. (the latter is true for many place-names). All nouns also belong to certain genders (masc., fem. or neut.) and declensions related to these. Verbs belong to various conjugations. Second, words can have meaningful inflection to the extent that the speaker will choose different endings in order to convey different meanings. Number for nouns, comparison for adjectives and tense for verbs are typical instances of this type, which I will call *substantial inflection*. Third, we also find grammatical inflection, which is not a choice of the speaker but a consequence of the syntactic environment. Ordinary adjectival and verbal agreement are typical grammatical inflections. Case must be seen as partly substantial and partly grammatical. Nominative and accusative are normally dependent on the syntactic configuration (*structural case* in generative terms). The same is true for many complements of prepositions, which invariably take the same case (like the gen. after *til* in ON). On the other hand, case may also be a substantial inflection. For instance, dative is used for all phrases of time and distance introducing prepositional phrases and subordinate clauses: *niu manæþum æptir þet bonden doþær ær* (UL, ms. B) [nine month-dat. after that peasant-the dead is]. A similar thematic case is found with certain complements of prepositions, which take different cases for different meaning (*i hūs / i hūsi*), i.e. the accusative is used for direction (or bounded meaning), whereas dative is used for location (or unbounded meaning). Thus, while case can be both substantial and grammatical, since it is normally found in a syncretism with number, I will treat it together with number (i.e. as sub-

Table 104.1: Grammatical categories

	Inherent category	Substantial inflection	Grammatical inflection
Proper names	gender/ + def/number	case	(case)
Nouns	gender	number/case/def	(case)
Personal pronouns	person/number/ + def/case	(case)	
Possessive pronouns	person/number		gender/number/case
Adjectives		comparison	gender/number/case
Verbs		tense/mode	person/number

stantial inflection). The distinctions made above are concluded in table 104.1.

Nouns with certain combinations of number/gender inflections are grouped into declensions, and verbs with certain combinations of tense/number inflection are grouped into conjugations. Note that a category can be specified twice. Possessive pronouns may have an inherent specification (normally visible in the root) for the number of the possessor, but it also agrees with the possessee in number. Personal pronouns can be said to inflect only marginally, since different forms may be based on different roots. Following tradition, I will, however, include them in the survey. This synchronic section is thus divided into seven separate subsections:

- nouns and proper names (case and number)
- personal pronouns (case, number and person)
- pronominal agreement (case, number and gender)
- adjectives (comparison)
- adjectival agreement (case, number and gender)
- verbs (tense and mode)
- verbal agreement (person and number)

I will give a simplified picture of the facts here. Definiteness of noun phrases is often signalled by a definite suffix on the noun. This suffix takes basically the same form as pronominal attributive pronouns. Thus I will present the forms of nouns with the suffixed article together with attributive pronouns.

Generally, the old unstressed vowels, [i, u, a], are retained in OGu. In OSw. and Old Scanian, they are often weakened to [e, o] and (sometimes) [æ], respectively, by the end of this period. In ODan. all unstressed vowels are

normally weakened to [ə] (spelled <e> or <æ>), thus removing the distinction. Throughout, I will give examples with the original vowel preserved. Svarabhakti vowels are only present in the latter part of this period. There are still texts that frequently leave out the svarabhakti vowels, i.e. ÄVgL, GL and several manuscripts of UL, as well as the major part of KS (Moberg 1984, 166–174). In the texts with svarabhakti, we find <a> frequently in OGu. and in some texts from Östergötland. DL has <i>, whereas other OSw. texts normally have <æ> or <e>. ODan. has the ordinary unstressed <æ>. The svarabhakti vowel is not visible where there has been assimilation between the end of the stem and the inflectional suffix (when the stem ends in [s], [l], [r] or [n]). I use <æ> as svarabhakti vowel all through this survey. By the end of the period we also find the total loss of final unstressed vowels in Old Jutlandic: *bær, hald* (corresponding to Old Zealandic *bæræ, haldæ* or Old Scanian/OSw. *bæra, halda*). The following gives this idealised picture of OEN morphology. Since the common origin of ODan. and OSw. is almost always best preserved in OSw., I will basically present OSw. morphology in the tables, pointing out deviancies in ODan. and OGu. in the text.

2.1. Nouns

Ordinary nouns are inherently specified for gender. They are inflected for number and case. They may also take the suffixed article, which makes the noun phrase that they head definite. This suffixed article is in turn inflected for case and number. Proper names are inherently definite and they are either sg. or pl. They have a number/case suffix just as ordinary nouns do.

Table 104.2: Nouns in Old Nordic

Vowel	Strong nouns			Weak nouns (-n stems)		
	masc.	fem.	neut.	masc.	fem.	neut.
a/o	-a stem	-ō stem	-a stem	-an stem	-ōn stem	-an stem
i	-i stem	-i stem			-īn stem	
u	-u stem					

Nouns in ON are normally divided into stems, according to their PN forms. These stems consisted of a root and a derivational suffix, which normally is a vowel (strong nouns) or a vowel and a consonant (weak nouns). These stems correlate with one, two or three genders as illustrated in table 104.2.

Most of these stems are common, but -u stems, -īn stems and neuter -an stems comprise only few nouns. Among the masculines, the -a and -an stems are most common, among the feminines the -i and -ōn stems are most common, whereas almost all neuter nouns are -a stems. The -a/-an and -ō/-ōn stems formerly had variants with a [i] or a [j] before the vowel, -ia/-iō and -ja/-jō stems, which still affects the inflection. Apart from the stems presented in table 104.2, there are three types of stem that do not contain any vowel in the suffix. These stems have their pl. nom./acc. in -r (or svara-bhakti + -r). The three types are the root stems, which have no stem suffix at all (the inflectional ending is added to the root), the -r stems and the -nd stems. They are represented by very few nouns, but some of them are quite frequent, such as *maþær*, *hand*, *fapir*, *mopir*, *bondi*. I will treat these three types of nouns together with the strong nouns, as is customary in modern works on Scandinavian morphology. In the following, a brief survey of these noun stems is provided.

2.1.1. Strong nouns

The stem vowel of -a and -ō stems is still visible in the pl. (nom./acc.). It appears as an [a] in OSw., OGu. and Old Scanian, but the weakening of vowels has turned it into [ə], spelled <æ> or <e>, in ODan. The -a and -ō stems are inflected as in table 3 (some qualifying remarks are found at the end of this subsection).

Table 104.3: -a stems and -ō stems

Sg.	masc. -a stems	fem. -ō stems	neut. -a stems
Nom.	<i>fisk-ær</i>	<i>sōl</i>	<i>bēn</i>
Gen.	<i>fisk-s</i>	<i>sōl-ar</i>	<i>bēn-s</i>
Dat.	<i>fisk-i</i>	<i>sōl-u</i>	<i>bēn-i</i>
Acc.	<i>fisk</i>	<i>sōl</i>	<i>bēn</i>
Pl.			
Nom.	<i>fisk-ar</i>	<i>sōl-ar</i>	<i>bēn</i>
Gen.	<i>fisk-a</i>	<i>sōl-a</i>	<i>bēn-a</i>
Dat.	<i>fisk-um</i>	<i>sōl-um</i>	<i>bēn-um</i>
Acc.	<i>fisk-a</i>	<i>sōl-ar</i>	<i>bēn</i>

Most masc. nouns are inflected like *fiskær*, e.g. *dagær*, *stēnn*, *konungær*, *diævul*, *siōr*, and almost all neut. nouns are inflected like *bēn*, e.g. *hūs*, *ār*, *skip*, *haf*, *træ*. A minority of the fem. nouns are inflected like *sōl*: e.g. *graf*, *siæng*, *iorþ* and derived nouns in -ing or -ning.

The -ja/-ia and -jō/-iō stems differ from the pure -a and -ō stems. First, in sg. the -ia stems have an -i ending throughout the singular, and the -iō stems have an -i ending in dat. and acc. sg., as illustrated in table 104.4 (the plural paradigm is the same as in table 104.3).

Table 104.4: -ia and -iō stems in the singular

	masc. -ia stems	fem. -iō stems	neut -ia stems
Nom.	<i>ōr ir</i>	<i>byrþ</i>	<i>rīk i</i>
Gen.	<i>ōr is</i>	<i>byrþ ar</i>	<i>rīk is</i>
Dat.	<i>ōr i</i>	<i>byrþ i</i>	<i>rīk i</i>
Acc.	<i>ōr i</i>	<i>byrþ i</i>	<i>rīk i</i>

The neut. *-ia* stems are quite frequent: *æpli*, *mínni*, *dómi* etc. and some words in *-ilsi*, whereas the masc. and fem. ones are rare. Second, in OSw., OGu. and (less often) in Old Scanian, there are *-ja* and *-jō* stems, which are distinct from ordinary *-a* and *-ō* stems, in that they have a [j] before suffixes beginning in [a] or [u], e.g. the nom. and dat. pl. for masc. *-ja* stems and fem. *-jō* stems: *væfiar* and *væfium* (from *vævær*) and *ængiar* and *ængium* (from *æng*). Most masc. *-ja* stems end in a velar consonant, and those take *-iar*, e.g. *læggiar* in the gen. sing., instead of *-s*.

The *-i* stems are characterised by an *-i* ending in nom./acc. pl. The same is true for *-u* stems. The difference between *-i* and *-u* stems is that originally the former have a root vowel with *i*-umlaut, whereas the latter have *i*-umlaut only with retained *-i*. The *-i* and *-u* stems are illustrated in table 104.5.

Table 104.5: *-i* and *-u* stems

Sg.	masc. <i>-i</i> stems	fem. <i>-i</i> stems	masc. <i>-u</i> stems
Nom.	<i>sip-ær</i>	<i>dygb</i>	<i>sun</i>
Gen.	<i>sip-ar</i>	<i>dygb-ar</i>	<i>sun-ar</i>
Dat.	<i>sip-i</i>	<i>dygb</i>	<i>syn-i</i>
Acc.	<i>sip</i>	<i>dygb</i>	<i>sun</i>
Pl.			
Nom.	<i>sip-ir</i>	<i>dygb-ir</i>	<i>syn-ir</i>
Gen.	<i>sip-a</i>	<i>dygb-a</i>	<i>sun-a</i>
Dat.	<i>sip-um</i>	<i>dygb-um</i>	<i>sun-um</i>
Acc.	<i>sip-i</i>	<i>dygb-ir</i>	<i>syn-i</i>

Many fem. nouns are inflected like *dygb*, e.g. *færb*, *synd*, *sak*, *æt*. Several masc. nouns inflect like *sipær*, e.g. *rættær*, *vinær*, and derived nouns in *-naþær*. Very few words inflect like *sun*, e.g. *lutær*.

The acc.pl. of *-u* stems is originally *-u*, e.g. *sunu*, but this is rarely found. The ending is normally *-i* (or sometimes *-ir* in ODan.).

The strong nouns are alike in many ways. The following comments apply to all of them. The masc.nom. forms in *-ær* are dropped early in Old Jutlandic and Old Zealandic, a bit later in Old Scandian, where some instances are found in the manuscripts. The ending is normally retained in OSw. and OGu. manuscripts, but forms without it may be found by the end of the period. The dative *-i* in the masc. and neut.sg. is found in runic inscriptions in Denmark and Sweden. In the manuscripts, the *-i* ending is mostly found in fixed phrases (*af garthæ*, *mæth swornum ethe*) in ODan.; in Old Scanian the form is more frequent, and in OSw. and OGu. it is normally retained until the end of the period. In the gen. the fem.sg. ending often loses the *-r*, and by the end of the period the vowel is also lost. In Codex Bureanus from around 1350, the root is often used as the fem.gen.sing. form (Ottelin 1905, 94, 97). The *a(r)*-ending is, however, used in compounds. Individual nouns, like the *-u* stem *sun* and the *-ō* stem *væruld*, take the genitive *-s* of *-a* stems (Norde 1997, 120ff.). In the dat. the fem.sg. *-u* is partly retained in SkL and ÄVgL, but in other texts the *-u* endings are rare. The masc.nom.pl. *-ar* is found in Dan. runic inscriptions, but not in the manuscripts, where only *r*-less forms are found. The same is true for fem.nom./acc.pl., but some forms with *-r* are found in Old Scanian. The *-i*

Table 104.6: Root stems, *-r* stems and *-nd* stems

Sg.	masc. root stems	fem. root stems	masc. <i>-r</i> stems	fem. <i>-r</i> stems	masc. <i>-nd</i> stems
Nom.	<i>fōt-ær</i>	<i>hand</i>	<i>fapir</i>	<i>mōþir</i>	<i>bōnd-i</i>
Gen.	<i>fōt-ar</i>	<i>hand-ar</i>	<i>fapur</i>	<i>mōþur</i>	<i>bōnd-a</i>
Dat.	<i>fōt-e</i>	<i>hand</i>	<i>fæþær</i>	<i>mōþær</i>	<i>bōnd-a</i>
Acc.	<i>fōt</i>	<i>hand</i>	<i>fapur</i>	<i>mōþur</i>	<i>bōnd-a</i>
Pl.					
Nom.	<i>fōt-ær</i>	<i>hænd-ær</i>	<i>fæþær</i>	<i>mōþær</i>	<i>bōnd-ær</i>
Gen.	<i>fōt-a</i>	<i>hand-a</i>	<i>fæþr-a</i>	<i>mōþr-a</i>	<i>bōnd-a</i>
Dat.	<i>fōt-um</i>	<i>hand-om</i>	<i>fæþr-um</i>	<i>mōþr-um</i>	<i>bōnd-um</i>
Acc.	<i>fōt-ær</i>	<i>hænd-ær</i>	<i>fæþær</i>	<i>mōþær</i>	<i>bōnd-ær</i>

and *-u* stem plurals in *-ir* (masc.nom. and fem.nom./acc.) retain the *-r* to a greater extent, especially in Old Scanian.

The nouns that lack a vowel in the stem suffix are root stems, *-r* stems and *-nd* stems. They are inflected as in table 104.6.

The word *maþær* (*manns*, *manni*, *mann*, nom./acc.plur. *mænn*) is also a root stem. Otherwise, we only find a few masc. root stems (such as *spandær*, *fiŋgær*) and fem. root stems (such as *nätt*, *bök*, *tann*). For *-r* stems we only find the five relational words *faþir*, *bröþir*, *möþir*, *döttir* and *systir*. A few words inflect like *böndi*, e.g. *frændi* and nouns in *æghandi* and *væriandi*. All *-nd* stems are inflected like masc. *-an* stems in the sg., but as masc. root stems in the pl. All of them are nominalised present participles. (The nom.sg. *-ær* ending, the dative *i*-ending and fem.gen. *-ar* in root and *-r* stems are subject to the same restrictions as in the *-a/-ö stems*).

The word *hand* was formerly a *-u* stem, and therefore it sometimes takes a dat.sg. *-i*: *hændi*. The old dat. forms of *-r* stems (*faþær*, *möþær*) are often replaced by the acc./gen. forms (*faþur*, *möþur*) by the end of the period. The nom.-acc. distinction in *-r* stems disappears in ODan. and Old Scanian (Bjerrum 1954, 27), but it is retained in OSw. In the gen. of masc. *-r* stems an *-s* is introduced by the end of the period.

2.1.2. Weak nouns

Weak nouns include all *-n* stems: *-an-*, *-ön-* and *-in-* stems. They have two (or three) syllables in all forms and are inflected as illustrated in table 104.7.

Table 104.7: *-an-*, *-ön-* and *-in-* stems

Sg.	masc. <i>-an</i> stems	fem. <i>-ön</i> stems	neut. <i>-an</i> stems	fem. <i>-in</i> stems
Nom.	<i>nakk-i</i>	<i>hak-a</i>	<i>ör-a</i>	<i>glæþ-i</i>
Gen.	<i>nakk-a</i>	<i>hak-u</i>	<i>ör-a</i>	<i>glæþ-i</i>
Dat.	<i>nakk-a</i>	<i>hak-u</i>	<i>ör-a</i>	<i>glæþ-i</i>
Acc.	<i>nakk-a</i>	<i>hak-u</i>	<i>ör-a</i>	<i>glæþ-i</i>
Pl.				
Nom.	<i>nakk-ar</i>	<i>hak-ur</i>	<i>ör-un</i>	–
Gen.	<i>nakk-a</i>	<i>hak-na</i>	<i>ör-na</i>	–
Dat.	<i>nakk-um</i>	<i>hak-um</i>	<i>ör-um</i>	–
Acc.	<i>nakk-a</i>	<i>hak-ur</i>	<i>ör-un</i>	–

The masc. *-an* stems and the fem. *-ön* stems are very frequent: they include nouns like *hani*, *loghi*, *timi*, *vafi* and derived nouns in *-ari* as well as nouns like *gata*, *kona* (gen.plur. *kvinna*), *vika* etc. The neut. *-an* stems only include *ōgha*, *ōra*, *hierta* and a few others. The few *-in* stems, *glæþi*, *vrēþi*, *ræddi*, *ælli* etc. are all abstract mass nouns, and thus they lack pl. forms.

The gen.sg. of *-ön* stems is consistently *-ur* in OGu. This form is also found in some Sw. runic inscriptions. The nom.-oblique distinction in the sg. is lost at an early stage in ODan. In Old Scanian it is lost by the end of the period for *-ön* stems (Bjerrum 1954, 27). In OSw. and OGu., the distinctions are retained throughout the period. The *-na* ending in the gen.pl. is rare; in OSw. we also find a *-u* ending for fem. nouns: *humblu*, *kyrkiu*.

A variant of the *-an/-ön stems* had a [i] in the stem (*-jan/-jön stems*). These have a visible [i] in endings beginning with an [a] or [u]. The *-jan* stem *vili* is *vilia* in the oblique sg. form, *vilium* in dat.pl., and a fem. like *kirkiu* has *kirkiu* in the oblique sg. form.

2.2. Personal pronouns

Personal pronouns are inherently specified for definiteness and gender. Most of them have different roots in the singular and plural, and in the nominative and oblique case. Thus personal pronouns can only be said to inflect in a few instances. However, they express the other distinctions visibly, as illustrated in table 104.8.

The reflexive form is missing in the nom. due to syntactic restrictions. The 1/2 oblique forms are also used reflexively. To express 3 neut.sg. and 3 pl. (non-reflexive), the originally demonstrative pronoun *þænn* is used (see table 104.11). There are also 1/2 dual forms, which is not attested in all cases, but we find 1 nom. *vit* and acc. *okkær* in some OSw. texts and 2 *it* and *ikkær* respectively.

The distinction between acc. *mik*, *þik*, *sik* and dative *mæ(r)*, *þæ(r)*, *sæ(r)* (OGu. *mūr*, *þūr*, *sūr*) is found in runic inscriptions and in some OSw. and OGu. manuscripts. The dative form *sæ* is found in Old Scanian. Otherwise the old acc. is used in dat. contexts.

The forms *hāna/hōna* and *hann* in acc. begin to be replaced by the dat. *hænni/hānum* in ODan. during this period; the distinctive acc. forms are hardly attested at all in Old Jutlandic sources, but are mostly retained elsewhere. In OGu. (and sometimes in Codex Bureanus from Östergötland), the 3 fem.nom. pronoun is *hān*.

Table 104.8: Personal pronouns

	singular				plural		refl.
	1	2	3 masc.	3 fem.	1	2	3
Nom.	<i>iak</i>	<i>þu</i>	<i>hann, sá</i>	<i>hön, sū</i>	<i>vi(r)</i>	<i>i(r)</i>	–
Gen.	<i>mīn</i>	<i>þīn</i>	<i>hans</i>	<i>hænnar</i>	<i>vār</i>	<i>īþar</i>	<i>sīn</i>
Dat.	<i>mæ(r)</i>	<i>þæ(r)</i>	<i>hānum, honum</i>	<i>hænni</i>	<i>oss</i>	<i>īþær</i>	<i>sæ(r)</i>
Acc.	<i>mik</i>	<i>þik</i>	<i>hann</i>	<i>hāna, hōna</i>	<i>oss</i>	<i>īþær</i>	<i>sik</i>

2.3. Pronominal agreement

Attributive pronouns normally agree with their nouns. Here, I will give the paradigms for the more common cases. Table 104.9 illustrates the first-person possessive pronoun *minn*.

Table 104.9: Possessive pronoun *minn*

	singular		
	masc.	fem.	neut.
Nom.	<i>minn</i>	<i>mīn</i>	<i>mitt</i>
Gen.	<i>mīns</i>	<i>minna(r)</i>	<i>mīns</i>
Dat.	<i>mīnum</i>	<i>minni</i>	<i>mīnu</i>
Acc.	<i>minn</i>	<i>mīna</i>	<i>mitt</i>
	plural		
	masc.	fem.	neut.
Nom.	<i>mīni(r)</i>	<i>mīna(r)</i>	<i>mīn</i>
Gen.	<i>minna</i>		
Dat.	<i>mīnum</i>		
Acc.	<i>mīna</i>	<i>mīna(r)</i>	<i>mīn</i>

The possessive pronouns *þinn* (2 person) and *sinn* (reflexive) inflect like *minn*. In Old Jutlandic unassimilated forms such as *mint* can be found for neut. nom./acc.sg. The third person *hans, hænnar, þæss* and *þera* are non-agreeing gen. forms of *hann, hon* and *þænn*.

The demonstrative *inn/hinn* is inflected in the same way as *minn*, but when used as a pronominal article, it has the form *hit* in the neut. nom./acc. sg. The suffixed article *-inn* is in principle an agreeing pronoun cliticised to the noun. Number and case are thus visible twice on a noun with a suffixed article. In table 104.10 the most common types of nouns are given with the suffixed article.

The article is added to the inflected noun, but the vowel of the article is elided when the inflected noun ends in a vowel or a vowel and an *-r*. The pl. *-r* in the masc. and fem. is dropped in front of the article. In three cases the complex form cannot be described as the adding of an article *-inn* to an inflected noun. This involves the fem.gen.sing. and the fem.dat.sing. of *-ō* stems, where the noun has no case endings

Table 104.10: Nouns with the suffixed definite article

Acc.	<i>fiska-na</i>	<i>nakka-na</i>	<i>dygþ-inar</i>	<i>haku-nar</i>	<i>bēn-in</i>	<i>rīki-n</i>

of its own: forms like **grafa(ri)nnar* and **grafunni* are not attested. The third instance is dat.pl., where the form *-umin* is best described as a noun with a case ending followed by an article without case ending. The age of the article is a debated issue (see section 3.4.).

The form *fiskrinn* (with the nom. *-r-*) becomes less frequent by the end of the period; the form without the *-r-* is in the majority in the texts by then.

The demonstrative pronoun *þænn* is normally used as the independent article. It is inflected as in table 104.11.

Table 104.11: Demonstrative *þænn*

	singular		
	masc.	fem.	neut.

Gen.	<i>þēra, þærra</i>		
Dat.	<i>þēm</i>		
Acc.	<i>þā</i>	<i>þā(r)</i>	<i>þē, þō(n)</i>

The gen.sg. is *thæns* and the gen.pl. *thærres* in some younger ODan. texts. The masc. dat.sg.

is often replaced by the accusative form, starting even in the oldest manuscripts. In the fem.sg., the form *þæn* is generalised by the end of the period in ODan. For the fem.sg. in OSw. *þōn* is sometimes borrowed from neut.pl., but by the end of the period, *þe* is generalised in all cases. The form *þau(n)* in neut.nom./acc.pl. is found in runic inscriptions and OGu. The OSw. counterpart is *þō(n)*. ODan. however consistently has *n*-less forms. The dat.plur. *þēm* often replaces the acc. forms in the younger texts.

The demonstrative *þænni* is based on the pronoun *þænn*, *sā* to which the particles *-si* or *-a* are cliticised. Several analogical processes have been active. In table 104.12, the most common forms are given. In OGu. the nom.sg. forms are *þissi – þissun – þitta*.

Table 104.12: Demonstrative *þænni, sāsi*

	singular

Dat.	<i>nokorum</i>	<i>nokorri</i>	<i>nokoru</i>	<i>ængum</i>	<i>ængi</i>	<i>ængu</i>
Acc.	<i>nokon</i>	<i>nokora</i>	<i>nokot</i>	<i>ængi(m)</i>	<i>ænga</i>	<i>ænkti</i>
Pl.						
Nom.	<i>nokorir</i>	<i>nokorar</i>	<i>nokor</i>	<i>ængi</i>	<i>ængar</i>	<i>ængin</i>
Gen.	<i>nokorra</i>			<i>ængra</i>		
Dat.	<i>nokorum</i>			<i>ængum</i>		
Acc.	<i>nokora</i>	<i>nokorar</i>	<i>nokor</i>	<i>ænga</i>	<i>ængar</i>	<i>ængin</i>

The masc.acc. form *þenna* is also used in dat. contexts in the younger texts (Ottelin 1905, 138; GG V; § 575,3).

The universally quantifying pronoun *allær* is inflected as an ordinary adjective (see table 104.17). The dual universal quantifier *þáþir* (fem. *þáþar*, neut. *þáþi*) has gen. *þæggia*. The indefinite pronouns *nokorr* and *ængi(nn)* are inflected as in table 104.13.

Nokorr comes in many forms, e.g. *nakvarr*, *nakorr*, *nakvorr*. A vowel in the suffix causes the reduction of the second vowel in ODan. and often in OSw.: e.g. masc.nom.pl. *nokrir*. This is standard by the end of the period. In masc.acc.sg. we also find *nokorn*, *nokron* and the like, and in ODan. sometimes the nom. is used instead of the acc.

The fem.gen./dat.sg. forms of *ængi(nn)* sometimes become *ænginna*, *ænginni* respectively. In Old Jutlandic texts, and sometimes in Old Zealandic texts, the masc.nom./acc.sing. form is *ængi*. Old Scanian uses the same forms as OSw.

The sg. numeral *enn* is inflected like *minn* (see table 104.9 above). In OGu. its nom. sg. forms are *ann* – *ain* – *att*. The numerals *tvēr*, *þrīr* and *fiūrir* are inflected as in table 104.14, whereas other cardinal numerals are in principle uninflected.

The paradigm is somewhat levelled in ODan., where the acc. forms prevail in the masc. and fem. The dat. forms are e.g. almost only found in Old Scanian. The ordinal *fyrstær/fyrsti* is inflected as an adjective, either strong or weak. *Annarr* may be used as the ordinal ‘second’ or as a pronoun with the meaning ‘other’ or ‘one out of two’. It always takes the strong inflection. In table 104.15, the forms of *annarr* are shown. In cases where the second vowel is syncopated, the sequence *-nnr-* becomes *-þr-*.

Table 104.15: The pronoun/numeral *annarr*

	Singular		
	masc.	fem.	neutr.
Nom.	<i>annarr</i>	<i>annur</i>	<i>annat</i>
Gen.	<i>annars</i>	<i>annarrar</i>	<i>annars</i>
Dat.	<i>aþrum</i>	<i>annarri</i>	<i>aþru</i>
Acc.	<i>annan</i>	<i>aþra</i>	<i>annat</i>
	Plural		
	masc.	fem.	neutr.
Nom.	<i>aþrir</i>	<i>aþrar</i>	<i>annur</i>
Gen.	<i>annara</i>	<i>annara</i>	<i>annara</i>
Dat.	<i>aþrum</i>	<i>aþrum</i>	<i>aþrum</i>
Acc.	<i>aþra</i>	<i>aþrar</i>	<i>annur</i>

The forms with a syncopated vowel, like *aþrum*, are by and large replaced by forms with *and-* by the end of the period: *andrum*. The other ordinal numbers *þriþi*, *fiærþi* etc. are inflected like weak adjectives (see table 104.18).

2.4. Comparison

Comparison is almost entirely restricted to adjectives. Adjectives are divided into two classes, those that take *-ari*, *-astær* as the comparative endings, and those that take the shorter endings: *-ri*, *-stær*; the latter always cause *i*-umlaut. Some adjectives have different roots in positive and comparative/superlative and some lack a positive form, in which case the comparative and superlative are normally based on a preposition or particle (like *ofri*, *ytri*, from *over*, *ut*).

Table 104.14: Cardinal numbers

	masc.	fem.	neut.	masc.	fem.	neut.	masc.	fem.	neut.
Nom.	<i>tvēr</i>	<i>tvār</i>	<i>tū</i>	<i>þrīr</i>	<i>þrēar</i>	<i>þrȳ</i>	<i>fiūrir</i>	<i>fiūrar</i>	<i>fiughur</i>
Gen.	<i>tvæggia</i>			<i>þriggia</i>			<i>fiughurra</i> , <i>fiūra</i>		
Dat.	<i>tvēm</i>			<i>þrim</i>			<i>fiūrum</i>		
Acc.	<i>tvā</i>	<i>tvār</i>	<i>tū</i>	<i>þrēa</i>	<i>þrēar</i>	<i>þrȳ</i>	<i>fiūra</i>	<i>fiūrar</i>	<i>fiughur</i>

Table 104.16: Comparison of adjectives

positive	comparative	superlative
<i>langær/langi</i>	<i>længri</i>	<i>længstær/længsti</i>
<i>starkær/starki</i>	<i>starkari</i>	<i>starkastær/starkasti</i>
<i>gamall/gambli</i>	<i>ældri</i>	<i>ælstær/ælsti</i>
–	<i>ofri</i>	<i>oværstær/oværsti</i>

The positive and the superlative may take either strong or weak inflection, whereas the comparative can only have (a somewhat special) weak inflection (see section 2.5.).

Apart from adjectives and adverbs derived from adjectives, we find some instances of comparison in words from other word classes. Some true adverbs have ordinary comparative forms: *optar* – *opta(r)st*, *hældær* – *hælst*, *værr* – *værst*, but mostly they take the comparative ending *-mer* (sometimes added to the stem, sometimes to an ordinary comparative form): *optarmer*, *frammer*, *nærmer* etc. To some extent these adverbial comparatives have turned into true adjectives (occurring attributively).

The pronouns *margær/mangær* and *fār* have the comparative forms *flēri*, *flæstær* and *færri*, *fæ(r)stær*, respectively.

2.5. Adjectival agreement

Adjectival agreement can be either strong or weak. The strong form is always used for predicative adjectives and sometimes for attributive adjectives, principally in indefinite noun phrases. The weak form is normally found after the definite article (*(h)inn* or *þænn*, but some weak adjectives can be used without it. Comparative adjectives and most ordinal numerals can only have weak inflection.

Strongly inflected adjectives are similar to nouns; they are inflected like *-a* and *-ō* stems, with the exception of a few *-ja* stems. Ordinary

adjectives inflected strongly are given in table 104.17.

The endings with a full vowel and a final *-r* often lose the *-r* in ODan. and also in some OSw. dialects. The internal *-r-* in the fem.gen./dat.sg. and gen.pl. is almost totally absent in ODan. In OGu. the *-r-* is retained, and in OSw. it is found in many manuscripts, but it is mostly absent by the end of the period. A few *-ja* stems remain, e.g. *mipær*, *nȳr* and *tryggær*. These take a [j] before endings beginning in [a] or [u], thus *mipian* in masc.acc.sg. Several adjectives ending in OSw. *-a* (or ODan. *-æ*) are indeclinable, e.g. *enka*, *udda*, *lagha*.

The weak adjectival forms are illustrated in table 104.18. Some adjectives, like *sami*, only have a weak form.

Table 104.18: Weak adjectival inflection

	Singular			Plural		
	masc.	fem.	neut.	masc.	fem.	neut.
Nom.	<i>lang i</i>	<i>lang a</i>	<i>lang a</i>	<i>lang u</i>		
Gen.	<i>lang a</i>	<i>lang u</i>	<i>lang a</i>	<i>lang u</i>		
Dat.	<i>lang a</i>	<i>lang u</i>	<i>lang a</i>	<i>lang u</i>		
Acc.	<i>lang a</i>	<i>lang u</i>	<i>lang a</i>	<i>lang u</i>		

The few *-ja* stems are inflected as in table 104.18, but with an [j] before the endings [a] and [u]: e.g. *nyia*, *nyiu*. In the comparative form we find a slightly different weak inflection. First, the forms ending in *-u* in table 104.18 above, end in [i]. Second, the [i] ending can also replace the forms ending in *-a*. Third, the pl.dat. form may end in *-um*. Comparative adjectives derived from adverbs or particles, e.g. *ofri*, *fræmbri*, *fyrrri*, may inflect like ordinary weak adjectives or like other comparatives. Present participles in *-andi* are inflected like comparatives. Ordinal numbers higher than two are inflected like ordinary weak adjectives.

Table 104.17: Strong adjectival inflection

	Singular			Plural

redupl.	<i>hēta</i>	<i>hētær</i>	<i>hēta</i>	<i>hēt</i>	<i>hētu</i>	<i>hētinn</i>
weak	<i>bēta</i>	<i>bētar</i>	<i>bēta</i>	<i>bētaþi</i>	<i>bētaþu</i>	<i>bētaþær</i>
pret-pres.	<i>vita</i>	<i>vēt</i>	<i>vitu/vita</i>	<i>vissi</i>	<i>vissu</i>	<i>vitat</i>

2.6. Conjugation

Verbs have three non-finite forms, the infinitive (ending in [a], or in ODan. [ə]) and two participles. Verbs are inflected for three modes and two tenses. The imp. mode is not combined with tense, whereas the ind. and subj. are. The participial forms are inflected like adjectives; the past participle inflects strongly and weakly, whereas the present participle inflects like comparative adjectives (see section 2.5.).

The different verb classes are identified by specific forms (Sw.: *verbtema*). Strong verbs may have different ablaut vowels in the infinitive, past sg., past pl. and past participle. Thus these forms are normally used to identify the class. The formerly reduplicating verbs are normally seen as a special subgroup of the strong verbs. Weak verbs are identified by the infinitive, pres. sg., past sing. and past participle forms. The fourth group includes the preterite-present verbs. The four sorts of verb classes are given in table 104.19. The identifying forms are underlined for each class.

Strong verbs (and formerly reduplicating verbs) are characterised by their four different ablaut stages; there are six different ablaut series. The stem vowel in the pres. is normally the same as in the infinitival stem, but in Old Jutlandic it has *i*-umlaut (or rather *R*-umlaut): e.g. Old Jutlandic *stær*, *kymær* corresponding to OSw. *stār*, *komær*.

Table 104.20: Strong verbs

	inf.	past sing.	past pl.	past part.
1.	<i>bīta</i>	<i>bēt</i>	<i>bitu</i>	<i>bitinn</i>
2.	<i>biūþa</i>	<i>bōþ</i>	<i>bupu</i>	<i>bupinn</i>
3.	<i>binda</i>	<i>band</i>	<i>bundu</i>	<i>bundinn</i>
4.	<i>bæra</i>	<i>bar</i>	<i>bāru</i>	<i>burinn</i>
5.	<i>biþia</i>	<i>baþ</i>	<i>bāpu</i>	<i>biþinn</i>
6.	<i>fara</i>	<i>fōr</i>	<i>fōru</i>	<i>farinn</i>

The first ablaut series includes many frequent verbs, such as *grīpa*, *vīka*, *rīþa*. The second series includes verbs with *-iū-* like *biūþa*, *niūta* and *-ū-* such as *sūpa*, as well as some where *-iū-* has become *-y-* like *flýta*, *þrýta*. The third, fourth and fifth series include verbs with an original short /e/ in the root of the infinitive. In ON, this turns up in many different forms. In the third series we find verbs like *svæltā*, *hialpa*, *drikka*, *siunga*. The fourth series includes verbs like *stiæla*, *nima*. The fifth series includes verbs like *læsa*, *giva*, *sitia*, *liggia*, as well as the highly irregular *vara*, *væra*, which has other roots in the present indicative and the present subjunctive (see table 104.27). The sixth series includes verbs like *taka*, *dragha*. There is also a group of formerly reduplicating verbs, which are part of the same ablaut series as the strong verbs (mainly classes 1 to 3), and which have the same *-inn* ending in the past participle.

Table 104.21: Formerly reduplicating verbs

	inf	past sg.	past pl.	past part.
1.	<i>hēta</i>	<i>hēt</i> , <i>hæt</i>	<i>hētu</i> , <i>hætu</i>	<i>hētinn</i>
2.	<i>lōpa</i>	<i>lop</i> , <i>lōp</i>	<i>lupu</i>	<i>lupinn</i> , <i>lopinn</i>
	<i>hugga</i>	<i>hiogg</i>	<i>hioggu</i>	<i>hugginn</i>
3.	<i>falla</i>	<i>fioll</i>	<i>fiollu</i>	<i>fallinn</i>
	<i>fanga</i> , <i>fā</i>	<i>fikk</i>	<i>fingu</i>	<i>fanginn</i>
X.	<i>lāta</i>	<i>lēt</i> , <i>læt</i>	<i>lētu</i> , <i>lætu</i>	<i>lātinn</i>

Old Jutlandic has *i*-umlaut (or rather *R*-umlaut) in the pres.sg.: e.g. *fællær* instead of *fallær*. Only a few verbs belong to this class, but most of them are quite frequent. Except for the examples above, we find *lēka* in the first class and *halda*, *valda*, *ganga/gā* in the third. The verb *lāta* takes a mixed inflection, which it shares with *grāta* and *rāþa*.

Weak verbs have a dental suffix in the past, which is *-þ-* (pronounced [ð]), *-d-* or *-t-* depending on the preceding phoneme. Weak verbs

are divided into four classes. The first class (-*ön* stems) has an -*a*- suffix in all forms, thus they have -*ar* in the pres. Class 2 verbs (-*ja* stems) have -*ia* in the infinitive, -*r* in the pres. sg., and *i*-umlaut only in the inf. and pres., whereas class 3 verbs (-*ia* stems) have -*ir* in the pres. and *i*-umlaut throughout. The fourth class (-*ē* stems) has -*ir* or -*r* in the present sg. The verbs in class 4 are normally of the type that cannot be passived, and thus the past participle can normally only be found in the default (neut. sg.) form. The -*r* ending in the pres. is assimilated with -*s*, -*l*, or -*n*: e.g. *væll*, *vill*. Some examples from the four classes are given in table 104.22.

Table 104.22: Weak verbs

	infinitive	present	past	past part
1.	<i>kalla</i>	<i>kallar</i>	<i>kallaþi</i>	<i>kallaþær</i>
	<i>byria</i>	<i>byriar</i>	<i>byriapi</i>	<i>byriapær</i>
	<i>spā</i>	<i>spār</i>	<i>spāþi</i>	<i>spāþær</i>
2.	<i>kræfia</i>	<i>krævær</i>	<i>kræþi</i>	<i>kræþær</i>
	<i>vælia</i>	<i>væll</i>	<i>valdi</i>	<i>valdær</i>
	<i>lykkia</i>	<i>lykkær</i>	<i>lukti</i>	<i>luktær</i>
3.	<i>byggia</i>	<i>byggir</i>	<i>bygþi</i>	<i>bygþær</i>
	<i>dōma</i>	<i>dōmir</i>	<i>dōmdi</i>	<i>dōmdær</i>
	<i>kōpa</i>	<i>kōpir</i>	<i>kōpti</i>	<i>kōptær</i>
4.	<i>liva</i>	<i>livir</i> , <i>livær</i>	<i>lifþi</i>	<i>livat</i>
	<i>hava</i>	<i>havir</i> , <i>havær</i>	<i>hafþi</i>	<i>havat</i> , <i>haft</i>
	<i>vilia</i>	<i>vill</i>	<i>vildi</i>	<i>vilit</i>

The preterite-present verbs have the same ablaut stages and personal agreement in the pres. as ordinary strong verbs have in the past tense. They lack the pres. -*r*. These verbs are few but frequent; some of them have become auxiliaries. As such they are seldom or never found in the inf. or as past participles.

Table 104.23: Preterite-present verbs

1.	<i>vita</i>	<i>vēt</i>	<i>vitu</i> , <i>vita</i>	<i>vissi</i> , <i>visti</i>	<i>vitat</i> , <i>vist</i>
	<i>ægha</i>	<i>ā</i> , <i>æghær</i>	<i>æghu</i> , <i>ægha</i>	<i>ātti</i>	<i>ātt</i>
3.	<i>kunna</i>	<i>kann</i>	<i>kunnu</i> , <i>kunna</i>	<i>kunni</i> , <i>kundi</i>	<i>kunnit</i>
	<i>unna</i>	<i>ann</i>	<i>unna</i>	<i>unti</i>	<i>unt</i>
	<i>þorva</i>	<i>þarf</i>	<i>þorvu</i> , <i>þorva</i>	<i>þurfti</i>	
4.		<i>mun</i>	<i>munu</i> , <i>muna</i>	<i>mundi</i>	
	<i>skulu</i> , <i>skula</i>	<i>skal</i>	<i>skulu</i> , <i>skula</i>	<i>skuldi</i>	<i>skulit</i> , <i>skulat</i>
5.	<i>magha</i>	<i>mā</i>	<i>mughu</i> , <i>mugha</i>	<i>mātti</i>	<i>mātt</i>

In OGu. *skulu* has the form *ulu* (*al* – *ulu*), which is also found in the dialects of Dalecarlia in Sweden. The inf. and pres.pl. sometimes have -*u* in OSw., but -*a* is the normal form, except for *skulu*; as usual Old Zealandic and Old Jutlandic have unstressed -*æ*.

2.7. Verbal agreement

ON verbs agree in person and number with the subject. The forms are slightly different in the ind. and subj. The imp. mode is used only in the 2nd person and in the 1 pl. The form is the same as the stem in the sg. (*bīt*, *brȳt*, *kalla*, *kræf*, etc.) and the pres. forms in the pl. in OSw. In ODan. we find 2 pl. forms in -*ær*, which is not found in OSw. until the next period.

The person and number agreement of strong verbs is illustrated in table 104.24. In these, the pres. subj. forms are based on the first ablaut stage (the infinitive), and the past subj. is based on the third ablaut stage (past pl. ind.). In the sg., person agreement is only seen in the past ind.

Table 104.24 Person and number agreement for strong verbs.

present	indicative		subjunctive	
1–3 sg.	<i>bītær</i>	<i>bærr</i>	<i>bīti</i>	<i>bæri</i>
1 pl.	<i>bītum</i>	<i>bærum</i>	<i>bītum</i>	<i>bærum</i>
2 pl.	<i>bītīn</i>	<i>bærin</i>	<i>bītīn</i>	<i>bærin</i>
3 pl.	<i>bīta</i>	<i>bæra</i>	<i>bīti(n)</i>	<i>bæri(n)</i>
past				
1 sg.	<i>bēt</i>	<i>bar</i>	<i>bīti</i>	<i>bāri</i>
2 sg.	<i>bētst</i>	<i>bart</i>	<i>bīti</i>	<i>bāri</i>
3 sg.	<i>bēt</i>	<i>bar</i>	<i>bīti</i>	<i>bāri</i>
1 pl.	<i>bitum</i>	<i>bārum</i>	<i>bitum</i>	<i>bārum</i>
2 pl.	<i>bitīn</i>	<i>bārin</i>	<i>bitīn</i>	<i>bārin</i>
3 pl.	<i>bitu</i>	<i>bāru</i>	<i>biti(n)</i>	<i>bāri(n)</i>

The pres. *-r* ending is assimilated with the stem if the latter ends in an *-s*, *-l*, or *-n*: e.g. *læss*, *stiæll*, *skīnn*.

The person and number agreement of weak verbs is illustrated in table 104.25. The subj. of weak verbs is based on the corresponding ind. roots.

Table 104.25: Person and number agreement for weak verbs.

present	indicative		subjunctive	
1 sg.	<i>kalla(r)</i>	<i>krævæ</i> r	<i>kalli</i>	<i>krævi</i>
2–3 sg.	<i>kallar</i>	<i>krævæ</i> r	<i>kalli</i>	<i>krævi</i>
1 pl.	<i>kallum</i>	<i>kræfium</i>	<i>kallum</i>	<i>kræfium</i>
2 pl.	<i>kallin</i>	<i>krævin</i>	<i>kallin</i>	<i>krævin</i>
3 pl.	<i>kalla</i>	<i>kræfia</i>	<i>kalli(n)</i>	<i>krævi(n)</i>
past				
1–3 sg.	<i>kallaþi</i>	<i>krappa</i>	<i>kallaþi</i>	<i>krappa</i>
1 pl.	<i>kallaþum</i>	<i>krappa</i>	<i>kallaþum</i>	<i>krappa</i>
2 pl.	<i>kallaþin</i>	<i>krappa</i>	<i>kallaþin</i>	<i>krappa</i>
3 pl.	<i>kallaþu</i>	<i>krappa</i>	<i>kallaþi(n)</i>	<i>krappa(n)</i>

In the sg., person agreement is hardly visible at all. The distinction between 1st and 2nd/3rd person in the pres.ind.sing. is partly retained in Jutlandic (GG I, § 17). A tendency to drop the *-r* more often in the 1st person can be found also in OSw. texts, but there is no general distinction in the texts (Jansson 1934, 233). In 3 pl. subj., the form ends in *-in* (*kallin*, *krævin* etc.) in OGu., which sometimes has an *-int* ending. OSw. normally has the *-in* form, but the *n*-less form is more common in VgL and HL (Noreen 1904, 476). In ODan. only *n*-less forms are found. The verb *vilia* has person agreement in the pres. (just like a preterite-present verb): 1/3sg. *vill*, 2sg. *vilt*.

Preterite-present verbs have pres. forms which correspond to the past forms of strong verbs; they also have the same person and number agreement, and thus they have person inflection in the sg. The pres. forms of *ægha* and *kunna* are given in table 104.26.

The form *æghær* was analogically introduced from the inf./pl. forms.

The verb *væra*, *vara* also has person agreement in pres.ind. (like a preterite-present verb). It furthermore has a special root both in the pres.ind. (*ær-*) and in pres.subj. (*sē-*)

Table 104.26: Person and number agreement for weak verbs.

present	indicative		subjunctive	
1 sg.	<i>ā</i> , <i>æghær</i>	<i>kan</i>	<i>æghi</i>	<i>kunni</i>
2 sg.	<i>āt</i> , <i>æghær</i>	<i>kant</i>	<i>æghi</i>	<i>kunni</i>
3 sg.	<i>ā</i> , <i>æhgær</i>	<i>kan</i>	<i>æghi</i>	<i>kunni</i>
1 pl.	<i>æghum</i>	<i>kunnum</i>	<i>æghum</i>	<i>kunnum</i>
2 pl.	<i>æghin</i>	<i>kunnin</i>	<i>æghin</i>	<i>kunnin</i>
3 pl.	<i>æghu</i> , <i>ægha</i>	<i>kunnu</i> , <i>kunna</i>	<i>æghi(n)</i>	<i>kunni(n)</i>

Table 104.27: Person and number agreement for *væra*, *vara*.

	indicative		subjunctive	
	present	past	present	past
1 sg.	<i>æm</i> , <i>ær</i>	<i>var</i>	<i>sē(i)</i> , <i>vari</i>	<i>vari</i>
2 sg.	<i>æst</i>	<i>vast</i>	<i>sē(i)</i> , <i>vari</i>	<i>vari</i>
3 sg.	<i>ær</i>	<i>var</i>	<i>sē(i)</i> , <i>vari</i>	<i>vari</i>
1 pl.	<i>ærum</i>	<i>vārum</i>	<i>sē(i)n</i> , <i>vari(n)</i>	<i>vāri(n)</i>
2 pl.	<i>ærin</i>	<i>vārin</i>	<i>sē(i)n</i> , <i>vari(n)</i>	<i>vāri(n)</i>
3 pl.	<i>æru</i>	<i>vāru</i>	<i>sē(i)n</i> , <i>vari(n)</i>	<i>vāri(n)</i>

Old Jutlandic and Old Zealandic have lost the person distinctions in the pl. for all verb classes. Only in some fixed phrases can we find the *-um* ending. The *-(s)t* ending in the sg., however, is preserved.

3. Diachronic aspects

The morphological system described above is idealised. During the ON period there were substantial changes in the morphological system from various kinds of causes. Since some of the most noticeable changes during this period also represent different types of change, I will illustrate the changes and the types of change simultaneously.

First, a morphological change can be due to a phonological change. For instance the weakening of unstressed vowels in endings will level several distinctions between different forms. Second, a change can be morphological in nature. In such a case, a suffix can be lost or changed through analogy with another form (without any sound change). Third, a syntactic change may reduce the use of a certain form, or even cause a form to die out. Fourth, a new morphological ending may arise, because of the cliticisation of a gram-

matical word onto another word, which is a subtype of grammaticalisation.

3.1. Phonological change

Phonological changes can affect the morphology of words. There are principally two different kinds of phonological change, one that alters the form of the word but not the morphological system, and one that changes both.

The first kind of phonological change can be exemplified by the insertion of a svarabhakti vowel. A svarabhakti vowel is primarily visible in the masc.nom.sg. of nominals (*fiskær*, *langær*), the plur.nom./acc. of certain noun classes (*hændær*, *fæþær*, *bøndær*), and the pres.sg. of strong verbs (*bītær*) and class 2 weak verbs (*krævær*). The svarabhakti vowel does not create any new distinctions in the language, nor does it cause the loss of any old ones. Thus, the morphological system remains intact. A similar change is the shift of voiceless stops and eventually to voiced fricatives. This development started in Jutland around 1100 and was completed in Denmark by the end of the period (Danish: *klusilsvækkelsen*). This change affects many endings *huset* > *hused* > *huseð*, but it never creates any new distinctions and it never causes the loss of any old distinctions.

The second type of phonological change does affect the morphological system. By far the most important one in this period is the weakening of vowels in unstressed syllables (Danish: *infortissvækkelsen*). The original vowels in unstressed syllables are [a], [u] and [i]. These are often weakend to [æ], [o] and [e] in OSw., Old Scanian and OGu., but the distinction between them is retained. In Old Jutlandic and Old Zealandic they all turn into [ə]. This weakening of vowels in unstressed syllables causes severe reductions in the morphological system. This is most visible in the sg. weak nominal paradigm and all the weak adjectival paradigms, where all endings contain just a single vowel. All gender and case distinctions disappear among the weak nouns in the sg. Thus we find *nakkæ* and *hakæ* for all cases in the sg.; the form *nakkæ* is also found in the gen. and acc. pl. In the weak adjectival paradigm all case, number and gender distinctions are lost. Thus *langæ* occurs throughout the paradigm. This change also erases distinctions in the strong nominal paradigm; for instance, the acc. and gen. pl. of *-i* stems: e.g. *sibi* and *siba*, now become indistinguishable as *sibæ*.

A parallel but less significant phonological change concerns the loss of final *-r*. In ODan. and some OSw. dialects (parts of Östergötland and Småland) the loss is quite consistent. This makes e.g. nom. and acc. identical in the pl. for masc. *-a* stems and *-i* stems (*fiska*, *sibi*). In combination with the weakening of unstressed vowels, the loss of *-r* levels many distinctions in the pronominal and strong adjectival paradigms: the strong pl. is now *langæ* in masc. and fem. nom./acc. Thus there are no longer any masc./fem. distinctions in the pl.

3.2. Morphological analogy

Another case of loss of morphological distinctions is found when a morpheme is dropped or replaced by another one. This can in principle give the same result as a phonological change, and the two types are not always easy to distinguish. If the loss of an ending is limited to a certain morpheme, we can, however, talk about morphological reduction. The loss of masc. *-ær* in the nom.sing. is such an example. The *-ær* ending is lost in this form exclusively; it is, for example, retained in the pl. (*fōtær*) and in the pres. of strong verbs (*bītær*).

The loss of masc.nom. *-ær* is earliest in ODan. By the end of the period the loss is almost completed (also in Old Scanian). In OSw., the *-r* is retained in the indefinite form almost without exception throughout the whole period. It is, however, frequently dropped in the definite form. This is the situation in Codex Bureanus from around 1350 (Ottelin 1905, 87f.). The loss of *-ær* can be seen as analogous to either the masc.acc. or fem.nom., but the latter seems more plausible (cf. Hansen 1956, 185).

The loss of the fem.dat. ending in *-ō* stems can be described as another instance of analogy (with nom./acc.). The *-u* ending is still found in SkL, ÄVgL and UL. In MEL it is missing, and we find dat. contexts without the *-u* ending: *vp v iorþ*, *i iorþ ællæ lös örum*. The same holds for the genitive *-a(r)* for fem. nouns, which seems to be retained mostly in compounds (cf. Ottelin 1905, 94; 97).

Another change through analogy concerns the 1 pres.sg. of weak verbs. From the beginning these lacked the *-r* ending, a situation that continued in Old Jutlandic. Elsewhere, the *-r* was introduced in the 1st person, in analogy with the 2nd/3rd person.

3.3. Syntactic reduction

A type of language change that does not normally affect the morphology in its meaning or function but does in its scope is syntactic change. A syntactic change can restrict the use of a certain form, and eventually eliminate it. A syntactic change can also widen the use of a certain form. An example of a form that had its scope narrowed during this period is the gen. The gen. is used in three major functions during this period.

- attributive genitive *mansins hus*
- governed genitive *til mansins*
- thematic genitive *allra manna bæstær*

First, the attributive gen. is found with all sorts of head nouns which have a loose relation to it – possessive, subjective, objective or just relational genitives. Second, the gen. can be assigned by a governing lexical element, e.g. a preposition like *til*, an adjective like *værbær* or a verb like *ræna*. Third, the gen. can be used to mark a certain thematic content, like when it is used to mark temporal adverbials (*annars dags*), standards of superlatives (*allra manna bæstær*) or phrases measuring time or distance (*fiughurra alna breþær*). The governed gen. and the thematic gen. are still quite frequent in SkL (cf. Bjerrum 1954, 31) and UL, but it has been shown that they are lost during the period 1250–1350 in OSw. (see Delsing 1991; Norde 1997). Personal pronouns still have the genitive after prepositions, though. Except for the gen. of personal pronouns, the only use of gen. left by the end of the period is thus the attributive possessive gen.

Thus, this syntactic change does not have any impact on the morphological system, but it clearly narrows the scope of the gen., which is replaced mostly by acc. or prepositional phrases. This narrowing is almost certainly a condition for the further development of the clitic *-s* of Mod. Scand., allowing group genitives like *Kungen av Danmarks bröst-karameller* (see Jespersen 1934; Delsing 1991; Norde 1997).

3.4. Grammaticalisation

In the previous three sections, I have illustrated cases where an inflectional suffix is altered or dropped by phonological change or morphological analogy or cases where the scope of an inflectional suffix is restricted. The final kind of change involves the introduction

of new inflectional suffixes by cliticisation of free elements, a process normally referred to as (a subcase of) grammaticalisation. The most significant representative of this type is, of course, the suffixed definite article. Nouns with definite references are provided with a definite ending. A word like *hūs* ‘house’ may have a definite form *hūsit* ‘house-the’. This development is found in practically all Scand. varieties, but it should be stressed that the suffixed article is missing in the modern dialects of Western and Southern Jutland. There, its counterpart is a prenominal article: *æhus* corresponds to Standard Danish *huset*. But the same modern dialects have reminiscences of the suffixed article in the gen. In Older Jutlandic texts, we also find the suffixed article in the gen.; non-gen. forms with the suffixed article are rare (Hansen 1927, 119–150).

There are several problems with regard to the development of the suffixed article, its origin, its age and the syntactic pattern from which it is supposed to have emerged; see e.g. Perridon (1989, 127–149) for a recent overview of the debate. The standard view is that the article (*hinn*) is cliticised onto the noun in constructions like *maþr inn gamli* ‘man the old’. This view has been quite widely accepted, but some researchers (e.g. Nygaard 1906, 33f.) have claimed that suffixed *inn* was originally not an adjectival article but a demonstrative. The fact that demonstratives are often placed postnominally is taken as a sufficient input for the cliticisation. It has been claimed that this alleged cliticisation took place as early as PN and as late as in the late Viking era or even after that.

For OSw. and ODan. the runic material is very meagre. The only instance of a cliticised definite article from Denmark is Tornby, **um morhen(e)n**, which is from around 1200 and normally attributed to a Norwegian. The only two instances from Swedish inscriptions are U 644 **kuþ heabi ontini** and U 669 **kuþ hialbi *antini**. In the first case, the reading is not absolutely certain, and in the second case, the stone has disappeared. We can also see that the oldest texts make scanty use of the article. In ÄVgL, Larm (1936, 24) reports 23 cases with the suffixed article, which would amount to approximately 0.5 per cent of the nouns. He reports that around 5 per cent of the nouns have the suffixed article in UL, and 7.5 per cent in ÖgL. According to Skautrup (1944, 269) 8 per cent of the nouns in SkL carry the suffixed article, and 10 per cent in JL. Even if their principles of excerption vary a little,

the figures still show that the suffixed article is very rare in ÄVgL and rare in UL, ÖgL, SkL and JL. The article is also rare in ON poetry. The scanty use of articles is often explained as a matter of style. Runic inscriptions, laws and poetry are not the kind of texts where we expect to find articles. This argument is stressed by Neckel (1924) and is often repeated in the handbooks (e.g. Skautrup 1944, 269; Wessén III: 1956, 27ff.). It should, however, be pointed out that some OSw. texts (Gutasaga and the chronicles in Vidhem) are written in styles where we would expect an ample use of the article; the article is, however, very rare in these texts too. In the chronicles in Vidhem (original from around 1250, ms. from 1325), there are 157 bare nouns, 6 with the indefinite article and 16 with a definite article (9 per cent). Gutasaga (original probably from around 1220, ms. from around 1350) has only two nouns with the article: *faroyna*, *drytningina*. Hence, I do not think that the low frequency of articles in the oldest texts can be explained by style, at least not as the main explanation. Rather, I am inclined to believe that the article developed as an innovation in the 13th c.

3.5. Conclusions

During this period the morphological system of ODan. and OSw. started on its way towards the simpler modern system. The causes of this simplification are to be found primarily within the phonological system. The weakening of unstressed vowels in suffixes and the dropping of final *-r*, which starts during this period, beginning in ODan., reduce many case, gender and number distinctions in the nominal system. These changes are accompanied by analogical processes internal to the morphological system, which level some case and number distinctions in the nominal paradigms and some person distinctions in the verbal paradigm. In addition, syntactic changes, which narrow the scope of the genitive, facilitate the loss of case distinctions in nouns, adjectives and pronouns. The true loss of case and gender distinctions belongs to later periods, but the changes during this period are crucial to the ensuing changes.

105. The syntax of Old Nordic

1. Basic sentence structure
2. Cases
3. The subject
4. Objects
5. The passive
6. The infinitive
7. Subordinate clauses
8. Word order
9. Empty argument positions
10. Literature (a selection)

1. Basic sentence structure

A declarative sentence in Old Nordic may consist of a finite verb, one or more non-finite verbs (infinitive or participle), one or several noun phrases in one of the four cases, adjectival phrases, prepositional phrases, and adverbs.

- (1) *þú skalt reka heim fimm tōgu ásauðar í sel*
 you-nom. shall drive home five-ty-acc.
 ewes to (the) barn

The only indispensable sentence element is the finite verb. Given the relevant context, any other constituent type (including the subject) can be omitted without the sentence being incomplete or elliptic. The element preceding the finite verb is the *topic* of the sentence. In (1) the topic is the subject, which is perhaps the most common case. But other elements may also serve as topics: see (54) in 8.2.

The number and order of sentence elements following the finite verb is very variable.

2. Cases

All nominal categories are inflected for case. There are four different cases: nominative, accusative, dative, genitive. When a noun or a noun phrase occurs outside of the sentence, that is without being syntactically governed or understood as being so, it occurs in the nominative. The nominative is the address form and the citation form of the noun. When a nominative phrase is used as part of a higher syntactic unit, a sentence, it presupposes a finite verb. These properties make the nominative case stand out among the cases. The other cases do not share any of these properties; they are referred to by the common term “oblique cases”. What follows is a brief outline of the main semantic and syntactic functions of each of the four cases.

The nominative is the case of the subject, and thereby also the case that typically denotes the agent, cf. (1), but a nominative subject may also express other semantic roles:

- (2) a. *hafid þit verit hér um hrið með mér*
 have you-nom. been here for a while
 with me
 b. *átti hann margt fé*
 owned he-nom. much money-acc.

By general agreement rules, a predicate complement is also in the nominative:

- (3) *hverr var þessi hinn orðsnjalli maðr?*
 who-nom. was this eloquent man-nom.

The typical function of the accusative is that of a complement of a verb (direct object) or of a preposition. When governed by a verb, the accusative typically expresses the role of a patient, as in (1) and (2b). When governed by a preposition, the accusative denotes ‘direction towards’:

- (4) *jarl fór í dal djupan*
 earl went in valley-acc. deep

Accusative NPs may be used as adjuncts to denote various temporal or local relations:

- (5) a. *hann bjó þar fá vetr*
 he lived there few winters-acc.
 b. *fjórir hleifar brauðs eru honum fōrðir*
hvern dag
 four loaves-nom. bread-gen. are him-dat. brought each day-acc.
 ‘Four loaves of bread were brought him every day.’

The dative shares its syntactic functions with the accusative: it can function as a complement of a verb or a preposition or as an adjunct. In addition, the dative may function as a complement of an adjective:

- (6) *þér mun verða gott til vista*
 you-dat. will become well to provisions
 ‘You will obtain good provisions.’

The dative denotes a set of rather well defined semantic roles: benefactive/recipient (6) and (5b), instrumental (7a), ablative (7b), or locative (7c). (A purely locative dative is found mainly with prepositions.)

- (7) a. *þeim reið Goðgestr konungr*
 it-dat. rode Godgest-nom. king
 ‘King Godgest rode (on) it.’

- b. *þú firðir mik miklu úhappi*
 you-nom. saved me-acc. great disaster-dat.
 ‘You saved me from a great disaster.’
- c. *hann bjó á Býnesi*
 he lived at Bynes-dat.

The genitive case has the same syntactic functions as the dative. It is governed by a verb in (8a), by an adjective in (8b), and by a preposition in (8c):

- (8) a. *heraðsmenn leituðu hennar*
 district-men-nom. sought her-gen.
 ‘Men from her district looked for her.’
- b. *ker fullt mjaðar*
 vessel full mead-gen.
- c. *jarl sendi þræla sína til Orms*
 earl sent slaves his to Orm-gen.

The primary function of the genitive is, however, to mark a specifier or a complement of a noun:

- (9) a. *dóttir Bergþórs*
 ‘Bergthor’s daughter’
- b. *Ása var farin á fund föður síns*
 Ása was gone at meeting father-gen. hers

Some of the uses of the genitive are clearly partitive in meaning. This is seen most clearly in expressions like *fjórir hleifar brauðs* ‘four loaves of bread’ etc. Besides this genuine partitive meaning, it is extended to denote partial objects, as in ‘provide some goods’, ‘try out (the effects of) a method’, and by further extension to denote totally unaffected objects, in the sense that the referent of the NP is unaware of its role, as with verbs like ‘desire’, ‘look for’, ‘wait for’, ‘miss’, ‘avenge’, ‘mention’, etc. Most uses of the genitive therefore seem to derive from a core partitive meaning.

3. The subject

Traditionally, the subject in Old Nordic and in languages with similar case systems is defined as a referring NP in the nominative case. The modifier “referring” is meant to exclude predicate complements. In *Bjarni hét maðr* ‘a man was called Bjarni’, *maðr* is a referring NP in the nominative, and thus the subject of the sentence, while *Bjarni*, also in the nominative, is a non-referring predicate complement. This subject definition implies that only finite verbs have subjects.

Some researchers (e. g. Rögnvaldsson 1991; 1995; Barðdal 2000; Haugan 2000) have ar-

gued that case does not define subjecthood in Old Nordic. According to them, the subject should be defined in terms of structural position. This allows for oblique subjects in Old Nordic as well as in Modern Icelandic. In this chapter the subject will, however, be defined as a NP in the nominative case, for reasons given in Faarlund (2001).

The nominative subject is in most cases also the logical subject of the finite verb of the sentence, as for example in the sentences in (7). In other cases, the nominative NP is the logical subject of a non-finite verb in the sentence. The subject may then be said to be derived from an underlying subordinate clause. Such derived subjects occur in the following construction types:

(a) Auxiliary + main verb, where the subject is the logical subject of the main verb, while the finite verb is an auxiliary; previous examples include (1), (2a), (6), and (9b).

(b) Passive constructions, which also consist of an auxiliary + main verb; here the subject is the logical object of the main verb, cf. (5b).

(c) “Nominative with infinitive” constructions, or “raising” constructions, with verbs meaning “seem”; the grammatical subject of “seem” is the logical subject of the subordinate clause, whose verb appears in the infinitive:

- (10) *hon þótti mér þat vel þekkjast*
 she seemed me-dat. that well like
 ‘She seemed to me to like it very much.’

(d) “Object raising” or “tough movement”, where the matrix verb is a form of *vera* ‘be’ with a predicate complement and an infinitive construction as its logical subject; the logical object of the infinitive serves as grammatical subject of the matrix verb “be”:

- (11) *var áin allill at sókja*
 was river-def. very-bad to seek
 ‘The river was difficult to cross.’

(e) *vera* ‘be’ + infinitive, where the logical object of the infinitive is the grammatical subject of *vera*:

- (12) *mikil tíðendi eru þaðan at segja*
 great news are therefrom to say
 ‘There is great news to be told from there.’

In general, the finite verb agrees with the nominative subject in number and person, as can be witnessed in all the examples above. However, nominative phrases that are not

prototypical subjects may not always trigger verb agreement.

- (13) *i þann tíma fannst í Danmörk kvernsteinar tveir*
 in that time found-3sg. refl. in Denmark millstones-nom. two
 ‘At that time there were two millstones in Denmark.’

The nominative subject of the verb *þykkja* ‘seem’ is always derived from the subordinate clause, and even if it is a 1st or 2nd person pronoun, *þykkja* may sometimes appear in 3rd person:

- (14) *mér þótti vit vera í hellinum*
 me-dat. seemed-3sg. we-nom. be in cave-def.
 ‘It seemed to me that we were in the cave.’

4. Objects

The term “object” is here used to refer to any oblique NP that is governed by a verb, regardless of case. What follows is a survey of the various kinds of case arrays that are found with different verbs in Old Nordic. It goes without saying that many interesting details will have to be left out for reasons of space.

4.1. Accusative

Most transitive verbs take their object in the accusative:

- (15) *Hallfreðr setti bú saman*
 Hallfred-nom. set home-acc. together
 ‘Hallfred set up a home.’

Verbs that do not normally assign a patient role to its complement may still take an accusative argument. These may be cognate objects with otherwise intransitive verbs (16a). Some objects may have a “looser” relationship to the verb in the sense that they are not semantically required by the regular meaning of the verb (16b).

- (16) a. *ek vil ráða þér annat ráð*
 I will advise you-dat. other advice-acc.
 ‘I will give you different advice.’
 b. *skaða mikinn höfum vér farit*
 injure-acc. great have we fared
 ‘We have suffered a great injury.’

Some verbs take an accusative as their only argument. They are then subjectless:

- (17) a. *mun þik kala*
 will you-acc. be cold
 ‘You will be cold.’
 b. *mik þyrsti*
 me-acc. thirsted
 ‘I was thirsty.’

Some verbs may take two accusative NPs. One is then a (usually animate) recipient, the other one a cognate object:

- (18) *konungr hjó hann banahögg*
 king-nom. struck him-acc. death-blow-acc.
 ‘The king gave him a death blow.’

Double accusatives are particularly common with verbs that do not take a nominative agent:

- (19) *Ragnhildi dróttning dreymdi drauma stóra*
 Ragnhild queen-acc. dreamt dreams-acc. great
 ‘Queen Ragnhild had great dreams.’

4.2. Dative

Dative objects are used with a variety of semantic functions, but they particularly have a benefactive or an instrumental role.

- (20) a. *Ólafur konungr þakkaði henni vel*
 Olaf-nom. king thanked her-dat. well
 b. *Þeim reið Goðgestur konungr*
 it-dat. rode Godgest-nom. king
 ‘King Godgest rode (on) it.’

The dative is, however, also used with other verbs where no such role can be specified (Kosuth 1980; Holland 1993). This may be due to analogical extension or attraction. Typically, verbs that are inherently causative take a dative object:

- (21) *hann ók heyjum sínum á yxni*
 he carried hay-dat. his on ox
 ‘He carried his hay on an ox.’

The dative may appear with verbs that are normally intransitive, such as *fara* and *koma*:

- (22) *hann kom fótum sínum undir sik*
 he came feet-dat. his under himself
 ‘He got onto his feet.’

Some verbs may take two dative arguments:

- (23) *bróðir hét honum griðum*
 brother promised him-dat. truce-dat.

The dative commonly occurs in combination with an accusative to denote the recipient

(indirect object), or the opposite meaning (ablative):

- (24) a. *hon skyldi bera öl vikingum*
 she-nom. should carry beer-acc.
 Vikings-dat.
 ‘She was to bring beer to the vikings.’
 b. *svíar vilja verja honum landit*
 Swedes will protect him-dat. country-
 def.acc.
 ‘The Swedes want to protect the coun-
 try against him.’

The dative is used with *þykkja* ‘seem’ and similar verbs for someone who receives an impression or expresses an opinion:

- (25) *mér þykkir þú fól*
 me-dat. seem-2sg. you-nom. fool
 ‘I think you are a fool.’

The dative is frequently used with verbs that take no nominative argument:

- (26) a. *konunginum svalaði mjök*
 king-def.dat. cooled much
 ‘The king became very cool.’

4.3. Genitive

A large number of verbs take their complement in the genitive. Semantically, they are basically of two kinds: partitive (27a), or non-affected (27b), (see section 2):

- (27) a. *naut hann þó eigi lengi konungdómsins*
 enjoyed he though not long kingdom-
 def.gen.
 ‘But he did not enjoy being king for long.’
 b. *heraðsmenn leituðu hennar*
 district-men-nom. sought her-gen.
 ‘Men from the district looked for her.’

Verbs meaning ‘ask, encourage, remind’, etc. may take a genitive complement together with an accusative complement referring to a person, typically with a recipient role:

- (28) *hon hefir mint mik þeira hluta*
 she has reminded me-acc. those things-gen.

Verbs meaning ‘provide, allow, lend, grant, deny, envy’, etc. may take a dative referring to a person recipient alongside the genitive:

- (29) *hann skyldi ljá honum fresta til annars sumars*
 he should lend him-dat. respite-gen. till
 other summer

5. The passive

The passive is formed by means of the auxiliary *vera* ‘be’ or (less common) *verða* ‘become’. The main verb occurs in the past participle and agrees with the nominative subject, if there is one:

- (30) a. *fjórir hleifar brauðs eru honum fórðir hvern dag*
 four loaves-nom. bread-gen. are him-
 dat. brought-masc.nom.pl. each day
 b. *af því varð bón hans heyrð*
 from that became prayer-nom.
 his heard-fem.nom.
 ‘Therefore his prayer was heard.’

The nominative subject in passive sentences always corresponds to an accusative object in the active counterpart. Any other oblique NP in the active remains in the same case, with the participle in the neuter nominative singular form:

- (31) a. *farit var til þings*
 gone was to assembly
 ‘They/one went to the assembly.’
 b. *henni var vel þakkat*
 her-dat. was well thanked-neut.

A few verbs may take two accusatives in the active – one cognate or effected object and one animate object. In those cases the animate object becomes nominative subject in the passive, while the effected object remains in the accusative. Compare the active (32a) and the passive (32b):

- (32) a. *konungr hjó hann banahögg*
 king-nom. struck him-acc. death-
 blow-acc.
 b. *var hverr þeira sleginn límahögg*
 was each-nom. them-gen. beaten-
 masc.nom. broom-blows-acc.
 ‘Each of them was beaten with a broom.’

The active subject is normally not expressed in passive sentences. But on rare occasions, mainly in translated texts or formal style, the agent may be expressed by means of a prepositional phrase with *af*:

- (33) *þá var hann beðinn af vinum sínum at staðfestast hér*
 then was he asked by friends his to estab-
 lish-refl. here

6. The infinitive

Old Nordic has two kinds of infinitives, one preceded by the infinitive marker *at* 'to', and one bare infinitive without the *at*. The infinitive marker is always adjacent to the verb. The rules given below for the distribution of the two infinitives are generally valid for classical prose texts, but there are some exceptions in poetry, probably for metrical reasons. The infinitive with *at* is used whenever the subject must be inferred either from the context or from a NP with another function in the sentence. The bare infinitive is used when the subject is present somewhere in the sentence without having another role. The difference can be illustrated with the two sentences in (34):

- (34) a. *þú skalt reka heim fimm togu ásauðar*
you-nom. shall drive home fif-ty-acc.
ewes
b. *hann heitr at gefa þeim bæði ríki ok fé*
he promises to give them both power
and wealth

In (34a) the infinitive *reka* 'drive' follows the auxiliary verb *skalt* 'shall'. This verb does not assign any semantic role to its subject. The subject *þú* is the logical subject of *reka*. In (34b) the infinitive *at gefa* follows the verb *heita*, which is an agentive verb with its own subject; *hann* is thus first and foremost the subject of *heita*, and *gefa* does not have its own subject anywhere in the sentences. In generative terms, we may say that in (34a) the subject is moved from the subject position of *reka* while in (34b) it is base-generated as the subject of *heitr*, and the subject of *gefa* is an abstract element *PRO* which is controlled by the subject of *heitr*.

The bare infinitive is used with auxiliary verbs, as we have seen. It is furthermore used in "raising" constructions where the subject of the infinitive is "raised" to the subject position of the matrix verb. This then results in a "nominative with infinitive" construction. This is typically found with the verb *þykkja* 'seem' and its synonyms. An example is given in (10).

In accusative with infinitive constructions, the infinitive has its own subject expressed, and here also the bare infinitive is used. The subject (that is, what would have been the subject in the equivalent finite sentence) may be said to be "raised" into the object position of the matrix verb without being semantically the object of that verb:

- (35) *opt hefi ek heyrtr yðr þat mæla*
often have I heard you-acc.pl. that say
'I have often heard you say that.'

Besides sensory verbs, such complements are also found with verbs of cognition and volition, and above all with *verba dicendi*.

The infinitive with *at* is mainly used in nominal functions. In (34b) it is the direct object of the verb *heita* 'promise'. It can also be used as a subject (36a); as a complement of prepositions (36b), nouns (36c), and adjectives (36d); and in various adverbial functions (36e):

- (36) a. *hörmuligt er slíkt at vita*
sad is such to know
'It is sad to know about such things.'
b. *áttu enga ætt til at vera konungr*
own-you no family for to be king
'You do not have the (necessary) family background to be a king.'
c. *hafa þeir þann sigr unnit at stíga yfir höfuð þvilikum höfðingja*
have they that victory won to rise above head such leader-dat.
'They have won the victory of rising above such a leader.'
d. *úfúss em ek at láta þetta band á mik leggja*
unwilling am I to let this band on me lay
'I am unwilling to have this band laid on me.'
e. *hann fór at heimta landskyldir*
he went to collect land-rent

The only regular exception to the distributions of *at*-infinitives and bare infinitives is the use of the bare infinitive in comparative constructions:

- (37) *ongan útveg á hon nema renna undan*
no way-out has she except run away
'She has no other means of escape than running away.'

7. Subordinate clauses

Finite subordinate clauses fill a variety of nominal, adjectival or adverbial functions. Their internal structure will be dealt with in sect. 8. Subordinate clauses are introduced either by a function word (a complementizer) or by an interrogative word.

7.1. Introduced by complementizer

The two most common complementizers used to introduce subordinate clauses are *at* and *er*. Clauses introduced by these complementizers are typically attached to a "head", which sometimes may be omitted. (Since the English *that* is both a pronoun/determiner and a complementizer, I will avoid confusion by glossing

at and *er* as “C” and the pronominal head as “PRO-x”, where x indicates the case form.)

7.1.1. Clauses introduced by *at*

These are *explicative* sentences, that is sentences with a nominal function. Their most common head is the neuter form of the determiner *sá* ‘that’, whose syntactic function in the matrix sentence determines the function of the subordinate clause:

- (38) *satt er þat, at mjök er niðrfallit ríki Haralds ins hárfagra*
 true is PRO-nom. C much is downfallen power Harold’s the fairhaired
 ‘It is true that Harold the Fairhaired’s power has declined much.’

The subject of (38) is the whole complex *þat at – hárfagra*. The clause, beginning with *at*, is always extraposed to the end of the matrix sentence, while the pronominal head normally retains its normal position. In this particular case, these requirements may be met without *þat* and the clause being separated. But often they are separated, as can be seen from some of the following examples:

- (39) a. *þat hyggjum vér, at hann kunnir fugls röddu*
 PRO-acc. believe we C he knows bird’s speech
 ‘We believe that he knows the language of the birds.’
 b. *því eru allir skyldir at trúa, at Þórr er mátkastr*
 PRO-dat. are all obliged to believe C Thor is greatest
 ‘Everybody has to believe that Thor is the greatest.’
 c. *jarl fýsti þess, at Þorkell skyldi fara til Noregs*
 earl wanted PRO-gen. C Thorkel should go to Norway
 ‘The Earl wanted Thorkel to go to Norway.’
 d. *Ólafur konungr gerði ekki atgönguna fyrr, því at hann beið Dags*
 Olaf king made not attack earlier PRO-dat. C he waited Dag-gen.
 ‘King Olaf did not attack earlier, because he was waiting for Dag.’
 e. *Þorsteinn tók við stýrimanninum, fyrir því at hann beiðdist þangat*
 Thorstein took with skipper-def. dat., for PRO-dat. C he asked-himself thither
 ‘Thorstein received the skipper because he wanted to come there.’

The verb *trúa* ‘believe’ in (39b) takes its object in the dative (*því*), and *fýsa* ‘want’ in (39c) takes its object in the genitive (*þess*). In (39d) the dative *því* is used in an adverbial function to express a cause. Adverbial functions such as cause, finality etc. are more commonly expressed by means of a preposition followed by the appropriate case of *þat*, as in (39e).

The pronominal head may sometimes be omitted, whereby the *at*-clause functions as a regular nominal clause:

- (40) a. *eigi er undarligt, at þú sér kallaðr Óláfr digri*
 not is strange C you-nom. are called Olaf Huge-nom.
 ‘It is no wonder that you are called Olaf Huge.’
 b. *skulum vér varast við, at eigi taki oss þau dómi*
 shall we beware-refl. with C not take us those examples
 ‘We should take care not to set ourselves such examples.’

An *at*-clause may also have a regular noun as its head:

- (41) *konungr ræðr honum þau ráð, at hann skal nú fyrst láta kyrt vera*
 king advises him PRO advice C he shall now first let quiet be
 ‘The king advises him first to leave it in peace.’

7.1.2. Clauses introduced by *er*

These are *implicative* clauses with an adjectival or adverbial function. If they have a nominal head, they are adjectival clauses, i.e. relative clauses. Usually a form of the pronoun *sá* is added to the head NP. This pronoun agrees with the NP for gender, number, and case and serves as the formal head of the relative clause. It does not show the case of the relativized item:

- (42) a. *í borginni var höfðingi sá er Óðinn var kallaðr*
 in castle-def.dat. was chieftain-nom. PRO-nom. C Odin was called
 ‘In the castle there was a chieftain who was called Odin.’
 b. *Hrafnkell átti þann grip í eigu sinni er honum þótti betri en annarr*
 Hrafnkel owned PRO-acc. treasure in ownership his C him-dat. seemed better than other
 ‘Hrafnkel had a treasure that was dearer to him than any other.’

As the sentences in (42) show, the PRO may precede or follow the noun and thus be adjacent to or separated from the *er*-clause.

The pronominal head may occasionally (especially in formal style) show the case of the relativized element in the clause:

- (43) *ok ólust þaðan af mankindir, þeim er bygðin var gefin undir Miðgarði*
and bore-refl. thereof races PRO-dat. C dwelling-def. was given under Midgard
'And from there were born peoples who were given a dwelling under the Midgard.'

In the popular style we would expect nominative *þær*, agreeing with the nominative *mannkindir*, instead of the dative governed by *gefin*.

The head of an *er*-clause may also be an adverb of place or time. The entire construction then serves as an adverbial clause:

- (44) a. *þeir hræddust, at úvinir mundu leita líksins þar, er var*
they feared that enemies would seek corpse-def.gen. there C was
'They feared that the enemy would look for the corpse where it was.'
b. *ok þá er hann hafði tekit fuglinn, þá vildi hann drepa fuglinn ok eta hann síðan*
and when C he had taken bird-def. then would he kill bird-def. and eat it since
'When he had caught the bird he wanted to kill it and then eat it.'

The adverb may be omitted, whereby *er* alone introduces an adverbial clause:

- (45) *Ólafur konungr fór, er váraði, út til sævar*
Olaf king went C became spring out to sea
'When spring came, King Olaf went out to sea.'

7.1.3. Other complementizers

Besides *er*, two other complementizers are used to introduce implicative clauses: *en* is mainly used in (eastern) Norwegian, and *sem* is originally a comparative particle ("as") which first was used as a complementizer in Norwegian and then spread to Icelandic.

- (46) a. *þau helgu orð en í bókinni vǫru*
PRO-nom. sacred words C in book-def. were
'those sacred words that were in the book.'
b. *eptir því sem Eyvindr segir*
after PRO C Eyvindr says
'according to what Eyvindr says.'

Conditional clauses are introduced by *ef* 'if' and by *nema* 'unless':

- (47) a. *ef þú setzt niður þá skal þú úrgr vera*
if you sit down, then shall you wet be
b. *eigi meguð þér inn ganga í ríki himna nema þér lægið yðr*
not may you-nom. in go in realm heavens' unless you-nom. lower you-acc.
'You may not enter heaven unless you humble yourselves.'

Ef is also used to introduce indirect questions:

- (48) *skal ek freista ef ek mega þik drepa*
shall I try if I may you-acc. kill

7.2. Introduced by interrogative words

Besides the use of *ef* as in (48), indirect questions may be introduced by various interrogative words.

- (49) a. *þat skyldi svá reyna, hvárt Baldr var svá ástsæll sem sagt er*
that should thus try, whether Baldr was as popular as said is
b. *hann spurði hvat mönnum þeir sé*
he asked what men-dat. they are
'He asked what sort of men they were.'
c. *sagði, hversu mikill grátr var með ásum*
said, how much weeping was with gods
'(He) said how much the gods were weeping.'

In learned style, the interrogative pronoun may be used as a relative pronoun, on the pattern of Latin and French, and is sometimes followed by *er*:

- (50) a. *hyggið þér at falsligum spámönnum, hverir til yðar koma i sauðaklæðum*
think you of false prophets who to you come in sheep-clothes
b. *þetta sama orð var ok upphaf, i hverju ok fyrir hvat er guð skapaði allan heiminn*
this same word was also beginning in which-dat. and for which-acc. C God created all world

8. Word order

Old Nordic is usually said to have "free word order". When compared to English or to the modern Scandinavian languages, this may to some extent be true, but even in Old Nordic, there are syntactic rules determining the order

of words and constituents. The apparent freedom of word order is mainly due to certain permitted movement rules, which do not all necessarily exist in the present-day Nordic languages. The function of these movement rules is mainly to order sentence elements in accordance with their discourse functions.

Unlike modern Scandinavian, Old Nordic does not seem to have different word order patterns for main and subordinate clauses. There is, however, a certain statistical difference in the frequencies of certain patterns.

8.1. The finite verb

One fixed position in the sentence is that of the finite verb, and other sentence elements can be located in relation to it. The finite verb is most often in second position in the sentence, as in several of the previous examples, e. g. (49a,b) and (50b). But the finite verb may also occur in initial position, as in (49c) and (50a). In all other respects, the word order pattern of verb-initial sentences is the same as that of verb-second sentences, the only difference being an empty position before the verb. Rather than considering the sentences in (49c) and (50a) “verb-initial”, they may for systematic and descriptive reasons be considered “topicless” sentences. This allows us to describe the finite verb as being in the same position in all main sentences, namely second position. The sentences starting with a verb then have an empty topic position, and Old Nordic can be considered a regular verb-second language, on a par with the other Germanic languages (except modern English).

8.2. Topicalization and *wh*-movement

The position in front of the finite verb is the topic position. As we have seen already, this position may be empty. If the sentence contains a question word, this is obligatorily topicalized:

- (51) a. *hverr var þessi hinn orðsnjalli maðr?*
 who-nom. was this eloquent man-nom.
 b. *hvat gerir þú?*
 what-acc. do you-nom.
 c. *hví dveljum vér*
 what-dat. hesitate we
 ‘Why are we hesitating?’

Phrases containing a question word are also fronted:

- (52) a. *hversu mikla frændsemi átt þú við Erling?*
 how great relationship-acc. own you-nom. with Erling
 ‘How close is your relationship with Erling?’
 b. *við hvat fóddist kýrin?*
 with what feed-refl. cow-def.nom.
 ‘On what did the cow feed?’

Even direct sentence questions may be introduced by a question word:

- (53) *hvárt eru allir menn í svefni á bónum?*
 whether are all men in sleep at farm-def.
 ‘Are all the men asleep on the farm?’

In declarative sentences, any sentence element may be fronted, with the exception of the finite verb, which is tied to the second position:

- (54) a. *Sámr var kvánaðr*
 Sam-nom. was married (subject)
 b. *Bjarni hét maðr*
 Bjarni-nom. was-called man-nom.
 ‘There was a man called Bjarni.’
 (predicate complement)
 c. *annan mann drap hann litlu síðar*
 other man-acc. killed he-nom. little later (direct object)
 ‘The other man he killed a bit later.’
 d. *Á þessum hesti hafði hann svá mikla elsku, at ...*
 on this horse had he so great love-acc. that
 ‘He loved this horse so much that ...’
 (PP adjunct)
 e. *eigi veldr ástleysi þessi brottkvaðning við þik*
 not causes lovelack-nom. this farewell-acc. with you
 ‘It is not lack of love that causes me to leave you.’ (sentence adverbial)

The head of a phrase may also be topicalized, leaving the rest behind in its original position:

- (55) a. *væta var á mikil um daginn*
 wetness-nom. was on great-nom. in day
 ‘There was much rain during the day.’
 b. *en á þykkir mér vera skuggi nökkurr mannum*
 but on seems me-dat. be shadow some man-dat.def.
 ‘But there seems to me to be a shadow over the man.’
 c. *þakka viljum vér yðr*
 thank will we you-dat.
 ‘We want to thank you.’

The fronting of a head noun or a preposition alone, as in (55a, b), is very uncommon. The fronting of a verb alone, as in (55c), however, is much more common. In fact, fronting a verb together with its complement seems not to exist: constructions of the form **þakka yðr viljum vér* are not attested. This may indicate that Old Nordic does not have VPs as regular constituents (Faarlund 1990, 95ff.).

A determiner or a modifier of a NP may also be fronted, leaving the rest of the NP *in situ*. This is particularly common with quantifiers but is also found with other determiners and with adjectives:

- (56) a. *engi var hann hermaðr*
no-masc.nom. was he soldier-nom.
'He was no soldier.'
- b. *þeirrar skaltu konu biðja*
that-fem.gen. shall-you woman-gen.
ask
'You shall ask for that woman.'
- c. *góðan eigum vér konung*
good-acc. own we king-acc.
'we have a good king.'

In subordinate clauses the fronted element ends up in a position immediately after the complementizer or the interrogative phrase. In the majority of cases, and much more often than in main sentences, this is the subject, as exemplified in most of the sentences in 7, e. g. (39). But other sentence elements may also be topicalized in subordinate clauses. In (38) and (40b) adverbs are topicalized, in (42a) a predicate NP, in (42b) a dative object, and in (46a) and (50a) prepositional phrases. If the interrogative phrase is the subject of the sentence, it is usually followed immediately by the finite verb; cf. (49c). It should be noted that sentence adverbials that are not fronted occur after the finite verb, as in main sentences:

- (57) *at ek hafa ekki varliga mælt*
that I have not carefully spoken

Fronting of a non-subject to the preverbal position is particularly common in subordinate clauses where the subject is missing, known as "stylistic inversion" or "stylistic fronting" (Maling 1980); cf. (42a).

8.3. Rightward movement

A constituent may be shifted to the final position in the sentence if it is long, complex or focussed, without leaving a visible trace in its original position. Under such conditions the

subject may occur at the end of the sentence, and the object may occur after an adverbial and thus further to the right than otherwise expected:

- (58) a. *hljópu þar út mýss*
ran there out mice-nom.
- b. *Þórolfur kastaði þá fyrir borð öndvegis-
súlum sínum, þeim er staðit höfðu í
hofinu*
Thorolf threw then overboard throne-
posts his, those that stood had in tem-
ple-def.

In particular, subordinate clauses are moved to the right, whether they are part of a NP or not:

- (59) a. *eigi er undarligt, at þú sér kallaðr Óláfr
digri*
not is strange that you-nom. are called
Olaf Huge-nom.
'It is no wonder that you are called
Olaf Huge.'
- b. *þat hyggjum vér, at hann kunni fugls
röddu*
it believe we, that he knows bird's
speech
'We believe that he knows the language
of the birds.'

In (59b), *þat* in initial position is the direct object of *hyggjum*; in the D-structure, the *at*-clause is an apposition to *þat*, and the two elements thus make up the direct object of the sentence (*þat at ...*). Therefore *þat* is not a dummy filling an empty object position but a pronoun constituting the head of the object phrase.

8.4. Position of the subject

The basic position of the subject is immediately following the finite verb. This is the unmarked subject position in main sentences with an empty topic position or with something other than the subject as topic, as in e. g. (54b-e). From this position the subject may be topicalized, as in (54a) and several other example sentences above. If heavy or focussed, the subject may be moved to the end of the sentence, as shown in sect. 8.3.

A fourth possibility is for a derived subject to remain in its original position. Thus in (60a), *hon* is separated from the finite verb but occurs in a position where we might expect the subject of *hafa gert* in a subordinate sentence; cf. (60b):

- (60) a. *þótti honum hon vel hafa gert*
seemed him-dat. she-nom. well have done
'She seemed to him to have done well.'
b. *at hon vel hafði gert.*
that she-nom. well had done

In passive sentences, the nominative may remain in the original object position behind the main verb. Of course, this is often impossible to distinguish from instances of rightward movement of subjects, as in (61 a), but sometimes other material may follow the NP, as in (61 b):

- (61) a. *var þeim gefinn dagverður*
was them given breakfast-nom.
'They were given breakfast.'
b. *ok var fluttr varnaður þeira til skips*
and were moved commodities-nom.
their to ship

The same position of the subject may be found also with active verbs. These may then be considered 'ergative' constructions, where the subject is an underlying object:

- (62) *ok var þá sigit blóð fyrir augu þeim*
and was then run blood-nom. before eyes their

None of the subject positions demonstrated here is a unique subject position. The topic position, the rightmost focus position, and the postverbal position may also host other sentence elements, and even the position immediately after the finite verb, which I called the basic subject position, may contain other elements, particularly pronouns in oblique cases, as in (60 a) and (61 a).

8.5. The verb and its complements

Old Nordic is a VO language, which means that objects and predicate adverbials regularly follow the non-finite verb. (The finite verb is fronted to second position; cf. 8.1.)

- (63) *þá skal ek sjalfr veita þeim lið*
then shall I myself give them-dat. help-acc.

Further examples are found in several of the preceding sections, e. g. (44). Generally, the indirect (dative) object precedes the direct (accusative) object, as in (63), but the order may be reversed:

- (64) *ok bauð Þorsteinn at gefa þann Gunnlaugi*
and ordered Thorstein to give it-acc. Gunnlaug-dat.

However, the object(s) may precede the non-finite verb:

- (65) *ef nokkurir vilji land hennar kaupa*
if some will land-acc. hers buy
'If somebody wants to buy her land.'

This is particularly common if the object is a pronoun, and above all if this is a subject-like pronoun ("oblique subject"), as in (61 a). A preverbal object NP or predicate adverbial may be interpreted in either of two ways. It may be a remnant of the older OV pattern of Germanic languages (cf. article 83), or it may result from a movement of the object or adverbial to a position in front of the verb ("scrambling", cf. Haugan 1999). The latter is probably the most plausible analysis when unstressed pronouns are involved. It also happens that some complements precede the verb while others follow it:

- (66) *þá mátt þú nú mikit lið veita Njáli*
then may you now much help-acc. give Njal-dat.

In cases like this, again two analyses are possible. On the basis of an old OV structure, the dative object has been extraposed because it is focussed; or on the basis of a VO structure, the accusative object has been moved in front of the verb. It would be consistent with a basic OV order for auxiliaries to follow the main verb. This is not the normal order but it is not unusual:

- (67) *ok munt þú ekki drauma ráða kunna*
and may you not dreams interpret can-inf.
'And you may not know how to interpret dreams.'

9. Empty argument positions

9.1. Deletion under identity

Noun phrases may generally be omitted if they are recoverable from the context. Thus in the second of two conjoined sentences, any argument phrase may be omitted if it is coreferential with a phrase in the preceding sentence, regardless of case or function:

- (68) a. *þá brá hann sverðinu hart ok titt ok hljóp í stofuna*
then drew he-nom. sword-dat. hard and often and [-] ran into room-def. (nom.-nom.)
b. *þá lét Óðinn bera inn í höllina sverð, ok váru svá björt ...*

then let Odin bring into hall-def.
swords-acc. and [-] were so bright ...
(acc.-nom.)

- c. *Einarr þambarskelfir fór með líki Magnús konungs ok flutti til Niðaróss*
Einar Thambarskelfi-nom. went with
corpse-dat. Magnus King-gen. and
moved [-] to Nidaros (dat.-acc.)
'Einar Thambarskelfi brought King
Magnus' corpse to Nidaros.'

A similar kind of deletion is found in subordinate sentences:

- (69) a. *þú munt eigi segja hersögu, nema sönn sé*
you shall not tell war-tales unless
true be
'You shall not tell news from the war
unless it is true.'
b. *sá baugr skyldi vera hverjum höfuðsbani, er átti*
that ring should be each-dat. death,
C owned
'That ring would be the death of
anyone who possessed it.'

9.2. Unspecified subject deletion

The subject may be omitted if it has a general or non-specifiable reference:

- (70) a. *ekki sá skipit fyrir laufinu*
not saw ship-def. acc. for foliage-def.
'The ship was invisible because of the
foliage.'
b. *bítr vel á um daginn*
bites well at in day-def.
'(The fish) bites well in the day.'

Verbs that normally take an agent subject may be used without a subject when they denote natural processes:

- (71) *Gerði myrkt*
made dark
'It got dark.'

Certain verbs regularly do not take a nominative NP and therefore always form 'subjectless' sentences. Some of these may take oblique arguments only; others have no arguments. These are typically verbs that refer to mental or natural states or processes:

- (72) a. *mik þyrsti*
me-acc. thirsted
'I was thirsty.'
b. *snjófaði mjök*
snowed much
'It snowed much.'

The passive of verbs that do not take an accusative object in the active also belongs to this category, since only accusative objects can become nominative in the passive; cf. (31) in sect. 5. In a parallel fashion, some adjectives may also occur without a subject:

- (73) *Mér er varmt*
me-dat. is hot
'I am hot.'

106. The Old Nordic lexicon

1. Introduction
2. General characteristics of the ON lexicon
3. Periodization
4. Typology of loans
5. Dialectal differences within ON
6. Literature (a selection)

1. Introduction

1.1. The Old Nordic (ON) lexicon is documented in a large and diversified body of literature. It may be subdivided into two branches: (1) Old West Nordic, comprising Old Norwegian, Old Icelandic and Old Faroese; and (2) Old East Nordic, comprising Old Danish, Old Swedish and Old Gutnish.

The earliest texts of the Western branch, scaldic poetry, belong to the 9th century, while the oldest preserved manuscripts were written in the latter half of the 12th century. The sources of Old Faroese are few and young: apart from two runic inscriptions, the most important ones are additions from the 14th and 15th centuries to a Norwegian legal text.

The oldest Danish and Swedish manuscripts, copies of legal texts, stem from the 13th century. Old Gutnish is known through a legal manuscript from ca. 1350 and a number of runic inscriptions. An important group of Old East Nordic sources comes from runic inscriptions. Such inscriptions are less important as sources of classical Old West Nordic, since they are by far outnumbered by manuscripts in the Latin alphabet.

In what follows, emphasis will be given to Old West Nordic, which has the larger and older corpus, especially from the classical period (1100–1350). The corpus gives a fairly broad picture of the ON lexicon, but not all areas of vocabulary are equally well covered. The vocabulary of the Christian church is extensively documented, whereas words and expressions dealing with everyday life are less known, because much less was written about these walks of life.

For lexical differences between and within the two branches, see section 5.

1.2. For Old West Nordic there are two larger general dictionaries, one by Fritzner (1886–1896, 1972), another by Cleasby/Vigfusson/Craigie (1957). A third large dictionary (planned to comprise 12 volumes), *A Dictionary of Old Norse Prose*, is being edited by The Arnarnagænan Commission in Copen-

hagen. Only the first and second volumes, *a-bam* and *ban-da* respectively, a volume of indices and a user's guide have been published so far (2001). Important specialized dictionaries are Hertzberg's glossary of law terms (1895), Jónsson's *Lexicon poeticum* (1913–16, ²1931), and two concordances, one by Larsson (1891) for Old Icelandic, and one by Holtsmark (1955) for Old Norwegian; both works cover the vocabulary of the oldest manuscripts down to ca. 1250. For Old Faroese no separate dictionary exists.

Dictionaries of Old Danish are provided by Lund (1877) and Kalkar (1881–1918). The vocabulary of Old Swedish is covered by Söderwall (1884–1918; supplements 1953–1973) and Schlyter (1877, law terms). Old Gutnish still lacks a separate dictionary.

1.3. The standard etymological dictionary is de Vries (1977), superseding Holthausen (1948). Additional information can be found in Ásgeir Blöndal Magnússon (1989).

2. General characteristics of the ON lexicon

2.1. On the whole, the ON lexicon has a clearly Germanic character, in the sense that the majority of words have close cognates in the other Old Germanic languages (cf. 2.2.1.). Peculiar to ON is, on the one hand, a substantial body of Nordic innovations, words having no obvious equivalents in related Germanic languages, although their roots may be Indo-European and Germanic (cf. Haugen 1982, 186–88 and 2.2.2.). On the other hand, ON has more loans than the other Old Germanic languages (cf. Fischer 1909, iii), especially from Old English (OE), Old French (OFr.) and Middle Low German (MLG), more sparingly from Old Irish (OIr.), Old Frisian, Middle English (ME), Slavic and remoter languages.

The standard survey of loanwords in ON is Fischer (1909), which presents most of the relevant material, classified according to source languages; semantic loans, derivatives and compounds on foreign patterns are more summarily treated. Many of Fischer's etymologies have been questioned or refuted by later scholars (Höfler, de Vries, Ásgeir Blöndal Magnússon), and several words are still etymologically obscure or disputed.

2.2. This section gives examples of words belonging to the common Germanic heritage (2.2.1., where Gothic and Old High German are abbreviated Go. and OHG, respectively), and examples of Nordic peculiarities (2.2.2.).

2.2.1. ON *aldr*, OE *ealdor*, OHG *altar*; ON *aptr*, Go. *aþtra*, OE *æfter*, OHG *aftar*; ON *ár*, Go. *jer*, OE *geár*, OHG *jâr*; ON *bað*, OE *bæþ*, OHG *bad*; ON *band*, Go. *bandi*, OE *bend*, OHG *bant*; ON *berg*, *bjarg*, OE *beorh*, *beorg*, OHG *berg*; ON *blindr*, Go. *blinds*, OE *blind*, OHG *blint*; ON *dagr*, Go. *dags*, OE *dæg*, OHG *tag*; ON *dáð*, Go. *gadēþs*, OE *dæd*, OHG *tât*; ON *djúpr*, Go. *diups*, OE *deóp*, OHG *tiuf*; ON *drekka*, Go. *driþkan*, OE *drincan*, OHG *trinþkan*; ON *ef*, Go. *ibaþ(i)*, OE *gif*, OHG *ibu*; ON *eiðr*, Go. *aipþs*, OE *āþ*, OHG *eid*; ON *ellri*, Go. *alþiza*, OE *ieldra*, OHG *eltiro*; ON *endi(r)*, Go. *andeis*, OE *ende*, OHG *enti*; ON *faðir*, Go. *faðar*, OE *fæder*, OHG *fater*; ON *fara*, Go. OE, OHG *faran*; ON *fé*, Go. *faihu*, OE *feoh*, OHG *fihu*; ON *friðr*, OE *friþ*, OHG *fridu*; ON *fugl*, Go. *fugls*, OE *fugol*, OHG *fogal*; ON *garðr*, Go. *gards*, OE *geard*, OHG *gart*; ON *gefa*, Go. *giban*, OE *gifan*, OHG *geban*; ON *gjarna*, OE *georn*, OHG *gerno*; ON (g)*nógr*, Go. *ganohs*, OE *genōh*, OHG *ginuog*; ON *góðr*, Go. *gods*, OE *gōd*, OHG *guot*; ON *gráðigr*, Go. *grēdags*, OE *grædig*, OHG *grâtag*; ON *hafa*, Go. *haban*, OE *habban*, OHG *habên*; ON *hár*, OE *hær*, OHG *hâr*; ON *harðr*, Go. *hardus*, OE *heard*, OHG *hart*; ON *hefja*, Go. *hafjan*, OE *hebban*, OHG *heffen*, *heven*; ON *heimr*, Go. *haims*, OE *hām*, OHG *heim*; ON *heita*, Go. *haitan*, OE *hātan*, OHG *heizzan*; ON *heyra*, Go. *hausjan*, OE *hiéran*, *hýran*, OHG *hōren*; ON *himinn*, Go. *himins*, OE *heofon*, OHG *himil*; ON *hrafn*, OE *hræfn*, OHG *hraban*; ON *hrís*, OE, OHG *hrís*; ON *hross*, OE *hors*, OHG *ros*; ON *hundr*, Go. *hunds*, OE *hund*, OHG *hunt*; ON *hvítr*, Go. *hweits*, OE *hwit*, OHG *wiz*; ON *iss*, OE, OHG *ís*; ON *jafn*, Go. *ibns*, OE *efn*, OHG *eban*; ON *jörð*, Go. *airþa*, OE *eorþe*, OHG *erda*; ON *júgr*, OE *ūder*, OHG *útar*, *útar*; ON *kambr*, OE *camb*, OHG *kamb*; ON *kinn*, Go. *kinnus*, OE *cin*, OHG *chinne*; ON *kjósa*, Go. *kiusan*, OE *céosan*, OHG *kiosan*; ON *kljúfa*, OE *cléofan*, OHG *klioban*; ON *kné*, Go. *kniu*, OE *cnéo*, OHG *knio*; ON *kona*, Go. *qino*, OE *cwene*, OHG *quena*; ON *korn*, Go *kairn*, OE *corn*, OHG *korn*; ON *kraptr*, *krqþr*, OE *cræft*, OHG *kraft*; ON *kunna*, Go., OHG *kunnan*, OE *cunnan*; ON *kvöl*, OE *cwalu*, OHG *quála*; ON *kóla*, OE *cēlan*, OHG *chuolen*; ON *kýr*, OE *cū*, OHG *chuo*; ON, Go., OE *land*,

OHG *lant*; ON *leggja*, Go. *lagjan*, OE *lecgan*, OHG *lecchen*, *legen*; ON *lif*, OE *lif*, OHG *lib*; ON *lúka*, Go. *galūkan*, OE *lūcan*, OHG *lūhhan*; ON *maðr*, Go. *manna*, OE, OHG *mann*; ON *með(r)*, Go. *mipþ*, *mid*, OE *mid*, OHG *mit*; ON *mjolk*, Go. *miluks*, OE *meol(u)c*, OHG *miluh*; ON *nátt*, *nótt*, Go. *nahts*, OE *neaht*, *niht*, OHG *naht*; ON *nökkviðr*, Go. *naqaþs*, OE *nacod*, OHG *nackot*; ON *nýr*, Go. *niujis*, OE *nīwe*, *neówe*, OHG *niuwi*; ON *óðal*, OE *ōþel*, *ēþel*, OHG *uodal*; ON *orð*, Go. *waúrd*, OE *word*, OHG *wort*; ON *ragr*, *argr*, OE *earg*, OHG *arg*; ON *reiðr*, OE *wrāþ*, OHG *reid*; ON *riða*, OE *rīdan*, OHG *rītan*; ON *sáð*, OE *sæd*, OHG *sât*; ON *segja*, OE *secgan*, OHG *sagên*; ON *skaði*, OE *sceaþa*, OHG *scad(h)o*; ON, OHG *sumar*, OE *sumer*, *sumor*; ON *sverð*, OE *sweord*, OHG *swert*; ON *tamr*, OE *tam*, OHG *zam*; ON *tíð*, OE *tīd*, OHG *zīt*; ON *tún*, OE *tūn*, OHG *zûn*; ON *þak*, OE *þæc*, OHG *dah*; ON *þunnr*, OE *þynne*, OHG *dunni*; ON *þorþ*, OE *þearf*, OHG *darba*; ON *ulfr*, Go. *wulfs*, OE *wulf*, OHG *wolf*; ON *ungr*, Go. *juggs*, OE *geong*, OHG *jung*; ON *uxi*, *oxi*, Go. *auhsa*, OE *oxa*, OHG *ohso*; ON *vaka*, OE *wacian*, OHG *wahhên*; ON *vefa*, OE *wefan*, OHG *weban*; ON *verða*, Go. *wairþan*, OE *weorþan*, OHG *werdan*; ON *qngr*, Go. *aggwus*, OE *enge*, OHG *engi*.

2.2.2. Some idiosyncrasies in word formation distinguish ON from the other Germanic languages (cf. Haugen 1982, 184–195). Among such features are a series of derivational suffixes, e.g. *-að-*, *-átta*, *-d/-ð* and *-ning*, forming deverbal nouns (*batnaðr* from *batna*, *barátta* from *berja*, *hefnð* from *hefna*, *byggð* from *byggja*, *brotning* from *brotna*, *soðning* from *soðna*); *-leikr/-leiki* forming nouns from adjectives (*góðleikr*, *kunnleiki*, *vaskleikr*); and *-látr* forming adjectives from other adjectives (*blíðlátr* from *blíðr*, *mikillátr* from *mikill*, *vandlátr* from *vandr*).

A major deviation from Germanic usage is the absence of the unstressed prefixes **bi-* and **ga-*, which have left few traces (*breiða*, *gnógr*).

In a number of cases ON words are clearly related to other Germanic words, but have been constructed by choosing different alternative formations. Thus ON *ljós* ‘light’ is based on a form with the suffix *-s*, whereas OE *leoht* and OHG *lioht* have been derived with the suffix *-t*; all three come from Germanic **leuh*. ON *björn* ‘bear’ corresponds to OE *bera* and OHG *bero*, all from Germanic **ber*; here West Germanic shows an *an*-stem

(**beran*), North Germanic a reshaped *u*-stem (**bernu*). The word for 'up' could form its comparative with the suffixes *-ōz or *-iz in Germanic; OHG chose the former, giving *obaro*, OE and ON the latter, giving ON *ofri*.

Several areas of the ON lexicon show innovations, e.g., words denoting (a) physical terrain: *bakki* 'hill', *fors/foss* 'waterfall', *kjarr* 'thicket', *oddi* 'headland'; (b) plants and trees: *barr* 'evergreen needles', *einir* 'juniper', *grøn* 'spruce', *heggr* 'chokecherry', *laf* 'lichen', *lyng* 'heather', *sef* 'rushes'; (c) animals and birds: *aurriði* 'trout', *gedda* 'pike', *gríss* 'pig', *már* 'gull', *refr* 'fox', *sild* 'herring', *þerna* 'tern'; (d) buildings and houses: *bjalki* 'beam', *fjós* 'cowbarn', *golf* 'floor', *ljóri* 'smoke vent', *svalar* 'hallway', *sæng* 'bed'; (e) food and clothing: *doggurðr* 'breakfast', *ermr* 'sleeve', *grýta* 'kettle', *hetta* 'hood', *kjöt* 'meat', *náttverðr* 'supper'; (f) people: *drengr* 'hero, man', *dróttning* 'queen', *ekkja* 'widow', *kerling* '(old) woman', *staðkarl* 'beggar', *þræll* 'slave, serf'; (g) law and commerce: *eykt* 'working period', *knorr* 'merchant ship', *leiðangr* 'naval conscription', *lög* 'law', *skeið* 'longship', *umboðsmaðr* 'deputy'; (h) descriptive terms: *dofinn* 'lazy', *fátókr* 'poor', *hógri* 'right (vs. left)', *kátr* 'merry', *spakr* 'wise', *úsæll* 'unhappy, miserable', *vánder* 'bad, evil'.

3. Periodization

3.1. The development of the ON lexicon does not allow clear-cut chronological divisions comparable to those of phonology and morphology. Nevertheless it is possible to discern some vaguely distinct phases partly based on the range, character and treatment of loanwords (e.g. Nordic loans in Finnish), partly on grounds of general cultural history. The main division is marked by the introduction of Christianity (10th–11th centuries), which brought in a host of words relating to the beliefs, concepts and institutions of the new religion. Cf. Indrebø 1951, 33–34, 54; Seip 1955, 6–7, 56–58; Haugen 1976, 164–65.

3.2. The pre-Christian era can be subdivided according to the age and character of important cultural contacts.

3.2.1. The oldest stratum seems to appear in some Celtic loans: *ambátt* 'bondswoman, maid, concubine', *isarn*, *jarn* 'iron', *ríkr* 'powerful', *ríki* 'power; kingdom'. Somewhat later, but prior to the Viking Age, a number of loans were adopted from the Frisians, the leading

Germanic traders in the 6th–9th centuries. Words generally attributed to Frisian are *akkeri* 'anchor', *bákn* 'beacon', *bátr* 'boat', *dúkr* 'cloth, sail', *gjaldkeri* 'the king's rent-collector, steward', *kál* 'cabbage', *kerra* 'cart', *klæði* 'cloth', *kuggi*, *kuggr* 'a kind of ship', *sekk* 'sack', and *stræti* 'street'. Some of these (*kál*, *sekk*, *stræti*) can be traced back to Latin, others (*akkeri*, *sekk*) even further (Greek, Semitic); some (e.g. *bákn*) may also have been influenced by OE or OSx counterparts. Cf. Indrebø (1951, 54) and Haugen (1976, 164), and further references in these works.

3.2.2. Other prehistoric loans, of uncertain origin, are *apaldr* 'apple tree', *epli* 'apple', *api* 'ape', *ertr* 'peas', *hampr* 'cannabis, hemp', *plógr* 'plough', *tjald* 'tent', and *ulfaldi* 'camel'.

3.2.3. Early loans from Latin are *eyrir* 'ounce of silver; money', *kapp* 'contest; eagerness', *karfi* 'a kind of galley', *kaupa* 'to buy' and *kaup*, *ketill* 'kettle', *múta* 'payment, bribe', *móttull* 'mantle', *pund* 'pound', *tafl* 'a game', *vin* 'wine', *qrk* 'ark, chest'; and possibly *kyllir* 'bag; scrotum', *kqtr* 'cat', *pungr* 'purse'. Some may have come into ON via OE or OSx. (*manga*, *múrr*, *mylna*, *penningr*, *pund*, *tolldr*), while for others (*pell*, *tafl*, *vin*) OE or MLG transmission has been suggested; *móttull* comes via MLG.

3.2.4. Many other cultural loans are assumed to have come from or via OE, especially after the Viking contacts with England (from the end of the 8th century). Examples of words from OE: *barlak* 'barley', *byrli* 'to wait upon', *byrlari*, *byrli* 'waiter', *hirð* 'a king's or earl's bodyguard, the king's men', *láðmaðr* 'guide', *stívarðr* 'steward', *vend* 'name of the *v*-rune'; and possibly *bjórr* 'beer', *krukka* 'pot', *skruð* 'ornament; furniture; a kind of cloth', *tákn* 'sign', *vimpill* 'wimple, a kind of hood, veil'. From Latin via OE: *belti* 'belt', *diskr* 'plate', *gimr*, *gimsteinn* 'gem-stone', *kalkr* 'chalice' (cf. also *kalekr* 3.3.), *kempa* 'champion', *kista* 'chest, box' (ult. Greek), *koparr* 'copper', *krog* 'saffron', *kylna* 'kiln', *kyrtill* 'gown, tunic', *leó*, *león*, *ljón* 'lion' (cf. also *leena* 3.4.1.), *næpa* 'turnip' (possibly Egyptian origin), *pá(i)* 'peacock' (possibly Indian origin), *páll* 'hoe or spade', *pera* 'pear', *piliza* 'pilch, fur coat', *pipari*, *piparr* 'pepper' (ult. from the Orient), *port* 'gate', *skutill* 'plate, table', *stallari* 'a king's marshal', *sútari* 'tanner, shoemaker'; and possibly *klefi* 'closet', *mynt* 'coin', *plóma* 'plum', *tigl* 'tile, brick'.

For the words of Latin origin, it is not possible to say for certain whether they came to ON from OE or OSx. (cf. 3.2.3. and 3.3.). Many words of Latin origin were common coin in western Europe and could have been spread through Roman traders and soldiers as well as through Germanic speakers.

3.2.5. Loans from other languages are few and do not readily fit into a chronological frame. Some words have Celtic origins: *gaflak* 'javelin', *gjalt* 'insanity', *laustik* 'nightingale', *skjaðak* 'darnel; inferior beer', *ærgin* 'shieling, mountain pastures'; and possibly *þúst* 'flail'. (Cf. also *ambátt* etc., 3.2.1.) Among these, *gjalt*, *skjaðak*, *ærgin* and *þúst* come from Irish. For other Irish loans see 5.3.4.

The following loans are considered to have come from Slavic: *bismari* 'steelyard', *brakki*, *brakun* 'broker', *buzar* 'a kind of beverage', *dyflissa* 'jail', *fill* 'elephant' (ult. Arabic), *leðja* 'ship', *prámr* 'flat-bottomed boat', *safali* 'sable(-fur)', *silki* 'silk' (ult. from the Orient), *taparox* 'small axe', *trapiza* 'table' (ult. Greek), *torg* 'market place', *tulkr* 'interpreter'; and possibly *humli* 'hops'. *bismari*, *dyflissa*, *prámr* and *tulkr* reached ON via MLG.

3.3. The profound influence of Christianity has been extensively studied, especially by Kahle (1890), Taranger (1890), and Thors (1957).

The ecclesiastical terminology was mainly Latin in its origin. (Ultimately from Greek were *antefna*, *biskup*, *djákn(i)*, *djǫfull*, *engill*, *erki*-, *kirkja*, *krisma*, *krismi*, *kristinn*, *munkr*, *musteri*, *postoli*, *prestr*, *salmr*, *saltari*, *skóli*, *qlmusa*.) It was channelled into ON through adaptations made either in OE (especially) or OSx. and MLG. Some terms were sometimes cited unadapted (e.g., *kredo*, *monachus*, *monasterium*), but as a rule they were more or less adapted (e.g. *munkr*; *mustari*, *mynstr*; see also 4.3.). Via OE came, e.g., *ábóti*, *biskup*, *djákn*, *engill*, *erki*-, *imbrudagar*, *kalekr* (cf. *kalkr* 3.2.4.), *kanóki*, *kannúkr*, *kanunkr*, *kirkja*, *klaustr*, *klerkr*, *kredda*, *krisma*, *krismi*, *kristinn*, *munkr*, *postoli*, *prestr*, *prim*, *prófasti*, *prófastr*, *salmr*, *skrin*, *skript* [in the sense 'confession'], and probably *messa* and *url(an)* 'veil'. Via OE or OIr.: *bagall* 'crosier' and *kross*; via OE or OFr: *funtr*, *fontr*.

Via OSx. have come *djǫfull*, *qlmusa* (cf. Kahle 1890, 13), and probably *altari*, *alteri*, *altara*, *frú*, *herra*, *pína*, *synd*; via OE or OSx.: *bókstafr*, *offra*, *prédika*.

Via MLG have come, e.g., *abbadis*, *ametta* 'linen cloth worn by priests', *bréf*, *bréferr*,

dómkirkja, *ferma*, *gradal*, *graðall*, *(h)yumni* (ult. Greek), *kapella*, *karína* 'fast of 40 days', *kir(k)messa*, *klokka*, *klukka* (ult. OIr.), *konvent(a)*, *kraptr*, *krǫptr* [in the sense 'crypt'], *leikr* 'lay', *lektia*, *lektari*, *páfi*, *paradis(i)*, *páskar*, *patriarki*, *píkis*-, *pikkisdagr*, *pela*-, *pílagrimr*, *pítenz*, *plága*, *regla*, *spitali*, *spitall*, *texti*, *textr*, *vill* 'veil'; and possibly *abbati* and *skrifra*. Via ME: *primsigna* 'to give the "prima signatio"'. Via OE or MLG: *kapellánn* (cf. also *kapaleinn*, *kapalinn* 3.6.1.) and *skóli*.

OE has supplied some ecclesiastical words, e.g. *bleza*, *blesa*, *guðspell*, *guðspjall*, *reykelsi*, *ræðingr*, *sál*, *sálast*; and possibly *hunsl*, *húsl*, *rim* 'computation, calendar'.

Much of the Christian terminology was adapted through loanshifts (cf. 4.3.).

3.4. In the wake of Christianity followed the large-scale introduction of the Latin language and literature. Its early phase in Norway and Iceland belongs to the 11th and 12th centuries (cf. Walter 1976, 7, 37 with references). Surveys of Latin loanwords are given by Fischer (1909, 67–75) and de Vries (1977, xxxiv). Latin's influence, which is especially strong in ecclesiastical and learned literature, makes itself felt throughout the ON period and will not be divided here into chronological layers (except for 3.2.3. and 3.3. above).

3.4.1. Additional examples of Latin loanwords are *amor* 'love', *ampli*, *ampulla*, *ampullr* 'vessel, flask', *annáll* 'annal, record', *balsamr* 'balsam' (ult. Semitic), *biblia*, *bifflia* 'bible' (ult. Greek), *bussel*, *buzel* 'cask', *buza* 'merchant-ship', *daktílr* 'fruit of the date palm' (ult. Greek), *dalmatika* 'a kind of liturgical garment', *dekan* (= *djákn*, cf. 3.3.), *dekreta*, 'decree', *dekreta*, 'to decree', *eximi* 'silk, velvet', *eyrir* 'ounce of silver', *figúra* 'figure, metaphor', *fika*, *fíkja* 'fig', *fitónsandi* 'magic, prophetic power', *flórena*, *flórin*, 'florin', *fustan* 'a kind of cotton' (ult. Arabic), *gafi* 'griffin, a kind of mythical creature' (ult. Greek?), *gladel* 'lance, spear', *gráða*, *gráði* 'step', *homília* 'sermon' (ult. Greek), *iðusdagr* 'the Ides of a month', *jacinctus* 'a kind of blue silk', *justa* 'a kind of measure for liquids', *kaldel* 'cake', *kalendasdagr* 'the first day of the month', *kanceler* 'chancellor', *kanon* 'song', *kantiki*, *kantilena*, *kantilia* 'song', *kapituli* 'chapter; congregation of canons', *kapp* 'strife', *kardináli* 'cardinal', *karína* 'fast of 40 days', *kastr* 'fortress, camp', *klausu* 'clause, passage', *klúss* 'dear', *kollekta* 'collect, prayer', *kolorr* 'colour', *kóméta* 'comet' (ult. Greek), *kommún*

'commune, guild', *kompon* 'composition in Latin', *koróna* 'crown', *krónikubók* 'chronicle' (ult. Greek), *kvaðrantr* 'quadrant', *kvaterni* 'quire', *kussari* 'corsair, pirate', *latína* 'Latin language', *leena* 'lioness' (cf. also *léo* etc., 3.2.4.), *legáti* 'envoy', *léoparðr*, *hlébarðr* 'leopard' (cf. also *léparðr* 3.6.4., *parði* 3.5.2.), *lepra* 'leprosy' (ult. Greek), *linja* 'gallery', *máláttusótt* 'leprosy', *malmari*, *marmari* 'marble', *manna* 'manna' (ult. Arabic?), *metr* 'metre' (ult. Greek), *mítr*, *mítra* 'mitre, tall cap worn by bishops', *móménta* 'moment, 1.5 minute', *músikalist* 'music' (ult. Greek), *muskat* 'muscat', *múta* 'bribe', *mútari* 'a hawk that has moulted', *náttúra* 'nature; property', *nigromantia* 'sorcery' (ult. Greek), *nóna*, *nóni* 'the ninth hour, noon', *nóti* 'note, mark', *obláta*, *oblét*, *ofláta* 'sacramental wafer', *offerenda* 'offering', *oktavudagr* 'the eighth day after a feast day', *olífa* 'olive', *organ* 'organ', *pakti*, *paktr* 'epact, the "age" of the moon' (ult. Greek), *palata*, *palati* 'palace', *palma*, *palmi* 'palm-tree', *passia* 'the sufferings of Jesus', *past* 'food', *pati* 'father', *patena* 'the plate holding the bread in the Eucharist' (ult. Greek), *patriarki* 'patriarch' (ult. Greek), *PELLA* 'parchment', *persóna* 'person', *pikturr* 'painter', *portari* 'doorman', *prefatía* 'preface, introduction to the Mass', *prímstafr* 'prime letter' (i.e. golden number, the number of a particular year in the Metonic moon cycle – a period of 19 years – used to fix the date of Easter), *priorr* 'prior in a convent', *próba* 'to investigate, prove' (cf. *prófa* 3.5.2.), *processia* 'procession', *prófeta*, *prófeti* 'prophet' (ult. Greek), *prólaga* 'to bargain for oneself', *próvenda* 'prebend, benefice', *psalmr*, *psaltari* 'psalm, psalter' (cf. *salmr*, *saltari* 3.3.), *pulkrokirkja* 'the church of the sepulchre in Jerusalem', *purpura*, *purpuri* 'purple', *regula* 'monastic rule', *responsi* 'responsory (in worship)', *sálifa* 'saliva, spit', *salterium* 'psaltery, a stringed instrument' (ult. Greek), *samvit*, *samvizka* 'consciousness, wit; conscience', *samvitand* 'cognisance, knowledge', *sekventia* 'sequence, part of a chant in the Mass', *signa* 'to consecrate, bless', *simfón*, *sinfón* 'lyre', *skapular* 'a garment, part of a monk's habit', *skipt* 'the camp of the Varangians at Constantinople', *smaragdr* 'emerald' (ult. Greek?), *sónn* 'sound', *statút* 'statute', *still* 'stylus; style', *stóla*, *stóli* 'stole, strip of cloth worn like a scarf by some clergymen', *stóll* 'fleet' (ult. Greek), *subtil* 'a garment worn by a subdeacon', *suzingull* 'surcingle', *tabla*, *tabola* 'picture, altar-piece', *tesaurr* 'treasure, treasury', *testament* 'will', *timpanum* 'kettledrum' (ult. Greek),

titull 'heading; inscription; story; abbreviation sign', *traktr* 'a kind of chant', *tripla* 'to chant in three voices', *turturi* 'turtle-dove', *unian* 'onion', *vigiliudagr* 'the day before a festival', *vinflaki* 'a kind of cover or shelter'.

3.4.2. Typical Latinisms are the verbs in *-era*, which mainly occur in ecclesiastical and learned literature. In ON the type seems to be patterned on MLG verbs in *-eren*. MLG models can be found for a number of these verbs, cf. 3.5.3.

Directly from Latin have come, e.g., *diskordera* 'to disagree', *dispensera* 'to dispense', *disputera* 'to dispute', *divisera* 'to distribute', *emendera* 'to amend', *kancellera* 'to stretch out', *komponera* 'to compose', *konfirmera* 'to confirm', *konkordera* 'to agree', *nótera* 'to denote, mark', *traktera* 'to treat, entertain', *visitera* 'to visit'; and possibly **pretitulerá* (presupposed by *pretituleran* 'heading'), *prokurerá* 'to procure', *punktera* 'to point, dot', *studera* 'to study'.

A number of these verbs occur in shortened forms in *-a*: *diskorda*, *disputa*, *emenda*, *kompona*, *kompona*, *studia*.

Corresponding verbal nouns end in *-an* (cf. 3.5.3.): *dispenseran*, *disputan*, *disputeran*, *komponeran*, *konkorderan*, *studeran*, *trakteran*.

3.5. The next great wave of loans came from MLG, beginning in the late 12th century and rapidly growing in the 13th. The ground was to some extent prepared partly through those Christian missionaries whose mother tongue was OSx. (cf. 3.3.), partly through commercial and cultural contacts with peoples bordering on the North Sea coasts in the Viking Age and even before that time (cf. 3.2.1.). But the greater part of the MLG influence was imported through contacts with members of the Hanseatic League. In the ON period the linguistic results were most conspicuous in the language of merchants and the nobility, who had closer contacts with the Germans. MLG loans are thus fairly frequent in the charters, and this had far-reaching effects on colloquial speech as well, as can be seen from later sources, e.g. in the Scandinavian dialects. The MLG influence was facilitated through some structural similarities between MLG and the Scandinavian languages, viz. the absence of diphthongisation of Proto-Germanic long vowels (cf. e.g., High German *Eis*, *Haus*) and of the affricates *pf*, *ts* (cf. e.g., High German *Apfel*, *Zunge*), which reduced the linguistic distance between the languages involved. On

the other hand, MLG loans are in some cases more easily recognized as such because of certain distinctive phonological and morphological criteria, such as *kt* from *ht*; *mp*, *nt*, and *nk* (in words where the pre-literary ON assimilation to (resp.) *pp*, *tt*, and *kk* would have been expected); initial *ju-*; the affixes *bi-*, *for-*, *-inna* etc.; cf. Fischer 1909, 26; Simensen 1995, 71.

3.5.1. Based on semantic content, the MLG loanwords can roughly be divided into four main categories, viz. (1) trade and handicrafts, (2) chivalry, (3) the military, and (4) a remainder category containing, i. a., some “fashionable” words and more common words.

(1) Examples from the sphere of trade and handicrafts: *blik* ‘sheet metal’, *brák* ‘a tanner’s implement’, *buðla* ‘to sieve, sift’, *dokka* ‘windlass’, *espíngur* ‘a ship’s boat’, *fóðr* ‘lining’, *frukta*, *frykta* ‘to load, transport’, *gígja* ‘fiddle’, *hala* ‘to haul’, *hanzki* ‘glove’, *hirsí* ‘millet’, *húðfat* ‘leather bag’, *iperst* ‘cloth from Ypres’, *jurt* ‘herb’, *kalka* ‘to chalk, lime’, *katlari* ‘kettle-maker’, *kloflaukr* ‘garlic’, *kram* ‘merchandise’, *kranz* ‘circle, garland’, *krydd* ‘spice’, *leðr* ‘leather’, *lest* ‘cargo’, *lifs-*, *lispund* ‘lis-pound’ (a kind of weight), *linlak* ‘linen bed-sheet’, *mengdr*, *menginn*, *mengjaðr* ‘mixed, blended’, *messing* ‘brass’, *okr* ‘interest, usury’, *pakki* ‘package’, *pantr* ‘pawn, pledge’, *pinni* ‘pin’, *plagg* ‘luggage, garment’, *reikna* ‘to count, calculate’, *reipari* ‘ropemaker’, *reisa* ‘journey’, *sikta* ‘to sift’, *silfar* ‘a kind of woollen cloth’, *skarfr*, *skerfr* ‘coin’, *skjaldari* ‘shield-maker’, *skrá* ‘iron plate’, *skraddari* ‘tailor’, *slípari* ‘whetter’, *smelt* ‘enamel’, *snid-dari* ‘tailor’, *sparlak* ‘curtain’, *sprang* ‘lace-weaving’, *steinmez* ‘a kind of knife’, *strip* ‘striped cloth’, *tygi* ‘stuff, things, equipment’, *vekt* ‘weight’, *veski* ‘bag’; and possibly *kuggi*, *kuggr* ‘a kind of merchant-ship’, *pottr* ‘pot’, *rist* ‘gridiron’, *tappa* ‘to tap, draw’.

(2) Examples from the sphere of chivalry: *ers*, *ess* ‘steed’, *greifi* ‘count’, *hertogi* ‘duke’, *hóf* ‘banquet’, *hofferð* ‘pride, pomp’, *hóverskr* ‘courtly’ (and derivatives), *jungfrú* ‘young noblewoman’, *jungherra*, *junkeri* ‘young nobleman’, *knapi* ‘servant, valet’, *klénn* ‘beautiful’, *lén* ‘fief’, *orlof* ‘leave’, *riddari* ‘knight’, *skenkja* ‘to serve drinks’, *skylmask* ‘to fence’, *tykt* ‘discipline, chastisement’, *þéna* ‘to serve’ (and derivatives), *æra* ‘to honour’ (and derivatives).

(3) Examples from the military sphere: *doppa* ‘boss of metal’, *fanga* ‘to capture’, *fangelsi* ‘prison, jail’, *fangi* ‘prisoner’, *klót* ‘knob on a sword’s hilt’, *kragi* ‘collar on armour’,

rýt(n)ingr ‘dagger’, *skuttingr* ‘shield’, *skyr sill*, *skózill* ‘tasse on a suit of armour’, *speja*, *spæja* ‘to spy’; and possibly *fóra* ‘armour, harness’, *skyttá* ‘shooter’, *orlygi* ‘battle’.

(4) Examples of loanwords from other categories: *akta* ‘to attend to; examine; determine’, *andvarða* ‘to hand over’, *angist* ‘anxiety’, *armóða* ‘hardship, toil’, *bilæti* ‘picture’, *buðkr* ‘box’, *býta* ‘to change’, *dára* ‘to mock’, *ferskr* ‘fresh’, *flygill* ‘wing’?, *fría* ‘to free’, *frygð* ‘joy’, *hínka* ‘to limp’, *hop* ‘hope’, *hópr* ‘host, flock’, *innsteri* ‘bowels’, *jaga* ‘to hunt’, *klókr* ‘clever’, *krankr* ‘ill, sick’, *líða* ‘to suffer’, *lukka*, *lykka* ‘luck’, *maka* ‘to make’, *makt*, *mekt* ‘power; pomp’, *mála* ‘to paint’, *meina* ‘to mean’, *möguligr* ‘possible’, *noti* ‘match, equal’, *plaga*, *plega* ‘to cultivate; treat; be in the habit of’, *reyfari*, *raufari* ‘robber’, *skákmaðr* ‘robber’, *skálkr* ‘rogue’, *skammfóra* ‘to spoil’, *skari* ‘host, troop’, *skelmir* ‘devil’, *skikka* ‘to order, ordain’, *skorsteinn* ‘chimney’, *skókja* ‘whore’, *slangi* ‘serpent’, *slekt* ‘family, kind; way of living’, *slenr* ‘sloth’, *spraki* ‘rumour’, *spezskór* ‘a kind of shoe’, *strax* ‘at once’, *stumpr* ‘stump; piece of bread’, *tæra* ‘to consume, spend’, *þerna* ‘maid-servant’, *vága* ‘to dare’, *vakta* ‘to watch, guard’, *vallari* ‘traveller, tramp’, *visundr* ‘bisonox’, *æverðligr* ‘everlasting’, *öldurmaðr* ‘alderman’; and possibly *gáfa* ‘gift’, *mát* ‘estimate’, *mega* inf. of *má* ‘may’, *spinka* ‘to sprawl’.

3.5.2. Many words that reached ON from MLG were of Latin or Greek origin, e.g. *amatisti* ‘amethyst’, *arbyssa*, *arbysti* ‘cross-bow’, *baldikin* ‘a kind of silk; canopy’, *barki* ‘small boat’ (ult. Greek or Egyptian), *beja*, *bæja* ‘shackle’, *bisund* ‘Byzantine gold coin’, *bliat*, *bliaz* ‘a kind of silk’, *bréf* ‘letter’, *bukran* ‘cloth of linen or cotton’, *dekur* ‘10 hides’, *dikta* ‘to compose; think up, contrive’ (and derivatives), *edik* ‘vinegar’, *elefantr* ‘elephant’ (ult. Greek), *er(i)miti* ‘hermit’ (ult. Greek, cf. *heremita*, *hermiti*, 3.6.1.), *fals* ‘fraud, cheat’ (and derivatives), *fóguti* ‘a kind of bailiff’, *form* ‘form, shape; picture’, *fótskemill* ‘foot-board’, *fruktr*, *fryktr* ‘fruit’, *galeið* ‘galley’ (ult. Greek), *glafja*, *glefja* ‘lance, spear’, *grípr* ‘vulture’, *kamarr* ‘toilet’, *keisari* ‘emperor’ (and derivatives), *kerti* ‘wax candle’, *klár* ‘clean, bright’, *kórr* ‘choir’ (ult. Greek), *kosta* ‘to kost’, *kostr* ‘cost, expense’ (and derivatives), *krúna* ‘crown’, *krús* ‘pot, tankard’ (ult. Greek?), *kukl* ‘sorcery’, *kvátra* ‘a kind of board game’, *legill* ‘cask’ (ult. Greek?), *lína* ‘rope’ (ult. Greek), *manga* ‘ballista’ (ult. Greek), *meistari* ‘master’, *mintá* ‘mint’, *mirra* ‘myrrh’

(ult. Arabic), *múll* ‘mule’, *mútaðr* ‘something that has moulted’, *muza* ‘a kind of jacket’ (ult. Arabic), *náttúrligr* ‘natural’, *olea, olía* ‘oil’ (ult. Greek) (and derivatives), *organ* (ult. Greek), *pallaz* ‘palace’, *panna* ‘pan’, *panzari, panzer* ‘coat of mail’, *par* ‘pair’, *parði* ‘leopard’ (ult. Iranian? cf. *hlébarðr, léoparðr* 3.4.1., *léparðr* 3.6.4.), *pilárr* ‘pillar’, *pilz, pilzungr* ‘pilch, fur coat’, *plána* ‘to efface, blot out’, *planka* ‘plank, thick board’, *planta* ‘to plant’, *plástr* ‘plaster’ (ult. Greek), *plata, pláta* ‘plate armour’, *ponta* ‘to point, dot’, *portinhérr* ‘porter, doorman’, *prófa* ‘to investigate; prove’ (cf. *próba* 3.4.1.), *renta* ‘income, rent’, *sargent, sergent* ‘soldier trained to fight on foot’, *simili* ‘flour’ (ult. Arabic), *sirop* ‘syrup’ (ult. Arabic), *sister* ‘a measure of land’, *skáldpípa* ‘flute, pipe’, *soldari* ‘soldier (mercenary)’, *spégill* ‘mirror’, *spiza* ‘to furnish with provender’, *spons* ‘bung in a barrel’, *sponsa* ‘to bung a barrel’, *strúz* ‘ostrich’ (ult. Greek), *tabúr* ‘drum’ (ult. Arabic), *taferni* ‘tavern’, *tapit* ‘carpet, tapestry’ (ult. Asiatic), *templari* ‘Knight Templar’, *tempra* ‘to temper, moderate’, *ten(n)ingr* ‘die’, *tóni, tónn* ‘tone, tune’ (ult. Greek), *tortis(s)* ‘torch; big wax candle’, *tréhakl* ‘antidote’ (ult. Greek), *triza* ‘pull, tress’?, *vers(i)* ‘verse’, *versa* ‘to put into verse’, *vinzari* ‘steelyard’; and possibly *búss* ‘boxwood’, *innsigli* ‘seal’ (and derivatives), *korf* ‘basket’, *lenz* ‘lance’, *píla* ‘arrow’, *pípa* ‘pipe’, *skyrbjúgr* ‘scurvy’, *stoppa* ‘to stuff’, *violat* ‘violet cloth’.

From OSx.: *kellari, kjallari* ‘cellar’; from MLG or OE: *fíðla* ‘fiddle’, *lilja* ‘lily’ (ult. Egyptian), *punktr* ‘point’, *rós*, ‘rose’, *sóli* ‘sole of a shoe’; from MLG or OFr.: *morsel* ‘bit’, *penni* ‘pen’; perhaps directly from Latin: *bik* ‘pitch’, *planéta* ‘planet’, *prócessia* ‘procession’, *próvenda* ‘prebend, benefice’.

3.5.3. Conspicuous are the verbs ending in *-era*, many of which have come into ON via MLG (from Latin or OFr., cf. 3.4.2., 3.6.1., 3.6.3.): *dustera* ‘to tilt, fight’, *fallera* ‘to deceive, mislead’, *formera* ‘to form, shape’, *fundera* ‘to found’, **hófera* ‘to be proud, haughty’ (presupposed by *hóferan* ‘haughtiness’), *mútera* ‘to change’, *spazera* ‘to walk’, *summera* ‘to sum, count’, *turnera* ‘to take part in a tournament’; and possibly *appellera* ‘to cite, summon’, *glósera* ‘to explain by a gloss’, *studera* ‘to study’, *terminera* ‘to limit’.

Corresponding verbal nouns end in *-an* (cf. 3.4.2.): *dusteran, formeran, hóferan, spazeran, appelleran, studeran*.

3.5.4. The examples indicate that MLG loans flourished in the learned literature and in the literature of chivalric romance (“*riddarasögur*” etc.). But even the central ON vocabulary was affected. A trace of the MLG prefix *be-* is etymologically discernible in *breiða* ‘pay’ (< MLG *bere(i)den*). Still, the majority of forms with MLG affixes (cf. 4.3.2.) and such frequent words as *men* ‘but’ and *blifa* ‘to become’ are not attested in the ON period.

3.6. The 13th and 14th centuries also witnessed the importation of words of Romance origin, not only channelled through MLG (cf. 3.4.2., 3.5.2., 3.6.2.), but also through ME, and probably for the most part directly from OFr., although this distinction according to origin cannot be maintained in all cases (cf. Fischer 1909, 76). The OFr. influence seems to have been initiated especially during the reign of King Hákon Hákonsson (1217–63), who is traditionally credited with having instigated the translation of French courtly romances known as *lais* and *chansons de geste* into ON prose.

Among the Romance loans are many words for different kinds of textiles, exotic items and concepts from the sphere of chivalry. They are fewer than those from OE, Latin and MLG measured in the number of known lexemes (cf. the lists in de Vries 1977, xxvii–xxxiv). In general, they are characteristic of the language of the higher circles of the sophisticated culture of Western Europe in the High Middle Ages. Like many MLG loans, they are especially frequent in courtly literature.

3.6.1. Directly from OFr. have come, e.g., *al(a)mandr, amendashnot* ‘almond’, *ámalera* ‘to enamel’, *amía* ‘sweetheart’, *ársali, ársalr* ‘bed-hangings’, *asni* ‘ass’ (Latin *asinus*), *bar(r)ún* ‘baron’, *blank* ‘white cloth’ (cf. *blakt* 3.6.4.), *bóla* ‘seal’, *bóti* ‘boot’, *buris* ‘borax’, *burt* ‘a kind of tournament’, *dauss* ‘die showing the side with two dots’, *drómundr* ‘big warship’ (ult. Greek), *dubba* ‘to dub a knight’ (ult. Germanic), *duz* ‘dozen’, *ermíns* ‘ermine’, *flúr* ‘flower; flour’, *formel* ‘female Greenlandic falcon’, *fors, forz* ‘violence, wrath, rage’, *gammi* ‘musical scale’ (ult. Greek), *gardekors* ‘a kind of short jacket’, *glósa* ‘gloss, explanation’, *glósa* ‘to explain’, *heremita, hermiti* ‘hermit’ (ult. Greek, cf. *ermíti* 3.5.2.), *hrókr* ‘the castle in chess’ (ult. Persian), *isope* ‘hysop’ (ult. Semitic), *jarngrilli* ‘iron grill’, *justis* ‘judge’, *kamelet* ‘camelot, a kind of fine cloth’, *kapaleinn, kapalínn* ‘chaplain’ (cf. *kapellánn*

3.3.), *katel* 'chattel, possession', *kisill* 'shirt of linen or silk', *klare*, *klaret* 'claret', *kofri* 'hood or bonnet of fur', *kompáss*, *kumpáss* 'ring, circle', *kordúnuhosur* 'hose of cordovan leather', *kordúnuskór* 'shoe of cordovan leather', *kothardi* 'cloak, coat', *kreatýr* 'creature', *kria*, *kræja* 'to crave, assert', *kunkteis* 'countess', *kurt* (n.) 'king's court', *kurt* (f.), *kurteisi*, *kurtr* 'courtesy, chivalry, good manners', *kurteiss* 'courtly, gentle', *kveif* 'coif, cap', *kver* 'quire, sheet folded in a book', *kærr* 'dear', *laðrúnn*, *latrónn* 'robber', *latún*, *latúnn* 'brass', *laz* 'lace' (and derivatives), *letr* 'letters; writing', *livori* 'hard wood, ebony?', *malla*, *mella* 'loop, noose', *manér* 'manners', *marbr(i)* 'marble cloth', *marchiss* 'margrave, marquis', *mát* 'checkmate' (ult. Persian), *morel* 'dark brown horse', *mærr* 'mayor', *offrend* 'offering during Mass', *olifant* '(horn of) ivory', *osterin* 'purple silk', *palafrey* 'palfrey, saddle horse', *pardueri* 'as a token of love', *pardún* 'pardon', 'forgiveness', *pataldr* 'battle', *pía* 'magpie', *píment* 'a kind of wine', *presenta*, *presentera* 'to present', (s)*púsa*, 'to marry', (s)*púsa* (f.), (s)*púsi* (m.) 'spouse' (with derivatives and compounds), *rábítr* 'Arabian horse', *reison* 'order, rule', *roba* 'robe', *sifra* 'zero' (ult. Arabic), *siment* 'cement', *sinjórr* 'lord, master', *sira*, *siri* 'sir', *siridúkr* 'wax cloth', *sirihúfa* 'wax hood', *skarmandi*, *skarmendingr* 'cape-like vestment worn by priests' (ult. Greek), *surkot*, *syrkot* 'surcoat', *spáz* 'space, room', *trafali* 'hindrance, impediment' (a nickname), *truff* 'trumpery', *úklúsaðr* 'unhampered', *turniment* 'tournament', *vargulfr* 'were-wolf'; and possibly *aiol* 'a kind of hard wood', *glatunshundr* 'weasel'.

Several of these, e.g. *amía*, *duz*, *formel*, *gammi*, *gardekors*, *kisill*, *marbr(i)*, *morel*, *olifant*, *osterin*, *palafrey*, *reison*, *silfra*, *siment*, *spáz*, *vargulfr*, appear to be nonce formations, since they are each known from only one ON text. (Cf. also 3.6.2. and 3.6.4.)

3.6.2. Via MLG have probably come, e.g., *áss* 'ace', *barbér* 'barber', *basún* 'trombone', *basúna* 'to play the trombone', *bukl* 'the boss of a shield', *burdeigja*, *burdia* 'to ride a tilt', *burt* 'tilt, tournament', *dans*, *danz* 'dance' (ult. Germanic), *dubla*, *dufla* 'to play or gamble with dice', *dust* 'tilt, tournament', *falkeneri*, *falkiner* 'falconer', *fantr* 'vagabond' (ult. Germanic?), *feila* 'to falter, be shy', *finn* 'fine', *foel* 'velvet', *gardian* 'head of a Minorite monastery', *harneskja*, *hernesekja* 'harness, armour', *innrenta* 'income', *kamell* 'camel' (ult. Semitic?), *kanifas* 'canvas', *kaprún* 'a kind of

cowl or cap', *kompánn*, *kumpánn* 'companion, fellow, mate', *konstabl*, *konstafl* 'constable, an official of the royal household, court etc.', *kovertúr* 'saddlecloth', *kult* 'quilt, counterpane', *kvitta* 'to acquit', *kvitr* 'quit, acquitted', *lampi*, *lampr* 'lamp', *mustarðr* 'mustard', *partr* 'part, share', *plaxa* 'plain, open place', *prisa* 'to praise; torture', *priss* 'pomp, state', *púta* 'whore' (with derivatives), *rím* 'rhyme, poem' (ult. Greek), *rolla* 'roll, scroll', *roti* 'crowd', *safran* 'saffron' (ult. Arabic), *salún* 'a kind of cloth', *sapol*, *sjappel*, *þjapel* 'wreath', *skák* 'chess' (ult. Persian) (with derivatives), *spaldener*, *spaldenære* 'armour for the back', *ævintýr(r)* 'adventure, tale; event', and possibly *trejja* 'jerkin', *trumba* 'pipe, trumpet', *tumba* 'to tumble, fall'. Via OSx.: *turn* 'tower'.

From MLG or OFr.: *palliment*, *parlament* 'parley, conference', *prinz* 'prince', *prisand*, *prísund* 'prison', *siklát*, *siklátum*, *siklátun* 'a kind of expensive silk' (ult. Arabic), *sæi(n)* 'fine woollen cloth'. Via MHG (?): *gammr*, *gambr* 'griffin, vulture'.

Of these, *barbér*, *kamell*, *kanifas*, *konstabl*, *konstafl*, *kovertúr*, *plaxa*, *roti*, *spons*, *sponsa* are probably nonce formations (cf. also 3.6.1. and 3.6.4.).

3.6.3. For some verbs in *-era* it is not clear whether they have been transmitted via MLG or OFr., or directly from Latin; they are not mentioned in the etymological dictionaries for ON and Icelandic. On general grounds, the latter alternative seems more probable, cf. Holthausen 1948 under *pretituleran*, *prokure-ra*, and *punkt(er)a*. The verbs in question are *artikulerá* 'to articulate; enumerate', *degrade-ra* 'to degrade, dismiss', *deponera* 'to dismiss', *examinera* 'to examine, interrogate', *komplera* 'to compile', *officera* 'to perform the services of the church', *repetera* 'to repeat', *resignera* 'to resign'.

Possible analogical formations are *parta*, *partera* 'to part, divide', *punkta* 'to point, dot'; cf. 3.4.2.

3.6.4. Via ME have probably come, e.g., *bastarðr* 'bastard; a kind of cloth', *blakt* 'white cloth' (cf. *blank* 3.6.1.), *buffeit* 'buffet, blow', *burgeis* 'burgess; big man', *dan* 'sir', *fól* 'fool', *gingibráð* 'ginger', *léparðr* 'leopard' (cf. *hlébarðr*, *léparðr* 3.4.1., *parði* 3.5.2.), *markeiss* 'margrave, marquis', *puliza* 'to polish', *purtrea* 'to portray', *ribbaldi* 'ribald, savage', *skviari*, *skýjari* 'esquire', *spis*, *spiz* 'spices, delicacies', *tersél* 'a kind of falcon'; and possibly *dubba* 'to arm, dress; dub a knight', *par* 'scrap'.

Via ME or MLG: *skarlat* ‘scarlet’ (ult. Persian). Via ME or OFr.: *skons* ‘lantern’.

Nonce formations are probably *buffeit*, *markeiss*, *puliza* (cf. 3.6.1. and 3.6.2.).

4. Typology of loans

4.1. Several lexemes occur in different forms, often due to borrowing from or via different languages. Generally, such varying forms reflect differing degrees of assimilation to the ON phonological system.

Examples of such pairs or triplets are *blank* (from OFr.): *blakt* (via ME), *kapellánn* (via OE or MLG): *kapaleinn*, *-lím* (from OFr.), *koróna* (from Latin): *krína* (via MLG), *kredo* (from Latin): *kredda* (via OE), *palata*, *palati* (from Latin): *pallaz* (via MLG): *polota*, *polut* (probably from Slavic), *próba* (from Latin): *prófa* (via MLG), *psalmr* (from Latin): *salmr* (via OE).

For another type of doublet see 4.4.

4.2. On the whole, unassimilated loans are not very numerous. In addition to those cited above (e.g. *blank*, *koróna*, *kredo*, cf. also 3.3.) may be mentioned some OFr. loans, not only those such as *aiol*, *offrend*, *pardueri*, *truff*, which show foreign combinations of sounds, but also *duz*, *gardekors*, *palafrey*, *reison*, *siment*, which do not show inflection and thus may possibly have been mere citation words. This is also the case with some Latin loans, which are either uninflected (*expens*, *manna*, *tesaur*) or, at least in some texts, inflected according to the rules of Latin grammar (*biflia*, *jacinctus*, *paradisus*, etc., cf. Fischer 1909, 8).

4.3. The assimilation of loanwords may take on different forms. Phonological (cf. 4.3.1.) and morphological (cf. 4.3.2.) assimilation are common. Other forms of loan-coinage (cf. 4.3.3.) are more restricted to special types of texts.

4.3.1. Phonological assimilation is fairly consistent, e.g. in MLG loans in charters from the 14th century, where MLG *á* is rendered as ON *á* in early loans (e.g. *náðir*, ‘mercy, peace’ (1307), *mátuliga* ‘fitting’ (1320)), in later loans as *a* (e.g. *kragi* ‘collar’ (1353)), which had by then presumably been lengthened in ON (in connection with the quantity shift). On the other hand ON phonotactics demands a short vowel before *dd*, as in *skraddari* and *sniddari* ‘tailor’, where MLG had a long vowel. Cf. also *kredda* (4.1.).

As regards consonants, ON *ð* is substituted for MLG *d* between *r* and a vowel (*garðian*, *náðr*). MLG *g* and *ch* denoting the voiced and unvoiced allophones respectively of the velar fricatives (/ɣ/ and /χ/), are generally rendered *g* or *gh*, and *k*, as in *tygh* ‘harness’ vs. *slekt* ‘family’. On the other hand the nasal groups *mp*, *nk*, *nt* (in preliterary ON generally assimilated to *pp*, *kk* and *tt*) are usually kept unchanged, e.g. as in *krankleiki* ‘illness’, *pant* ‘pledge’. Cf. Simensen 1995, 61–63.

4.3.2. Morphological assimilation appears in its simplest form in a series of folk etymologies, like *abbadis* ‘abbess’, *ábóti* ‘abbot’, *bilæti* ‘picture’, *hlébarðr* (cf. 3.4.1.), *húðfat* ‘leather bag used to sleep in’, *kyndill* ‘torch’, *opinberr* ‘manifest’, *skammfóra* ‘to spoil’, etc., cf. Fischer 1909, 10.

More regular morphological assimilation is shown by (a) adaptation to productive native patterns and (b) increased productivity of certain borrowed affixes.

(a) Some loans have adopted ON suffixes in the formation of derivatives, e.g. the deverbal nouns in *-an* (*aktan*, *reiknan*) from the borrowed verbs *akta*, *reikna* (from MLG), and the Latinisms in *-an* (*disputeran* etc., cf. 3.4.2. and 3.5.3.); others have given rise to new words with such Common Germanic suffixes as *-dómr* (e.g. *hertogadómr*, *jungfrúadómr*, *krankadómr*, *lækidómr*, *riddaradómr*) and *-skapr* (e.g. *dáraskapr*, *klókskapr*, *kompánaskapr*, *mangaraskapr*, *reiðskapr*, *riddaraskapr*).

(b) One of the oldest is the nomen agentis suffix *-ari*, ultimately and generally derived from Latin *-arius*. Examples are *mútari* ‘hawk’, *falsari* ‘impostor’, *mylnari* ‘miller’, *myntari* ‘mint-master’. Latin origins have also *kaupari* (cf. Latin *caupo* ‘merchant’), *keisari* (cf. Latin *Caesar*), *sútari* (Latin *sutor* ‘shoemaker, tanner’), *prédikari* (Latin *praedicator*). This suffix was very productive. From OE comes *loddari* ‘player; jester’, while *skraddari* ‘tailor’ and *spæjari* ‘scout’ have MLG origins. It is added to ON roots in a number of words, such as *gróðari* ‘healer, saviour’, *harpari* ‘harper’, *kallari* ‘crier, herald’, *kambari* ‘comb-maker’, *laggari* ‘cooper’, *lausnari* ‘saviour’, *lokkari* ‘allurer’, *leikari* ‘player; jester’, *riðari* ‘rider, knight’, *sigrari* ‘victor’, *skapari* ‘creator’, *stjörnari* ‘steersman, ruler’, *svikari* ‘traitor’, *talmari* ‘person who hinders, obstructs’, *tjúgari* ‘pitch-forker, robber’. Cf. also Fischer 1909, 3–5.

More limited in use was the verbal suffix *-era* (cf. 3.4.2., 3.5.3., 3.6.3.).

From MLG comes the feminine noun suffix *-inna*, attested in *hertuginna* ‘duchess’ and *keisarinna* ‘empress’.

Among the prefixes, the relationship of *for-* and *fyrir-* to their MLG counterpart *vor-* remains unclear, partly because of our incomplete knowledge of the distribution of stress. It is generally assumed that these prefixes carried stress in classical ON prose. The MLG prefix was unaccentuated. Both prefixes are Common Germanic, but classical ON uses *for-* only with nouns and verbs derived from nouns (cf. Falk/Torp ²1960, 251), such as *foreldri*, *forellrar* ‘parents’, *forvitnast* ‘to enquire’. According to Johannisson (1939, 198–205) those formations with *fyrir-* where the prefix carries a pejorative meaning, e.g. *fyrbjóða*, *fyrirbjóða* ‘to prohibit’, *fyrirdjarfa* ‘to disgrace’, should be regarded as autochthonous in North Germanic. Some of these verbs, e.g. *fyrbanna* ‘to forbid’, *fyrbjóða*, are known from Eddaic poems, where the metre indicates that the prefix is unstressed. In ON prose unstressed *fyr-* is usually replaced by the stressed *fyrir-* (cf. Johannisson 1939, 198, 215, 216). A special case is verbs composed with *fyrir-* in the sense of ‘before, foregoing, previous’, e.g. *fyrirhugsa* ‘to premeditate’, *fyrirsegja* ‘to predict, foretell’, *fyrirskipa* ‘to prescribe, order’. This type, which generally coexists with combinations of simple verbs + particle in the same senses, seems to be modelled on Latin compounds with *prae-*. It is possible that the presence of verbal nouns with *fyrir-*, e.g. *fyrirhugsan*, *fyrirsogn*, *fyrirskipan*, contributed to the increased use of such verbs (cf. Johannisson 1939, 197 with further references). Nevertheless ON has loans with *fyrir-* modelled on MLG formations with *vor-*; an example is *fyrirstanda* ‘to understand’. The presence of *for-* and *fyrir-* in verbal nouns with the same stem has led to a number of doublets, e.g. *fordóming* : *fyrirdóming*, *forlitning* : *fyrirlitning*. Here *for-* represents the older formation, *fyrir-* a younger one, transferred from the verb compounded with originally unstressed *fyr-*, later *fyrir-* (cf. Johannisson 1939, 216). MLG influence and native analogy led to an increase of verbs with *for-* modelled after nouns with the same prefix, e.g. *forláta* ‘to forgive’ (after *forlát*), *forsmá* ‘to despise’ (after *forsmán*), *fortaka* ‘to deny’ (after *fortak*) (cf. Johannisson 1939, 194). On the other hand, several compound verbs with *for-* belong to a later chronological layer, modelled on MLG. Examples from the Late ON period are *formerkja* ‘to perceive’, *forráða* ‘to betray’, *for-*

standa ‘to understand’ (cf. Johannisson 1939, 193–4).

4.3.3. Other kinds of adaptation are shown in a number of highly differentiated forms of loan-coinage.

Loan extensions (semantic extensions of native terms) are frequent, e.g. *andskoti*, *fjandi* ‘enemy, fiend > devil’, *dygð* ‘strength > (Christian) virtue’, *halda fyrir* ‘to hold before > withhold’, *heilagr* ‘inviolate > sacred’ (in a Christian sense), *hreinn*, *skírr* ‘bright, clean > (morally) pure’, *jól* ‘(pagan) midwinter festival > Christmas’, *mildr* ‘mild, gentle > pious’, *rétta* ‘to make right, straight > judge’, *trú(a)* ‘trust, confidence > faith, belief’. Cf. also Fischer 1909, 1.

Loan creations are either literal translations (calques, substituting native morphemes for foreign), like *alþingis* (MLG *aldink*), *bókstafr* (OE *bōcstæf*), *dagþinga* (MLG *degedingen*), *dómkirkja* (MLG *dōmkerke*), *guðspell* (OE *godspell*), *himinriki* (Latin *regnum coelorum*), *hvitásunnudagr* (OE *hwīta sunnandæg*), *inntekja* (MLG *inname*), *kunngera* (MLG *kunt maken*), *þyrnihjalmr* (OE *þyrnene helm*), *(ú)hlýðni* (Latin *(in)oboedientia*) (cf. also Fischer 1909, 5–6); or less exact renditions, like *bindendi* (Latin *continentia*), *klykkja* ‘to ring a bell’ (derived from *klukka*, from MLG), *litillátr* (Latin *humilis*), *trúlauss* (Latin *infidelis*), *æverðligr* (MLG *iewer(l)de*); or still freer loan formations, such as *hófsemi* (Latin *temperantia*), *føstudagr* (Latin *ieiunium*); and more independent loan creations, such as *réttlætisdómur* (for Latin *iustitia*) and *villumaðr* (for Latin *haereticus*).

New terms for Christian concepts were also created, e.g. *gróðari* ‘saviour’, *leiðrétting* ‘conversion’, *spámaðr* ‘prophet’.

Foreign influence probably also led to an increased frequency in some previously infrequent native words, such as *ofmetnaðr* (corresponding to Latin *superbia*) and *réttlátr*, *réttlæti* (corresponding to Latin *iustus*, *iustitia*). Cf. Haugen 1982, 198; Walter 1976, 80–81, 99.

4.4. One of the effects of borrowing was the creation of pairs of lexical doublets, often used as parallelisms for stylistic ornamentation, where one member of the pair was of native origin, the other a loanword. Examples of such pairs (from Norwegian charters with MLG loans) are *aktan ok atgeymsla*, *heiðr ok æra*, *klókr ok vitr*, *nafnlíga ok sérlíga*, *sómd ok æra* (cf. Berulfsen 1948, 270).

Another was the loss or reduced frequency of the native member(s) of groups of near-synonyms, such as *auðsýnn* giving way to *opinberr*, *ganga* to *gá*, *hátr* to *máti*, *heita* and *játa* to *lofa*, *hyggja* and *ætla* to *meina*, *leyfi* to *orlof*, *líkn* and *miskunn* to *náð*, *ljúfr* to *kærr*, *mátr* and *veldi* to *makt*, *sýsla* to *lén*, *songhús* to *kórr*, *veð* to *pantr*, *vitr* to *klókr*, *ætt* to *slekt*, *þjóna* to *þéna*; *fyrir hǫnd* and *af halfu* to *af/á vegna* (cf. Simensen 1995, 72).

5. Dialectal differences within ON

5.1. A number of dialectal differences between Old West Nordic and Old East Nordic, and within each of these branches, have been noticed, although this subject has never been fully investigated.

5.2. Peculiar to Old East Nordic are, e.g., *aftenbakke* ‘bat’, *fælled* ‘common pasture land’, *helleflynder* ‘halibut’, *ladegård* ‘barn, stable’, *mulm/molm* ‘dark, dead of night’, *slegfred* ‘concubine, mistress’, *tagskæg* ‘eaves’; some plant names like *kabbeleje* ‘Caltha’, *veger* ‘Salix’, *åkande* ‘Nuphar, Nymphaea’; and a number of MLG loans and derivatives in *-else* and (to a smaller extent) *-end(e)*, e.g. *dopælsæ* ‘baptism’, *fordomælsæ* ‘damnation’, giving rise to new formations of the same kind, e.g. *fræstæls* ‘temptation’, *othmykælsæ* ‘humiliation’, *fiskende* ‘fisheries’, *akallænd* ‘invocation’; cf. Hellquist 1929, 388, 391; Skautrup 1944, 290–291, 296.

5.2.1. Characteristic of Old Danish are, e.g., *dynd(e)* ‘mire, mud’, *fnat* ‘scabies, itch’, *nor* ‘infant’, *ryle* ‘sandpiper’, *ægt* ‘driving, transport’; plant names like *dude* ‘Lolium’, *gir* ‘Spergula’, *hejre* ‘Bromus’; and some verbs: *bøge* ‘to roar, bellow’, *dræve* ‘to falter, hesitate’, *gæffe* ‘to bark, yap’; cf. Skautrup 1944, 297.

5.2.2. Characteristic of Old Swedish are, e.g., *hēman* ‘home, landed property’, *vidskepelse* ‘superstition’; cf. Hellquist 1929, 393, 421, 424 and *passim*.

5.2.3. Old Gutnish is in many ways more archaic than the other Old Nordic dialects. The word *lamb*, e.g., means ‘sheep’, as in Gothic. MLG loans peculiar to Old Gutnish are *hogsl* ‘child support’, *hogsla* ‘to pay hogsl’ and *slaper* ‘sleeper’; cf. Pipping 1905–07, CXII–XIII.

5.3. Earlier scholars (Hægstad 1933; Indrebø 1951, 141; Seip 1955, 82, 208–209) have al-

ready recorded some differences between Old Norwegian and Old Icelandic, the most important ones probably related to legal concepts and other phenomena that appear to be peculiar to one of the two countries. In what follows, the present writer’s own findings are included in the surveys.

5.3.1. The following may be considered Norwegianisms: *álborinn* ‘measured with a line’, *álburðr*, *taumburðr* ‘mensuration with a line’, *alþingis* ‘altogether’, *ámálga* ‘to claim’ (with compounds and derivatives), *baugskerðing* ‘diminishing of fines’, *elgskot* ‘elk-hunting’, *halflyti* ‘a half’, *ketilgarðr* ‘kiln’ (?), *knefill* ‘post, pole’, *krossfé* ‘payment to support a holy rood’, *kylna* ‘kiln’, *mánaðarmatr* ‘a month’s rate’ (with compounds), *moldrofsmaðr* ‘a man who breaks a bargain for the sale of land’, *skipreiða* ‘ship-levy’, *spann* ‘pail’, *tillægi* ‘appurtenances of an estate’, *útekja* ‘(time for) bringing wares (to markets)’, *útvegr* ‘the outer march or boundary’; some compounds denoting the value of farms, where the first part indicates the size of the rent: *eyrisból*, *halfsælduból*, *mánaðarmatarból*; some standard phrases in charters: *frjals ok heimoll* ‘at one’s free disposal, in one’s full possession’, *veðslaus ok vǫrzlu* ‘free of mortgage’; and a number of appurtenance clauses (“formules d’appartenance”, cf. Mediaeval Latin *pertinentia* ‘belongings’): *á gǫrðum ok grindum* ‘on fences and gates’, *ffogurra stafstóða í millum* ‘between four corner posts’, *frá heiðnum haugi* ‘from heathen hows (i.e. times)’, *hǫgg ok hǫfn* ‘trees and pastures’, *með fiski ok fygli* ‘with fish and fowl’, *með qllum hlutum þeim er til liggja* ‘with all appurtenances’, *útan garðs ok innan* ‘outside and inside the fence’, *vann (vǫtn) ok veiðistǫð* ‘water(s), fishing- and hunting-place(s)’. (In Old Icelandic the common corresponding formula is *með gǫgnum ok góðum* ‘with (all) products, revenues and emoluments, i.e. with everything useful and good’.)

5.3.2. There is a marked difference in the naming of some weekdays: Old Norwegian generally uses *týsdagr* ‘Tuesday’, *óðinsdagr* ‘Wednesday’, *þórsdagr* ‘Thursday’ and *frjádagr* ‘Friday’. All these are rare in Old Icelandic, which prefers *þriðidagr*, *miðvikudagr*, *fimmti dagr* and *fastudagr*.

5.3.3. Peculiar to Old Icelandic (in the sense that the words denote Icelandic phenomena and/or have no known cognates in Norwe-

gian) are *aðili* 'chief defendant or prosecutor', *aftekja* 'revenue', *forlendi* 'the land between sea and hills', *forvista*, *forysta* 'leadership', *hize*, *hizi* 'yonder, there', *ítak* 'a partial right of property in another's estate', *itala* 'a proportionate share in a right or in an estate', *knár* 'pithy, vigorous' (with derivatives), *laga-*, *lögripting* 'a legal voidance', *miski* 'misdeed, offense', *réttsýni* 'a straight direction' (with the adverb *réttsýnis*), *ræsta* 'to clear, clean out', *ræxn* 'knot, mesh', *skeitung* 'vanity' (?), *slyppr* 'unarmed', *spryna* 'to kick', *targa* 'shield', *tefill* 'hinderer', *tízka* 'custom, fashion', *ú(h)ræsi* 'a filthy thing', *undirdráttull* 'covetous', *unnvarp* 'wave-drift', *uppivözlumaðr* 'a turbulent, noisy man', *uppivözlumikill* 'troublesome', *úræst* 'filth', *úræstligr* 'filthy', *úvænkast* 'to grow worse', *úværateigr* 'a strip of land overrun by strange cattle', *úþínsligr* 'unworthy of you', *úóðr* 'not passable on foot', *þaðra* 'there', *þerfilligr* 'useful, convenient', *þermlast* 'to lack, miss'.

5.3.4. In addition, the following Irish loanwords are only known from Icelandic sources: *bjának*, *bjannak* 'blessing', *diar* 'gods; priests', *gresjárn* 'some kind of iron', *kapall* 'a hack, nag', *kjafall* 'a kind of garment', *korki* 'oats' (?), *lung* 'a ship', *minþak* 'a dough made of butter and flour', *súst* 'a flail', *tarfr* 'a bull'.

5.3.5. The vocabulary of Old Faroese is practically identical to that of classical Old West Nordic. Among the few lexical peculiarities are some words related to sheep breeding: *einganga* 'walking alone', *hagamark* 'boundary mark of an enclosure', *hagfastr* 'a sheep which stays in a certain pasture', *iskipan* 'regulation of the maximum size of livestock to be admitted to a pasture', *lenda* 'to give land to a person', *samrétt(i)* 'common enclosure for livestock', *tvilembdr* 'a sheep which has two lambs', *vagnhogg* 'piece of blubber'; cf. Agerholt 1959, 237 (quoting from an unprinted ms. by Fredrik Scheel).

107. The development of Old Nordic personal names

1. Sources
2. Forenames
3. Bynames
4. Family names
5. Literature (a selection)

1. Sources

1.1. Runic inscriptions after 1100

Runic inscriptions in the Scandinavian countries from the 12th and 13th c., and to some extent throughout the Middle Ages, are important sources which partly overlap with the documents written in Roman letters, although their character changed. The erect runic stone monuments typical of the Viking Age were replaced by tombs and slabs of stone in the church floors, thus in every respect representing the new religion. The runic texts are sometimes even repeated in Latin with Roman letters on the same monument. The number of medieval runic grave inscriptions is considerable, but runes are to a greater extent found on all kinds of everyday objects, combs, tools etc. A great number of runic inscriptions on wooden sticks have been found in Bergen and Trondheim. The Bergen inscriptions from the 13th and 14th c. alone amount to 618 regis-

tered items containing 157 different names borne by approximately 300 people (Markali 1983, 2, 77). Altogether, including inscriptions from Scandinavian colonized territories – the Orkneys and Greenland, there exist about 1270 medieval inscriptions containing identifiable names of living persons. The distribution of these inscriptions is, however, somewhat uneven. Slightly more than half of them, 651, are Norwegian. Sweden has about 350, but more than half of them, 180, are from Gotland and 77 are from Västergötland. The tiny remainder is spread over Middle Sweden. In Uppland, where the vast majority of Viking Age inscriptions have been found, there are only 23 medieval inscriptions left. The high number of Norwegian inscriptions is due to the Bergen finds. In total, no less than about 240 different names have been found in over 650 Norwegian inscriptions containing names (Scandinavian runic-text database).

In Denmark there are 169 inscriptions containing names with 93 different forenames in use (Scandinavian runic-text database; cf. Lerche Nielsen 1997, Bilag 17 ff.).

In Iceland only 47 genuine inscriptions have been preserved, most of them on slabs from the later part of the Middle Ages or even

younger, the very oldest from about 1200 (Bæksted 1942, 21, 52). In 35 inscriptions, about 50 different names are to be found (Scandinavian runic-text database).

Medieval runic inscriptions from Greenland and Orkney should also be mentioned. There are 27 runic documents from Greenland containing 32 different names, and 24 from Orkney, all but 4 of them found within the ancient cairn of Maeshowe and containing 30 different names of clearly Scandinavian origin (Scandinavian runic-text database; cf. Barnes 1994).

1.2. Place-names

A few place-name types are considered medieval in the sense that their productivity period is mainly supposed to be limited to the Middle Ages.

Much debated are the names in *-thorp*. They vary in age; the oldest – from the pre-Viking Age – are found in Jutland and are connected with identical continental names. However, the vast majority in Sweden and Norway are no doubt medieval. Three quarters of them contain personal names. Old Scand. names prevail in the south, younger “Christian” ones in the north, mirroring the supposed spread of the type from south to north (Eriksson 1974, 493 ff.). Names like *Johannes*, *Niels* and *Peter* and others are first elements in Dan. *-thorp*-names attributed to the oldest part of the Middle Ages (Lerche Nielsen 1997, 111; cf. Hald 1974, 88, map 87).

Another type of more clearly medieval origin are the place-names in *-arve(t)* known from parts of Eastern Sweden (Dalarna, Uppland and Hälsingland) and those in *-arve* from Gotland. They contain not only a number of names of Christian origin but also German ones, which places them at the end of the period (Ståhl 1956, 253 ff.).

Among other place-name elements of mainly medieval origin, the names in *-bodh(a)*, *-bod*, *-bud* are widespread in Scandinavia, many of which use personal names and personal designations as a first element (Ståhl 1957, 30 ff.; Hald 1957, 32 f.; Hovda 1957, 33 f.).

More locally distributed are the almost 900 representatives of the Sw. names in *-måla* and *-målen* mainly spread throughout Småland and Blekinge. They very often contain personal names known from other Middle Age sources (Ståhl 1967, 114 ff.). There are other place-name types from this period which could also be taken into account here, for instance

those ending in *-bo*, *-bygd*, *-byggning* and *-böle* (Otterbjörk 1968, 207).

1.3. Literary sources

It is a problem that our knowledge of the Scandinavian personal nomenclature of the time following the runic period mainly rests on texts written in non-native languages. Chronicles, calendaries, necrologies and charters are in Latin with endings and forms of the names adapted to this language, in some cases obscuring the original native form, for example *Homerus* for *Ormer* or *Orm*, *Hericus* for *Erik* because ⟨*h*⟩ was a mute letter in medieval Latin. Other examples of misleading Latinizations of Scand. names are *Kanutus* for *Knut*, Lat. *canus*, *canutus* meaning ‘grey, inspiring awe’, *Ovidius* for *Øvith*, *Simon* for *Sighmund* etc. (Hornby 1947, 187 ff.).

1.3.1. Charters

Most of the medieval names can be found in a great number of medieval charters during this period, written on parchment. These documents are as a rule very rich in names and come from all over Scandinavia. For the period dealt with, most charters are published in national cartularies for each country: *Diplomatarium Danicum*, *Islandicum*, *Norvegicum* and *Suecanum* and *Finlands medeltidsurkunder*. The main stock of charters are from the 13th and the following centuries. The oldest ones are mostly clerical documents written in Latin. From the end of the 13th c. there are so many extant charters and other written documents that it is possible to some extent to ascertain the contemporary nomenclature. In the 14th c. the sources are rich, but this is true only for the central parts of the countries. For the island of Gotland, for instance, there are almost no medieval documents, and in the northern parts of Sweden and Norway only a few are known. This fact makes the material less useful for investigations or calculations of geographical distribution. The Swedish material from the central parts of the country is especially rich in names because most of the legal documents dealing with pieces of land (Sw. *fastebrev*) include the names of 12 witnesses, mostly domiciled farmers. Women of the peasantry, though, are very seldom mentioned in medieval official documents, which makes our knowledge of the personal nomenclature less comprehensive (Otterbjörk 1968, 206 f.; Modéer 1989, 15 note 3).

1.3.2. Other early sources

Besides the charters, there are only a few early sources worth mentioning as examples of name usage, i.e. disparate lists of names in confraternity books, *libri vitae* and memorial lists from monasteries and churches in and outside Scandinavia. Unfortunately none of these lists or any others contain a sufficiently large number of names spread over the whole of Scandinavia to allow adequate statistical treatment.

1.3.2.1. The *Reichenau Confraternity Book*

Especially noteworthy is the confraternity book from the 11th and 12th c. from the Reichenau Benedictine Monastery at Lake Constance containing approximately 715 more or less successfully written forms of Scandinavian personal names. It is, however, difficult to fully identify the name bearers, no doubt pilgrims on their way to Rome and other places, with regard to which part of Scandinavia they came from, even if there is a title *Hislant terra* (Iceland) under which 13 slightly disguised Scand. names are listed, for instance *Wigedis*, *Arnur* and *Gudemunder*. No less than 270 different names of Scand./Gmc origin are represented. In contrast to most medieval name lists, Reichenau has a high percentage of women's names – 34 per cent (Naumann 1991, 131f.).

1.3.2.2. *Necrologium Lundense*

The slightly younger *Necrologium Lundense* in the cartulary of S:t Laurentius Cathedral in Lund contains a *Memoriale fratrum*, i.e. a list of names of deceased members of different confraternities as well as names of benefactors of the church. They are registered in calendary form from 1123 to 1170. Of the nearly 690 cases of written name forms, it is possible to identify about 230 different names of Scand./Gmc origin, 51 of which are women's names. These early records are of great importance for our knowledge of the early introduction of names of Christian origin and other foreign names into Scandinavia (Naumann 1991, 134ff.).

1.3.2.3. The Brother List in *King Valdemar's cadastre*

Next comes the so-called Dan. brother list in King Valdemar's taxation list (*cadastre*) dating back to the latter part of the 12th c. The

list is heavily weighted for Jutland. Nearly 215 names, 50 of which are of Christian origin, give us a glimpse of the name stock in use at that time. Most frequent is *Niels* with 20 bearers, followed by *Peter* with 16 and *Iohannes* (*Ion*, *Ioens*) with 8. It should also be noted that there are a few Fris. (and Sx.) names like *Occa*, *Poppo*, *Wirik*, *Liæf*, *Folklef* and *Radolf*, probably borne by foreigners. It should also be mentioned that the names in the list are borne by people of high rank, so the list has probably very little to say about the naming of common people (Hald 1974, 83). In spite of the high number of names of Christian origin, the list contains between 2/3 and 3/4 native names. This proportion was to be altered radically during the centuries to follow in Denmark.

Other sources covering the whole of Denmark are lacking. As a random sample, the land register of the Danish bishop of Roskilde from about 1370 could be mentioned. It includes other parts of the country, e.g. the names of about 70 farmers from the little island of Møn. Only 12 of these bear Scandinavian names, and there are examples of German names like *Henrik*, *Herman* and *Henneke* (Hald 1974, 83f.).

1.3.2.4. The 1312 taxation lists from Uppland

From 15 Swedish parishes in Northern Uppland, taxation lists from an extra tax tribute in the year 1312 have been preserved. About 1670 persons, 1625 men and 45 women, are registered by names; 435 different names, 38 of which are bynames, are used. The nomenclature is rather conservative. Of the 396 forenames, only 37 are non-native, i.e. 9 per cent, but among them certain Christian saints' names dominate, especially in the central parishes. Such names and others connected with the new religion are borne by no less than 644 persons, i.e. 39 per cent. Most popular by far is *Olaf* (together with its hypocoristic *Olle*) at 8.3 per cent, no doubt due to the popularity of the Norwegian saint Olav. It should be noted that the name of the Swedish national saint, Erik, at this time had not yet reached the peak of its later popularity; only 8 men are named *Erik* (0.5 per cent). Among the 39 women's names used, 7 are of Christian origin, with *Katerina* and *Margareta* coming top, borne by 6 and 4 women, respectively.

The 15 most commonly used names in 1312 were (percentage in brackets):

Johan 119 (7.3), *Olaf* 113 (7.0), *Niklas* 77 (4.7), *Laurens* 62 (3.8), *Peter* 57 (3.5), *Jakob* 47 (2.9), *Anders* 40 (2.5), *Björn* 29 (1.8), *Kettilbjörn* 22 (1.3), *Olle* 21 (1.3), *Gudvast* 20 (1.2), *Mikael* 20 (1.2), *Thorsten* 19 (1.2), *Kettilvast* 18 (1.1), *Thomas* 18 (1.1).

The interesting thing about the lists is the very rich variety of native Viking Age names; no less than 359 different such names are used (Otterbjörk 1968, 214; Dahlbäck 1997, 175).

1.3.3. Scandinavian names in Russia

In the 9th and 10th c., Scandinavian vikings known as Varangians penetrated into Russia and brought their names into the Novgorod region where they settled down under the rulers *Rurik* (ON < *Hrærikr*), *Askold* (< *Hqskuldr*) and *Dyr*. From that era, about 85 names of Scandinavian settlers and their descendants are preserved in the early Russian chronicles. A few of them were soon russified. Only about 15 were current in the Middle Ages and became incorporated in the Old Russian personal onomasticon. The great prince of Kiev in 882–911 was *Oleg* (< ON *Helgi*). His name is still popular in Russia. Later, in 932, *Igor* (< ON *Ingvarr*), the son of Rurik, held the same position. His wife was *Olga* (< ON *Helga*), whose name became popular because of her later status as a saint. Another saint was Saint *Gleb* (< ON *Guðleifr*), the son of Vladimir the Saint. The dynasty of Russian rulers was Scandinavian by origin, but Slavic names appeared in the mid-10th c. in the Rurikide clan, the earliest being *Svjatoslav*, prince and son of the great prince *Igor*. Vladimir the Saint was married to the daughter of a prince of Potolsk named *Rogvolod* (< ON *Rqgnvaldr*). Other names borne by people of the same class are *Uleb* (< *Óleifr*), *Ivor* (< ON *Ívarr*), *Aldan* (< ON *Halfdan*) and *Jakun* (< ON *Hákun*, *Hákon*) (Bækklund 1956, 26 ff.). Several of the Scandinavian names were fully adopted in the Old Russian onomasticon, and some of them seem to have been preserved far into the Middle Ages in the Novgorod region by bearers who probably were descendants to the Viking settlers. Thus we meet the name *Jakun* several times, borne by officials in Novgorod and elsewhere in the region. This name is represented at the latest in a birch-bark letter from 1369–1382. Other names of Scand. origin used in late chronicles and on six medieval birch-bark letters are *Az-gut*, *Sten*, *Vigar* and *Gugmor* (< *Guðmarr*) (Melnikova 1996, 218 ff.).

2. Forenames

2.1. General changes since the Viking Age and the introduction of foreign names

The Viking Age Scandinavian nomenclature was to a great extent formed by so-called variation, i.e. a rather free combination of two name elements linking family members together (see art. 85, 4.1.). Semantically the Viking Age name elements consist of ancient Gmc words for battle, glory, fame and heaven gods. The native medieval names from the 11th c. and onwards are basically the same as far as the repertoire is concerned, although the stock of names was not renewed by means of variation and the meaning of the name elements is more or less obscured. All through the Middle Ages, names containing *Por-*, *Guf-*, *Gun-*, *Sigh-*, *Porbiorn*, *Guplek*, *Gunvald*, *Sigsten* and others remained popular in spite of the change of religion, a fact that has been much discussed (see Kousgård Sørensen 1990, 394 ff.).

However, name-givers had to choose their children's names from an existing set of names. Gradually this name repertoire expanded in a new way due to the import of foreign names. A new custom of naming children after saints, biblical persons and kings was rapidly established, even though odd examples of a kind of late variation are recorded, such as OSw. *Kristmoþer* and OWN *Kristrún* given after the Christianization period (see art. 85, 3.1.; Andersson 1995, 797). In a recent study of the Christianization process in Sweden, it has been shown that very few names of Christian origin are recorded on Viking Age memorial stones in spite of the fact that a great many of them show signs of the new religion, such as Christian crosses and prayer formulas. In fact, only 13 instances of *Johan* and *Jon* are known (Eldblad 1994, 58), together with two instances of *Nicolaus* and one each of *Klement* and *Martin* (Williams 1996, 70). There is evidence to show that as early as in the 12th c. the aristocracy adopted the new custom of introducing foreign names into their dynasties, for instance *Burislef*, *Rikiza* and *Valdemar* from Slavic countries (Otterbjörk 1968, 209). Once the principle of naming children after people from outside the close family was established, and the more the names of popular saints were chosen after Christianization, the more the great mass of old Scand. names, borne by fewer individuals, became obsolete in favour of popular saints' names like *Jon*, *Johan*, *Jön(i)s* (< *Iohannes*),

Nils (< *Nicolaus*), *Per* (< *Petrus*) and *Lars* (< *Laurentius*). The introduction of Christian and foreign names was more extensive in densely populated areas, where ecclesiastical influence was greater. In the Norwegian Østland-region, as many as 75 per cent of the farmers bore native names as late as in 1529 (Halvorsen 1968, 204).

It would be very interesting to follow in detail the increasing importation into Scandinavia of foreign names during the Middle Ages if that was possible. This importation, especially of names of Christian origin, is of course closely related to cultural and other contact with surrounding peoples and countries. The names introduced with Christianity are saints' names and names from the Bible, i. e. for the most part names of Hebrew, Greek and Latin origin. They are not as numerous as the names of German origin, which were introduced later, but they are borne by far more people. Thus they characterize the name stock of the Middle Ages as a whole. The process of this introduction has been much discussed, but no one doubts the crucial part played by the Scandinavian kings and the aristocracy (Hald 1974, 44).

2.2. Saints' names

As stated above, the characteristic trend in medieval Scandinavian personal nomenclature is the increasing use of imported saints' names. Among the most popular were *Johannes*, *Nicolaus*, *Petrus*, *Laurentius*, *Andreas*, *Benedictus*, *Jacobus* and *Thomas*. The first five names achieved unsurpassed popularity by the end of the Middle Ages, and they developed a rich variety of forms adapted to the Scandinavian tongues.

However, it should be noted that the time of introduction of these names varies from name to name. Generally they all reached Denmark and Sweden earlier than Norway and Iceland. They did not arrive in great numbers and waves, but rather first appeared as single instances surrounded by heathen, native names. The competition between old native names and those associated with the new religion for a long time favoured the native ones, but gradually the newcomers penetrated the Scandinavian personal onomasticon. In contrast to the religious spheres where the orthodox church was in control and actively worked for eradication of heathen names in connection with the baptismal rite, Scandinavian religious society seems to have been tol-

erant towards native pagan names, allowing a more peaceful coexistence (Grape 1911, 78 ff.; Kousgård Sørensen 1990). It is interesting to look closer at a few of the popular Christian names such as *Johannes*, *Nicolaus*, *Petrus* and *Iacobus*.

Johannes was introduced into Scandinavia very early and quickly, no doubt due to its wide use all over the Christian world in memory of *Johannes* the Baptist and *Johannes* the Apostle. As stated above, there are 13 instances of *Johan*, *Jon* on Swedish runic stones, and in Iceland bishop *Ión Qgmundar son*, born in the middle of the 11th c., is believed to be the first bearer there of this name. Other *Ións* from Norway and Iceland are known from *Heimskringla* in the 11th c. (Lind 1905–15, 649; Gunnes 1982, 156).

In Denmark the earliest recorded instance of this name is from the first half of the 11th c., but it must have been known among the Danes considerably earlier since it quite frequently appears in place-names in *-thorp*, *Jonstrup* for instance (Lerche Nielsen 1997, Bilag 35). The shorter forms *Johan* and *Jon* imply an early and more direct import because of the shift in stress to the first syllable. The form *Iones*, later *Ionis*, *Jons* came in a later wave to Denmark and Sweden probably due to Low German influence. The form *Hannus*, *Hans* was introduced later into Scandinavia from German-speaking areas; in Sweden it was first recorded in 1352 (Eldblad 1994, 61). The name was by far the most frequent in Denmark during the Middle Ages (Hald 1974, 46f.).

Nicolaus, the name of a Greek saint, was used early on in Scandinavia, in Norway and Sweden from the 11th c. In Sweden it is also known from two runic inscriptions. In Denmark the oldest bearer is believed to have been the king from 1104–34. Like many other saints' names, it was first borne by clerics but became popular soon enough, first among highly ranked people, cf. the brother list in King Valdemar's cadastre in which it tops the name list, and later among common people (Hald 1974, 48 f.; Gunnes 1982, 156 f.; Grape 1911, 81 f.; Hornby 1947, 214 f.).

Later in the Middle Ages, a rich variety of forms was developed. The short form *Klaus* was no doubt borrowed from Germany (Janzén 1947, 141), while *Nicklas*, *Nikils*, *Nighels*, *Niels*, *Nils* and *Nisse* developed within Scandinavia (ibid., 142).

Petrus, the name of the most famous apostle, was introduced into Sweden about 1100. In Denmark it was borne by the king's

equerry in 1085, but like *Iohannes* it appears in place-names in *-thorp* which are believed to be older (Lerche Nielsen 1997, Bilag 38).

In Iceland there was a *Pétrus frá Ósi* in the *Landnámabók* as early as about 1000, but in Norway and Iceland it was not frequent until after 1200 (Lind 1905–15, 830 ff.). During the period up to 1350 and afterwards, the name in the form of *Peter*, *Pedher*, *Per*, *Pelle* became the most frequent name all over Scandinavia (Janzén 1947, 142).

Jacobus was the name of the patron of pilgrims. It became popular in Scandinavia rather late. Most of the first bearers in Denmark and Sweden were clergymen recorded in the Lund cartulary (cf. 1.3.2.) from the end of the 12th c. and onward (DGP and Sveriges medeltida personnamn, samlingar). However, the very first Swedish Jacob was the Svea king *Anund Jacob* (1022–1050) who, according to Adam of Bremen and *Heimskringla*, adopted the Christian name as an extra name when he was baptized (Grape 1911, 79 f.). In Denmark about 8,000 *Jacobs* were registered, before 1450 with a great variety of forms (Hornby 1947, 212). The growing popularity of *Jakob* in Gotland from the beginning of the 14th c. was probably due to influence from Denmark or Germany. It seems to be one of the most popular early established Christian names in the island and was outstanding in a context of genuine native names. There are no records of it in Norway during this period. One of the first bearers of this name in Norway (Bohuslän) seems to be a parish priest in 1366. In Iceland an *Einarr Jacobs son* is known from the 12th c., but there is no evidence that his father was born in Iceland (Lind 1905–15, 613 f.). Later, especially in Denmark, “native” forms like *Jæp*, *Jæppe* and *Ib* developed (Janzén 1957, 141; Hald 1974, 56).

Andreas, the name of one of the most important apostles, appears in records in Norway in 1135 through *Andreas Brunsson*, a priest, and at the end of the same century it was borne by several Danish clergymen. In Iceland it was used in one family in the middle of the 13th c. In Sweden there are no reliable records of it until the end of the 13th c., with the exception of three cases in runic inscriptions from the province of Västergötland from the 12th c. The name then rapidly spread throughout Scandinavia and to all strata of society. In its late medieval forms *Andres* and *Anders*, it has become one of the most used Swedish male names (Grape 1911, 55 f.).

2.3. Other foreign/imported names

During the Migration and Viking periods, contact between the peoples of Europe was close and thus of importance for name exchanges, although not on a large scale. Best known are a few names brought into Scandinavia through dynastic connections. Names like *Valdemar* (< Sl. *Vladimir*), *Boris* and *Dagmar* (< Sl. *Dragomir*) are examples from Danish royal families (Hald 1974, 42 f.). Names were also imported from the West, i. e. the saint's name *Edward* from England and *Njáll* from Celtic-speaking areas.

The main source of imported names, however, came from the south, from Germany and the Netherlands. This borrowing reached its peak during the late Middle Ages but started probably before the 12th c. and was reinforced by the Hanseatic trade. In the towns, foreign names of Low German origin became increasingly more frequent. Examples are names ending in

-bert, *-brikt*: *Albrikt*/*Albert*, *Engilbrikt*, *Lambrikt*;

-helm: *Anselm*, *Vilhelm*;

-man: *Folkman*, *Herman*, *Tideman*;

-rik: *Diderik*, *Frederik*, *Henrik*;

-wini: *Gervin*, *Rikvin*.

Examples of women's names of German origin are *Hillegun*, *Mektild*, *Vendela*, *Gertrudh* and *Valborgh*, the latter two being names of saints.

A rather large group of German names were used in hypocoristic forms such as *Fikke* (from *Frederik*), *Heyne* or *Hinze* (from *Henrik* and other names), *Timme* (from *Tideman* and other names). Another type of imported German hypocoristic is *Heneka*, *Henika* (from *Henrik*), *Konika* (from *Konrad*), *Lydika*, *Tideka* etc. with fem. weak declension (Modéer 1989, 45 ff.).

3. Bynames

The need for a more specific identification of individuals in wider contexts has led to the development of different name patterns, most often formed as an attributive addendum, i. e. an appositional element to the forename (see definitions in art. 85, 3.3.).

3.1. Patronymics and matronymics

A common way of denoting a person is with reference to close relatives, mostly parents, by way of so-called patronymics and matronym-

ics. There are a few examples of regular compounds, true patronymics, in medieval runic inscriptions; for instance instead of *sun Ulf*s, which is a syntactic sequence typical for Viking Age runic inscriptions, we find *Ulfssun* beginning in the 13th c. (Modéer 1989, 51 note 2). An early example is *suen sazærsuæn* (= Sasser-sen) in a Danish medieval runic inscription (Kousgård Sørensen 1984, 78). The development of the compound type could be looked upon as parallel to or depending on such Latin flexional patronyms as *Ericus Olai* for *Erik Olafsson* (see *ibid.* 108ff.).

Matronymics are also known from all Scandinavia, although they are few compared with the patronymics. *Sven Estridsen* (11th c.), *Peder* and *Ubbe Bodilsen* (12th c.) and *Karl Ingeborgsen* (13th c.) are examples from Denmark. The reason or reasons why the mother's name is used instead of the father's has been much discussed, but most cases concern people of high rank, where possibly the mother's rank was regarded as higher than the father's (see Peterson 1990 and Kousgård Sørensen 1984, 123ff. with references; see also art. 85, 3.3.1.).

3.2. Occupational names

During the Middle Ages and particularly during the 15th c. we find a great number of name combinations in which the apposition in most cases – but not always – reveals the bearer's actual occupation. Thus, a *Petrus Bryggæræ* 'brewer' is mentioned 1349 in a Dan. charter. Most likely he was a brewer by profession. Most persons called *Peter Skomare* ('shoemaker'), *Magnus Muramæstare* ('mason'), *Olaff Kiotmangare* 'butcher' and many others named in the same way actually practised the profession. However, names based on occupations do not always imply this. In cases like *Pape*, *Kesare* and *Biscop* the context sometimes makes it clear that the names were meant to be ironic or humorous, unlike in Icelandic sagas where names with *konungr*, *jarl* or *skáld* actually denote these occupations (see Modéer 1989, 106; Ekbo 1947, 282).

3.3. Characterizing bynames

A very large part of the name vocabulary in Scandinavia throughout the Middle Ages consists of bynames which in one way or another must first have been given to an individual in order to characterize him or her. Often such names were meant as nicknames in the pejor-

ative sense of the word. The very first individual to be called *Get* 'goat', *Gylta* 'sow', *Ræf* 'fox' or *Puke* 'devil' was probably not flattered by this, but nevertheless all were adopted and inherited by new generations, one of them, *Rääf*, later being recognized as the name of a noble family.

A good portion of the bynames seem to be easy to understand and interpret, like *Lang* 'long', *Gammal* 'old', *Ung* 'young', *Bred* 'broad', *Diger*, *Digre* 'big, fat'. The same goes for *Kroknæf* 'bent nose' and even *Peder Timberman medh ena ögat* 'P. T. with one eye', but in most if not practically all cases, the exact reason why a byname was given remains obscure. There are, for instance, several possible reasons for the name *Olafuer Graflax* 'raw spiced salmon'. Two of the obvious ones are that he might have sold salmon or that he might have liked salmon, but there are many other possibilities, for instance his having been involved in an incident connected with salmon (Modéer 1989, 98). There seems to have been no limit to creative imagination in this field, but the ultimate reasons for this kind of name-giving are not possible to establish. Was *Hjalti jarnauga* ('iron eye') so called because of his hard and sharp eye, or had he on some occasion had his eye damaged by a piece of iron? *Ketill flatnefr* ('flatnose') seems easy to understand, but it is not so clear in which sense the byname *Þorsteinn blindigr* ('blind man') was intended (Jónsson 1907, 199, 202, 201). There have been a number of attempts at different times to categorize bynames from all the Scandinavian countries, and a large amount of material has been collected by different scholars. Dan. and Norw.-Icel. bynames have been published as parts of the name books, *DGP 2*, *Tilnavne* and *Norsk-isländska personbinamn från medeltiden* by E. H. Lind. Bynames from the name-rich Icelandic old literature were presented and commented on earlier by Finnur Jónsson (1907, 161f.). He emphasized not only the linguistic importance of the bynames themselves, but also the cultural knowledge about the old society which could be acquired from them. He chose to present the names in 10 semantic groups, starting with names assumed to have been given after ancestral origin, kinship and birth place, for instance *Sigurðr Markusfóstri* (d. 1163) 'fosterson of Markus', *Árni byskupsfrændi* (d. 1201) 'relative of the bishop', *Einarr gotneski* 'the Gotlander'. A very common way of denoting residence or birthplace was to put the byname in front of the forename, e. g. *Gnúpa-*

Bárðr, living in Gnúpar in Fljótshverfi. By-names referring to the human body and its parts seem to be the most used of all. Finnur Jónsson also exemplified other possible sources for the old bynames, for instance armour, clothes, ornaments, mental skills, animal names and so on. In a similar way Elof Hellquist (1912, 84ff.) listed and commented on OSw. bynames. His work remains the most comprehensive on the subject, but there exists a large hand-written collection waiting to be published in the Archives for Swedish medieval personal names in Uppsala (SMPs).

OWN bynames have been discussed in a survey by Sven Ekbo (1947, 269ff.) also along with material from the eastern parts of Scandinavia.

4. Family names

Family names in the modern sense of the word did not exist during the Middle Ages, but the custom of adapting inheritable family names – in most cases derived from place-names – was well established earlier on in Germany, and merchant immigrants in Scandinavian cities used names of this kind. There are a few examples of native names which seem to follow the German pattern. The most frequently recorded is *Laurencius Bobiærgh*, a nobleman first mentioned in 1283, whose name – originally a place-name – was inherited (Briekorn 1915, 8–12). Another early example involves two generations, *Conradus* and *Hinricus Arxo*, known during the 14th c., probably from the island of Hargön near Stockholm (Briekorn 1912, 166ff.).

There are also early signs of a more vernacular type of inherited bynames in the Swedish aristocracy. Some of these were first used just to distinguish among family members with the same forename and patronymic, but a few have survived as family names of noble families, for instance *Bonde*, *Puke* and *Soop* (Gilligstam 1965).

108. The development of Old Nordic place-names

1. Settlement names
2. Parish names
3. Town names
4. Street names
5. Castle and manor names
6. Field names
7. Nature names
8. Literature (a selection)

1. Settlement names

1.1. Dating

A strict delimitation between Viking Age and medieval place-name types is not possible to uphold, since many Viking Age name types continued to be productive also in the early Middle Ages. This is, in turn, essentially due to the fact that the agrarian expansion that started in the Viking Age continued also into the Middle Ages. The same kind of localities, therefore, to a certain extent, continued to be given the same kind of names. The greatest cultural change during this period, of course, was the definitive establishment of Christianity in the Nordic countries and the resulting dominating influence of the Church. A reliable method of dating types of place-names to the Middle Ages, then, is the occurrence of Christian name elements, especially Christian personal names as first elements of compound place-names. The absence of a certain name type in the western Viking colonies on the British Isles or in Normandy could be an indication that the name type in question became productive only after the colonization period. In some cases, however, there are different explanations, and this dating criterion, then, is not totally reliable.

1.2. Frequent medieval place-name elements

1.2.1. *-bodh(a)*

The word *bodh* (*búð*) fem. 'shed' is found as second element in many medieval Nordic place-names, e.g. *Tokabodhum* 'Toke's sheds', *Malungsbodhum* 'the sheds by Lake Malunger'. The names are normally plural, originally *-bodhir* (*-búðir*), later *-bodha*, which nowadays often has been reduced to simply *-bo* (*-bu*). The names allude primarily to different types of simple sheds, such as hay barns, fishing sheds or cattle sheds. Settlement names in *-bodh(a)* are spread all over the Nordic countries, but

are especially frequent in southern and middle Sweden, where the common meaning of the name element in all probability is 'meadow lands with hay barns' (Hellberg 1967, 183 ff.). The meaning 'summer pasture farm' (Swedish *fäbod*) is not as general as was supposed by earlier researchers and is furthermore limited to the areas in the north, where summer pasture farming is a historically known practice. Some of the oldest names in *-bodha* may date back to the Viking Age, but the overwhelming majority is medieval.

1.2.2. *-bol* and *-bole*

The two related words *bol* neut. and *bole* neut. originally meant 'dwelling place'. The modern dialectal meaning 'lair, den' is also very close to this original sense. In settlement names we probably normally have on the one hand the meaning 'habitation, residence', on the other the somewhat more general meaning 'landed property, farm'. *Bol* probably originates from Germanic **bubla*, and *bole* is an analogically formed derivative of *bol* (Hellberg 1985, 63 f.). Place-names in *-bol* and *-bole*, e.g. *Laggarabol* 'the cooper's farm', *Karabole* 'Kare's farm', can be found in large parts of the Nordic countries, but while *-bol* is most frequent in western Sweden, *-bole* is more widely spread with concentrations in southern Denmark, south-eastern Norway and neighbouring parts of western Sweden, eastern Götaland and Svealand, Norrland, Åland and southern Finland (Thors 1952, 11 ff.; Fries 1962, 42 ff.). The oldest names may be from the Viking Age, but the great majority denote medieval new settlements. There are also medieval field-names in *-bol* and *-bole*.

1.2.3. *-by/-bo*

Place-names in *-by/-bo* essentially belong to pre-Christian times (see articles 77 and 86), but in parts of the Nordic countries this name type continued its productivity also into the Middle Ages, denoting medieval new settlements. This is true in particular for the numerous place-names in *-by* in Finland and Estonia, but also elsewhere, e.g. in western Sweden and eastern Svealand. The medieval place-names in *-by* often have personal names as their first element, e.g. *Kætilsby* 'Kætíl's farm'.

1.2.4. *-hester*

Settlement names in *-hester* in the Nordic countries can be found only in central Götaland in Sweden (Ekenvall 1942, 187), e.g. *Arngærdharhestrum* 'Arngærdh's forest', *Apoldahestrum* 'the forest where apple trees grow'. Nature and field names formed from the same word, however, are somewhat more widely spread and the word *hester* probably once had a continuous area of distribution from northern France, Belgium, Holland, north-western Germany through Denmark and Scania up to central Götaland (Ljunggren 1969, 35; Romell 1975, 248f.). Two different opinions have been expressed concerning the meaning of *hester* as a place-name element: 'young forest of fruit-bearing trees (oak, beech)' (Ekenvall 1942, 198) and 'coppice' (Romell 1975, 243ff.; Strid 1993, 69f.). The names may probably partly date back to the Viking Age, but the great majority are medieval.

1.2.5. *-hult*

Place-names in *-hult* (*-holt*). e.g. *Ælmihult* 'elm forest', *Haraldshult* 'Harald's [farm] in the forest', are common in most parts of the Nordic countries, with the exception of northern Sweden. The basic meaning of the place-name element *hult* most likely is 'forest', a sense which is clearly documented in many old names of large forest areas. Also suggested for it is a more specialized meaning 'coppice', i.e. a kind of cultivated deciduous forest (Hellberg 1967, 100ff.; Strid 1996, 19ff.), but the arguments are uncertain and not very convincing. The great number of medieval place-names in *-hult* in older forest districts rather indicates that the names on the whole have denoted new settlements in forests (Benson 1972, 35f.). In the west Nordic countries a secondary meaning '(rocky) hill' has evolved, which usually is assumed in the Icelandic place-names in *-holt*. The oldest layer of the Nordic *-hult*-names certainly is as old as the Viking Age, but most names are medieval. A derivative *-hylta* is less common and limited to southern Sweden and Nyland in Finland, e.g. *Haghsioarhylta* 'the small forest by Lake Haghsior'.

1.2.6. *-kop*

The place-names in *-kop*, e.g. *Jonskop* 'Jon's bought landed property', are most likely only of medieval origin. They can be found in

southern Sweden (Götaland) and in Zealand with the meaning 'bought landed property' (Sahlgren 1920, 223ff.; Sahlgren 1925, 266ff.; Hald 1965, 156f.). A suggestion to separately date the Danish names to the Viking Age (Jørgensen 1994, 170) is not convincing.

1.2.7. *-mala*

Place-names in *-mala* > *-måla*, e.g. *Sibbamala* 'Sibbe's measured land', occur very frequently in south-eastern Sweden. A few names also can be found in the south-west of Finland. The place-name element is in fact an inflected form of *male* masc., has the meaning 'measured land' and denotes medieval new settlements (Ödeen 1927, 1ff.).

1.2.8. *-mark*

There are place-names in *-mark* (*-mork*), e.g. *Gudmundsmark* 'Gudmund's [farm] in the forest', *Alptamark* 'the forest by Lake Alpte', in many parts of the Nordic countries. The meaning is 'borderland, outland', 'border forest, outforest' or '(large) forest'. The different meanings overlap and are difficult to separate. A concentration of names can be found in Norrland in Sweden, where the large number of medieval place-names in *-mark* probably bears witness to an extensive wave of new settlements in forests (Fries 1983, 132ff.). In other areas, the name type cannot be given such a homogeneous dating. Many are certainly medieval, but they may be both older and younger.

1.2.9. *-rudh*

Place-names originating from *-rudh* (*-ruð*), e.g. *Geirsruð* 'Geir's clearing', *Birkiruð* 'the clearing where birches grow' or 'the clearing in the birch forest', are frequent in the south-east of Norway and neighbouring parts of Sweden as well as more sporadically in other parts of the two countries (Ejder 1979, 93ff.). The names of Zealand now ending in *-rod* have the same original form. The meaning is 'clearing' and so the names indicate extensive new settlement in forest areas. The names are medieval, hardly older. This group of place-names should not be confused with *-riudh* > *-rydh*, which is related by ablaut, and which has a somewhat different meaning, another and more southern distribution as well as an earlier dating on average (see below 1.2.11.).

1.2.10. *-rum*

The place-names in *-rum*, e.g. *Algutsrum* 'Algut's open ground', *Yxnarum* 'the open ground where oxen graze', are on the whole concentrated in eastern Götaland in Sweden (Lindroth 1916, map). A few names occur in Denmark. The meaning is most likely 'open ground (in a forest)'. A considerable portion of the names probably originally denoted meadowlands (Strid 1986, 187 ff.; Strid 1987, 297 ff.). The name type was productive both before and during the Middle Ages.

1.2.11. *-rydh/-rjóðr*

This place-name element is in Old West Nordic called *-rjóðr*, in Old East Nordic *-riudh* > *-rydh*. The greatest number of such names exists in the south-west of Sweden, e.g. *Tranurydh* 'the clearing where cranes stay', *Hørydh* 'the open land where hay is harvested'. There are some further occurrences in Norway. The meaning is on the one hand 'clearing', on the other more generally 'open ground (in a forest)'. As was the case for *-rum*, many names have primarily denoted meadowlands, but also new settlements in forests have been given names in *-rydh* (Fridell 1992, 243 ff.). A considerable share of the names were formed in the Viking Age, but the majority nevertheless are medieval (Ejder 1979, 362 ff.; Fridell 1992, 203 ff.).

1.2.12. *-sel*

The word *sel* neut. is a diminutive derivative of *sal* masc. Place-names in *-sel*, e.g. *Gradosælia* 'the summer pasture farm by the stream', occur in Norway, central Sweden (mainly Dalarna) and on Iceland. The meaning is 'summer pasture farm' and the names thus denote actual summer pasture farms (Swedish *fäbodrar*) or farms that originated as summer pasture farms (Beito 1949, 118 ff.). The names are to a large extent medieval, but may also be younger.

1.2.13. *-stqðull*

The place-name element *-stol* < *-stqðull* is very common in Norway. The meaning is 'summer pasture farm'. The primary sense of the word, however, is 'milking place', a meaning which is still preserved in the language of western Norway as well as on Iceland and the Faroe Islands (Beito 1949, 84 ff.).

1.2.14. *-sæter/-setr/-sætr*

In the middle of Sweden there are settlement names in *-säter*, e.g. *Biornasæter* 'the forest meadow where bears have been seen', that can be dated to the Viking Age and the Middle Ages and where the primary meaning of the name element is 'outlying meadow, forest meadow'. They correspond formally to the Norwegian names in *-set*, where however as a rule the meaning 'dwelling place, habitation' has been assumed as well as a somewhat earlier dating (the Viking Age and just before). The West Nordic place-names in *-sæter* 'summer pasture farm', which is related by ablaut, also occur in Norway and neighbouring parts of Sweden. They are also to a considerable extent medieval. The semantic relationship between the three name groups is, in spite of many notable research efforts, still obscure (Hedblom 1945, 223 ff.; Beito 1949, 11 ff.; Brink 1987, 79 ff.; Helleland 1989, 59 ff.).

1.2.15. *-thorp*

The place-name element *-thorp* (*-þorp*) occurs in many medieval names, denoting secondary settlement separated from older, larger settlement units. In addition one must reckon with a younger, weakened sense 'new settlement'. The name type, e.g. *Svensthorp* 'Sven's settlement', *Sioarthorp* 'the settlement by the lake', is very frequent in Denmark and southern Sweden and can also be found in the south-east of Norway. It was productive over a very long time span before, during and after the Middle Ages (Hellberg 1954, 106 ff.).

1.2.16. *-thvet*

Place-names in *-thvet* (*-þveit*), e.g. *Rúgþveit* 'the clearing where rye is grown', *Grimstthvet* 'Grim's clearing', are relatively common in southern Norway and Denmark, but also occur sporadically in southern Sweden. The meaning is 'clearing, cutting' and indicates new settlements in forest areas (Markey 1978, 70). The name type is mainly from the Viking Age, but continued to be productive also in the early Middle Ages.

1.2.17. *-vret/-reit*

In the middle of Norway (principally Møre and Trøndelag) are found a large number of presumably medieval place-names in *-reit* (Sandnes 1968, 388 ff.). This corresponds to Swedish *-vret*, which occurs more sporadically

in southern and central Sweden. The Swedish names cannot be given any uniform dating, but some of them apparently are medieval. The meaning of *-vret/-reit* is 'delimited piece of land', and the names seem primarily to have denoted outlying arable fields.

1.2.18. Place-names and fire-clearing

Certain types of place-names with the meaning 'land cleared by burning' are probably to a large extent medieval and accordingly an essential source for the history of fire-clearing. To this group belong place-names in *-bruni*, *-bruti*, *-brænna*, *-svidh* and *-svidhia*. Some other place-name elements with the primary meaning 'cutting, clearing' as *-fall*, *-fælla*, *-girdhe* and *-rydhs* apparently very early on also developed a secondary sense 'land cleared by burning'.

1.3. Place-names and settlement history

The majority of the early medieval Nordic types of place-names are names related to expansion and new settlements. They reflect linguistically how new settlements were established (*-bol*, *-bøle*, *-by*, *-thorp*), how new land was cultivated (*-mala*, *-vret/-reit*), how new summer pasture farms came into use (*-bodha*, *-sel*, *stqðull*, *-sætr*), how forests were cleared (*-rudh*, *-rydh*, *-thvet*), how new open land for haymaking and pasture was created (*-bodha*, *-rum*, *-rydh*, *-sæter*) and how new farms were set up in forest areas (*-hult*, *-mark*). To a certain extent the categories of second elements in place-names are interchangeable. If a new settlement was founded in connection with forest clearing it could have been given a name based on either the settlement itself, the piece of land, the location in the forest, the clearing or the resulting open land, but still be the same kind of settlement. The same type of new settlement could in one region be given a name in *-rydh*, in another region a name in *-bodha*, in a third a name in *-mala* and so on. The choice of second element is in such a case culturally dependent and based on analogy.

The datings that have been given above (section 1.2.) concern the age of the settlement names. In those cases where the place-name primarily denoted not a settlement but a field (*-bodha*, *-hester*, *-mala*, *-rudh*, *-rum*, *-rydh*, *-sæter*, *-thvet*, *-vret/-reit*) or a natural feature (*-hult*, *-mark*), the name may have previously existed as a field or natural feature name. It

was for instance probably not unusual for a field that was created and named in the Viking Age to have its name transferred to a settlement established at or nearby the field in the early Middle Ages. Such a name transfer presupposes, however, a certain continuity of settlement structure and cultural landscape. That means that it is unrealistic, as has recently been suggested (Strid 1986, 187ff.; Strid 1993, 82f.; Strid 1996, 22; 35f.), to assume that place-names in e.g. *-rum*, *-rydh* and *-sæter* as field names could date back to the early Iron Age or even earlier. The great changes in settlement and cultivation that took place in the transition period from early to late Iron Age makes this very unlikely. Place-names in *-bodha*, *-rum*, *-rydh* and *-sæter* are both spatially and semantically closely linked to the settlement structure of the late Iron Age and to the agrarian expansion which took place within the framework of this structure during the Viking Age and the early Middle Ages, especially to the extensive expansion of meadow area during that time.

In connection with new colonization of earlier uninhabited and uncultivated areas, the place-name formation process is supposedly partly different from that of the successive extension of an older inhabitation. In the early Middle Ages such new colonization took place on a large scale both in earlier forest areas in the old countries as well as in new countries (Åland, Finland, Estonia). It has often been commented on that the percentage of personal names in the first element of place-name compounds tends to be higher in areas of new colonization, that a relatively large proportion of the settlement names are primary natural feature names, and that analogy in naming relatively speaking grew more important. The latter often implies that a single place-name element is extremely frequent within a limited region.

As a result of expansion through the successive extension of an older inhabitation, we get a naturally grown place-name inventory where names of outlying fields belonging to a primary habitation turn into settlement names when a new habitation is established at the old field and assumes its name. This model of place-name formation (cf. Brink 1989, 232ff.), however, is not applicable for massive new colonization of an earlier uninhabited and uncultivated area. In such cases we have to assume to a large extent that compounded settlement place-names with field or natural feature denotations as second elements are primary

settlement names (cf. Hald 1965, 185 ff.). This line of reasoning is in principle applicable to all settlement names containing field and natural feature denotations as second elements (-*bodha*, -*hester*, -*hult*, -*mala*, -*mark*, -*rudh*, -*rum*, -*rydh*, -*sæter*, -*thvet*, -*vret/-reit* and so on) but assumes a particular weight for understanding the names in -*hult* and -*mark*. It is not reasonable to presuppose that, for instance, all the many medieval settlement names in -*hult* in previously uninhabited forest areas were names of larger or smaller forests before they became settlement names. Such names probably should be regarded as new settlement names which were formed on a large scale through the establishment of a name pattern in connection with the colonization. It has been suggested that in such cases one therefore has to reckon with a change of meaning for -*hult* from 'forest' to 'forest farm' (Benson 1972, 35f.; cf. Pamp 1988, 21) or a weakening in meaning to simply 'settlement'. As long as the place-name element in question also is still living as an appellative noun in the language, however, such shifts in meaning are unlikely. Two hypothetical primary settlement names **Svensbiærgh* and **Svenshult* mean 'Sven's [farm] at the mountain/hill' and 'Sven's [farm] in the forest' respectively rather than 'Sven's mountain farm' or 'Sven's forest farm'. Alternatively one could argue that a second element -*hult* as a place-name element in the onomasticon in such cases shows a shift in meaning to 'farm in a forest', while the word as an appellative noun in the lexicon preserves the old meaning 'forest'. This, however, is doubtful and it is better to treat **Svenshult* in the same manner as **Svensbiærgh*. It is hardly possible to maintain that *biærgh* as a place-name element in the onomasticon could mean 'farm at a mountain/hill'. Place-names of the type **Svenshult* and **Svensbiærgh* thus could be seen as being formed through a kind of metonymic association.

1.4. Farm names

The different farms in a village probably always have had names as long as they have existed as separate entities. The need to be able in speech to simply refer to and mention a certain farm has necessitated names. It has been claimed that the Danish medieval farms in a village as a rule were nameless (Hald 1965, 157). However, this is highly unlikely. We cannot in such a case infer this from the lack of written evidence. The names must have been

there, although they were not written down or didn't have official status. The few known medieval names of farms in a village normally end in -*gardh(en)*. The first element often is a personal name or a directional or positional word (e.g. *Norr*- 'north', *Mellan*- 'middle'). A high proportion of the names of farms still existing in villages today probably have a medieval origin.

1.5. Particular areas

1.5.1. Iceland and the Faroe Islands

The most predominant trait in the place-name inventory of Iceland generally speaking is the many names in -*staðir*, a place-name element which here, in contrast to the other Nordic countries, to a certain extent continued to be productive also after the Viking Age in the formation of names of small farms. The meaning in Iceland is probably simply 'farm' (another opinion is presented by Sigmundsson 1990, 61 ff.). Also -*bær* 'farm' was used for the formation of medieval names. The medieval name inventory of Iceland is otherwise characterized by place-name elements with the meanings 'enclosure' (-*garðr*, -*gerði*, -*tún*) or 'smaller house, shed' (-*búð*, -*hús*, -*kot*, -*sel*) (Lárusson 1939, 642 ff.; Lárusson 1960, 642 ff.; Bandle 1977, 40 ff.; Sigmundsson 1996, 413 ff.).

Primary natural feature names heavily dominate the Faroese settlement names. The most important of the other type of place-names are -*bour* 'farm; cultivated land', -*garður* or -*gerði* 'enclosure' and -*toftir* 'site of farm' (Matras 1939, 53 ff.; Thorsteinsson 1996, 183 ff.). There is no established chronology for Faroese place-names, but it is likely that the elements mentioned above were productive during the Viking Age as well as the Middle Ages.

1.5.2. Finland and Estonia

The Swedish speaking parts of Finland (Åland, Österbotten, Åboland and Nyland) and Estonia were colonized in the early Middle Ages from Sweden. This means that in principle all Swedish settlement names in these areas are medieval or younger (Lagman 1964, 9 ff.; 1987, 5 ff.; Huldén 1980, 109 ff.; 2001, 453 ff.; Hellberg 1987, 57 ff.). The dominant name type over this entire area is -*by*. In southern Finland -*bole* is also very common.

Less frequently, *-bodha* and *-thorp* occur in southern Finland and *-mark* in Österbotten (Thors 1953, 1 ff.; Granlund 1956, 1 ff.). On Åland there are some names in *-bolstadh* with probable reference to settlements that were deserted during the Viking Age and reinhabited during the early Middle Ages (Hellberg 1987, 142 ff.).

1.6. Place-name geography

Certain second elements of compounded place-names show a complementary distribution and thus are examples of variation based on place-name geography. Clear cases are *-sæter*, *-rum* and *-rydh*, which denote the same kind of open meadowlands in three different neighbouring areas in Sweden, and *-thvet* and *-ruth* which denote clearings in complementary areas in Denmark. At a more general level all place-name elements of course are connected to language geography in some way or another. Thus, *-stqðull* and *-sel* are decidedly West Nordic medieval place-name elements; *-hester*, *-køp*, *-mala* and *-rum* are obviously South-east Nordic. A predominantly South-east Nordic distribution occurs for *-rydh* and *-thorp*. For certain name types it has been assumed that it is possible to reconstruct a pattern of distribution showing that they emerged from a certain area and from there spread in different directions. This kind of explanatory model was commonly used by early Nordic place-name researchers, in particular Jöran Sahlgren (1920, 223 ff.; 1925, 266 ff.), who claimed that *-thorp* as well as *-rydh* had spread from the European continent through Denmark to Sweden and that *-køp* had originated in Denmark and later came to Sweden from there. Nils Ödeen (1927, 462) has correspondingly argued that the place-names in *-hult* spread from present-day Germany through Denmark to Sweden. For *-hult* and *-rydh*, the explanation most certainly is incorrect. The illusory impression of later occurrence of the name types in question in Sweden arises because the written sources are earlier in Germany and Denmark (Ejder 1979, 384 ff.; Fridell 1992, 210). For, also, the names in *-thorp* the theory of "importation" from abroad most likely is fallacious. The names probably are of spontaneous native origin, the result of an appellative which existed in the language becoming productive as a place-name element. The names in *-køp*, however, may as a result of cultural influence have come to Sweden from Denmark. The names in

-sæter in Sweden seem to have diffused from the central part of Svealand around Lake Mälaren, as also seems the case for the names in *-bole* (Fries 1962, 42 ff.). A special type of place-name diffusion is the so-called "wandering names", which are ready-made imported fashionable names. Medieval examples are *Rosendal* and *Fuglsang*, both arriving in the Nordic countries from the south.

2. Parish names

According to most contemporary researchers the Nordic parishes were formed and named in the early Middle Ages. The parish names are of different types (Andersson 1988, 65 ff.; Brink 1990, 123 ff.; Sandnes 1991, 15 ff.). The most common case, especially in the south, is that the parish took over the old name of the village where the church was situated. Other kinds of secondary parish names are old district names and so-called church-site names, which refers to cases where the parish took its name from the locality where the church was built. In contrast one can find a relatively small number of primary parish names of different types, e.g. church names such as *Nyakirkia* 'the new church' or *Knutskirkia* 'Knut's church' (from which later came *Knudsker sogn*). The parish names on Bornholm in Denmark are of the last type.

3. Town names

If one, quite reasonably, combines trading places and towns as one category, the medieval Nordic names of these localities can, in parallel with the parish names, be divided into primary and secondary names. Among the primary trading place and town names, the most important second element is *-køping(er)*/*-køping(er)*/*-kaupang(r)*. It occurs in Denmark, Norway and Sweden (Ljunggren 1937, 99 ff.; Ståhl/Hald/Hovda et al. 1971, 667 ff.). This type has a Viking Age origin, and it is difficult to decide which names were formed then and which ones are medieval. The secondary trading place and town names, being the most frequent group, are names of the localities where the trading place or the town was established, either older village settlements (e.g. *Vimmerby*), fortifications (e.g. *Ålborg*), bridges (e.g. *Örebro*), natural features (e.g. *Niðaróss*) or something else. For some names denoting natural features, e.g. *Aros* 'river estuary', we cannot however exclude the

possibility that the name primarily was given to the trading place without existing before as a name of a natural feature.

4. Street names

Because of fires and changed town layouts, a great deal of the medieval street names have disappeared, but some still have survived until today. Common second elements of medieval street names are *-gata* (Sweden and Denmark); *-stræte* (Denmark and Norway); *-grænd* and *-brink* (Sweden); *-veit*, *-geil* and *almenningr* (Norway) (Hald/Ståhl/Rosén et al. 1960, 151 ff.).

5. Castle and manor names

The fortified castles in the Nordic countries often have names with the second elements *-borgh*, *-hus* or *-holm* (Mattisson 1982, 17 ff.; Mattisson 1986, 14 ff.); *-borgh* here means 'fortification' and *-hus* 'fortified house', while *-holm* in the early medieval names has the sense 'elevated land, (partly) surrounded by water', a kind of locality where, for reasons of defence, it was natural to build a fortification. Medieval Swedish and Danish manors of the nobility for the same reason have also often been given names in *-holm*. At the end of the Middle Ages the name element *-holm* gradually acquired a weakened meaning and was used just to mark the high and noble status of the manor or castle, independent of the topography. In Denmark we can also find medieval manor names in *-garth*.

6. Field names

Field names, i. e. mainly names of arable land, meadows, and pastures, must have existed at least as long as sedentary agriculture because of the need to identify such valuable areas. Field names thus were formed both before, during and after the Middle Ages. The specific medieval part of the documented field name inventory is, on the other hand, hard to determine. The issue of continuity of field names has been discussed thoroughly by Nordic place-name scholars (Hald 1948, 14 ff.; Lisse 1960, 96 ff.; Jørgensen 1984, 259 ff.; Harling-Kranck 1990, 11 ff.; Bandle 1996, 1456 ff.). Apparently there is a continuous exchange of field names, but it is still likely that in old villages there was a nucleus of medieval (or

older) field names which were preserved at least until the great redistributions of land holdings in the 18th century and onwards. It has been claimed that in Denmark certain field names in principle could date back to the Viking Age (Hald 1948, 28 ff.), but also that the majority of the Danish field names known from 16th- and 17th-century sources date from the late Middle Ages (Jørgensen 1984, 269). Normally there are no definitive chronological grounds for absolute or relative dating of a certain type of second element in compounded field names.

7. Nature names

The inventory of names of natural features (lakes, rivers, brooks, islands, mountains, forests, wetlands and so on) shows, just like the field names, a tendency towards continuous exchange and renewal. Smaller localities, whose names are known by fewer people, generally run a greater risk of changing their names. Therefore many natural feature names were established in the Middle Ages, even in the areas of old settlement. Moreover, the colonization of new land of course gave rise to new natural feature names. A strong general tendency was for (especially smaller) natural features to be named after a settlement (farm or village) at or near the locality. This may also have been the case when the settlement name itself was secondary to a name for the natural feature, resulting in names like *Gölsarydssjön* (< **Gylsioarydhssio(r)* 'the lake by the farm *Gylsioarydh*'), which earlier had been called **Gylsio(r)* 'the lake that is (small) like a mere'. Some individual natural feature names can be dated linguistically to the medieval period, for instance through the occurrence of Christian personal names or other Christian words in the first elements of compounded names. On the other hand it is hard to find specific medieval types of natural feature names. A probable case is the river names in Finland that have a personal designation as a first element and the second element *-a* 'river', e.g. *Sjundeå* from the male name *Sunde*, and *Helsingå* (from which later on *Helsingfors* and *Helsing* > *Helsinki*) from *helsing* 'person from the province of Hälsingland (in Sweden)' (Granlund 1956, 13 ff.; 33 ff.).

Staffan Fridell, Uppsala (Sweden)

109. Old Nordic types of texts I: Old Icelandic and Old Norwegian

1. Introduction
2. Poetry
3. Saga literature
4. Non-fictional prose
5. Literature (a selection)

1. Introduction

This overview is concerned with all vernacular text types produced in Iceland and Norway between 1100 and 1350. In such a short article, simplifications and abridgements are necessary, even if textual transmission from Iceland and Norway is extremely heterogeneous as to the nature of the corpus and the age of our sources. Moreover, as can be said for medieval literary sources in general, Old West Nordic texts only present glimpses of the whole literary production of the period. When, in the title of this article, the Old Icelandic texts are given precedence before the texts from Norway, this ranking is in fact due to the far greater differentiation the Icelandic text types developed over the course of time compared to the ones originating in the Norwegian mother country. Although the bulk of Old Nordic texts can be classified by using the categories stated above, there are always some features and types that cannot be categorized so easily. On the one hand, we have types of texts derived from a long-standing oral tradition, but on the other hand, we also find texts drawing on insular and continental models which originated during a comparatively short period of time.

The oral precursors of Icelandic literature are actually to be looked for in Norway, as it was from there the settlers reached Iceland in the 9th c. The Christianization of Iceland in the 11th c., however, led to a process of acquiring literacy, which in Iceland proceeded very much faster into the life even of the uneducated illiterate population than was the case in comparable societies in other parts of Europe. Additionally, Icelandic monasteries were predominantly founded by the Orders of St. Augustine or St. Benedict which, with their fondness for theological and scientific knowledge, at the same time promoted vernacular literacy.

The process of becoming literate in Iceland and Norway was thus obviously connected with the new Christian faith. With clerical literacy, Latin script reached northwest Scandi-

navia mainly via the Anglo-Saxon area. Caused by and connected with late Christianization, the transmission of Icelandic and Norwegian texts started at a time when secular texts in southern Germania gradually freed themselves from their clerical embrace. Basically, the text types discussed here may be said to fall into the three main categories of poetry, saga literature and non-fictional prose, although this distinction is quite artificial sometimes.

2. Poetry

2.1. Eddaic poetry

2.1.1. Content

The term *Eddaic poetry* refers to a type of text characterized by features of metre, style and content which in turn are essentially found in the texts of the so-called Codex Reginus. Early research bestowed the name *Edda* on this collection of texts by mistake. Until the 17th c., general opinion held that Snorri Sturluson's handbook of poetics, the *Snorra Edda*, was based on an older anthology. Its author was thought to be the Icelandic historiographer Sæmundr Sigfússon, called *inn fróði* 'the learned', 'the historian'. When – probably in 1643 – Brynjólfur Sveinsson (the bishop of Skálholt) came into possession of a manuscript containing a great number of poetic texts which shared stanzas with *Snorra Edda*, he believed this codex to be the supposed anthology of Sæmundr inn fróði. The codex was subsequently named *Sæmundar-Edda*. In 1663, the codex left Iceland and went to Denmark, where it was added to the Royal Collection under the signature GKS 2365,4. Although given back to Iceland in the 1970s, the codex is still known today as Codex Reginus, and it is dated to the late 13th c. Besides Codex Reginus, there is a second fragmentary manuscript AM 749 4to containing Eddaic poetry and dating from the early 14th c. Writing mistakes that are otherwise inexplicable and space management on the pages indicate that both manuscripts are based on a further lost source usually dated to the middle of the 13th c.

In Cod. Upsaliensis and in some younger manuscript fragments, Snorri Sturluson's handbook of poetics is named *Edda (bók þessi*

heitir Edda ‘this book is called Edda’). The exact meaning of *Edda* has not yet been satisfactorily explained. Among several suggestions are a connection to the farm Oddi (where Snorri spent a part of his life), and the interpretations of *Edda* as a pet name derived from OWN *edda* ‘great grandmother’, or as a derivation of *óðr* ‘enthusiasm’, ‘poetical inspiration’.

Although the surviving texts originate from the 13th c. only, the roots of Eddic poetry reach far back into the Viking Age. Unlike scaldic poetry, Eddaic poetry is anonymous and its themes are not taken from everyday life. Lines are usually drawn between mythological poetry, gnomic poetry and heroic poetry, and the way the poems are arranged in Codex Regius seems to support this categorization. The heroic poems are thematically related to continental Germanic literature, as they use stories and motifs that can be found e.g. in the MHG *Nibelungenlied*.

Outside Codex Regius, Eddaic stanzas can be found, as we have seen, in *Snorra-Edda*, in other collective manuscripts and even implemented in sagas. As *lausavísur*, stanzas featuring the same metrical forms and content, are transmitted in saga manuscripts from the 13th and 14th c., most of all in the *fornaldarsögur*, and they are usually termed *Eddica minora*. This term was coined by Andreas Heusler and Wilhelm Ranisch as a title for their first edition of the corpus. Moreover, excavations in Bergen between 1956 and 1967 led to the discovery of several objects incised with runes. A few of those texts use Eddaic metrical patterns and must be included in the corpus of Eddaic poetry as well.

2.1.2. Style

From the viewpoint of text typology, a sharp separation between Eddic and scaldic poetry is difficult to justify. The metrical patterns of Eddaic poetry, with alliterative verse as a prominent feature, are all derived from the Germanic long-line and are relatively simple compared to the ones found in scaldic poetry. Two of them are predominantly used in Eddaic poetry: *fornyrðislag* (with *málaháttir* as a variant) and *ljóðaháttir*. The long-line metre *fornyrðislag* is the metre of the epic Edda poems. A typical stanza contains four long-lines consisting of eight half-lines. The quatrain, however, is by no means the only regular form, as there are three-line, five-line and even six-line stanzas. Each long-line in turn is divided in two

by a heavy caesura, each half dominated by two strongly stressed alliterating syllables.

Ljóðaháttir traditionally has a peculiar style and word order. Traditionally the metre of gnomic poetry, teaching poetry and magic spells, it even appears in these functions in stanzas with other metres, cf. the mnemonic stanzas in *Grímnismál* and *Reginismál*. *Ljóðaháttir* is characterized by the alternation of a long-line and a so-called full verse. The full verse is often without caesura and has three stresses which may all alliterate with each other.

As to style, almost every Edda poem features exceptions to the “proper” metre. Generally, the style of Eddaic poetry can be characterized as plain and succinct. There are almost no tensions between the verses and syntax, as end-stopped lines are generally preferred to enjambement, of which there are only occasional examples. Variations in the lexicon are not very frequent. Although we occasionally find *kenningar* (poetical paraphrases typical for the scalds), they appear less frequently and not in the sophisticated form so rich in variants that is found in scaldic poetry.

2.2. Scaldic poetry

2.2.1. Content

OWN *skáld* (n.) means ‘poet’ and is possibly etymologically related to OHG *skeldan* ‘to scold’. Unknown to medieval sources, a dichotomy between Eddaic and scaldic poetry has been established mainly through peculiarities of the transmission process. Actually, there are no precise criteria on which to base the drawing of such a line of demarcation. Nevertheless, scaldic poetry is distinguished from Eddaic poetry because of formal features as well as content. Formally, scaldic poetry is characterized by peculiar verse forms, a more rigid awareness of syllables in the metre, a word order freer and more removed from prose than in Eddaic poetry, and a semantically veiling use of words, which is usually termed “scaldic diction”. Scaldic poetry is, unlike Eddaic poetry, concerned with themes related to the present.

There are two main groups of scaldic poetry: praise poetry and occasional poetry. In most cases, the praise poem is in praise of kings and princes, but it can also be composed in honour of friends. As to the level of complexity, there are two hierarchically distinguished forms: *drápa*, which is artfully constructed with a refrain, and *flokkr*, without a

refrain. *Drápa* developed early on as the preferred form to praise princes, but then came to be used even to convey Christian themes.

The term *occasional poetry* summarizes many different *lausavísur* ('loose poems'), which, describing an event related to a particular situation or reflecting on an event, pretend to be spontaneous, extempore poetry. In most cases, however, the stanzas were actually not composed by the historically known people to which they are ascribed, but are a later addition and therefore called spurious stanzas. Some fragments preserved by chance (runic inscriptions from Vinje, Urnes and Bergen) indicate that scaldic verse forms were used as late as the 14th c. in occasional poetry.

As the earliest scaldic poem, Snorri Sturluson names *Ragnarsdrápa*, a shield poem by Bragi Boddason the Elder, which was probably composed towards the end of the 9th c. Due to its rigid metre, scaldic poetry has been transmitted orally for centuries before it found its way into the manuscripts. There is no collection of scaldic poetry as we find in Codex Regius for Eddaic poetry. Most of the scaldic verses that have been handed down to us are found in saga prose. Only in the course of developing Christian scaldic poetry were scaldic stanzas written down for their own sake. Other important sources for scaldic stanzas are the scaldic handbooks *Háttalykill* by Jarl Rögnvald and the even weightier *Háttatal* by Snorri Sturluson. Not only do we learn about metrical terminology there, but we also find a number of examples of scaldic stanzas, of which we have no traces elsewhere. *Háttalykill* describes 41 kinds of scaldic stanzas, while Snorri presents 102. However, for some stanza forms it must be assumed that the differentiation is purely artificial, as there is no transmission of such stanzas outside the model poems.

2.2.2. Style

The most common metre of scaldic poetry is *dróttkvætt*, which is subject to extraordinarily sophisticated rules and predominates in about 80 per cent of all scaldic poems. Each of the eight lines in a stanza possesses six syllables, and every two lines are linked by alliteration to form pairs. The first line of each pair has two alliterating stresses (*stuðlar*), the second line one more alliterating "main" stress (*hofuð-stafr*) on the very first syllable. While half rhyme (*skothending*) is restricted to the first line and full rhyme (*aðalhending*) to the second line of a pair, assonance (*hending*) is

found throughout the stanza. A thematical caesura divides the eight-line stanza into two half-stanzas (*helmingr*).

A semantically veiling use of language, i. e. conscious obscuring by means of metaphor or imagery, is characteristic of scaldic poetry. The replacing word is called *heiti*, and the whole composition consisting of several elements is called *kenning*. *Kenningar* are also known from Old English literature, e. g. from Beowulf, but not in forms as elaborate as the ones found in Old Nordic. Most *kenningar* are dependent on two elements, but there can also be more. Exceptionally, as many as six elements can be found.

The *kenning* is a stylistic form that appeals to knowledge and reason, which might explain why so many names and terms from Nordic mythology are used. Discovering the meaning behind the veiling language procures intellectual satisfaction and is, even in saga literature, frequently used as an element of the plot. Praise poems tend to a particularly rich use of *kenningar*. When the Christian scaldic poems (e. g. *Plácítusdrápa* or *Geisli*) merged with the praise poem tradition, the metrical patterns did not change, but *kenningar* referring to names and terms of heathen mythology were often replaced or avoided, although they did not disappear completely.

3. Saga literature

3.1. Content

Even in medieval manuscripts, the term *saga* is used for a range of very different prose texts. The noun *saga* is derived from the verb *segja* 'to say', 'to speak', 'to tell' and properly means 'tale', 'report'. Even in modern Icelandic, the word is generally used to denote any prose text, no matter whether it is long or short, old or new, fictional or non-fictional. In a narrower sense, *saga* denotes the medieval prose texts that will be discussed here.

Unlike the Continent, the high medieval North did not produce long verse epics. Instead, the study of historiographic and hagiographic texts in foreign languages led to the origin of an extensive body of prose literature, of which some texts must be deemed extraordinary. Texts belonging to saga literature are often precursors of the modern novel in their way of thinking, their psychology and their highly developed narrative technique. Saga literature is prose which is clearly distinguished from other types of texts by form and style.

How a text type so exceptional compared with Insular and Continental literature could develop has been the object of study since the beginning of research, but even today, the question is far from being answered.

Typologizing the sagas as a group is not without difficulties, as there is hardly any criterion which can be found in all texts. Traditionally, the sagas have been classified according to subject matter into five groups: kings' sagas (*konungasögur*), Icelandic family sagas (*Íslendingasögur*), mythic-heroic sagas (*fornaldarsögur*), *Sturlunga saga* and bishops' sagas (*byskupa sögur*). Schier (1970) counts these five groups among saga literature in the narrower sense of the word ("Sagaliteratur im engeren Sinne"). Looking for saga literature taken in a wider sense, four more groups can be found: knights' sagas (*riddarasögur*), fairy-tale sagas (*Märchensagas*), legends and translations of historical or pseudo-historical works. In a wider sense, saga literature thus consists of a number of texts which early research classified as translated and not genuinely Scandinavian, as these texts were obviously derived from foreign models. We have to consider, however, that a medieval translator saw himself more like an equally legitimate editor and author than like a modern translator copying his model as accurately as possible. As a result, a number of texts deviate so considerably from their models that more recent research has led to the decision to add them to the corpus of saga literature.

Researchers have felt uncomfortable with the rather crude and imprecise categorization of sagas according to content for quite a long time. Nordal (1953) therefore proposed a classification which was different from the canonical categorization when he grouped the texts according to the time at which their plot is set. His aim was not to suspend the traditional categories but to create units of a higher order under the aspect of historical veracity. By estimating the time span between the time a given saga was composed and the period in which its events purported to take place, Nordal believed he was able to detect "factors of falsification" more accurately. His three categories are:

- (1) contemporary sagas (*samtidssagaer*), describing events in the time range of composition,
- (2) sagas of olden times (*fortidssagaer*), set in the years from 850 A.D. to 1100, and
- (3) ancient sagas (*oldtidssagaer*), set in the time before the settlers came to Iceland.

The problem of categorization has been subject to discussion ever since and is far from reaching a satisfactory solution. Current research tries to move away from the earlier idea of chronological decoding, as the preserved texts usually cannot be used to establish an accurate chronology. The bulk of texts is transmitted fragmentarily, in many cases only in paper manuscripts which are very much younger. The so-called Icelandic school mainly subscribed to one line of research, aiming to establish the chronology and typological history of saga literature by unravelling the complex manuscript stemmata and textual dependencies between texts and text groups. In the past few decades, several datings of individual sagas have been revised, however without a coherent view of the whole body of texts emerging.

For a long time, the debate on the origin of the sagas was dominated by subscribers to two theories: free-prose theory and book-prose theory. According to free-prose theory, the texts have existed in their oral form for centuries and were transmitted orally with only minor alterations before being written down on parchment. Book-prose theory, on the other hand, claims that the texts were produced only at the time of writing down. Since the second half of the 20th c., the general opinion has been crystallizing that it is probably not a question of one or the other, but more likely a complex process in which the seemingly opposite poles of free-prose theory and book-prose theory are joined.

3.2. Style

Earlier research believed it was possible to describe a typical saga style, which in some research works was called "objective". This term soon proved not to be accurate enough. More recent investigations have shown that the pinning-down of the texts' style to a classical variant is only a projection of modern ideas back on older texts. Several intensive studies of individual texts prove that each saga is stylistically so independent that it often transgresses the narrowly defined borders of a postulated uniform saga style.

3.3. Icelandic family sagas

3.3.1. Content

The term "Icelandic family sagas" is used for a corpus of approximately 35 to 40 prose tales, which are distinguished from other sagas

because of their content and style. Icelandic family sagas tell about Icelanders, and their plot is set mainly in Iceland, although they frequently start off in Norway and the protagonists sometimes undertake long journeys into non-European countries. Normally, the plot is set in so-called saga time (*söguöld*, ca. 930–1030 A.D.), but this time span is managed differently in each saga, also depending on its length. In the individual sagas, the antecedents and aftermath of the plot can even extend beyond the time of settlement and the end of the Viking Age. Thus the category “Icelandic family sagas” extends without clear demarcation towards *Sturlunga saga* and the shorter *þættir*, which both narrate events of a later period, as well as towards the kings’ sagas or the *fornaldarsögur*, which describe earlier history.

Thematically, all Icelandic family sagas share a focus on feuds and blood-letting with their legal and social disputes and implications. Most Icelandic family sagas are oriented along the biography of an individual, on whom the narration focuses. Subgroups of this kind of saga are e.g. the scald sagas (*Kormáks saga*, *Hallfreðar saga*, *Gunnlaugs saga ormstungu*, *Bjarnar saga hitdælakappa*), which focus on the life of individual scalds, or outlaw stories (*Gisla saga*, *Grettis saga Asmundarsonar*), which put an outlaw at the centre. Other sagas do not focus on individual characters but deal with groups which often lend their name to the saga (*Eyrbyggja saga*, *Laxdæla saga*, *Ljósvetninga saga*). However, even sagas naming only one person in their title can have a collective nature (*Hænsa-Þóris saga*, *Njáls saga*). The length of these texts spans from 25 printed pages (*Hrafnkels saga*, *Hænsa-Þóris saga*) up to several hundred pages (*Njáls saga*).

The sagas vary structurally. Some of them narrate along a linear chronology, while others present several strings of the plot in parallel and jump back and forth between them.

3.3.2. Style

There is still no comprehensive analysis of style in the Icelandic family sagas. Individual, frequently repeated elements are the “objective” style, the succinct, direct and laconic mode of narration, which moreover often is humorous in nature. The “objective” style is achieved by using a number of features. The narrator pretends to be objective by usually not commenting on the events but reporting what is visible on the outside. Moreover, the

sagas pretend to pass on an oral tradition and ask their audience to receive the story and the reports as historical facts. Tense shift occurs without recognizable coherent motivation, and the texts sometimes present a movie-like perspective of suspense, which is not determining in itself. Dialogue occurs frequently, sometimes leading up to perfect dramaturgy, because it takes on important functions in the characterization of people. As the narrator does not comment on the feelings of the characters, direct speech is even more informative and the texts switch from indirect to direct speech without introducing pronouns or verbs, often with anacoluthic syntax.

All these stylistic devices also occur in other types of prose, but not equally often. The Icelandic family sagas, however, lack the decorative figures of style taught through Latin rhetoric and school grammars, as for example tropes, which appear frequently in other text types. The *lausavísur* used in the Icelandic family sagas are not presented as evidence for the saga narrator’s trustworthiness, as is the case in the kings’ sagas, but are instead ornamental, besides serving to individualize the characters and to enhance the suspense by slowing the pace of the narrative.

The influences of medieval classical education are visible even in the Icelandic sagas, but elements e.g. from patristic literature are disguised so skilfully that they can hardly be discovered. Flosi’s dream in *Njáls saga*, for example, is taken from the *Dialogues of Gregory the Great*.

3.4. Kings’ sagas

3.4.1. Content

The kings’ sagas form one of the oldest groups of saga literature. Their origin, however, is obscure. A large group of different and heterogeneous texts belong to this type of saga. Taken in a narrow sense, the corpus is made up of texts using the form and narrative structure of a saga, and describing the lives of Scandinavian kings or earls (*jarlar*), e.g. *Sverris saga* or *Ólafs saga helga*. Taken in a wider sense, even other text types with a chronical style belong to the corpus, e.g. *Ágrip af Noregs konunga sögum*, *Íslendingabók* and *Landnámabók*.

Most of the kings’ sagas were composed in Iceland by Icelanders. Similarly to scaldic poetry, the writing of such sagas developed to become a domain of the Icelanders. While the

authors of all Icelandic family sagas without exception remain anonymous, the authors of many kings' sagas are known.

Reaching even far back into an era of mythical origin, the kings' sagas thematize all epochs of Scandinavian history. Concerning their content, they are not restricted to Iceland and Norway, as is shown e.g. by *Ynglinga saga*, *Færeyinga saga*, *Orkneyinga saga* or *Knýtlinga saga*.

In the kings' sagas, numerous scaldic stanzas can be found, which are meant to emphasize the veracity of the story. Formally, two types of kings' sagas can be distinguished: first, a *vita*-type describing the life of an individual person; second, a type more like a description of a people's or nation's history.

The manuscript tradition of the kings' sagas is very rich and rather complex, since collective manuscripts and compilations often present revised older sagas.

3.5. Mythic-heroic sagas (*fornaldarsögur*)

In 1830, the Dane Carl Christian Rafn edited a collection of sagas under the title *Fornaldar sögur Norðrlanda*. Since then, the term *fornaldarsögur* has become established for the group of approximately 30 sagas from this collection, although some revisions of the original corpus have been made.

However, there are no features of content or plot or motives on which to base this category. A sub-categorization of the sagas published in the collection, too, can only be achieved if one is willing to accept inconsistencies. Usually, the lines are drawn between heroic sagas (*Völsunga saga*, *Ragnars saga loðbrókar*, *Norna-Gests þátr*, *Hervarar saga ok Heiðreks konungs*, *Hrólfs saga kraka*, *Ásmundar saga kappabana*), sagas of the Vikings (*Hálfs saga ok Hálfsrekka*, *Qrvar-Odds saga*, *Friðþjófs saga frækna*, *Heðins saga ok Hognar*) and adventure sagas (*Göngu-Hrólfs saga*, *Hrólfs saga Gautrekssonar*, *Egils saga einhenda*, *Bósa saga ok Herrauðs*, *Gautreks saga*). While the heroic sagas are set in a period before the proper Viking Age, the sagas of the Vikings develop their plot in the early Viking Age and partly narrate episodes similar to the ones found in the oldest kings' sagas and the oldest Icelandic family sagas. The adventure sagas on the other hand have no relation to a particular period in time, as they are based on very different models and use different motives. In any case, the chronology of the written texts approximates this division into categories: heroic sagas

were written down first, followed by sagas of the Vikings and finally by adventure sagas. Interestingly, *fornaldarsögur* are never set in Iceland, but in most cases in other parts of Scandinavia or in a vaguely remote half-mythological world. Hyperbolic or almost fairytale-like features are typical of the *fornaldarsögur*.

A small number of *fornaldarsögur* deal with themes of ancient Germanic heroic poetry. Hildibrand's death song, transmitted in *Ásmundar saga kappabana*, has thus been used to reconstruct the ending of the fragmentary Old High German *Hildebrandslied*.

3.6. Legendary sagas

The oldest manuscripts presenting narratives from Iceland and Norway are hagiographical texts. They focus on the life of a saint and depend on the Continental tradition of legend writing. The oldest Scandinavian legends date from the middle of the 12th c. Although their Latin model can rarely be established, it is very evident that all of them are translations from Latin. Two groups differing in style can be distinguished. Up to the middle of the 13th c., the style is obviously Latin-oriented, but still there are stylistic elements corresponding to the classical saga style. This is telling for the development of later saga texts out of this type. Towards the end of the 13th c., few new texts were translated into Old West Nordic, but instead, the existing legendary texts were enlarged and revised. Their style then changed considerably. Featuring a frequent use of adjectives and compounds, a tendency to use parallel structures and alliteration as well as a preference for participial constructions, this style is usually termed "florid" or "florissant".

The *postola sögur* are a subgroup of the legendary sagas. Dependent on Latin models, there is one for each Apostle.

3.7. Contemporary sagas

Sturlunga saga and the bishops' sagas together form the group of contemporary sagas. *Sturlunga saga* is a compilation of very different individual sagas. The compilation covers the historical period from 1117 till 1264, when the descendants of Sturla Þórðarson were cultural and political leaders in Iceland, and it was most likely made by the lawyer Þórðr Narfason (died 1308), but there is only indirect evidence for his authorship. *Sturlunga saga* is transmitted in two manuscripts from the 14th c. The bishops' sagas, on the other hand, focus on the lives of some bishops in the 12th to

the 14th c. and are on the border between historiography and hagiography.

As regards content, while connections to the bishops' sagas can be established, the texts in *Sturlunga saga* differ considerably from them in form and style. Some of them, however, approach the perfect art of the Icelandic family sagas in their dramaturgical structure, in the succinctness of their dialogues and in their precise characterizations.

3.8. Sagas of the knights (*riddarasögur*)

In the 13th c., courtly verse narratives from the French and Anglo-Norman areas were translated and revised in Norway. Most of them, however, are only transmitted in Icelandic manuscripts dating from after the Middle Ages. These texts are called *translated riddarasögur* 'sagas of the knights', to distinguish them from the indigenous Icelandic sagas of the knights produced from the turn of the 14th c. onwards, which are not relevant for the period discussed here.

The impulse to translate Continental texts came from the Norwegian King Hákon Hákonarson (1217–1263). The courtly style of the texts is far more decorated with rhetorical figures than the style of the Icelandic family sagas. Antithesis, parallelism and alliteration are frequently found, as well as the participial constructions which the "learned style" of hagiographic literature inherited from Latin.

A subgroup of the translated sagas of the knights are sagas translated from Latin models which are concerned with matters from classical antiquity. Examples of such texts are *Trójumanna saga* or *Alexanders saga*. The fact that the Latin models of those sagas are very different in style is barely visible in the Nordic versions, which are written in classical saga style.

3.9. Þættir

Like *saga*, *þáttur* ('string of a rope', pl. *þættir*) is a term already found in the manuscripts. On the one hand, it denotes a paragraph with a particular theme inside a longer narrative, i. e. story within the story. Most such *þættir* appear in the kings' sagas and correspond to the surrounding texts in style. On the other hand, the same term is used to denote an individual, shorter narrative. A definition is difficult, since in Old Nordic literature the use of the terms *saga* and *þáttur* is not consistent, even for the same text. Observed more closely, such *þættir* can actually only be distinguished from sagas by the fact that they are shorter.

4. Non-fictional prose

4.1. Glosses

While there are thousands of glosses known from the Continent, we only find traces of this tradition in Iceland and Norway, which nevertheless show that glossography had developed to a comparatively high level in a short period of time. The oldest glosses in the Old Icelandic *Homiliubók* provide evidence of a long preceding period during which Latin texts were studied. In computational manuscripts, we find fragments of glossaries with lexical units relating to very different areas of life. Their form and function is certainly dependent on Continental models but is otherwise difficult to determine, as there are so few of them.

4.2. Legal texts

Legal texts belong to the earliest testimonies of literary transmission in Iceland and Norway. Contrary to the situation on the Continent, laws were never written down in Latin in the Old West Nordic area. The codification of legal regulations had been an oral process for a long time when the new culture of literacy mediated by the Church led to their being written. Mnemonic and judicial verse are still clearly visible in the written law codes. At the annual allthing, the law speaker (*lögsgumaðr*) had to recite a third of the law, so that at the end of his three-year term of office, the whole body of law had been recited once.

In the early 12th c., the writing down of the free state's laws started in Iceland. All the laws originating before the end of the free state period are together called *Grágás*. The oldest Icelandic church laws are the tithe laws from 1096/97 (*Um tíundargjald*). They are documented in connection with the oldest church law (*Kristinna laga þáttur*, 1122–33) and are also part of the *Grágás*. According to Ari Þorgilsson, the oldest secular laws were written down only in the winter of 1117/18. It is quite difficult to distinguish the older secular laws from the younger laws transmitted in the *Grágás*, the most important manuscripts of which date from the second half of the 13th c. The *Grágás* is transmitted in two codices: *Konungsbók* (GKS 1157, fol. ca. 1260) and *Staðarhólsbók* (ca. 1280). In *Konungsbók* the winter of 1117/1118 is mentioned as the date when *Haflíðaskrá* ('parchment of Haflíði Másson, a wealthy farmer from Breiðabólstaðr in Vesturhóp) was written down. Probably the body of laws in Iceland started to be written as early

as the end of the 11th c., due to the narrow cultural contacts with Norway. Stylistically, the *Grágás* lacks the rhetorical devices found in mainland Scandinavia.

In medieval Norway there were four jurisdictional districts (þing-districts), each of which started to write down its collection of laws as early as the 11th c. (*Gulaþingslag*, *Frostuþingslag*, *Eiðsivabingslag* and *Borgarþingslag*). These early district laws have, however, been preserved only in later copies and partly only in fragments. Covering the south-western district, the *Gulaþingsbók* was transmitted orally in the 9th and 10th c., before the text was written down in sections probably from the second half of the 11th c. onwards. All in all, there are only three editions of it. The oldest edition I exists only fragmentarily in three excerpts of a manuscript dating from the late 12th c. The oldest coherent text is transmitted in Codex Rantzovianus (around 1250). There, edition I is attributed to Saint Olaf, which might, however, just be an attribution to a ruler following medieval tradition, since even the feast of Saint Olaf himself is among the Christian holidays fixed by the author. Nevertheless, edition I has come to be known as Olaf's edition. In the times of King Magnus Erlingsson (1162–1184), innovations were most of all made in the church law, so that one can then speak of edition II or the edition of Magnus. Around 1200, the editions of Olaf and Magnus were compiled, and this compilation has then become known as edition III.

4.3. Historiographical texts

As described above, historiographical writing cannot easily be distinguished from saga literature. We have almost chronicle-like historiographical texts such as *Ágrip*, *Morkin-skinna* and *Fagrskinna*, but also *Íslendingabók* and *Landnámabók*, which can only be added to saga literature with some reservations. On the other side, the kings' sagas and bishops' sagas, the *Sturlunga saga* as well as the legends only come to life because of their historiographical interest. Historiography developed in the 12th c. first in Latin, but the shift to the vernacular occurred comparatively early. The prosimetre, a mix of prose and verse, was taken up from ancient historiographers (Sallust).

Íslendingabók (*Libellus Islandorum*) by Ari Þorgilsson is the first Icelandic book. It is derived from a lost version which was probably written down in the first quarter of the

12th c. The manuscript we have is possibly an abridged edition of the first version, although the differences cannot be established accurately. In this second edition, Ari Þorgilsson left out genealogical passages and historiographical descriptions of kings. *Íslendingabók* offers a comprehensive overview over the history of Iceland from the time of settlement (from 870 A. D.) up to the end of the free state era (1264). With Ari's *Íslendingabók*, historiography in the vernacular became established, while the rest of Europe still wrote in Latin. Thus the conditions which enabled a rich development both of scientific and fictional prose in the vernacular were created. Without the cutting of the cultural ties to Norway which let memory-consciousness arise, the rich literary production in Iceland would not have become possible.

4.4. Cosmographical texts

Vernacular cosmography is clearly more developed in Iceland and Norway than on the Continent. Although the first preserved texts date from as late as the 12th c. and most other manuscripts originate from the 14th c. only, all cosmographical genres are present: astronomy texts and pictures of the spheres, *mappae mundi*, chorographs, itineraries as well as geographic and ethnographic treatises.

Normally, cosmographical texts are found loosely bound together into compilation manuscripts, and only occasionally do such collections assume the status of a coherent text, e.g. the Old Norwegian *Konungs skuggsjá*. The bulk of scientific OWN cosmographical texts consists of editions of Latin works from the British Isles and the Continent. During the 12th c. and until the beginning of the 13th c., Icelandic and Norwegian scientific writing was very much up-to-date as to current topics in Continental European thinking. Works by authors such as Honorius of Autun, Lambert of St. Omer, William of Conches, John of Sacrobosco and Vincent of Beauvais were received with no or only a little delay. Over the course of the 13th and 14th c., almost no new sources were used, yet many old texts were revised. Beginning in the 13th c., a shift from the reception of Latin scientific literature towards the writing of original vernacular texts can be observed.

The geographic and ethnographic descriptions of Greenland and the Atlantic coast of North America are unique within the entire body of medieval European cosmographic work.

4.5. Grammatical and rhetorical writings

In the Codex Wormianus edition of *Snorra Edda*, we find four so-called grammatical treatises. The first two of those are very exceptional within European literature, as they give a surprisingly accurate overview over Old Nordic phonology. In the *First Grammatical Treatise*, the anonymous author is concerned with the question how to codify a language orthographically by means of a foreign alphabet. In addition, he works out a system of signs, which – although not used systematically in any text that has come down to us – still is very informative as to the contemporary phonological situation, because it presents phonemes in a structuralist manner by listing minimal pairs. The *Second Grammatical Treatise*, too, is a pioneering work from the viewpoint of a structuralist, as it deals with the distribution of the phonemes, syllable structure and the criteria for rhyming syllables. In the Cod. Upsaliensis edition of *Snorra Edda*, the *Second Grammatical Treatise* is placed just before *Háttatal*, showing that the compiler evidently deemed knowledge of syllable structure to be a useful basis for the art of rhyming.

The *Third* and *Fourth Grammatical Treatise* are derived from Latin grammars and rhetorics by authors such as Donatus Aelius, Priscian of Caesarea, Petrus Helias, Alexander of Villedieu and Eberhart of Béthune. Latin terminology is taken up and illustrated with Icelandic examples. The *Third Grammatical Treatise* is the only one for which we know the author. It was written around 1250 by Snorri's nephew Óláfr Þórðarson.

110. Old Nordic types of texts II: Old Swedish and Old Danish

1. Provincial laws and early national laws
2. Diplomas and statutes
3. Medical writing
4. History texts
5. Educational writing
6. Fiction
7. Religious texts
8. Literature (a selection)

In the early Middle Ages, most of the texts written in Latin characters were in the Latin language, but during the 13th century these characters started to be used for vernacular texts as well. The texts were initially mostly written on parchment, but as time went on paper became more and more common, and parchment was only used for particularly important texts. The texts are mostly known only in fairly late copies; the exact year or even decade of the original is impossible to establish with any certainty (cf. art. 93). Subsequently, the names of the writers are unknown in many cases. In any case, whoever the writers were, they must be regarded more as compilers or translators than as original authors. Even though they are unknown, it is obvious that their background was academic and that many of them had been studying at universities in Italy, France or Germany. They belong to a European writing community, their writing is part of a European tradition, and no text type is particularly Scandinavian. Their work is distinguished by certain text structure patterns, even involving the use of sentences with a prototypical wording. In all such cases, the patterns used were taken over from corresponding text types in other parts of Europe.

In the Middle Ages, access to writing defined an educated middle class, chiefly connected with administration, commerce and the church. Outside the clergy, writing was not really a characteristic of the upper classes, although they recognised its role in organising society. It was not regarded a chivalrous activity, although writing was encouraged, but it was considered a handicraft to be performed by clerks. The peasant population was to a large extent illiterate, slaves and farmhands completely so. Medieval Nordic culture was thus predominantly oral, and the texts produced were designed to function in oral communication and to be read aloud. This was of course necessary when the receiver could not read and had to rely on others to interpret the text, which was quite a common situation

even in the higher classes of society. Even when the receiver could read the text, he read it aloud to himself and did not take it in just by looking at it (cf. Lindell 1994).

During the early Middle Ages, until the middle of the 14th century, the number of people participating in writing and reading activities was particularly limited, and the range of genres was very narrow. Judicial texts constitute the largest and most diversified text type. Most of the judicial texts are provincial laws, and the development of national laws was initiated during this period. Beside the laws, there are some other judicial texts, statutes and diplomas, although they primarily belong to later periods. Medical texts constitute an old text type with its roots in classical times. The ODen. and OSw. texts go back to the 13th century.

The text types mentioned constitute the largest part of the early medieval text universe in Scandinavia. Texts with historical and religious content as well as fiction and texts with a pure educational aim started to appear during the early part of the Middle Ages but flourished during later periods (cf. art. 131). These texts are rather divergent as far as text structure features are concerned, and texts with historical content may in this respect be regarded as belonging to different text types. The same may be said of the texts with religious content. At the same time it could rightly be argued that historical and religious texts can be educational and entertaining as well. As a matter of practicality, historical and religious texts are treated in specific sections of this article due to their content, and texts with principally educational or entertainment goals are treated in other sections.

The translations into English of the Old Danish and Old Swedish text extracts are intended to mirror the basic textual and syntactical characteristics of the texts. This means that the word order of the original text is retained in many cases instead of rendering an idiomatic English translation.

1. Provincial laws and early national laws

Latin characters were used early on in provincial laws, which contained written documentation of the social norms of a particular

province. The law was administered by the lawman, who read it out aloud at court sessions, the *ting*. He, and not the written law, was the legal authority, and written documentation was first produced for the benefit of the lawman's memory and as a way of handing down the law to new generations of lawmen.

1.1. The law texts

In Denmark, written documentation of the laws started in about 1200. The *Scanian law*, which applied to the eastern Danish provinces, i. e. Scania, Blekinge, and Halland, was written down at the end of the 12th century or perhaps at the beginning of the 13th century. The oldest existing manuscripts are from the 13th century. The *Jutland law*, which operated in Jutland, Funen, and some adjoining small islands, is known from manuscripts from the beginning of the 14th century. The *Zealand law* was in force in Zealand and adjoining islands. It is represented in two main editions, Valdemar's law and Erik's law. Valdemar's law is supposed to be the oldest, represented in three editions, two of which are known only as fragments.

The Swedish provincial laws are sometimes divided into a southern group, called Göta laws, and a northern group, called Svea laws. This is not just a grouping based on geographical circumstances. The laws within one group to some extent display similarities in content and language which is divergent from the laws of the other group.

The southern group consists primarily of the laws of Västergötland and Östergötland. The *Västergötland law* applied to Västergötland and Dalsland, and the north-west corner of Småland. It seems to be the first law that was written down. The oldest complete manuscript is dated to about 1280, but it is believed to represent an edition made by lawman Eskil Magnusson, who was lawman in Västergötland in 1217–1227. It was followed somewhat later by a new edition, the *younger Västergötland law*. The *Östergötland law* was in force in Östergötland, in the coastal area of Småland and on the island of Öland. It is known from a manuscript from the middle of the 14th century, believed to be a copy of a version dating back to the later half of the 13th century, compiled by the lawman Bengt Magnusson possibly on the pattern of the *Västergötland law*. The remaining parts of Småland fell under the *Småland law*, and the province of Värmland under the *Värmland*

law. These two laws are preserved only as fragments.

As far as the northern laws are concerned, the *Dalecarlia law* is supposed to be the oldest, possibly written down at the middle of the 13th century, and its oldest existing manuscript is from the 14th century. It is generally believed to represent very ancient norms, and the language used is somewhat archaic even in comparison with other medieval laws. The *Uppland law* was authorized by the Swedish king Birger Magnusson in a letter dated January 2nd, 1296. Other northern laws are the *Hälsingland law*, the *Västmanland law*, and the *Södermanland law*. No copies remain of the *Närke law*.

On the island of Gotland, the Guta law was in force until 1595. It was written in the old Gutnish dialect, supposedly at the beginning of the 13th century, and it is known from a manuscript from the middle of the 14th century.

In the 13th and 14th c. jurisdiction started to become national, and at the same time the written text in itself became more important. It was no longer just a documentation of the law, it *was* the law. The importance of the written law may be seen from the existence of "bag binding", where the cover of the law book is shaped like a bag, which made it possible e. g. for officials to carry the book with them on their journeys.

In Denmark, the *Jutland law* was authorized by the Danish king Valdemar Sejr in 1241, and eventually it came into force in all the Danish provinces. In Sweden, a national law, *Magnus Erikssons landslag*, was compiled, based on provincial laws and on statutes issued by the king during the 1330s and 1340s. Work on this law was probably brought to an end at the beginning of the 1350s, and it came into force in the Swedish provinces during the latter half of the 14th century. A number of manuscripts are extant from this period.

1.2. Content

Many of the norms documented in the laws had been passed on orally for centuries before being written down, as may be seen e. g. from a prescription in the *Västergötland law*: "ingsins mans arf takær han, mæn i Girklandi sitær" [he will not be the heir of any man as long as he sits in Greece]. This was for obvious reasons an important regulation in the Viking Age, but hardly so in the 13th century. Many other norms are quite modern from a medieval

point of view, and so the laws present different chronological content.

The laws contain regulations concerning weddings, inheritance, theft, injuries and murder. Some regulations concern court proceedings, e.g. specifying the number of men in the jury, and there are regulations concerning what the sentence should be, how a death penalty should be executed, or the amount of the fees of fines that had to be paid and who should receive them. Church matters were regulated in specific law chapters, or sometimes in statutes or in independent law books, and specific city laws were instituted for the developing cities in the later medieval period.

1.3. Text structure

In the laws, the text structure is rather stereotypical and text-type specific. Legal prescriptions are typically divided into two parts, one representing an event and stating the case, and another stating a regulation and specifying what should be done, e.g. what fine a sentenced person had to pay.

Even though a few legal prescriptions had only a regulatory role, e.g. from the *Västergötland law* “sun ær faþurs arvi” [the son is the heir of his father], the most salient genre characteristic of the Danish and Swedish laws is the division of the prescriptions into two parts. The following starts with a representative event, stating the case:

Ganger maþer fra kunu sinne laghgifte ok fæste sik aþra kunu laghlika ok hæfþa, mæþan hin liuer, sum han før meþ laghum hafþe fangit, varþer þæt skælleka leet. mæþ vppinbarum vitnum ok kirkionna ræt in til hans [...] (*Magnus Erikssons landslag*)

[Leaves a man his lawfully married wife and marries another woman and has intercourse with her while the other is still alive, the one he was married to before, and is it legally proved with eyewitnesses and according to church justice.]

After that a regulation follows, stating what is to be done:

[...] hauri forgiort liue sino; ok kona samuleþ æn hon gør þæt; han skal hals hugga ok hona stænka. [he has forfeited his life, and the same applies to a woman if she does it, him one shall decapitate and stone her].

In the first part, sentences with inverted word order starting with the verb are often used, and sentences with an initial conditional subordinating conjunction are far more infrequent. These two possibilities may be exem-

plified by: (1) “dræpar maþær danskan man” [kills one man a Danish man] (the *Västergötland law*) and (2) “of man giuær annæn thiwfs sak” [if a man accuses another of theft] (the *Jutland law*). The latter alternative with a conjunction is used in more prescriptions in the Danish laws and the southern Swedish laws, except for the *Västergötland law*, than in the northern Swedish laws, where the alternative with inverted word order is dominant. Other types of clause may also be used, although infrequently, such as a generic relative clause: *hwar sum dræper man* [(s)he who kills a man] (the *Dalecarlian law*), or a temporal clause: “siþan bonde haur fangit þiuui sinum matban i hæraþæ” [after the man has had his thief sentenced to be expelled from the social community of the district] (the *Scanian law*).

The action of a case statement is often fairly concrete while the actors are treated in rather general terms, which gives the text a fairly impersonal quality. An offender is generally known only as such, e.g. “særir nokir man annan man j howit” [injures some man another man in the head] (the *Zealand law*). Sometimes the actor is specified as to sex and social status, e.g. “dræpar kona man” [kills a woman a man] (the *Västergötland law*), “þræl dræpar man ættæþæn” [a thrall kills a free man] (the *Västergötland law*). Sometimes animals are involved, e.g. “nu bitær hæstær skiut” [now bites a horse a mare] (the *Östergötland law*), “nu stangar þiur oxa” [now butts a bull an ox] (the *Östergötland law*). The case statements supplied exemplars, and it fell to the lawman to decide which prescription was valid for a certain case presented in court.

The regulatory part of the prescription specified what actions should be taken in a specific case, e.g. “hængin wþ han” [hang up him] (the *Dalecarlian law*). It often started with a connective *þa* [then], e.g. “þa a at bõdas fulla manbõdir fare” [then shall be paid a full fine for manslaughter for that] (the *Zealand law*), “þa a hun j bali brinna” [then shall she at the stake burn] (the *Östergötland law*). The prescription could be restricted to stating what something was called, e.g. “hete þe konæ laghtakin” [is called that woman “taken by law”] (the *Uppland law*), “þæt ær fuldær þiufnaþær” [that is full theft] (the *Östergötland law*), and it was part of the knowledge of the people to recognize what actions should be taken in such cases. The verdict could also be a dismissal, e.g. “wæri saklõs” [be guiltless] (the *Uppland law*).

The different prescriptions were distributed over various topics, each containing prescriptions for e.g. inheritance, marriage, theft or manslaughter. This distribution is not explicit in the Danish laws, but in the Swedish tradition, these topics, called *balkar*, are specifically marked. The *Guta law* agrees in this respect with the Danish ones.

The texts are divided into chapters, containing prescriptions with closely related contents, e.g. giving the regulations concerning a specific kind of manslaughter, as in the following excerpt from the Jutland law.

Wil man hoggæ annæn a hæst. oc mistær man oc hoggær hæst. tha bötæs for thæt saar thær hæstæn fæk thre mark. swo sum han hivggæ mannæn. oc thæn hæst thær han hioo takær han til siin hæfth. oc gør hanum swo gooth sum han war fyrræ æn han wrth hoggæn. æn wrthær hæstæn døøth æth liwt. gialdæ hæstæn æfter. swo sum han waar wird fyrræ æn han wrth hoggæn. oc bötæ thre mark.

[If one man wants to hit another man on horseback, and he misses the man and hits the horse, then a fee of three marks shall be paid for the wound that the horse got, as if he had hit the man. And the horse he hit, he shall take into his care and make it equally good as it was before it was hit. But if the horse is dead or lame, he must pay back the value of the horse as it was worth before it was killed, and shall be payed with three marks.]

The text structure of the laws found in the medieval Danish and Swedish legal documents is a characteristic of all Germanic legislation, not just Scandinavian but German and Anglo-Saxon as well. It is reasonable to describe it as a common Germanic law text culture. This tradition lived on until modern times and also characterises the legislative texts of today.

1.4. Specific language features

The texts are characterized by a number of terms referring to activities in medieval rural society, e.g. buying and selling, gifts, marriage, court sessions, guilt and punishment, testifying. Many terms refer to the professions and daily life of middle-class citizens. In the law texts, a number of central Scandinavian legal terms that previously had existed only in oral tradition are established in writing, as well as terms within a number of other areas (cf. art. 40).

The different chronological layers of content reflect the language as well. The language of the laws uses forms and structures that are

lost in later language. Nouns, especially in the older Swedish laws, are used without a definite article, even in definite positions: “Takær maþær þiuf sin ok þiuft mæþ, bindi þiuf a bak” [Takes a man his burglar and (the) theft too, he bind (the) burglar on (the) back] (the *Västergötland law*). Verb complements are often placed in front of the infinite verb, as in “han skal ikki arvi hans væræ” [he shall not his heir be] (the *Västergötland law*), “nu skal bondin til þingxs fara” [now shall the man to the court go] (the *Östergötland law*). This is more common in the Swedish laws than in the Danish laws, where the complement more often is placed after the verb, which may be regarded as a more modern word order.

Since a part of a sentence, particularly the subject, is commonly omitted, the interpretation depends on cultural knowledge, which determines e.g. who, according to the social norms, is expected to do what, as in “nu stan-gar þiur oxa gialde fullum gialdum” [now butts a bull an ox, pay it back with full payment] (the *Östergötland law*), “dræpar kona man, þa skal mælæ a man þen skyldæstæ” [kills a woman a man, then shall bring an action against the man closest related] (the *Västergötland law*).

The conjunctive mode of the verb is common in the prescriptive part of a regulation. For the most part it is used in a few verbs connected with the legal context, such as *dömi* ‘sentence (somebody)’, *böti* ‘pay a fine’, *dyli* ‘declare or prove oneself not guilty’. In other cases, a phrase containing a modal auxiliary is used, e.g. *þen skal a bale brinna* [(s)he shall burn at the stake] (*Magnus Erikssons landslag*). The frequency of the conjunctive mode varies somewhat; it is more frequent in the Danish and northern Swedish laws than in the southern Swedish laws.

Stylistic features corresponding to oral tradition are rather common. These include repetition of a concept with alliterated synonymous terms, e.g. “sætær stok ok stava” [puts up posts and poles] (the *Östergötland law*), a feature that is not, however, very frequent. Linguistic features that explicitly specify the structure of the text are used more often, such as the Latin *item*, or the synonymous vernacular *æn* in the Danish laws and *nu* in the Swedish laws. This was particularly important when the texts were read aloud to an audience.

2. Diplomas and statutes

Beside the laws, early judicial texts include the so-called diplomas. The term *diploma* is used for medieval official documents, equivalent to Latin *charta, epistola*. They consist of missives and official letters, e.g. wills, agreements, depositions of evidence, verdicts, decisions of authorities. Unlike the laws, they were written almost exclusively in Latin until the middle of the 14th century. It was not until after 1350 that the vernacular (or Low German) was used more frequently (cf. art. 131). The text structure of the Latin diplomas as well as the few vernacular ones was stereotypical. The text starts by identifying the sender in a characteristic phrase, as in a diploma dated August 29, 1344: “Allæ the thettæ bref höræ ok see helsær jæc Birghittæ Anundædotir með Guði” [all those who this letter hear or see, greet I Birghittæ Anundædotir with God]. The use of the verb *hóra* is common and shows that it was not presupposed that all the receivers could read. The diploma ends with the date it was issued and the names of those confirming the authenticity of the diploma, who attached their seals to the document, together with the senders if they had one.

þer til at thettæ se fult oc fast oc iæc hawir egh inzighle, bedis iæc ærlix faþurs inzighle herræ Frendæ biscops j Strengnes, oc hans capituli herræ Lafrinzæ Wlphson, laghmanz j Suthermannælande. oc herræ Birghirs Magnusson sætiæs for thættæ bref. Scriuet eptir waars herræ byrþ þusænd arum thry hundræþ arum fyritighi arum oc fyrum arum jn decollacione sancti Johannis baptiste.

[In order that this be complete and certain and I have not a seal, ask I the seal of honourable father Sir Frende bishop in Strängnäs and his dean Lafrinz Wlphson lawman in Södermanland and Sir Birghir Magnusson to be put on this letter. Written after the birth of Our Lord one thousand years three hundred years forty years and four years on the day of the decapitation of John the Baptist.]

The language of the diplomas is syntactically complex, containing long sentences with abundant subordination, using various subordinating constructions, not least contractions, that are both adverbial and adjectival. Today such diplomas are especially important because they mention a great number of place-names and personal names.

In order to bring the laws up to date, e.g. by regulating the norms for different new subgroups in society, a number of statutes, sometimes called articles, were issued throughout

the Middle Ages as codicils. An addition to the *Jutland law* is called *Thord diægns artikler* [The articles of Thord the deacon], originally written in Latin around 1300, but with later Danish and Low German versions, Sweden had the *Alsnö stadga* [The statutes of Alsnö] and *Skänninge stadga* [The statutes of Skänninge]. In addition, there were statutes for churches and convents, and statutes issued by the king on a number of different matters, e.g. estate statutes, the “gårdsrätt”, concerning misdemeanours of those employed on the king’s estate. This was instituted in Sweden during the reign of King Magnus Eriksson and later exported to Denmark. He also issued statutes on innkeeping in 1344. Other collections of statutes were later drawn up for the trade and craft guilds of the cities.

In some statutes the text structure is reminiscent of that of the laws, with an initial part of the regulation stating the case followed by a description. For the most part, the text structure reflects that of the diplomas, to which the statutes are also stylistically very close with very complex syntax. The borderline between diplomas expressing decisions of authorities and the statutes is in most cases very hard to draw. In academic literature, diplomas and statutes are almost always treated as the same text type.

The language style of the diplomas and the statutes may have its roots in classical times. It continued to be used in the language of the chancelleries for centuries and is still alive at least to some extent in the language of modern legal and political authorities.

3. Medical writing

Almost as old as the laws are texts on medicine. Medieval medical writing in the Nordic countries is closely associated with the Dane Henrik Harpestræng, although his name is explicitly attached only to copies of a rather late origin such as “Hær byrias lækedombir aff mæsther henrik harpostræng” [here starts the remedy of master Henrik Harpestræng] in a Swedish manuscript from the middle of the 15th century. Harpestræng was a canon at the cathedral of Roskilde and died in 1244. The oldest existing copies of his texts are from the end of the 13th century.

The texts attributed to Harpestræng are versions of a book on drugs, which is chiefly a translation into Danish prose of a Latin work written in hexameter, *Liber Herbarum* by Macer (pseudonym for Odo of Meung), who

in his turn drew on ancient (Greek and Arabic) medicine. Other parts of the book are based on work by Constantinus Africanus, another intermediary of Greek-Arabic medicine to western Europe (cf. the introduction by Marius Kristensen to his edition of Harpestræng's herb book).

Some Danish medical texts seem to have used quite different sources from those employed by Harpestræng. Some Swedish texts are compilations using Harpestræng as their main source, but much information nevertheless deviates from that given in the texts ascribed to Harpestræng. The origin of the Swedish medical texts is not clear, as we know them only through manuscripts from the 15th or 16th century. The text was copied over and over again, as it represented the prevailing view on sickness and medicine at least until the 18th century.

3.1. Content

Most of the medical texts are concerned with drugs made of herbs as in the following example:

Vrtica. ær nætlæ. hun ær mykæt het. hun dughær for gulæ sot. of man stampær hænnæ mæth win oc drikkær. Nætlæ frø wæld innæn hunugh. thæt dughær for siuknæth innæn kuddæ. oc thæt helær gamæl hostæ of man drikkær thæt oftæ. oc thæt wrækær burt kuld af lungæ oc ær got bolæn qwith. for allæ thæssæ ær nætlæ frø got mæth hunugh. ællær of man drikkær oftæ grøn nætlæ os.

[Urtica is nettle. She is very hot. She helps against jaundice if one pounds her with wine and drinks. Nettle seed boiled in honey, it helps for illness within testicles, and it heals old cough if one drinks it often. And it ejects cold from the lungs and is good for swollen abdomen. For all these is nettle seed good with honey, or if one drinks green nettle broth].

Remedies were also based on minerals (collected in the *Lapidaria*) and various animal products.

Phlebotomy is sometimes mentioned, as well as prophylactic treatment such as what to eat to maintain one's health. There is some use, although very rare, of religious incantations.

The texts are rather impersonal, concentrating on symptoms and the remedies as in "Raphanus piprarot doger mot magha soth" [horseradish helps for stomach illness]; sometimes the word "illness" is omitted, as in "Saluia hun dughær for liuær" [sage helps for

liver]. If the sick person is referred to, this is typically done in very general terms, e. g. *then siwke* "the sick", but can be more specific, e. g. *spitælskom* "lepers". Sometimes the sick person is referred to with a generic *man* "a man", "one", e. g. "Æther man synaps ffrø" [eats one grain of mustard]. Direct reference to the sick person is very rare, although he may be addressed, as in "Om thu hauer houeth wærk" [if you have a headache]. The patient's gender is implicit in remedies for e. g. help in giving birth, menses or the virile member, and sometimes specific remedies may be recommended for children or for old people. The carer is implicitly referred to in phrases like "Giiffwer man purløk mz wiin dricka thom skadde ære" [gives one leek with wine to drink to those who are injured]. Instructions like "warder hon swden" [is she boiled] or "stamper man hennes frø" [pounds one her seed] may be directed either to the patient or the carer, or even to the druggist.

The Harpestræng text is a very close although prose rendering of Macer. It is, however, abbreviated, and some content is missing. This does not seem to have been done in any systematic way, except that information given by Macer about sexual matters, giving birth and menses was very often omitted by Harpestræng.

3.2. Text structure

The structure of the medical texts is rather standardised, based on similar texts from classical times. The text is divided into paragraphs, the theme of each being either a remedy, such as a particular herb, or a specific symptom. The former type (cf. the example in 3.1.) starts with specifying the remedy, e. g. giving the name of the herb, usually both in Latin and the vernacular: "Vrtica ær nætlæ" [Urtica is nettle], "Thus. røkilsæ" [Tus, incense], followed by the medical qualities of the remedy according to the prevalent medical ideology of the time, humoral pathology: "thus thæt ær het oc thiurt innæn annæn trappæ" [Tus it is hot and dry to the second degree].

The main part of the paragraph deals with the effects of the remedy, e. g. "thæt dughær for ethær" [it helps against poison]. This is the common pattern, but sometimes a description is given of how the remedy should be handled to be efficient for different illnesses, e. g.: "Stampær man røkælse mæth fet af swin. thæt dughær til thæt thær brænt ær" [crush you in-

cense together with the fat of pigs, it helps for what is burnt], “drikkær kunæ hænnæ thær döt barn hauer. tha kummær barn ut af hænnæ” [Drinks woman her (wormwood) who a dead child has, then comes the child out of her]. This descriptive part generally consists of a sentence with inverted word order.

Paragraphs with a symptom as their theme start with naming it, e.g. “Om thu hauer houeth wærk” [if you have a headache] For hostæ” [for coughs], followed by an enumeration of possible remedies, as in the following excerpt:

Item for lösa tender skwalpa ätykya j mwnnen thed festher tendher verum est. Item for blod soth skal man tagha gress tormentilla som wexer i mosanom oc haffuer golt blomster mz fyra blad oc haffuär rödhä rooth, thed hielper tz är vist. [Further for loose teeth, splash vinegar in the mouth, it fastens teeth, that is true. Further for dysentery, one shall take the grass tormentilla which grows in the peat and has yellow flowers with four leaves and has a red root, it helps, that is certain.]

The prescription may end with a general statement of the effects of the remedy, such as “tha hielper thz” [then helps that], sometimes with a reference to some medical authority, e.g. “tz hielper siger Galienus” [that helps says Galen].

3.3. Language aspects

The medical texts are characterised by a great number of terms, some of them taken directly from the Latin sources, others from the vernaculars (both Nordic and northern German) used previously in oral communication. They refer to anatomy, physiology and sicknesses, as well as to names of herbs and other drugs. Through the medical books, these terms have been established in the Nordic written language, and most of both the Latin and the vernacular terms are used even today. The herbal terminology, both Latin and vernacular, is firmly associated with the pharmaceutical tradition, and was later used by e.g. Linné.

The names of different herbs, as well as anatomical terms like *milt* ‘spleen’, *nyræ* ‘kidney’ and terms for illnesses, like *gulæ sot* ‘jaundice’, *blodsot* ‘dysentery’, are mostly used without any further explanation, presupposing that the reader or listener possessed a great deal of previous knowledge about symptoms of sicknesses and how different herbs in the garden are to be recognized. This implicitness suggests that the purpose of making the texts

was probably to create a notebook, a kind of reminder of particular remedies for the practitioner. At least to some extent, the text was also directed to the ordinary person who was taken ill.

The vernacular language was used, possibly because good knowledge of Latin was not that widespread even among those for whom the texts may have been intended. Some parts are rendered only in Latin, and Latin is sometimes used in otherwise vernacular texts when referring to illnesses of the genitalia.

4. History texts

In many of the Danish and Swedish history texts from the Middle Ages, the language is Latin. This is the case for the extensive Danish chronicle by Saxo, *Gesta Danorum*, from about 1200, as well as a Swedish history book written in the middle of the 15th century by Ericus Olai. The yearbooks or annals composed in the monasteries, which recorded both local and European events during each year, are mostly written in Latin, although some items are in the vernacular language. Historiography also embodies catalogues of more or less obscure kings and rhymed chronicles. Characteristic of all these texts are terms referring to warfare and politics as well as the activities and appearance of the upper classes.

One reason for writing the chronicles was the desire to keep the memory of the events alive in order to secure and strengthen the group identity among those reading them or listening to them. This was particularly important in a situation where national states were being formed. Perhaps equally important was the question of who was to govern these new states, so that making particular rulers look better than others in the eyes of the people was another goal of the chronicles. Catalogues of rulers, often with extensive genealogical information, have been used in many cultures as a means of justifying the predominant position of a certain individual or family. Other types of text might serve similar purposes. The rhymed chronicles were probably particularly efficient because they were entertaining, and they were also read aloud in places where many people were gathered, e.g. market places. A number of ballads from the later part of the Middle Ages with historical content probably served the same function.

4.1. The Guta Saga

In the same manuscript that contains the Guta law, there is also a history of Gotland, called the *Guta Saga*. It starts out with the first colonisation of the island:

Gutland hitti fyrsti maþr þan, sum Þieluar hit.
Þa war Gutland so eluist, at þet daghum sanc oc
natum war uppi. En þann maþr quam fyrsti eldi
a land, oc siþan sanc þet aldri.

[Gotland found, as the first, the man who Tjelvar
was called. Then was Gotland under such a spell
that it during the day sank and in the nights was
up. But this man brought as the first fire to the
land, and then sank it never more].

It continues with the story of people emigrating from the island to the south of Europe. It also tells about heathen traditions and how the island was Christianized, and about political issues. The *Guta Saga* relates the political and ecclesiastical status of the island, which provides good motivation for it to have been included in the *Guta law*. It is believed that it was written not later than 1285, because an agreement was made that year between the people of Gotland and the Swedish king Magnus Ladulås that changed some norms which it records as still valid.

4.2. The notes of the priest of Vidhem

The oldest Swedish history text is a catalogue of lawmen and kings, called *Vidhemsprästens anteckningar* [the notes of the priest of Vidhem] and is ascribed to a Västergötland priest. It was probably written in the middle of the 13th century; the oldest manuscript is from the beginning of the 14th century, attached to a manuscript containing a copy of the Västergötland law. It enumerates 19 lawmen in Västergötland as well as 18 Swedish kings from the first Christian king, Olof Skötkonung, to King Johan, who died in 1222. All paragraphs start by stating the ordinal number of the king and his name, then giving some information or an evaluation of the king:

Þriðhi war Æmundær slemæ, þy at war sliskær
oc eygh goðþær at þra i þy mali, han wildi
fræmmiæ. Oc han gørdhe skiael mællin Swerikis
oc Danmark, swa sum sighx i landæmærum.

[The third was Edmund rogue, because he was
mean and not easy to have to deal with in those
cases he wanted to promote. And he made the
border between Sweden and Denmark, as is said
in the section on borders.]

The kings during that period came from two different families who were fighting for the

Swedish throne. The author shows an obvious partiality for a family with connections to Västergötland, shown e.g. by a statement like “Oc e glæddus wæstgøtær af hanum” [And the people of Västergötland were always happy with him].

4.3. The chronicle of Erik

The oldest rhymed chronicles in Europe were written by the Anglo-Normans in the 12th c., using the French *chanson de geste* as a pattern. This text type flourished in Europe around 1300. The first Swedish rhymed chronicle, *Erikskrönikan*, was probably written some time between 1322 and 1332, and it gives an account of the period from 1230 until King Magnus Eriksson was crowned in 1319. The oldest existing copies are, however, from the 15th century. It was followed by a number of chronicles written during the later part of the Middle Ages (cf. art. 131).

4.3.1. Language features

The meter of the chronicle is knittelvers. The characteristics of this meter is that the lines are rhymed in pairs, and each line has four to seven feet, but in the Nordic tradition it was treated very freely. This text type may be illustrated by the following excerpt, where the Swedish earl Birger jarl is talking to his wife about finding a wife for their son Valdemar:

Qwinnor fynna ok godh rad stundom.
Huro tykker tik hær vm wara
– ther skaltu mik wel til swara –
vm war son, som konunger ær
– han er oss badhum hionom æmkær –
huar han matte ena jomfrw faa,
at rikit matte tess bæther staa?
[Women find also good means at times.
What do you think about this – please
answer me – about our son, who is king
– he is equally dear to both of us –
where will he get a wife so that the kingdom may
prosper?]

A characteristic stylistic feature is fictitious direct and indirect speech. This makes the texts more down-to-earth and perhaps more trustworthy, and it has a dramatizing effect, which makes the texts more interesting and easier to comprehend. It is also a means of showing what is supposed to be the motivation for an individual's activities. Similar patterns may be seen in modern journalism.

The chronicle is characterized by the style of romance poetry, with rather stereotypical

descriptions of the male and female characters and their actions, such as phrases like “Tha swarade hon, som hon wel kunne, søth ordh aff rødhum mwnne” [Then she answered as best she could, sweet words out of a red mouth], “Riddara ok swena wordo tha kledde, frome hælade ok men vrædde” [Knights and squires were then equipped, brave knights and men without fear].

5. Educational writing

Educational texts are essentially intended for a wider range of people. In the early Middle Ages, the audience for written texts was very small, which may be the reason why educational texts from the early part of the Middle Ages are very scarce. Probably education was still predominantly oral at that time.

A number of proverbs illustrating moral norms are ascribed to the otherwise unknown Dane Peder Låle. They are Latin proverbs presented with Danish equivalents, and Danish proverbs or common phrases presented with Latin equivalents.

Alterius plena frustra sonat ere crvmena/Then
pungn ær thom som andær mans peningh ær i.
[That purse is empty which another man’s money
is in].

Ampnem paruorum facit vnda frequens fluuio-
rum/Mangæ bekkæ ok smo gøæ en stor aa.
[Many brooks and small make a big stream.]

The proverbs were collected in the 14th century, but the oldest manuscript is a fragment from the middle of the 15th century. The complete collection was printed in 1506. It is known that the collection was used in the beginning of the 15th century as a school book, not just for ethics but also to teach Latin.

The education of young men within the aristocracy, notably those who would become kings, is the subject of the Swedish text *Konungastyrelsen* [The governing of kings]. This is supposed originally to have been written in the first part of the 14th century, but the only complete copy is Bure’s printed edition from 1634, besides a manuscript fragment from the first half of the 15th c. It was compiled, as it says explicitly in the text, from works of Egidius de Columna, e.g. *De regimine principum*. The text provides general codes of behaviour by which a young man should be brought up: he should learn good virtues and wisdom, be moderate in eating and drinking, be careful of his words, not participate in sinful activities and avoid bad company. The

most important part of the book starts with the words “Nw sigs, huru konunghir ælla hōfðinghir skal styra landh ælla almogha” [Now is said how a king or a chief shall govern land or people], and the norms given are related to Aristotle, Seneca and King Solomon among others.

The educational texts are written in a straightforward and syntactically simple language. A rule of behaviour is given and sometimes the reasons for it, without any linguistic ornamentation.

6. Fiction

Like in other parts of Europe, the new aristocracy in the Nordic countries had a desire for entertainment. People of the upper classes promoted the production of texts that were pure fiction, with no other purpose than to entertain: “them til skemptan ther a wile hōra” [to diversion of those who want to listen], as it says in *Ivan the Lion Knight*. However, the borderline between historical and educational writing is sometimes hard to draw.

In the beginning of the 14th century, possibly 1303–1312, the Norwegian queen Eufemia is believed to have promoted translations into Swedish knittelvers of three chivalry romances: *Ivan the Lion Knight*, *Duke Fredrik of Normandy* and *Flores and Blanceflor*. A Swedish copy of these texts is dated to about 1400, and there are copies of a version in Danish which are about a hundred years younger. The date of the original text is given in the end of Ivan:

Tha thusand vinter, thry hundradh aar
fran Gudz føzlo lidhin var
ok ther til thry, ij thæn sama tima
vardh thæsse bokin giordh til rima,
Eufemia drøtning, thet maghin ij tro,
læt thæssa bokena vända swo
aff valske tungo ok a vart maal.

[When one thousand winters, three hundred years
from the birth of God had elapsed, and yet three,
at that very time was this book made into rhyme.
Queen Eufemia, that must you believe, had this
book translated from French and into our lan-
guage.]

Of course, this kind of information is not very reliable. As was usual in those times, “translation” means that the text was a compilation from a number of texts, not only romances but also ballads, and there are even traces of Norwegian sagas in it.

7. Religious texts

There were few religious texts during the early medieval period (cf. art. 131), but some seem to have existed in written form. In the Swedish *Pentateukparafrazen*, parts are a paraphrased translation of the Pentateuch, while other parts are commentaries to the text, e.g. “Hær skulom wi vndirstanda at [...]” [At this point we should understand that], “Oc ær thz mærkelikt at gud bœriadhe daghin aat quældino” [and it is to be noted that God started the day at the evening].

Certain kinds of religious texts are called legends, a term based on a Latin word meaning ‘what should be read’, because they were used as an instructional part of the liturgy. A number of these are collected in *Fornsvenska legendariet* [The Old Swedish book of legends], handed down in manuscript copies from the middle of the 14th century. They start with stories about the Virgin Mary and end with stories about holy persons from the middle of the 13th century; some of them were probably known during the early medieval period. The text is based on a *Legenda aurea* by Jacobus de Voragine, which contains narratives with a saint as the main persona. They were entertaining as fiction and at the same time instructive, and they were probably regarded as effective religious propaganda.

8. Literature (a selection)

Swedish medieval texts are published in *Samlingar utgivna av Svenska fornskriftsällskapet* by a society founded in 1843. Many editions have introductions to the texts. The Danish laws are published in *Danmarks gamle Landskabslove* 1–8 (1932–51), and the Swedish laws in *Samling av Sveriges gamla lagar* I–XII, ed. by C.J. Schlyter, I–II together with H. S. Collin (1827–69). Translations into Modern Danish and Modern Swedish with commentaries are found in Kroman, Erik/Juul Stig, *Danmarks gamle Love paa Nutidsdansk* 1–3 (1945–48) and Holmbäck, Åke/Wessén, Elias. *Svenska landskapslagar tolkade och förklarade för nutidens svenskar* (1933–46). Diplomas are collected in *Diplomatarium Danicum* (1938 and later), and in *Svenskt Diplomatarium* (1829 and later).

111. Translations and interference by translation in Old Nordic I: Old Icelandic and Old Norwegian

1. Translations
2. Interference from translation
3. Literature (a selection)

1. Translations

The vehicle for the transmission of foreign literature to Norway and Iceland was above all the Christian Church, which brought the Norwegians and Icelanders into touch with European civilization in a way they had not been before. The intercourse between the centers of learning on the Continent and in Britain and the monasteries and cathedrals in Norway and Iceland in the centuries following their conversion to Christianity led to the translation of an astonishing number of not only devotional and doctrinal books, but also secular works of various kinds.

1.1. Translations from Latin

Presumably, the Norwegians and Icelanders confined themselves at first to translations of the essential tools for Christian instruction. Indeed, the earliest preserved manuscripts are of clerical provenance: AM 732a VII 4to from 1121–39 has an Easter Table; AM 237a fol. from ca. 1150 contains a fragment of two homilies, while AM 655 IX 4to from ca. 1150–1200 contains fragments of the lives of Saints Placid, Blaise, and Matthew. It is not known when religious literature was first translated into Norse, but it is unlikely that it made its appearance before the latter part of the 11th century, after the establishment by Bishop Ísleifr Gizurarson (1056–80) of the school at Skálholt in Iceland, and in Norway with the establishment of the episcopal sees in the reign of Óláfr kyrr Haraldsson (1066–93) (Kirby 1980, 17). On the other hand, neither AM 237a fol. nor AM 655 IX 4to is an original: AM 655 IX 4to is a copy of earlier material, and AM 237a fol. is not only a copy, but makes use of a Norse translation of Gregory the Great's 34th gospel homily extant in later manuscripts, which implies that the earliest translation of Gregory's *Homiliae in evangelia* was undertaken before the mid-12th century. Other translations, some of a theological and philosophical rather than devotional nature, which appear at the end of the 12th century, but which may be older, include the *Physio-*

logus, Gregory the Great's *Dialogues*, *Niðrstigningar saga* (a translation of the second part of the Gospel of Nicodemus, the *Descensus Christi ad inferos*), and most of the material contained in the two books of homilies, commonly referred to as the *Stockholm or Old Icelandic Homily Book* and the *Old Norwegian Homily Book*. The two books, which have eleven items in common, all based on earlier exemplars, are, however, homiletic handbooks rather than homiliaries and also contain commentaries on the *Paternoster* and the service of the mass. The *Old Icelandic Homily Book* also includes an allegorical interpretation of the eight church modes, a rendering of a section of Pseudo-Ambrose's *Acta Sancti Sebastiani*, two versions of the *Credo*, an Easter gospel harmony, a passage from a life of Saint Stephen, and prayers to Christ and the Virgin Mary. The *Old Norwegian Homily Book* contains a translation of Alcuin's *De virtutibus et vitiis*, a translation of the Old French poem *Un samedi par nuit*, a homily on Saint Óláfr derived from a *vita* predating Archbishop Eysteinn Erlendsson's *Passio Olavi*, and a vernacular version of the extended series of twenty *Miracula Beati Olavi*. Sources for a number of the texts in the two homily books have been found in the works of Ambrosius Autpertus, Augustine, Bede, Caesarius of Arles, Fulgentius of Ruspe, Gregory the Great, Haymo of Auxerre, Honorius Augustodunensis, Maximus of Turin, and Pascasius Radbert. Much of the source material used by the homilists was available in well-known homiliaries including those compiled by Alan of Farfa and Paul the Deacon, but the homilists probably utilized other collections as well (McDougall 1993, 290–91). In addition, the translation of the now-lost Latin *vita* of Saint Magnús, preserved in the extant vernacular accounts of the Orkney saint, and *Veraldar saga*, of a more secular nature, have been dated to before 1200. This work is a chronicle of world history covering the six *aetates mundi* from the Creation to the 12th century, the core of which is presumably a reworking of an unknown original. The oldest part is based ultimately on Bede's and Isidore's chronicles, but is augmented with matter drawn from the Bible, Bible commentaries, and other sources. For the section on the ancient history of Rome, the compiler appears

to have relied on *Rómverja saga*, a translation of Sallust's *Bellum Iugurthinum* and *Coniuratio Catilinae* and Lucan's *Pharsalia*, which has been dated to the 1180s at the latest. The material for the history after Bede is known from German annals and chronicles, but no specific source has been identified. Translations in existence by ca. 1200, but which cannot be dated more precisely, include *Elucidarius* (a translation of Honorius Augustodunensis' theological textbook), the epigrams of Prosper Aquitanus, preserved fragmentarily in AM 677 4to (ca. 1200–25), which also contains the end of the Pseudo-Cyprian document *De XII abusivis saeculi*, and AM 685c 4to (ca. 1300–25), a commentary on the Penitential Psalms preserved in two fragments, AM 655 XXIII 4to and AM 696 XXIV 4to from the early 13th century, and some other liturgical material, notably the fragments of a breviary in AM 655 XXI 4to dated to ca. 1200–50. In addition, it is possible that the translation of Exodus 19 to the end of Deuteronomy, the work commonly referred to as *Stjórn II* and preserved in a 15th- or early 16th-century addition to AM 226 fol. (ca. 1350–70), may represent a translation from before or around 1200 of the historical literature of the Old Testament, although there is not as yet consensus on the date of *Stjórn II* (Kirby 1986, 56–60). The same applies to the translation of *Visio Pauli*, preserved fragmentarily in AM 681c 4to (ca. 1400) and AM 624 4to (ca. 1500) (Sverrir Tómasson 1993, 270).

Translations of hagiographic material in different forms were produced throughout the medieval period and comprise the bulk of Old Norse translated texts. It is difficult to assign a date to much of this material. As noted above, AM 655 IX 4to contains three legends, and to these early translations may be added the legends of Basil, Clement, Erasmus, Nicholas, and Silvester, which are all found in early manuscripts, more specifically from the first quarter of the 13th century, which saw also the life of Jón Ögmundarson, bishop of Hólar (1106–21), presumably translated soon after Jón was declared a saint in 1200. The original, now-lost Latin *vita* of Jón was composed by the monk Gunnlaugr Leifsson of Þingeyrar (d. 1218/19), who is credited also with the composition of a Latin *Óláfs saga Tryggvasonar*, which, like that of his fellow-monk Oddr Snorrason, has survived only partially in Old Norse translation, and *Merlinusspá*, a versified translation in *fornyrðislag* of the *Prophetiae Merlini* contained in Geof-

frey of Monmouth's *Historia regum Britanniae*. *Merlinusspá*, along with *Hugsvinnsmál*, a loose rendering of the *Disticha Catonis*, and *Heilags anda vísur*, a free rendering of the hymn *Veni, creator spiritus*, which have both tentatively been dated to the 13th century, are the only versified translations so far identified in Old Norse. The translation and compilation of the life of the Virgin Mary, which in *Guðmundar saga* is attributed to the cleric and bishop-elect Kygri-Björn Hjaltason (d. 1237/38), has also been assigned to the early 13th century. The work is based on a number of sources, of which the primary ones are *Liber de ortu beatae Mariae et infantia salvatoris* (Pseudo-Matthew) and *De nativitate Mariae*, which depends on the former. Minor sources for the account of Christ's childhood are the canonical gospels of Matthew and Luke. The historical background for Mary's life is drawn mainly from Flavius Josephus' *Antiquitates Judaicae*. Additional sources are Jerome, Gregory the Great, Augustine, and John Chrysostom. Only a few of the sources for the many theological commentaries that are interwoven into the story of Mary's life have yet been brought to light. Further works dated to the early 13th century are two semi-historical works: *Trójumanna saga*, a compilation of translations of Dares Phrygius' *De Excidio Troiae*, *Ilias latina*, and other sources; and *Breta sögur*, a translation of the *Historia regum Britanniae*. From the mid-13th century come *Barlaams ok Josaphats saga*, a tale based upon the legends of the life of Buddha, and *Duggals leiðsla*, a translation of the *Visio Tnugdali*. Of a slightly later date is the earlier *Thómas saga erkibiskups*, a life of Thomas à Becket, based on the so-called *Quadrilogus prior*. Also dated to shortly after the mid-13th century are *Stjórn III*, a translation of Old Testament material from Joshua to 2 Kings, augmented with matter drawn from the *Imago mundi* and *Speculum ecclesiae* of Honorius Augustodunensis, the *Liber exceptionum* of Richard of Saint Victor, and possibly Peter Comestor's *Historia scholastica*; and *Gyðinga saga*, based on 1 and 2 Maccabees, *Historia scholastica*, and a certain "historia apocrypha" of the lives of Pontius Pilate and Judas Iscariot, compiled by Brandr Jónsson, bishop of Hólar (1263–64), to whom has also been attributed *Alexanders saga*, a translation of Galterus de Castellione's *Alexandreis*. Finally, a translation of the anonymous poem *Pamphilus de amore* and two philosophical-theological dialogues grouped together as the so-

called *Viðræða líkams ok sálar* in *Hauksbók* (AM 544 4to; ca. 1290–1350) have been assigned somewhat more broadly to the 13th century. One is a translation of the Pseudo-Senecan dialogue *De remediis*, which figures in a shortened form as the 26th chapter, “De fiducia et securitate”, of *Moralium dogma philosophorum*; the other is an interpolated translation of Hugh of Saint Victor’s *De arrha animae*.

It is generally believed that most of the translations of saints’ lives originated in the last quarter of the 13th century and during the 14th century. The corpus is varied and includes the passions of the early martyrs, such as those of Agnes and Sebastian, the sources of which are the Pseudo-Ambrosian *passiones*; lives of the early ascetics, such as those of Anthony of Egypt, the source of which is the *vita* of Athanasius, and the desert fathers, that is, *Vitae patrum* based on Rufinus’ *Historia monachorum*, *Verba seniorum*, and Pelagius’ commentary on the latter work; and the lives of the early confessors, such as those of Martin of Tours, based on the *vita* of Sulpicius Severus with additional material from other sources, and Paul the Hermit, based on Jerome’s *vita*. The lives of the fathers of the Church include those of Ambrose, based chiefly on the *vita* of Paulinus; Augustine, translated by Runólfur Sigmundarson (d. 1307), Abbot of Pykkvibær, from an unidentified source; and Gregory, the source of which is the *vita* by John the Deacon. Works on the apostles, however, appear to have taken pride of place; legends of all the apostles, including Paul and Matthias, are extant often in several versions. In its earliest form, the rendering of this material represented close translation of the Latin sources. AM 645 4to from ca. 1220–50, for example, contains fairly straightforward translations of *passio* material on Peter, James the Greater, Bartholomew, Matthew, Andrew, and Paul, and on Pope Clement and Bishop Martin. But in the course of the 13th century much of this material was reworked and expanded, and a greater freedom in the use of sources becomes noticeable. In AM 655 XII–XIII 4to from ca. 1250–75, containing the legends of Peter, James the Greater, Bartholomew, Matthew, and the composite legend of Simon and Jude, the apostolic legend material has been retranslated and supplemented with, for instance, an account of the apostle’s life as described in the Gospels and an account of the history of his relics. The saints’ lives in general underwent no such change: in most cases their con-

tent did not lend itself to amplification, and their transmission suggests that, with only few exceptions, the older versions remained in vogue throughout the medieval period. Stock. Perg. 2 fol. from ca. 1425–45, for example, contains texts of a number of saints’ lives, which have been copied virtually unchanged from earlier exemplars. Later still, a different approach to the work of translation became popular, in which the emphasis was on paraphrase. With the often copious additions, usually of an illustrative, explanatory, or purely decorative nature, from the Church Fathers and more recent works, such as the *Historia scholastica* and Vincent of Beauvais’ *Speculum historiale*, the genre of translated religious literature became a more individualistic one. In the case of the legends of the apostles, this new approach is seen in, for example, the *Codex Scardensis* (ca. 1360) legends of Peter, Paul, and the composite legend of John and James the Greater, based on an exemplar dated to ca. 1300. A similar style is found also in the priest Grímr Hólmsteinsson’s (d. 1298) legend of John the Baptist. The work is a compilation of information about John in which his life story according to the Gospels is filled out with material from, for example, Bede, Peter Comestor, Vincent of Beauvais, and the Church Fathers Gregory the Great, Augustine, Ambrose, and Jerome. Further examples are the lives of the Archangel Michael and Archbishop Nicholas, both attributed to Bergr Sökkason (d. 1350), Abbot of Munkaþverá; the composite life of Martha and Mary Magdalen; the younger *Thómas saga erkibiskups*; and also *Stjórn* I, the translation of Genesis-Exodus 18 with additions drawn from *Historia scholastica*, *Speculum historiale*, Isidore’s *Etymologiae*, William Durand’s *Rationale divinarum officiorum*, Jacobus de Voragine’s *Legenda aurea*, and the works of Augustine.

The last-mentioned works have been dated to the early 14th century, and from the first half of this century we also have *Amicus saga ok Amilius*, based on *Speculum historiale*, and the life of Saint Dunstan compiled by the monk and priest Árni Laurentiusson (b. 1304) on the basis of a life by Abelard written between 1006 and 1012, a life by Eadmer of Canterbury, *Speculum historiale*, *Passio Sancti Edwardi*, and Isidore’s *Etymologiae*. Another type of material is represented by the exempla, many of which are translations of a few Latin collections whose ultimate sources were Caesarius of Heisterbach, Martin of Troppau,

and Vincent of Beauvais. Over a dozen exempla appear to be based on oral tradition, however, and some of these are attributed in the manuscripts themselves to the Norwegian Jón Halldórsson, Bishop of Skálholt (1322–39), who allegedly translated *Klári saga* from a now-lost Latin original.

Somewhat more difficult to date are the translations included in *Hauksbók* (AM 544, 4to), some of which are found in manuscripts older than *Hauksbók*. Apart from two sermons, which are considered translations from Old English (Ælfric’s homilies *De falsis diis* and *De auguriis*), all the material is translated from Latin. While the specific sources for some of the geographical, chronological, and theological dissertations and excerpts in the section commonly labelled „Heimslýsing ok helgifræði” remain unknown, the majority of texts appears to be extracts from Isidore’s *Etymologiae*, although the geographical compendium may equally be based on Honorius Augustodunensis’ *Imago mundi*. Among the sources identified for translations included in the following section, “Heimspeki ok helgifræði”, are *De duodecim abusivis saecule* and Godofridus de Trano’s *Summa super titulos decretalium*. Further texts based on foreign sources include a lapidarium, the source of which is Marbodius of Rennes’ *Liber lapidum*, and two mathematical treatises, *Algorismus*, the source of which is Alexander de Villa Dei’s *Carmen de Algorismo*, and *Prognostica temporum* in Latin, a translation of which is found in several manuscripts. An encyclopedia of a similar kind, though with more of an emphasis on the natural sciences, is represented by, for example, GKS 1812 4to (ca. 1192–1500), which draws on the works of several astronomers (John of Sacrobosco, Gerlandus, and Helpericus), as well as medieval popular texts (*Elucidarius* and *Cisio Janus*) and encyclopedic works by a variety of authorities (Isidore, Macrobius, Hrabanus Maurus, Bede, and Jerome).

1.2. Translations from French

Until the first decade of the 13th century, virtually all translations into Old Norse were from Latin. At this time translations from French make their appearance. These are the romances, the translation and production of which is believed to have been initiated by King Hákon Hákonarson (1217–64). He is named as the commissioner of *Tristrams saga* (based on the *Tristan* poem by Thomas), *Elis*

saga (based on the *chanson de geste Elie de Saint Gille*), *Ívens saga* (a translation of Chrétien de Troyes’ *Yvain*), *Mottuls saga* (a translation of the *fabliau Le Lai du cort mantel*), and *Strengleikar* (a translation of 11 of the 12 *lais* traditionally attributed to Marie de France, six anonymous *lais* found in other collections, and four *lais* for which no source has survived). Most likely *Erex saga* and *Parcevals saga/Valvers þátr* (translations of Chrétien’s *Erec et Enide* and *Perceval*) were also written for the court of King Hákon. Dated to about the mid-13th century are *Karlamagnús saga* (a compilation of Carolingian *chansons de geste* as well as the Latin *Pseudo-Turpin Chronicle*), *Flóres saga ok Blankiflúr* (translated from *Floire et Blancheflor*), *Flóvents saga* (an adaptation of a lost *chanson de geste*), and *Partalopa saga* (based on a lost version of *Partenopeus de Blois*). *Bevers saga* (translated from a lost version of *Boeve de Haumtone*) has been assigned to the end of the 13th or the early 14th century. Sometimes included among romances is *Þiðreks saga*, a compilation of tales of German origin about Dietrich of Bern.

2. Interference from translation

The translation of foreign works into Old Norse influenced the language most notably at the lexical and syntactic levels. Although both foreign and native currents mingled from the start, some differences of language and style can be observed in the translated works, and the term “learned style” has been applied to distinguish the language of these works from that of native compositions on native subjects, which has commonly been labelled “popular style”. In the late decades of the 12th century, the salient features of learned style are found only sporadically, and it is not until the early 13th century that it begins to develop into an artistic prose medium. The two *Homily Books*, for example, are written in a simple, idiomatic prose style reminiscent of the home-spun narrative of the Sagas of Icelanders. They are generally devoid of Latinate vocabulary and syntax, though in some passages, rhetorical devices, such as isocolon, antithesis, chiasmus, anaphora, alliteration, and word pairs, are exploited to achieve a high style (McDougall 1993, 290).

2.1. The learned style is characterized above all by a greater verbosity than the popular

style and by the use of rhetorical figures of speech and grammatical constructions alien to or infrequent in the native works. The verbosity consists to a considerable extent of characterizing adjectives (epithets), the use of parallelisms and antithetic expressions (e. g., *hreysti ok riddaraskapr* [valor and knighthood]; *valk ok vandræði* [worry and difficulty]; *syrgði hann hana dauða, en landslýðr allr syrgði hann viltan* [he mourned her death, but all the people of the land mourned his having gone astray]), assonance, rhyme, and alliteration (e. g., *harmr ok hǫrmung* [grief and affliction]; *ráð ok ræður* [counsels and speeches]; *siðaði ok friðaði* [reformed [the faith] and restored to peace]). Grammatical constructions typical of learned style include the extensive use of participle constructions, for example, in apposition to the subject with the function of a subordinate clause (e. g., *spakr maðr hræðisk guð í qlum verkum sínum vitandi sik hvergi mega flýja návistu hans* [a wise man fears God in all his actions knowing that he can by no means escape His presence]), the use of the dative absolute (e. g., *liðnum þeim sjau vetrum* [when the seven winters had passed]), and the use of reflexive forms with a pronounced passive sense (e. g., *hirð eigi þú yfir at stigask af illu* [beware of being overcome by evil]). Further characteristics of learned style are the use of interrogative pronouns as relative pronouns, the substantive use of adjectives, and the use of *sjálfir* ‘himself’ (like *ipse*) to lay stress on the relative relation. All these features do not necessarily appear in all works written in learned style, nor are they at all times direct translations or imitations of similar Latin expressions and constructions; in many cases they may be due to the rhetorical training of the translator rather than the respective Latin source. The frequency of loanwords and new coinages also varies greatly and is to quite an extent determined by the nature of the source text. Generally, only a limited number of Latin loanwords appear to have entered the language via translations, and these tend to be restricted primarily, although by no means exclusively, to religious or more scientific terminology, such as *amor* ‘love’, *ampulla* ‘flask’, *antifona* ‘antiphon’, *atóma* ‘atom’, *dalmatica* ‘dalmatic’, *disputa* ‘debate’, *figúra* ‘figure’, *graðall* ‘gradual’, *homilia* ‘homily’, *iuristi* ‘jurist’, *kollekta* ‘collect’, *kóróna* ‘crown’, *marmari* ‘marble’, *obláta* ‘host’, *past* ‘food’, *piktúrr* ‘painter’, *psalmr* ‘psalm’, *purpuri* ‘costly cloth’, *regula* ‘monastic order’, *salterium* ‘psalter’, *testament* ‘testament’, and *vigilia* ‘vigil’

(Hødnebo 1966, 45). Some loan translations may also be attributed to the adaptation of Latin literary works to Old Norse (e. g., *vespers* > *aptansqngr*, *synagogue* > *þinghús*, *prophet* > *spámaðr*, *decimal* > *tíund*, and *vigil* > *vaka*) (Hødnebo 1966, 45).

2.2. The so-called “court style” represents a further development of the learned style and is found primarily, but by no means exclusively, in translations from Old French. It is characterized by a wider range of rhetorical elements, in particular various forms of parallelism, and well-known conventions are used more frequently and in a more sophisticated manner than in the learned style. Synonyms, alliteration, and assonance are common, but the use of participles and antithesis is more limited than in the learned style. Loanwords appear frequently; many are isolated occurrences, but a fair number gained ground, such as *asni* ‘donkey’, *glósa* ‘explanation’, *isópi* ‘hyssop’, *kamell* ‘camel’, *kordúna* ‘cordovan’, *kreatýr* ‘creature’, *kurteisi* ‘courtesy’, *lampr* ‘lamp’, *marchíss* ‘marquis’, *mustarðr* ‘mustard’, *pardún* ‘pardon’, *prinz* ‘prince’, *púsa/púsi* ‘spouse’, *sira* ‘sir’, and *turniment* ‘tournament’ (Jakob Benediktsson 1964, 97; Hødnebo 1966, 45).

2.3. The works that reveal most noticeably foreign influences are those written in what has been called the “florid style”. The emergence of this style is connected with general developments in European Latin writing in the 13th century, in which there was a growing preference for the elaborate and the bombastic. It is characterized by ornate phrasing and rhetorical mannerisms: a profusion of adverbs and adjectives (especially of the type ending in *-liga/-lega*) and compound nouns, often abstracts, with frequent repetition for the sake of parallelism or antithesis; abundant alliteration; and a preference for participial verbal forms in imitation of Latin usage, but often freely constructed and without any foundation in the Latin sources. An abundance of metaphors serves as pedagogic tools, as do digressions. The florid style was regarded as an advanced manner of writing, and there were practitioners of the style in the latter half of the 13th century (it is found fully-fledged in Grímr Hólmsteinnsson’s *Jóns saga baptista*), but its golden age was the 14th century, with Bergr Sokkason as its best-known exponent, who used it also for independent compositions.

112. Translations and interference by translation in Old Nordic II: Old Swedish and Old Danish

1. Introduction
2. The paraphrast: the translator's forerunner
3. The genres
4. The influence of translation on the East Nordic vernaculars
5. Literature (a selection)

1. Introduction

The role of translation in the development of the written vernacular depends, of course, on contact with other linguistic communities. Not until this contact assumes such character and such proportions as to call for communication over otherwise unbridgeable linguistic gulfs does translation become relevant. In Scandinavia, this historical situation coincides with the first initiatives to use the Latin alphabet for composing written documents in the vernaculars. This means that the oldest vernacular texts essentially comprised more or (often) less literal imitations of Latin originals,

and sometimes there were even different types of mixture between this kind of imitation and writing exclusively in Latin or directly in the vernaculars.

In Sweden and Denmark, this early phase of written transfer over linguistic boundaries falls roughly within the final half-century of the period treated in this article, or approximately 1300–1350. In Sweden this means the culmination of the so-called Folkunga epoch; in Denmark the period is delimited by Kings Eric Menved and Valdemar Atterdag. In the history of the Nordic languages we are dealing with the period traditionally referred to as, respectively, older (or “classical”) Old Swedish (by Wessén and others) and Early Middle Danish (by Skautrup) or (early) Old Danish (cf. art. 4).

Christian missionary activities, followed by the Latin language, Latin script, rudimentary book-learning and the beginning of literacy, had reached Denmark before Sweden: in the

10th and 11th c. respectively. With an excellent, stylistically first-rate historiographer like Saxo Grammaticus, Latin writing in Denmark was flourishing already during the so-called Great Valdemar epoch in the later 12th and earlier 13th c. – at a time when Sweden could offer nothing of the sort. It was not until more than half a century later that Sweden was capable of producing a Latin work on a European level: *St. Bridget's Revelations*. It is hardly accidental that this latter achievement coincides in time with the pioneering epoch of vernacular East Nordic literature dealt with here.

This use of vernacular language in writing with the Latin alphabet presents the reverse picture: here Sweden was ahead of Denmark. This is reflected in the dating of the oldest preserved documents: the Swedish *Äldre Västgötalagen* ca. 1220–50 and the Danish *Skånske lov* ca. 1250. Nor is it accidental that both these pioneering documents are provincial laws. Legislation, along with the constantly increasing use of written documents in official administration, was the principal field of competition between Latin and the vernaculars during this period, and Swedish was made use of for this before Danish. (See further Kaspersen/Kværndrup/Lönnroth et al. 1984, 143 ff.).

The difference is far more than a possible earlier start of a few decades. Even generally, medieval vernacular literature was quantitatively and qualitatively greater in Sweden than in Denmark. Already at this pioneering stage in the High Middle Ages, vernacular text was written to a considerably larger extent and spread over a wider scope of literature in Old Swedish than in Old Danish. However, this is partly a question of the quantity of preserved literary sources and does not imply that translation into the vernacular did not occur in Denmark, though it is hard to judge to which extent and in which forms it actually did. (The general conditions surrounding Danish book production during this period are discussed by Th. Damsgaard Olsen in Kaspersen/Kværndrup/Lönnroth et al. 1984, 392 ff.). In any case, this literature arose under conditions which were similar for translation and original production.

2. The paraphrast: the translator's forerunner

Translation in today's sense of the word, aiming at a reasonably strict formal equivalence between a source and a target text (see

further art. 133), occurred only marginally in this period.

The "real" translator has, however, a very important forerunner, who was strikingly diligent at this early stage of domestic literary culture: the adapter, the maker of paraphrases in the vernacular which were freely modelled upon foreign originals. The paraphrast was certainly not an original writer in a strict sense but was dependent, like the translator, on a given source text (sometimes several texts). As to content, though, as well as to linguistic and stylistic form, he is quite sovereign to this "source". The paraphrast could add fresh material, which he gathered from other writings or fabricated himself, could prune, transpose and alter the text – all according to the logic of his priorities.

In high medieval Sweden, with its traditionally conceived "golden age" in the Folkunga epoch, practically all texts preserved today, with the possible exception of the provincial laws, are paraphrases of foreign, particularly Latin, sources. The classical showpieces of the epoch are often referred to as "free translations" or "very free translations" of foreign "originals", composed by anonymous "translators" or "adapters" – or even "authors". The terminological confusion reflects a descriptive dilemma: scholars do not have established categories for the adequate characterization of literary products from this extensive medieval borderland between translation and original writing.

The distinction, then, between the one form of literary production and the other is not very significant in this early phase of developing East Nordic literacy. Whoever wanted to write something interesting, edifying or amusing in the vernacular normally had access to excellent foreign sources in Latin, French, Low German or possibly even West Nordic. These could be retold freely in good Swedish or Danish. Consequently, all literary genres and types of texts from the High Middle Ages, entirely or partly cultivated in East Nordic vernacular, are relevant from the perspective of translation.

3. The genres

The main types of texts of relevance here are laws, official documents, legends, the Bible, chivalric epics and professional texts. In Sweden, vernacular writing of significance has been documented for this period in all these

genres except the last one; in Denmark mainly laws, official documents and professional text (cf. art. 110).

3.1. Laws

When fixing the legislation of the separate, judicially autonomous provinces in written documents, learned law editors in Sweden and Denmark were paving the way for the first extensive and significant use of the vernacular in writing. Provincial law, then, represents the first important genre in Swedish and Danish vernacular literature after runic inscriptions. These laws are documented in hundreds of preserved manuscripts, only a few of which, though, are dated to the pioneering phase in this period.

The law text proper, divided into sections (balkar) and later into chapters and paragraphs, involves deep-seated problems, concerning i.a. far-reaching questions of legal history. The traditional status of this genre as original literature is no longer self-evident. Nevertheless, given the present state of research, its relevance to the history of translation, though potentially very significant, is hard to determine. The idea that particular continental legal documents in Latin were the object of imitation in Swedish and Danish by erudite law editors, in forms justifying the notion of translation – and more or less formally strict “translation” at that – is merely a hypothesis to be tested.

We are on firmer ground when we try to judge the editorial framework of the laws: prefaces, confirmation acts etc. This material is obviously written directly, originally; in this respect it is more unambiguously part of contemporary literacy. Such texts are records, attached to and incorporated in particular laws through their editorial arrangement, handed down in important manuscripts. Famous documents are e.g. a couple of Prefaces: to the Danish *Jutland law* from 1241 (used later in the Zealand and Scanian laws) and to the Swedish *Uppland law* from 1296. These texts were apparently composed by the editors themselves, in immediate connection with their editorial work. Their arguments are developed at a level of abstraction and in a grammatically complex, formal and Latinized style that is very remote from the simple, concrete and straightforward approach of the law text proper. Certainly, though, there was room even for very pithy wordings which were quite typical of “ordinary” law style, e.g. the famous

sentence introducing the Jutland law: *Mæth logh scal land byggjæx* ‘With law shall land be built’. An almost identical wording is found in the Uppland Law preface.

Whether these prefaces are to be regarded as products of original, more or less Latin-influenced authorship written directly in the vernacular, or as “translated” adaptations of some Latin versions available to the editors, is beyond judgement. No corresponding Latin texts have been found in these cases. In favour of the latter possibility, however, we may cite a few particular documents that are actually extant in both languages which are closely connected to Swedish as well as Danish law manuscripts.

3.2. Official documents

In Denmark, translation appears to have been fairly significant in the production of official texts during the period. There are e.g. indications of major legal acts having been worked out in Latin and translated into Danish, but except for some individual cases (like the Flensburg town charter of ca. 1300; cf. Th. Damsgaard Olsen in Kaspersen/Kværndrup/Lönnroth et al. 1984, 394), the documents in question are only preserved in late medieval copies, bearing little, if any, evidence of the production circumstances (cf. Skautrup 1944, 213).

In both countries, a number of minor official documents of the period were issued in Latin along with a vernacular version, particularly in connection with provincial laws. Not everything has been lost. Remarkable Danish examples are to be found in a few – certainly late – manuscripts of the *Scanian law* (*Skånske lov*), where even ordinances of Kings Canute VI and Valdemar II from the first half of the 13th c. were rendered in Latin. It is not self-evident, though, which version is translated from which; some putative Latin features in the Danish text have, far from conclusively, been adduced in favour of Latin priority (cf. Brøndum-Nielsen 1918, 132ff.).

A similar Swedish example of Latin and vernacular bilingual texts from this period – equally striking and more closely examined – is the *Confirmation act* of the *Uppland law*. In several main manuscripts of this law, a document appears in an Old Swedish version in which King Birger Magnusson, on January 2nd, 1296, in majestically imperative wording, gives his official sanction to the new law. Even this document was composed in Latin, and a

few copies of the Latin text have come down to us from the 17th c. In content, the two versions are parallel to such a degree that one of them must reasonably be a translation from the other. Actually, we are dealing here with a fairly faithful rendering which in part almost lives up to the modern standard of equivalence. Close scrutiny of the editorial arrangement and the linguistic form of this bilingual document proves rather conclusively the priority of the Latin version over the Old Swedish (Wollin, 2001 a, 122ff.). Accordingly, the *Uppland Law Confirmation Act* is the oldest dated document in the history of Swedish (and possibly East Nordic) translation.

The text is introduced (after the salutation formula) in Latin and Old Swedish versions as follows. (Corresponding passages are marked with italics and underlining, bold type marking non-corresponding text. Maximally literal English translations of each version marked in the same way have been added.)

Licet legum veterum non sit vilis autoritas, interdum tamen, *per processum temporum et humane propagationis successum, convictus mutui modo et ordine variatis, necnon insolitis aliquibus contingentibus casibus, nonnullis et antiquitatibus minus lucide traditis, immutari quoque contingit leges et statuta, quibus humane fragilitatis mores regulari et litigia quietari competit, æquitatis tramite observato.* Quod profecto tam in Ecclesiasticarum quam Civilium traditionum abrogationibus, suppletionibus ac novellis institutionibus clarius elucescit.

[Although the authority of ancient laws is not negligible, sometimes, however – *over the course of time and the progress of human propagation, the mode and order of common*

Þo at forni laghæ rættir sein wirþningæ wærþir, þa kombær stundum swa til, at um skiptis þæn laghæ stabgi sum skipapær ær til at rættæ kränkæ mannæ sibi ok mæþ iampnæþ aff læggæ mannæ missæmi, fore þæn skyld at, swa sum timin liþær ok mæn fra faldæ ok andri til föþæs, swa ymskæ mannæ samwæræ, fore þy at j langum timæ kunnu mang ny fall hændæ, ok atær fore þy at j gamblum laghum hittis sumpt mæþ faum orþom at saght ok æi swa liuslikæ sum wiþ þorff. Ok fore þæssum faldum giörs umskipti bapj kirkiu rætt ok kiæsæræ laghum, swa at sumpt ær aff laght ok sumpt mæþ faum orþom fullæt ok sumpt allungis nyskipæt.

[Although ancient laws deserve reverence, yet it sometimes comes about that the legal order is changed, which is instituted to correct weak mens' customs and with justness to settle mens' dissension, because, as time

intercourse varying, even some unusual cases occurring and several antiquities being less perspicuously rendered – it happens that the laws and the statutes are changed too, by which it is in [our] power that the customs of human fragility be regulated and disputes settled, the path of justness observed. This, certainly, stands out quite clearly in the abrogations, completions and more recent institutions in Canon as well as Civil traditions.]

passes on and men pass away and others are born, so is changed mens' intercourse, because over a long time many new cases may occur, and again because in the old law some things are found that are said in few words and not so clearly as is necessary. And for these cases change is made both in church and secular law, so that some is left out and some completed in a few words and some entirely new.]

This paragraph deals with necessary changes in legislation, their causes, realization and results. Both versions render essentially the same content; deleted and added material (in bold type) is marginal. However, the material has been arranged in differing ways. In the Latin version the causes of the changes (the sequence in italics) are mentioned before specifying and describing what is actually changed (the underlined sequence); in the Old Swedish version the order is reversed.

This sample is characteristic of the style in the entire document. The choice of words and the modes of expression are, as mentioned, at a high level of abstraction, and the complex Latin syntax is, despite the radical transposition of major sentence units, largely maintained in the target text. At lower levels of the syntactic hierarchy, in phrase construction and in the choice of words, the translator certainly proceeds very independently, but nevertheless sticks to the text with a fidelity that corresponds largely even to modern demands for semantic equivalence in an admittedly “free” though accurate translation. In this respect the translator differs from his contemporary – or even slightly later – more loosely paraphrasing colleagues working with other genres. Generally, his achievement is fairly representative of the style in charters, deeds, and other official documents composed in the Latinized vernaculars of the Middle Ages.

3.3. Legends

The legend literature in the classical Old Swedish vernacular of the period is comparatively rich, even by European standards. It has been handed down in several large manuscripts, containing a few hundred legends (Carlquist 1996, 36ff.). From the Danish realm, only about a half-dozen legends, all in a fragmentary state, are known. The literature of the medieval legends covers an extensive field, thematically as well as stylistically: from solemn meditations upon Christ and the Holy Virgin to racy cock-and-bull stories about sundry local saints. Above all, the genre aimed at broad entertainment and functioned as something like popular light reading during the Middle Ages.

Though stemming from important Latin traditions on the Continent, the legend was one of the first genres to bridge the gap to domestic spheres of literature. In vernacular versions the legend could probably link up with inherited epic patterns and continue domestic traditions in a suitable Christian shape. Legends were imported to Sweden and Denmark in Latin throughout the Middle Ages. They were first transformed into the vernaculars in the late 13th and the early 14th c.

Two great, separate traditions of the Old Swedish legend developed, each dealing with about one hundred saints. In the earlier medieval period, only the older tradition was cultivated (the younger, Birgittine, belonging to the succeeding late medieval period). The 19th c. editor of this older tradition (G. Stephens) has coined a designation which is still current: *The Old Swedish Legendary* (*Fornsvenska legendariet*; see further Jansson 1934; Carlquist 1996). Fixed in vernacular writing at some time during the period 1276–1307, this tradition reached its first and presumably greatest height in the middle of the 14th c. Its main source is the great work *Legenda aurea*, composed in Latin ca. 1250 by the Italian Dominican friar Jacobus de Voragine. Supplementary contributions from other, more or less independent sources occur, though rather marginally. The originator of the Old Swedish text is, despite numerous guesses, unknown.

The Old Swedish Legendary has been estimated as dating from ca. 1300 and, on the basis of certain dialectological features, has been located as coming from the southern part of the then Swedish realm, very reasonably to the Dominican convent of Skänninge in the southeastern province of Östergötland. It

originated as an imitation of legends in Latin and was executed as a single great enterprise – quite possibly, however, involving several more or less contemporary writers. The result was a text which was read and copied throughout the Middle Ages. In relation to the Latin original, the text maker of the older legend tradition rendered the text loosely, though within certain limits. His mode of procedure was in fact very similar to that of the biblical paraphrast.

3.4. The Bible

With the establishment in Scandinavia of Christianity and Latin in the early Middle Ages came, probably rather quickly, the demand for vernacular exegeses of the Scriptures. The pioneering phase in Sweden took place in the late 13th and early 14th c. At that time large parts of the historical books of the Old Testament were rendered in Old Swedish. In the Danish realm, no biblical literature in the vernacular is known from this early period.

Throughout the Middle Ages, biblical texts were written in the vernacular in different contexts and in different ways. As for the period in question here, we are dealing with certain (more or less) complete books of the Bible. The great Swedish text of the epoch is the so-called *Pentateuch Paraphrase* (*Pentateukparafrazen* or *Moseboksparafrazen*; see further Thorell 1959; Wollin 2001 b). It is a very independently accomplished, in parts considerably abridged, version of the first five books of the Old Testament, combined with (actually surrounded by) some connecting historical and philosophical tracts by St. Augustine and St. Thomas Aquinas. The paraphrase proper renders, with various reductions, most chapters of Genesis and Exodus, but considerably less of the other three books. The main source is the Latin Vulgate text. About twenty Fathers of the Church, particularly St. Augustine, are frequently quoted or otherwise referred to. The connecting tracts are equally loose paraphrases of their Latin originals. The text is to be taken as a whole, though. It has very much in common with the Old Swedish Legendary, and like that, it has been recently argued, it probably originated in a Dominican environment.

The first verse in the first chapter of Genesis in the *Vulgate* Bible and in the *Pentateuch Paraphrase* reads as follows (added material is in bold type).

In principio creavit Deus
caelum et terram.

[In the beginning God
created heaven and
earth.]

Gudh skapadhe aff alzenge
himil ok iordh. **ey aff sik
sälwom som fadhir födhe son
ok ey af nakro ämpne som
smedher gör yxe.**

[God created from nothing at
all heaven and earth. **Not of
himself, as a father gives life
to a son, and not of any stuff,
as a smith makes an axe.**]

The characteristic strategy here is the glossing, the addition of a brief passage, explaining or otherwise commenting upon the content of the source text – which in such cases is normally rendered with reasonable fidelity. When occurring in vernacular literature, glossing probably has its origin in preaching. This homiletic device is more or less systematically applied in certain, though not too numerous, sections of this pioneering Swedish biblical paraphrase.

More frequently, by deliberately but capriciously transposing central phrases, the paraphrast follows an equally typical, very common strategy in this early rendering of foreign originals. Other, very frequent devices are additions and omissions: the epic stream is enriched by numerous instances of new information, which develop the story at the level of basic content. At the same time, certain equally essential elements in the source text are dropped.

Nevertheless, the paraphrast cannot be accused of actually distorting the message. Rather, he was acting as the independent narrator, accurately rendering a story he had heard or read, but doing so in his own, entirely personal way.

3.5. Chivalric epics

Among the upper classes of a more or less feudal society during the Middle Ages, in Scandinavia as elsewhere, life and views were imbued with the ideas of chivalry. This applies even to the literary culture, in content as well as in form. Secular entertainment and refined manners are reflected in poetry and prose. The aristocratic outlook of the Swedish Folkunga epoch left its mark on some classical literary showpieces of the period: the three chivalric romances grouped together under the name *The Eufemia songs*; the historical, politically very biased *Erik's chronicle*; the political and philosophical tract *The Kings' Government*; and finally, an excellent little piece of clerical satire entitled *A Joke on all Abbots. The Eu-*

femia songs and *Erik's chronicle* are composed in rhymed *knittelvers*, imported from the Continent, whereas the other two works are elaborated in a stylistically sterling form of prose. Apart from *Erik's chronicle*, which is a purely original work, we are dealing here with vernacular literature originating from paraphrased imitations of foreign sources.

No Danish texts similar to these Old Swedish works are known from the period. Certain Danish participation, though, in the elaboration of the *Eufemia songs* has been suggested.

The comprehensive title of the *Eufemia songs* (*Eufemiavisorna*) refers to the three chivalric novels *Sir Ivan* (*Hærra Ivan*), *Duke Fredrik* (*Hærtogher Fredrik*) and *Flores and Blanzaflor* (*Flores ok Blanzaflor*). The title originates from a statement made in the final verses of the three poems, that they were “translated” (actually *vænde* ‘turned’) into Swedish on the initiative of the Norwegian Queen Eufemia, respectively in 1303, 1308 and soon before the Queen’s death in 1312, the first from French and the second from German; as for the third, no source language is mentioned. These assertions have long since been accepted by modern researchers (see further Jansson 1945; Williams 1999, 3ff.); the source language of the third work was French. The “Swedifications” of these very romantic poems are supposed to have been the Queen’s personal gifts to her son-in-law to be, the Swedish Duke Erik Magnusson at his betrothal and wedding to her daughter, the Princess Ingeborg.

The originals of *Sir Ivan* and *Flores and Blanzaflor* are, respectively, the versified romances *Yvain, Le chevalier au lion* by Chrétien de Troyes and *Floire et Blancheflor* by an unknown author; the supposed German original of *Duke Fredrik* has not been identified. *Sir Ivan* and *Duke Fredrik* are representatives of the genre called “romans bretons”, with motifs from the circle around King Arthur and his knights, whereas *Flores and Blanzaflor* has a certain oriental touch. The poems are chivalrous stories of love and warfare, reflecting an aristocratic parlour culture – continental and French in colour, though probably not lacking roots in ancient Nordic heroism.

The current view is that all three works were directly transferred into the Old Swedish target language without any West Nordic intermediary version, as had been suggested earlier. In addition, this was supposed to have been the work of a single individual. This man is

certainly unknown, but his dialectal peculiarities point to the southwest, particularly to the then Danish province of Halland.

The Swedish works have taken their metre from the foreign originals. It is based on the knittel, rhymed in characteristic pairs of normally four-foot verses. Their relationship to the foreign sources in terms of linguistic transfer has never been investigated more closely. At first glance, however, the Swedish version of *Sir Ivan* seems to render the French text with basic fidelity (the total number of verses in the source and target versions amounts to roughly 6,800 and 6,450 respectively), although the general pattern of paraphrase is never far away.

The *Government of Kings and Princes* (*Konunga Styrilse och Höfðinga*; cf. Moberg 1984; Wollin 1995; Delsing 2000) is an exemplary mirror of princes, an Old Swedish counterpart of the famous West Nordic *Konungs skuggsjá* (from which it is quite independent). It depicts, in an elevated Christian tone, the good ruler, chosen by God and trusted by his subjects. Its main source is a political and pedagogical tract in Latin entitled *De regimine principum*, written in 1280 by Egidius de Colonna, a disciple of St. Thomas Aquinas, but other sources have been used as well. The Swedish version is supposed to have been composed in the 1340s, intended as an educational piece for the infant sons of King Magnus Eriksson. The text maker – who is unknown – has treated his Latin original in the same manner as did the originators of the *Old Swedish Legendary* and the *Pentateuch Paraphrase*, i.e. he has proceeded as a prose paraphrast typical of his time. The *Government of Kings* has been praised unanimously by posterity for its sober, though perhaps somewhat verbose, style. The Latin tract is theoretically elaborated, including an element of scholastically meticulous theology. These features have been taken over in the vernacular version, where they mingle with unmistakable influences from the austere prose of the laws. The blend has assumed an independent, very personal touch.

In two 15th c. manuscripts comprising, among other works, the *Eufemia songs* and the *Erik's chronicle* – the older manuscript is dated to 1448 – a minor piece of text (roughly 500 words) is introduced by the words *Hær sigx aff abotum allum skemptan mykla* [Here is told of all abbots a big joke]. The text is usually referred to as *The joke on abbots* or “*Skemtan*” (*Skämtan* [om abbotar] or *Abbot-*

skämtet; see further the several articles in Ferm/Morris 1998). In a plain, matter-of-fact style, the anonymous writer presents an equally anonymous abbot in his magnificent attire. The reader witnesses the abbot's gargantuan meal, with scores of very substantial dishes and huge tankards of “good hop beer”; the latter scene is developed in an excellent, very famous biblical parody. *Skemtan* is a minor classic in Sweden's literary heritage.

The appearance of *Skemtan* in two manuscripts from the middle and the latter half of the 15th c. has determined its traditional dating to the late Middle Ages. However, its presence in the same manuscripts as the chivalrous verse romances and *Eric's chronicle* just as strongly indicates its literary conception in the time and cultural context of these works, i.e. in the early 14th c. Folkunga period. Another factor in favour of this conclusion is its relationship to the probable Latin original: *Skemtan* quite obviously belongs to the high medieval Swedish paraphrasing culture. Though this is perhaps a matter of some controversy (cf. articles by S-B. Jansson and L. Wollin in Ferm/Morris 1998), the Old Swedish text is reasonably seen as a free adaptation of a Latin original, entitled *Magister Golyas de quodam abbate* [Master Golyas on a certain abbot], attributed by tradition to the English prelate Walter Map (Mapes), who lived in the 12th and early 13th c.

3.6. Professional texts

Medical literature in the vernacular – books on healing herbs and stones – has been preserved from this epoch. The predominant name here is the Dane *Henrik Harpestræng*, who died probably in 1244 and was physician-in-ordinary to King Erik Plovpenning (Skautrup 1944, 213f.; Kaspersen/Kværndrup/Lönroth et al. 1984, 404ff.). Several works of this kind were attributed to him already in the Middle Ages (in some cases on weak grounds), later to be copied (actually translated) into Swedish. His main work, *The herb book* (*Urtebogen*), is an adaptation in Danish of a hexameter poem in Latin, *De viribus herbarum*, composed by the Frenchman Odo de Meung (or Macer) in ca. 1090, and another, slightly older Latin work, completed with elements of his own learning.

4. The influence of translation on the East Nordic vernaculars

The process of translation affects linguistic structure primarily at the levels of the lexicon, phraseology and syntax. Even at the level of text formation one might expect at least a potential influence exerted by translators. The loose relationship to the source text that left its mark on the paraphrasing culture of the period makes it difficult, though, to determine exactly which elements in a given target text can be traced back to the linguistic form of a source text. Equally difficult is the assessment of the paraphrast's loose handling of the overall structure and external organization of the material (the text formation) in relation to a source text, the exact formation of which is rarely known.

4.1. Lexicon and phraseology

In Old Swedish texts originating in the typical paraphrase of Latin, French and German sources, several words and word forms appear first in written text. In the cases where influence from foreign languages is incontestable – whether in loanwords or in domestic words given a new meaning or otherwise used in a new way – it is often impossible to know if the word/word form was actually coined in the text in question or just appeared there in accordance with a usage that was already prevalent at the time. However, directly or indirectly, new words and new usage of words even in this early literature undeniably testify to the paraphrasts' innovating achievements.

In literature from Latin originals, the predominant field of lexical innovation is quite naturally the religious sphere, whereas chivalric vocabulary leaves an equally natural mark on the romances, coloured by their French and Low German originals. The Old Swedish Christian and church vocabulary has been thoroughly investigated in philological research (Thors 1957), whereas the lexicon of the other spheres has not been penetrated to such a degree.

There are about 200 words pertaining to Christian or ecclesiastical terminology which can be found in undisputedly paraphrasing Old Swedish texts from this period – i.e. essentially in the literature treated above, except the laws. However, only one of the manuscripts in question (the Cod. Bureanus of the *Old Swedish Legendary*) is actually dated to (the end of) this early epoch (ca. 1350); for

the others, the possibility of influence from the succeeding period, when the manuscripts were written down, cannot be entirely ruled out. The number of words in this early layer of vocabulary from the Christian sphere which are actually attested in the Cod. Bureanus, and consequently for certain were used in this period, amounts to half, or about a hundred. A few of these words are well-known even in modern Swedish. Roughly thirty are loanwords, ultimately of Greek or Latin origin, like *altare* 'altar', *kloster* 'monastery', *kors* 'cross' and *korsfæsta* 'crucify', *præster* 'priest', Mod. Sw. *präst* and *ærmite* 'hermit', Mod. Sw. *eremit*. The rest are inherited words of Germanic descent. Like the loanwords, they are used in a specific meaning which is obviously different from their original, more general denotation. This new meaning is determined by a reasonably well-defined terminological system taken over from foreign sources and gradually established in the theological and ecclesiastical sphere. There are about sixty such words, e.g. *alzvaldugher* 'almighty', Mod. Sw. *allsmäktig*, *frälsa* 'save', *guddomber* 'godhead', *hælghidomber* 'sanctuary', Mod. Sw. *helgedom*, *hælviti* 'hell', Mod. Sw. *helvete*, *synd* 'sin', *tro* 'faith', *troa* 'believe', and *ælskoghe* 'charity, love', Mod. Sw. *älskog*, which is not used in the religious sphere.

The proportions of the two categories are striking. The growth of Christian terminology in early Old Swedish seems to be dominated by creative semantic development within an inherited store of vernacular lexemes. Adoption of loanwords is certainly important too – by no means are we dealing here with any kind of puristic tendencies – but nevertheless it plays a secondary part. The relationship to the paraphrasing ideal that governed literary text production during this epoch is interesting: the hypothesis that the independent treatment of foreign text sources favoured the development of new terminologies in the domestic language is an intriguing one.

The chivalrous sphere developed a rich terminology, too, though maybe one of lesser complexity and semantic elaboration than the religious. Anonymous translators and vernacular paraphrasts of continental epics probably served as mediators, which was equally important. Many of the new French and Low German words which entered the East Nordic vernaculars through literature or through being adopted in the spoken language of the aristocracy referred to central concepts in the chivalrous outlook, such as *hovisker* 'cour-

teous', Mod. Sw. *hövisk* and *æra* 'honour'. Some were terms for noble forms of fighting like *bohordh*, *torney* (both meaning 'tourney', Mod. Sw. *torner spel*, *turnering*) and *ors* 'warhorse', others for elegant textiles like *baldakin* 'canopy' and *bliald* 'silk'. Lasting vernacular designations for central elements of social life were coined in this high medieval sphere, like the word *danz* 'dance', Mod. Sw. *dans*.

Even outside these particular spheres of medieval culture – and whether mediated by translators or not – the lexicon was enriched by foreign influence. This is particularly clear in charters, deeds and other documents in official language, where the proximity of Latinate modes of expression is tangible. Quite often such Latinisms have strong phraseological implications. In the famous royal letter known under the title *Kopparbergsprivilegierna* ('the Kopparberg privileges'; the text has not been proved to be a translation), issued in 1347, we read about some goods that *varo ipær borto* 'were away for you', rather artificially reflecting (though not with certainty translating) the Latin *vobis deerant*. A frequent formula in this kind of regal deed is the phrase *gora witerlikt* 'make it known', 'notify', a close equivalent of the Latin *notum facere*. A probable mediator in the process of influence is the corresponding Low German wording *witlik don*. In Latin documents there was often an abundance of synonyms (in this case e.g. *evidenter elucere*, *constare* etc.), whereas the vernacular writers contented themselves with one single phrase, used routinely (cf. Holm 1967, 239ff.). Accordingly, though certainly stimulated by foreign influence in general, the development of vernacular lexicon and phraseology may thus even have included fixed patterns, copied from the source languages.

Very indicative of the intermediary role played by Low German in the constant Latinization of the East Nordic vernaculars – and striking in its high frequency – is the development of the pronoun *hvilikin* or *hulkin* ('which', Mod. Sw. *vilken*, Dan. *hvilken*). Originally it was interrogative: *hauin i eigh hört huliken dombar giuin är iui cristet folk* (Cod. Bur., 'have you not heard which sentence is given over Christian people'). Obviously based on the direct model of LG *welk*, indirectly (and maybe partly even directly) on the Latin interrogatives *quis* and *quid* which coincide in the rest of the paradigm with the relatives *qui* and *quod*, it assumed the parallel status of a relative pronoun early on. In the

same manuscript we read: *ängen toks vndan a huiliken han* (i.e. *lutren*) *fiöl* (Cod. Bur., [nobody was excepted on whom the lot fell]). The ease of using the pronoun in prepositional phrases probably paved the way for this relative construction, which is still used in modern Swedish and Danish.

4.2. Syntax

It is only in cases of reasonable formal correspondence between source and target text that influence from translation upon the syntactic structure of the product can be actually attested. As demonstrated above, this situation cannot be found during this pioneering epoch except in some sporadic instances, such as the *Uppland Law Confirmation Act*. Indirect influence from early translation exercises can be traced, of course, in vernacular documents like charters and deeds, even when they obviously were original works: style, particularly syntax, in this kind of text is normally highly Latinized. Beautiful and stylistically elaborate examples – whether conditioned by translation from the Latin or not – occur even in the two famous prefaces of the *Uppland* and the *Jutland law*.

In general, however, typically Latinate modes of expression are not as frequent during this early epoch as they are in the succeeding one (treated in art. 133, where they will be more systematically exemplified). In the common paraphrasing literature of the epoch, the vernacular target language is fairly independent of the Latin, which is no less striking with regard to syntax than to the lexicon. Classical written Old Swedish preserves successfully certain native, possibly colloquial forms. This is particularly obvious in the legend and Bible genres, where the sentence structure is not very complex, having relatively short clauses and a high relative frequency of finite verbs. These stylistic features certainly occur in the Latin originals, too, but the paraphrasts did not copy them, at the most they imitated them.

XII. Old Nordic III: The ecology of language

113. Dialects and written language in Old Nordic I: Old Norwegian and Old Icelandic

1. Introduction
2. Hægstad's classification of Old Norwegian dialects
3. West Scandinavian dialect features before 1350
4. Conclusion
5. Literature (a selection)

1. Introduction

The written form of Old Icelandic and Old Norwegian transmitted in manuscripts from the early 12th to the middle of the 14th c. is, as in most manuscript cultures, characterized by variance rather than standardization and uniformity. The heterogeneity displayed in the rather large corpus of manuscripts does in fact reflect random orthographic inconsistencies as well as variation based on dialectal differences in the spoken language.

Awareness among scholars of linguistic variation within the medieval West Nordic area goes back more than a couple of centuries. Jón Eiríksson, an Icelander who became Professor of Law at the Academy of Sorø, Denmark, as early as the 1760s distinguished between Icelandic and Norwegian medieval manuscripts on linguistic grounds (cf. Holm-Olsen 1982, 3ff.; 1984, 255ff.). Studies of dialect variance were not, however, carried out in more detail or at length till the end of the 1890s when Marius Hægstad (1850–1927), Professor of New Norwegian and Norwegian dialectology (Kristiania), started a large-scale project mapping mainly West Norwegian dialects before 1350 (cf. Rindal 1984). Hægstad managed to investigate what he interpreted as dialectal features on the basis of documents – charters in particular – traced to Trøndelag, Western Norway, and to some extent also based on manuscripts from Iceland, the Faroes and Shetland. His method had been considered by earlier scholars such as Ivar Aasen and Johan Storm, but in-depth studies had not been undertaken before. Today there

is a general consensus that Hægstad's results are in many respects still valid. Hægstad, at least to some extent, took into account evidence even from modern dialects when analysing the variance displayed in the written medieval source material. This material was sought first and foremost in the extensive corpus of charters, the overwhelming proportion of which dates from the 14th c.; as a consequence the end of the period 1150 to 1350 is overrepresented. Hægstad tried to overcome this difficulty by taking into consideration manuscript evidence from the areas he wanted to map – an approach which does not escape the dangers of circularity of argumentation. Also his tendency to attribute the provenance of charters too closely to the places and areas where they were dated has been criticized by later scholars. A difficulty common to most of the research on dialect variation in Old West Scandinavian sources is the methodological problem of distinguishing between the written level of language and the spoken language. A tendency towards overinterpreting variation on the written level as evidence for underlying dialect differences should be taken into consideration when using the results of this kind of research.

2. Marius Hægstad's classification of Old Norwegian dialects

Hægstad differentiated between four main dialect areas within western Norway and present-day Trøndelag without being able, of course, to draw isoglosses very precisely between them. He distinguished between the following areas: Trøndelag, Northwest Norway (which covered, it seems, the present-day areas of Romsdal, Sunnmøre, Nordfjord and the coastal areas of Sogn) and Southwest Norway. The latter was divided in two dialect areas: the Outer Southwest (which covered the coastal areas of present-day Rogaland and

Hordaland) and the Inner Southwest (which covered Agder, western Telemark, Sætedal and the remaining parts of Sogn, Hordaland and Rogaland – including the Faroe Islands and Iceland). Hægstad did not manage to include the rest of Norway in his survey. Studies on specific dialect features of East Norwegian were carried out by successors such as Didrik Arup Seip, Trygve Knudsen, Per Nyquist Grøtvedt and in later years by Magnus Rindal. East Norwegian is divided into Southeast Norwegian as opposed to East Norwegian in general by most scholars. Arguments for singling out the district of Upplond as a separate dialect area have been put forward (Rindal 1981). Source material from northern Norway parallel to that which forms the basis for studies of dialect variation elsewhere in medieval Norway is absent. Thus northern Norway in this respect remains a more or less blank area on the Norwegian map of medieval linguistic variation.

Hægstad's investigations of dialectal differences within the Old Norwegian – Old Icelandic linguistic area, as well as those carried out by his followers, first and foremost focused on the phonological level of language. Some morphological variation has been observed, whereas no significant syntactic and very few lexical differences have been treated as dialect variation in the period covered by this article. Later studies, of Old Norwegian in particular, have also concentrated on phonological, and to some extent morphological, variation – much in line with the general paradigm of Norwegian dialectology in the late 19th and most of the 20th c. Wide acceptance of the idea that certain linguistic features should be considered as dialect-related has prevailed since the work of Hægstad and his followers. This applies both to Old Norwegian before 1350 and to variation between Old Icelandic and common Old Norwegian features.

3. West Scandinavian dialect features before 1350

The most important West Scandinavian dialect features before 1350 can be summarised as follows: (1) Marked or unmarked *u*-umlaut of short *a* before preserved *u* as in *hofum* ~ *hafum* (1pl. pres. of *hafa* 'to have'). (Note that *u*-umlauted /a/ and the vowel /o/ are both as a rule written as *o* in Norwegian manuscripts.) Distribution: unmarked umlaut: Trøndelag and, it seems, adjacent parts of Upplond. (2)

Vowel harmony (highness assimilation) or fixed vowels in unstressed position, typically in the 2nd syllable as in *lifi* and *lifum* (dat.sg. and dat.pl. of *lif* neutr. 'life') ~ *lofe* and *lofum* (dat. sg. and dat.pl. of *lof* neutr. 'praise') on the one hand (= vowel harmony) and on the other *lifi*, *lifum*, *lofi*, *lofum* or *life*, *lifom*, *lofe*, *lofom* (= fixed vowels *i/u* or *e/o* respectively). As indicated by the examples above, the notion of vowel harmony is currently used for the phonetically conditioned distribution of unstressed vowels even if no morphological distinction arises from this variation. Distribution: Vowel harmony: Trøndelag, Northwest Norwegian, East Norwegian. Fixed *e/o*: Outer Southwest Norwegian, Icelandic (early manuscripts), fixed *i/u*: Inner Southwest Norwegian, Icelandic. The possibility that vowel harmony was a more general feature of Old Norwegian than claimed by Hægstad remains a possibility, in which case this could be seen as a distinctive feature of Old Norwegian as opposed to Old Icelandic. The chronological change of Old Icelandic *e/o* to *i/u* is thoroughly described and explained by Benediktsson (1962). (3) Consonant clusters *mn/ft* ~ *fn/pt* as in *namn/eftir* ~ *nafn/eptir* (neut. 'name' and prep. 'after'), to some degree also *fs* ~ *ps* as in *refsing* ~ *repsing* (fem. 'punishment'). Distribution: *mn/ft/fs*: Trøndelag and East Norwegian; *fn/pt/ps*: West Norwegian and Icelandic (Northwest Norwegian ambiguous). (4) Negative prefix *ú* ~ *ó* as in *úfeginn* ~ *ófeginn* (adj. 'unhappy'). A present-day isogloss splits Norway into a northern and a southern area which have /ú/ and /ó/ respectively. Distribution ca. 1150–1350: *ó*: Trøndelag, northern parts of Northwest Norwegian and Icelandic; *ú*: remaining parts of Norway. (5) Svarabhakti vowel *e/æ*, *a* or *u* as in *bæker/bækær/bækur* or *bækur* (fem.pl. 'books'). Distribution: *a*: Western parts of Southeast Norwegian (corresponding more or less to present-day isoglosses); *u*: Icelandic and a restricted part of Inner Southwest Norwegian; *e/æ*: remaining parts. Features 1–5 can, to some extent at least, be observed in sources from the entire period between 1150 and 1350. (6) Marked or unmarked progressive umlaut *ja* ~ *jæ* as in *jarn* ~ *jærn* (neut. 'iron'). This feature has not been attested in the sources earlier than the first quarter of the 13th c. Distribution: Trøndelag and East Norwegian. (7) A special feature of East Norwegian in the later part of the period is a tendency in the sources to mark a weakening of the unstressed (low) vowel *a* after long syllables, as in *hiarta* > *hiærtæ*

(‘heart’). In addition, it should be noted that Southeast Norwegian is characterised by preserving the old glide /w/ before /r/ as in *vreiðr* for *reiðr* (adj. ‘angry’). This feature is, to some extent, confirmed by the present-day distribution of the place-name element *Vrå* for *Rå* (‘corner’), used both monothematically and polythematically. A morphological feature which seems to single out the Southeast area is the present tense form of strong verbs unmarked for *i*-umlaut, such as *taker* for *tekr* (‘takes’). This is a feature which distinguishes present-day dialects of the Oslofjord region from those of the Old Norwegian Uppland. In addition, there are features which distinguish between Old Norwegian on the one hand and Old Icelandic on the other, the most important of which are, of course, the loss of initial *h* before *l*, *n*, *r* in Norwegian (*laupa*, *neisa*, *ross* as opposed to *hlaupa*, *hneisa*, *hross* in Icelandic) and the merger of long /æ/ and /æ/ in Icelandic but not in Norwegian towards the end of the period under discussion. In general, written Icelandic seems to have developed towards a higher degree of consistency and uniformity than did Norwegian in the period covered here. On the basis of runological evidence which is datable, it seems, to the early 14th c., a specific dialectal feature may be observed even for ON in Greenland: as opposed to Old Icelandic initial /þ/ seems to have merged with /t/ in this area, thus **teta**, **torir** for *þetta*, *þorir* etc. (cf. art. 136).

4. Conclusion

In general it should, of course, be noticed that no single manuscript, not even originals such as charters, displays any of these features uniformly or unmixed with alternative forms at any particular time. Thus the dialectal variants outlined above should not be considered regional “norms” even if local schools of writing can to some extent be identified on the basis of linguistic and palaeographic evidence (cf. Hagland 1984, 1992).

A much discussed problem in Norwegian language history is whether or not a standard written Old Norwegian “norm” was established during this period. Seip (1954) postulated the existence of a medieval reading language on the basis of which a “higher spoken language” emerged as a kind of standard spoken Norwegian. This, of course, is difficult to prove, and the idea has not been widely supported. On the other hand, the idea that a standard written language developed on the

basis of the language used in the king’s chancery was for a long time generally accepted. Studies by Hagland (1986; 1988; 1992) have hinted at this view. The development towards a standard written Norwegian based to a large degree on the production of law codes and legal documents in general can be observed towards the end of the period discussed here. With regard to this process, considerable influence from Icelandic scribes working in Norway should be taken into account.

114. Dialects and written language in Old Nordic II: Old Danish and Old Swedish

1. Language and dialect in medieval Denmark and Sweden
2. Denmark
3. Sweden
4. Gotland
5. Literature (a selection)

1. Language and dialect in medieval Denmark and Sweden

At the end of the Viking Age the language of the Scandinavians did not yet display much dialectal variation. This is remarkable since this language, *dǫnsk tunga* ‘the Danish tongue’, had undergone major changes in the course of its history. Although the sources, inscriptions in the older runic alphabet, are sparse and often hard to interpret, it is clear that the phonological make-up of Old Scandinavian was completely transformed by major sound changes in the pre-Viking period. The fact that the same changes are found all over the Scandinavian language area therefore strongly suggests that there was extensive contact between the various parts of this huge area.

After the introduction of Christianity and feudalism, the linguistic situation changed dramatically. The once relatively uniform language of the Vikings broke up into a great number of often mutually unintelligible dialects. The feudal fragmentation of society is thus reflected in the fragmentation of the language. The seafaring Viking, for whom the entire known world at that time was (at least in theory) his home, was transformed into a medieval peasant who hardly ever left the village where he was born. For him it did not matter whether or not he understood or was understood by people who lived farther away than the next village. By using the local dialect, he showed where he came from and thus where he belonged. Since he had no direct contact

with those in power, there was no need for him to adapt to their way of speaking.

Under such circumstances, local forms of speech could develop relatively independently. Major changes that affect all the vernaculars in Scandinavia are therefore not expected for the period after the feudal revolution had transformed society, i. e. after 1250.

2. Denmark

The language of the Danes underwent major changes in the period between the end of the Viking Age and the beginning of the 13th c.: the case system was given up, verbal inflection was simplified, word order within the noun phrase became fixed, stress was concentrated on the stem syllable, unstressed syllables weakened or were lost. Since these changes affected different parts of the Danish empire at different points in time and to varying degrees, regional differences emerged, eventually leading to the birth of dialects which at the end of the period (1350) were probably no longer mutually intelligible. There are three main dialect areas: (a) West Danish, or Jutlandic (*jysk*), which in most cases seems to be the dialect area where the changes started; (b) Central or Island Danish (*ømål*), which is the main source of the standard language (*rigsdansk*); and (c) East Danish (*østdansk*) or South Swedish, which hardly changed at all during the period treated in this article.

According to Skautrup (1944, 255–260) and Karker (1993) a “national” written language was created during the 12th and 13th c. Wessén (1979, 79), on the other hand, is of a quite different opinion: “A written language, common for all of Denmark, did not yet exist.” Skautrup and Karker appear to have a strong case, as the manuscripts show clearly that the Jutlanders tried to write Central

Danish (Zealandic), however without succeeding in hiding their linguistic background.

2.1. Changes in the morphological system

2.1.1. Definiteness

The most famous dialect boundary in Denmark, and probably in the whole of Scandinavia, is the one that separates East Jutlandic, which has a suffix of definiteness, from West and South Jutlandic, which lack such a suffix but have a marker of definiteness (æ or a) that is placed before the noun instead. Since all the Gmc and Romance languages south or west of the boundary have prepositive definite articles, but all the Gmc languages north or east of it have a suffix, “one is perhaps justified in calling it not only a Danish, but a European dialect boundary” (Ringgaard 1973, 192).

The position of the definite article in West and South Jutlandic has been explained by many as the result of strong Low German influence upon these Danish dialects. In the beginning of the 19th century the position of the markers of definiteness was deemed by some to be so important that they assumed that peoples that differed on this point had to be of different origins. In 1833 the Danish historian and man of letters Christian Molbech, for instance, suggested that the Jutlanders were originally a Saxon tribe who got mixed up with Scandinavian or “Gothic” tribes from the North (Skautrup 1944, 138). From a purely linguistic point of view, however, such a view is untenable: structurally Jutlandic æ is as different from the definite article of MLG and other Gmc languages as it is similar to the Standard Dan. suffixes of definiteness. Like Standard Dan. (*rigsdansk*), but unlike MLG, West and South Jutlandic make a distinction between definiteness in bare nouns and definiteness in other contexts, the only difference between the Jutlandic dialects and Standard Dan. being that the former have a prefix (æ) where the latter has a suffix (the Jutlandic examples are from Højer near the Danish-German border, see Nielsen/Sørensen 1990):

<i>South Jutlandic/Standard Danish</i>		
æ by	byen	‘the town’
den lille by	den lille by	‘the little town’
æ daw æte	dagen efter	‘the day after’
dæn daw	den dag	‘that day’
di ong	de unge	‘the young’
al æ post-wuwn	alle post-vognene	‘all the mailvans’
æ hele hus	hele huset	‘the whole house’

Since both systems thus turn out to be virtually identical in structure, it seems likely that they either have a common origin or, as has been argued by e. g. Møller (1945), that the one (Jutlandic æ) is a later development of the other (the Dan. suffix). The latter theory seems to be confirmed by the following facts: (a) the first appearance of a prefix of definiteness in writing dates from the 16th c.; (b) the suffix is found in the earliest texts written by Jutlanders, e. g. *Flensborg Stadsret*. But Møller’s theory creates in fact more problems than it solves, as it forces us to assume, on the basis of no evidence at all, that South and West Jutlandic lost the suffixes of definiteness that were retained in East Jutlandic. This brings us back to the hypothesis that the suffix and prefix have a common origin.

This origin, then, can be dated to the 11th c. on the following grounds: the suffixed article appears for the first time in writing on two runic stones from the 11th c., viz. U 644 (U: Uppland, Sweden) and U 669, both times in the phrase *Guð hialpi andinni* ‘God help soul-DEF’. In the *First Grammatical Treatise* (Iceland, first half of the 12th c.) the suffix is already used consistently. One may therefore assume that by 1100 the practice of formally marking definiteness in nouns had spread to all parts of the Scandinavian language area. Since there is no reason to suppose that the Danish Islands or Jutland formed an exception in this respect, we may assume that both the (forerunner of the) Jutlandic prefix æ and the suffixes of Central Dan. and East Jutlandic date from the 11th (or perhaps 12th) c.

But why did West and South Jutlandic develop a prefix instead of a set of suffixes as their sister Scand. dialects did? I venture the following answer to this question (cf. Skautrup 1944, 141–143). Before the prefix came into existence, both (groups of) dialects had undergone a major change in word order: attributes were placed before, instead of after, the noun they qualified. This change took place in the Viking Age (800–1000), as is shown by Kousgård Sørensen (1984): comparing the number of prepositive genitival attributes qualifying the word *sun* ‘son’ or *dottir* ‘daughter’ in Jutlandic and in East and Island Dan. runic inscriptions, he found that in 24 out of 28 cases the genitive was placed before the noun in Jutlandic inscriptions, but only in 13 out of 21 cases in the rest of Dan. inscriptions. In Sw. inscriptions from the 11th c. postposition of the attribute seems still to be the rule: in 30 inscriptions a genitive is

found before the noun *sun*, but in 73 inscriptions after that noun (Perridon 1996). The tendency to place attributes before the nouns they qualify seems thus to have originated in Jutland and to have spread from there to the East and the North. In South and West Jutland the demonstrative *þæn* (or perhaps (*h*)*inn*) coalesced with the noun after the change in word order, but in the rest of Scandinavia the change in the position of the attribute occurred after noun plus demonstrative (*inn* or *hinn*, see Perridon 1989, 127–149 for a discussion of the various theories on the origin of the suffixed article) had turned into definite noun forms.

2.1.2. Deflexion

In OWN, morphology is fusional: in the declension of nouns, case, number, gender and declension type are not expressed by means of separate morphemes but are fused into unanalysable endings; e. g. the *s* in a form like *dags* does not only indicate the case of the noun (gen.) but also its number (sg.), its gender (masc.) and the declension class to which it belongs (*a*-stem). As a result of sound changes, even stems partake in this fusion, e. g. *örn* (nom.sg.m.), *arna* (gen.pl.), *erni* (dat.sg.) ‘eagle’, or *ær* (nom./gen.sg.f.), *á* (dat./acc.sg.) ‘ewe’. Especially with ablauting verbs the allomorphy can be extreme, e. g. *auka* (inf.) ‘to increase’, *eyk* (ind.pres.lsg.), *jók* (ind.pret.1/3sg.), *yki* (subj.pret.3sg./pl.). This kind of opacity in the morphological system is, as Werner (1984) and Braunmüller (1985) suggest, probably only possible in small communities who have little contact with the outside world.

From the scanty evidence given by the runic inscriptions it is not clear whether East Scand. ever had the same kind of abundant allomorphy as OWN; the earliest written sources, however, exhibit a more transparent morphology, with usually only one form for the stem morphemes, e. g. OSw. *örn* (nom.sg.m), *örna* (gen.pl.), *örne* (dat.sg.) ‘eagle’.

To judge from the earliest texts that have come down to us, the morphology of OSw. and, to a lesser extent, East Dan. (Scanian), was still of the fusional type: nouns were inflected for case, number and gender. West and Central Dan., on the other hand, seem already in the period between the end of the Viking Age and the beginning of the 14th c. to have changed from a fusional to a more or less agglutinative type of morphology. Except in the

pronominal system, case was lost as a grammatical category, although remnants of the dat. are even in West Dan. texts to be found in set prepositional phrases like *a hæstæ* ‘on horseback’, *a marckæ* ‘on the ground’, *i fathærs nafnæ* ‘in the name of the father’; cf. Brøndum-Nielsen 1935, 263. As in the modern continental Scand. languages nouns have one basic form in medieval West and Central Dan. texts, from which a plural form is derived by means of a suffix *-er* (*-ær*) or *-e* (*-æ*); *-s*, the old ending for the gen.sg. of masc. and neut. *a*-stems, has turned into a clitic that can be placed after noun phrases of whatever form, e. g. (*thæn*) *hælxægh ands* ‘the holy ghost’s’, cf. OSw. *þæs hælxgha anz* (*Codex Bureanus*) with case marking in all three words.

Gender is only expressed by the noun itself when it is definite and singular: *præstæn* ‘the priest’ vs. *huset* ‘the house’ (not in West and South Jutlandic, see below), and in all other cases by the attribute, e. g. *thæn man* ‘that man’ vs. *thæt barn* ‘that child’. In the written language, especially of West Dan. provenance (cf. Brøndum-Nielsen 1935, 268–271), masc. and fem. gender tend to fuse into a ‘common gender’ (*fælleskøn*). Compare e. g. the following two versions of a passage in *Jyske Lov*: (a) *Sæl bondæ sinæ egnæ iorth*; (b) *Sæl bondæ sin æghæn iorth* ‘if someone sells his own land’: in (a) the attributes *sinæ* and *egnæ* still have forms that show that the noun (*iorth*) is fem., in (b) the form of the attributes only indicates that the noun is non-neuter (*fælleskøn*). Most Central Dan. dialects (*ømål*), as well as North-East Jutlandic (*Vendelbomål*), retained the old gender system until the 20th c. The long *n* that was the reflex of Old Scand. *-nR* < NGmc **-n-aR*, nom.sg.masc. of stems ending in *-n*, palatalised in many of these dialects and changed eventually to *i* (for example in the dialects of Vendsyssel and Funen) or *ng* (Zealand), which resulted in forms like *skåw’wi* ‘the forest’ (Standard Dan. *skoven*) or *grij’sing* ‘the pig’ (Dan. *grisen*). These masc. forms contrast with fem. forms ending in *-en/-n*, e. g. *kuenen* ‘the woman’, and neuters ending in *-et*.

In the dialects of West and South Jutland a wholly new gender system developed: all count nouns are common gender, mass nouns and abstract nouns neuter. This change in the gender system is old, as it is already attested in the oldest Dan. manuscripts, e. g.: *Flensborg Stadsret ien dyghæn* ‘one day and night’ (Dan. *et døgn*, Sw. *ett dygn*); *Jyske Lov* (AM 286 fol.) *en thing* ‘a thing (meeting)’ instead of *et*

thing; the iorth (the < thet) ‘that land’, common gender in Standard Dan. (cf. Skautrup 1924, 30–31).

In Old Scand., adjectives were inflected for case, number, gender and definiteness (“weak” adj. are definite, “strong” ones indefinite), agreeing with the noun or noun phrase on which they were predicated. In East Dan. this system is still in operation at the end of the period described in this article. But in Central and West Dan. the declension of adjectives was simplified at about the same time as the nouns lost most of their endings: in the manuscripts, case marking of adjectives has become an exception, e.g. *tha ær han værthær at (Eriks Sjællandske Lov)* ‘then he is worthy (deserves) to’, with the adj. *værthær* in nom.sg.masc.; but in general adjectives are inflected as in Mod.Dan., agreeing with the noun they qualify in number, definiteness and gender with an ending *-e (-æ)* for plural and definite adj., an ending *-t* for indefinite neut.sg., and no ending for indefinite sg. adjs. that are *fælleskon*. In most West Dan. dialects, adjectives are not inflected for gender (e.g. the dialect of Houlbjerg, described by Ella Jensen 1956); some dialects in South Jutland make only a distinction between a neut.sg. form ending in *-t* and a basic form without any ending, e.g. the dialect of Fjølde in Schleswig; cf. Bjerrum/Bjerrum 1974.

In Old East Dan. texts, verbs agree with the subject in number and person except in the sg. of the pres., which has one form for all persons (with an ending *-ær/ar*). In Central and West Dan. texts from the 14th c., on the other hand, it is the pl. that has one form for all persons (ending in *-æ*); in the pres.sg. the first person is still distinct from the second and third person (which end in *-ær*): (*Jyske Lov*) *ac dopæ thic* ‘I baptize thee’; (Christina, Cambridge fragment) *ac bith* ‘I pray’, *ac thackæ* ‘I thank’, (*Valdemars Sjællandske Lov*) *ac haf* ‘I have’; in the past sg. of strong verbs or the pres. of preterite-present verbs, the distinction between second and first/third person (no ending) is sometimes maintained: *thu skalt* ‘you shall’, *thu est/æst* ‘you are’. These forms have been retained in some dialects in South Jutland: the dialect that was spoken in Fjølde in Schleswig until the middle of the 20th c., for example, still had forms like: *du skat* ‘you shall’ (cf. *æ, hun skal, vi, i, di skul* ‘I, she, we, you (pl.), they shall’; *du kat* ‘you can’, *du kut* ‘you could’, *du æst* ‘you are’) (Bjerrum/Bjerrum 1974, 26–27). At the end of the period (1350), however, person was lost as a grammatical

category in the majority of the Central and West Dan. dialects.

Already at the end of the 13th c. the tendency to use the sg. instead of the pl. is discernible in West and Central Dan.: (*Jyske Lov*, Flensburg ms.) *allæ the thær thennæ bok ser* ‘all those who see this book’ (Skautrup 1944, 273; Karker 1993, 79). Some examples of sg. verb forms instead of pl. are also found in the East Dan. *Skånske Lov* (Bjerrum 1966, 56–57). As a result of these changes the ending *-er (-ær)* became a pure marker of the present.

2.1.3. Possessive pronouns

In NGmc the possessive pronoun *sin* < *PGmc *sīnaz* retained its reflexive function, but in Dan. its use was gradually restricted to singular antecedents. In the dialects of West and South Jutland it subsequently turned into an ordinary possessive pronoun, which refers to singular antecedents that can not be pronominalized with *han* ‘he’ or *hun* ‘she’. The possessive pronouns *hans* and *hinne(r)*, which originally were the gen. forms of the personal pronouns *han* and *hun*, are used in these dialects for reference to persons, but it does not matter whether they refer to the subject of the sentence (or another antecedent that in Standard Dan. requires the use of a reflexive possessive pronoun) or not. This use of *hans* occurs in the earliest manuscripts with a Jutlandic background, e.g. in *Flensburg Stadsret: af han wil ei mistæ olt hans gooz thær i skip ær* [if he doesn’t want to lose all his goods that are in the ship]; the other Scand. dialects and the standard languages would have a form of *sin*, here *sit*, in this position.

Sin is used in these dialects for reference to persons, objects etc. that are referred to by means of other personal pronouns, such as *den* or *det* ‘it’, or *en/den* ‘one’, e.g.: *æ kalv er ved sin moder* [the calf is with its mother]; *enhver so synes bedst om sine grise* [any sow likes her own pigs best]; no distinction is made between a reflexive and non-reflexive use of *sin*, so it is possible to say: *se sine øjne* ‘look at its (i.e. the child’s) eyes’ (Jul Nielsen 1986).

In West Jutland the third person possessive pronouns can be used as resumptive pronouns in genitival constructions: *æ kuen henner kjowl* ‘the woman her skirt = the skirt of the woman’; *Jens hans fader* ‘Jens his father = Jens’ father’; *æ kow si maw* ‘the cow its belly’ = ‘the belly of the cow’. The construction is also attested in MSw. texts: *the willo forraadha konungen sith liff* ‘they wanted to betray the

king his life = the king's life' (Söderwall 1891–1918, 333), as well as in other medieval Gmc languages (ME, MHG, MLG, OFris., MDu.).

2.2. Changes in the phonological system

2.2.1. Stød

Stød, a kind of creaky voice produced during the articulation of long voiced sounds (long vowel, or vowel + voiced consonant) esp. in monosyllabic words, is a characteristic feature of Standard Dan. and most of the West and Central Dan. dialects. There are no traces of stød in East Dan., nor in the West and Central Dan. dialects that are spoken in the southern parts of present-day Denmark. In Scania, South East Jutland, and South Funen the dialects have an opposition between accent 1 and accent 2 (or “melodic accent”), as in Sw. and Norw.

It is commonly assumed that the Dan. opposition stød / non-stød is a further development of a common Scand. opposition between accent 1 (“acute”) and accent 2 (“gravis”), caused by an extreme concentration of word stress on the first syllable (= stem syllable). In this view, stød is an innovation, which according to e. g. Bandle (1973, 69) is proved by its areal distribution.

How old is the stød? Skautrup (1944, 243) argues that stød cannot be older than the weakening of postvocalic voiceless stops (*klusilsvækkelsen*), as words like *otr* ‘otter’ or *akr* ‘field’ could only receive stød after they had become voiced. The stød in *odder* and *ager* may, however, be the result of analogy. For Skautrup the *terminus ante quem* is the beginning of the 13th c., when forms like *Vagen* (Vagn, a name) and *Haføn* (Havn, i. e. Copenhagen) start to appear in the documents. The epenthetic vowel between fricative and nasal should according to Skautrup be interpreted as a reflex of stød in writing. Ringgaard (1978) thinks that stød is of a more recent date, which he claims is proved by the fact that verbs with an unstressed prefix, such as *betale* ‘to pay’, have stød in Central Dan. and accent 1 in East Dan. (South Sw.), but lack stød in West Dan. This suggests according to Ringgaard that West Dan. had parted company with Central and East Dan. before it acquired the stød. Since verbs with an unstressed first syllable did not occur in the language before the 14th c., when this type was borrowed from MLG, the date of the origin of stød can hardly be pushed

back further than 1400. Ringgaard's argumentation is not compelling. The intonation pattern in weak-strong-weak sequences may very well antedate the borrowings from MLG by several centuries; it is for instance also found in (South) Sw. in phrases like *god mörron* ‘good morning’, cf. *mörgon*, and *för gammal* ‘too old’ (*gammal*) (Malmberg 1968, 130).

As Liberman (1982, 236) rightly remarks, it is always possible to invoke analogy in order to explain the presence of stød in words that cannot have had it before a late sound law had changed their phonological make-up. It is hence practically impossible to *prove* that stød did not exist at a given point in time. We can only make more or less educated guesses. In my opinion the traditional date for the appearance of stød, i. e. the 12th c., is still the best guess.

2.2.2. Vestjysk stød

In the dialects of West Jutland, the western part of South Jutland and North Funen, /p, t, k/ are preceded by a glottal stop “in originally medial position after a voiced sound in a stressed syllable” (Ringgaard 1960, 10) The pl. *ka'd* ‘cats’, for instance, derives from *katte*, in which form the dental stop is medial, and long. Skautrup sees a connection between apocope and the rise of this *vestjysk stød* (WJ stød): in the dialects of West Jutland the loss of final *-e* was compensated for by the lengthening of the final consonant of the stem, e. g.: *kom*: < *komme* ‘to come’ (cf. *kom* with short *m* ‘come!’); *skow*: *skoww*, Standard Dan. *skov*: *skove* ‘forest: forests’. But the geminates could not be lengthened any more, so the overlong closure was replaced by two closures, first a glottal then an oral stop. This theory does not account for the stød in words like *læ'dels* Dan. *lettelse* ‘relief’, or *ver'geli* Dan. *virkelig* ‘real’. Kortlandt (1988; 1997) suggests that the WJ stød is inherited from late PGmc which he claims possessed a series of preglottalized stops /p, t, k/. Although the interesting hypothesis that PGmc had preglottalized stops appears to “give a straightforward explanation of the WJ stød” (Kortlandt 1997, 176), it makes the history of the Scand. stops considerably more complicated, as their deglottalization in the various Scand. languages has to be accounted for. It seems, furthermore, not very likely that a distinctive feature such as [preglottalized], which helps to define a segment as just that segment, is systematically

lost, whenever the words in which it occurs lose their stress, as is the case with WJ stød.

According to Ringgaard (1960, 10) WJ stød is a characteristic of every stop in medial position in stressed words. If this were correct, we would have to assume that the speakers of the dialects in question still hear and produce some element after the stop in apocopated words like *ka''d* 'cats'. This is extremely unlikely. In my opinion the WJ stød is best considered a kind of reinforcement of all unaspirated stops after a stressed sonorous base; it is found word-finally in all apocopated words, as well as in non-apocopated words that end in an unaspirated stop, such as *a''g* 'egg'; aspirated stops lack the glottal reinforcement: *stærk* 'strong'.

2.2.3. Reduction and loss of unstressed syllables

In the 12th c., or perhaps even earlier, all vowels in unstressed final syllables were reduced to *-æ/-e* in West and Central Dan., as is attested by several runic inscriptions from that period, e. g.: *þene* (i. e. *þænne*) < *þænni* 'this, acc.sg.m.' on the Hanning-stone from around 1100 (for more examples, see Skautrup 1944, 225). In East Dan., on the other hand, the vowels /i/ and /u/ were retained after a high vowel /i, y, u/ or a short /ä/ in the preceding, stressed, syllable but lowered to /e/ and /o/ after other vowels; short /ä/ was retained after short syllables, but sometimes weakened to /æ/ after long syllables.

In West Dan. the reduced vowels were lost when not followed by a consonant. Loss of final /ə/ is well attested in manuscripts of *Jyske Lov* (JL) and *Flensborg Stadsret* (FS), e. g.: (FS) *skip rouær* < *rouæræ* 'pirates'; (FS) *tha scul skipmen bithæ ham ien dyghæn* [then the sailors shall wait for him twenty-four hours], with *scul* < *sculæ* cf. East Dan. *sculu*; (JL, AM 286) *saald* < *saaldæ* 'sold'. It seems likely that there still was free variation between forms with and without /ə/ in Jutland at the time when the manuscripts (beginning of the 14th c.) were produced, as both types of form may occur in the same text, e. g. *scul* and *bithæ* in the passage from FS quoted above. In this period the apocopated forms may have developed a circumflex, i. e. a kind of accent that, so to speak, adds an extra syllable to a stressed vowel, as e. g. in the Mod.Sw. word *ja*, which is often pronounced as [ja-a] or [jaha]. By means of the circumflex apocopated and non-

apocopated forms of the same word could be kept together, as Liberman (1982, 140–158) remarks. The circumflex is according to Ringgaard (1959) still to be heard in some dialects in West Jutland, where it is mainly found in apocopated words with long sonorous stems, such as *vî:s* < *vise* 'to show', *kôm:* < *komme* 'to come', *skrÿw:* < *skrive* 'to write'. Since long sonorous syllables developed stød in monosyllabic words, there is opposition in West Jutlandic dialects between words with stød, which originally were monosyllabic, and words with circumflex, which were originally disyllabic, e. g.: *fi'n* : *fi:n*, Standard Dan.: *fi'n* : *fine* 'fine, sg. : pl.>'; *hu's* : *hû:s*, Dan. *hu's* : *huse* 'house : houses'. As the same opposition can be expressed by the presence and absence of stød alone, the circumflex has no real function in the phonological system of the dialects in question, and is therefore likely to disappear in the long run, which, according to Ringgaard (1959), is exactly what happened in the dialects of East Jutland. In these dialects the distinction between old and new monosyllabic words is only maintained when the old monosyllable has stød (*hu's* sg. : *hu:s* pl.), but given up in other cases, e. g. *fesk* N. *fesk* vb., Dan. *fisk* : *fiske* 'fish : to fish'. Since the changes in the morphological system of West and Central Dan. all seem to indicate that the distinction between sg. and pl. has gained in importance, it is not surprising that only in the case of nouns the loss of final *-e* is compensated for. The pl. suffix *-er* is in East Jutland extended to words whose pl. would otherwise be indistinguishable from the sg., e. g. *katter* 'cats', *kæpper* 'sticks', *storker* 'storks' : *katte* > *katt* > *katter*. In the dialects of West Jutland stødless bases ending in *-p*, *-t* or *-k* have West Jutland stød in the pl., e. g. *kat* sg. : *ka''d* pl.; compensation for the lost ending *-e* by means of a suffix *-er* is therefore not necessary in these cases. (For a discussion of similar phenomena in the dialect of Fjølde in Schleswig, see Bjertrum 1944, 60–66.)

2.2.4. Weakening of consonants

In all Dan. dialects /p, t, k/ were weakened to /b, d, g/ when preceded by a stressed vowel and followed by either a vowel or a morpheme boundary, e. g. *gata* > *gada* (East Dan.) > *gade* (Central and West Dan.); *bôk* > *bog*. In Central and West Dan. the resulting voiced stops developed into voiced fricatives /β, ð, γ/, in writing *b*, *th*, *gh*. Forms with *b*, *d*, *th*,

g(h) occur sporadically in texts that were composed well before 1300 but have come down to us in more recent manuscripts, such as Saxo Grammaticus' *Gesta Danorum* (written around 1200), which has weakening in some Latinized Dan. names, e. g. *Krage* < ON *Kraki*, or *Valdemars Sjællandske Lov*, which has weakened forms like *uthæn* 'without, outside' and *withæ* 'know'. The number of occurrences of *b, d, g* < *p, t, k* in the manuscripts from the 14th c. is, however, extremely small, in an overwhelming majority of cases we find *p, t, k* instead of expected *b, d, g(h)*. Skautrup (1944, 229, 257–260) assumes that the written language of that time did not reflect the spoken language (at least not in this respect), but continued to use a traditional spelling. Others argue that the change belongs to a later period, viz. the end of the 13th or the beginning of the 14th c. (Wessén 1968, 50)

2.2.5. Diphthongization of long vowels in West Danish

In West Dan. the long vowels /ē, ō, ȝ became /i:e, u:o (u:ə, ow), y:ø (y:ə)/ before 1250. These diphthongs are attested in *Flensborg Stadsret*, e. g.: *ien, ient*, modern dialect: *jæn, jæt*, Standard Dan. *en, et* 'a, one'; *stien*, Dan. *sten* 'stone'; *gwoth*, dial. *gu'ə*, Dan. *god* 'good'; *hwos* Dan. *hos* 'at'. In South Jutland the diphthongs were later monophthongized again. The West Dan. diphthongization of /ō/ is described by Nielsen (1959, 53) as the result of a (push) chain reaction: long /ā/ was changed to long /ǎ/ in most of continental Scandinavia; this /ǎ/ became long /ō/, which caused the original long /ō/ to diphthongize.

2.2.6. Other features of West Danish

One of the most characteristic features of West Dan. is the "unbroken" form of the personal pronoun 'I': *a* or *æ* (in South Jutland; cf. Hesselman 1945, 56 who thinks that West Dan. *ak æk* "without any doubt goes back to a pre-literary *iak iäk*"). Unbroken forms of this pronoun are quite frequent in manuscripts of West Dan. origin, e. g. *Jyske Lov*: *Ak dop thik/ æc dopæ thic* (Flensborg ms.) 'I baptize thee'; *Legend of Sancta Cristina*: *ac thackæ thic* 'I thank you', *ac bith thæc* 'I ask you'; prayer, in Harpestreng ms.: *æk ær æi wærthigh* 'I am not worthy'. The verb *stælxæ* (Dan. *stjæle*) also occurs a number of times without breaking of original /ē/, e. g. in *Jyske Lov* and *Flensborg*

Stadsret: *hwo sum stæl i skip* 'who steals on a ship'.

In South Jutland short /a/ is rounded to short /o/ before long /l/, e. g. in *Flensborg Stadsret*, around 1300: *olt hans gooz* 'all his possessions', in the dialect of Fjølde: *ålt* (or *olt?*), cf. Mod.E.

Initial *h* before *w* or *j* was lost in all of Denmark before 1300, except in the North of Jutland, where it is retained up to now in the various dialects; *h* is also retained in writing, but occasional *h*-less forms occur from 1300 onward, e. g.: *ialpa* 'to help' instead of *hjalpa* (*Skånske Lov*), *war* 'each' instead of *hwar/hwær* (*Jyske Lov*, AM 286 fol.).

3. Sweden

In the course of the 13th century the Swedish king succeeded in strengthening his power, and thus in uniting the various parts of the country, at the cost of the ruling classes in the more or less independent "provinces" (*landskap*). In this way the ground was prepared for the creation of a standard language, the language of communication between the state and its subjects. In the written sources from the 13th and 14th c., however, there are hardly any traces to be found of a tendency towards such a "language of the state". Although a certain predominance of the Central Sw. dialects (*sveamål*) can be discerned at the end of the OSw. period (around 1375), no variety in Sweden had as yet attained the same status as Central Dan. in Denmark, which could function as the norm for a great number of local varieties. This may be due to an absence of major dialect differences in this period, which would have made a national language more or less superfluous: almost all the sound changes and changes in the grammatical system that were to fragment the Swedish language into mutually unintelligible dialects belong to the next period. It is possible that the relative uniformity of the language reflects a stronger position of the peasants in Sweden, who had not yet been tied to their lands to the same degree as their Danish colleagues: in Sweden the tax-paying peasants (*skattebönder*) owned more than half of the land, in Denmark less than one eighth.

Minor differences between the spoken language varieties in the various parts of the country were the result of sound laws that belong to the previous period (Runic Scand.), the most important of which are nasal assimilation, monophthongization and loss of pala-

tal /r/. Later changes foreshadow the quantity shift in the 15th and early 16th c.: vowels were weakened after stressed heavy syllables, but retained, or even strengthened, after light syllables (vowel balance). Palatalization of velar stops started in this period, which was to lead to important differences between the various dialects in the next period: some dialects did not change their velar stops at all, other dialects changed every velar stop before a high vowel, whereas the central dialects only changed them in word-initial position.

3.1. Nasal assimilation

In all Scandinavian dialects nasals tended to assimilate to a following voiceless stop: /mp/ > /pp/, /nt/ > /tt/, /nk/ > /kk/. In the dialects of West Scandinavia (Norway, Faroes, Iceland), as well as in the neighbouring West and North Sw. dialects, nasals assimilated in most positions, in East Sweden (North East Småland, Östergötland, Södermanland, South and East Uppland, Gotland) only in un- or weakly stressed position (Moberg 1944, 179–182; Bandle 1973, 36–39). The distribution of assimilated and non-assimilated forms in the various provincial laws (*landskapslagar*) confirms the theory that the nasal assimilation is a Norw. innovation which gradually spread to the adjacent parts of Sweden, until it came to a halt at the borders of Svealand (Moberg 1944, 33–67).

3.2. Monophthongization

The diphthongs /ei, øy (< /au/ with *i*-umlaut), au/ were monophthongized in Denmark and large parts of Sweden. The process started in Denmark; on the Gørlev runic stone from the 9th c. the words *risþi* and *stin* are written with an *i*-rune (to be read as *ē*) instead of an expected diphthong *ai* or *æi*. At a snail's pace it spread to the neighbouring Sw. dialects, reaching Central Sweden in the 12th c., or perhaps even later. The dialects of Gotland, Jämtland, Northern Sweden (Västerbotten and Norrbotten), Finland (except Åland) and Estonia were never affected. In all areas /ei/ changed to /ē/, and /øy/ to /ø:/; /au/ changed in most areas to /ø:/, but in Dalarna, Hälsingland, Gästrikland and even North West Uppland, to /å:/ and later /ō/, as is attested by the various dialects, and by several runic inscriptions from Uppland and Västmanland (Strid 1989; Elmevik 1998)

3.3. Loss of palatal r

Palatal /r/ < PGmc *z, which was extremely frequent in both nominal and verbal endings, fell regularly in compounds, e. g.: *sonabarn* (cf. *sunærbörn* in *Västgötalagen* I) 'son's child(ren)'; esp. before the suffix of definiteness: *syndina(r)* 'sin-DEF nom/acc. pl. (cf. Birgitta 2:60 *syndirnar*). Morpheme-final /r/ was lost in two distinct areas in Scandinavia: (a) in the south (Denmark, and South Sweden) and (b) in the west (most of Norway) and north (North Sweden), cf. Tjäder 1961. In Dan. and the dialects of South West Sweden (Götamål) the plurals that originally ended in *-aR* have *R*-less forms, which are already attested in the oldest manuscripts: *fiska* Mod.Sw. *fiskar* 'fishes, nom.'

In North Sweden /r/ fell regularly in all plurals, except in consonant stems, and in the present of strong verbs: *sov, bit, spring* Mod.Sw. *sover, biter, springer* 'sleep(s)', 'bite(s)', 'run(s)'.

3.4. Vowel balance and level stress

Reduction of vowels in unstressed or weakly stressed syllables occurs in all NGmc languages/dialects, as Hesselman (1949–53) has made abundantly clear. In some dialects all vowels in weakly stressed syllables were reduced to /e/ (Gotland, East Götaland, Värmland) or to /æ/ and /e/ < /i, u/ (Södermanland, Närke), both in open and closed syllables. In other dialects, however, weakly stressed vowels were only reduced after heavy syllables but were retained after light syllables. In the oldest manuscripts, such quantity-dependent reduction (vowel balance) is attested from all parts of the country, except West Götaland (and South Sweden, which at this time was part of Denmark). The "sharp" vowels /i, u, a/ after light stem syllables alternate with the "lax" vowels /e, o, æ/ after heavy stem syllables, e. g. *fabir : môþer* ('father' : 'mother', nom. sg.); *fabur : môþor* (acc. sg.); *tala : siungæ* 'to speak' : 'to sing' (Wessén 1968, 61). In a later period weakened vowels in open syllables were lost in Jämtland, Västerbotten, Norrbotten, Finland and Estonia (and Trøndelagen in Norway), which gave rise to the following alternations: (Finland) *kást : tala* 'to throw' : 'to speak'; *tûng : viku* 'tongue' : 'week' (Hesselman 1949–53, 37). The dialects which still have short stems and vowel balance, such as Ragunda in Jämtland, distribute word stress evenly over the two syllables in light stems

(level stress); the two light syllables together are, as it were, equal to one heavy syllable.

3.5. Intonation

Accent 2 is found in most dialects in Norway and Sweden, except in Finland, Estonia and parts of Uppland and Norrland (Överkalix). It is generally assumed that these latter dialects once had accent 2 but later lost it, probably under the influence of Finn., Est., and LG (Selenius 1972; Riad 1998, 72ff.). This assumption seems to be confirmed by the fact that there are some dialects in Finland (West Nyland) that have retained the tonal accent. It is not unthinkable, however, that the dialects that now lack accent 2 never had it, like Icel. and Far. (cf. Fischer-Jørgensen 1989, 19). This would mean that the accentual innovation did not reach Uppland, from where Norrland and Finland were colonized, until the 12th c. The tonal accent in the dialects of West Nyland would then be due to the immigrants from Sweden who were employed in the manors and steel mills in the area (Ahlbäck 1971, 6).

3.6. Palatalization

In most Scand. dialects the velar stops /k, g/ developed palatalized allophones [k^j, g^j] before a front vowel. In Dan. and Sw. manuscripts from the 13th c. onward these “soft” consonants appear as *ki* (*ky, kj*), *gi* (*gy, gj*): *Skielfiskor* ‘Skælskør’ (1253); *Kiætil* ‘Ketil’; *Gyæltynng* ‘Geltning’ (*Liber Census Daniæ*); *kiöt* Mod.Sw. *kött* ‘flesh, meat’ (*Codex Bureanus*); *kiäre* Mod.Sw. *kär* ‘dear-DEF’ (*SD* 1285). Original *kj* and *gi*, on the other hand, are sometimes ‘misspelled’ as *k, g*, e. g.: *gäf* ‘gift’ instead of *giäf* (*SD* 1334); *gärna* (= Mod.Sw.) ‘gladly’ instead of *giärna* (*Codex Bureanus*). In some parts of Denmark (Scania, North Jutland, the southern islands), Norway and Sweden, with the exception of Gotland, Estonia, some parts of Uppland and Nyland (Finland), Nagu and Pargas (Finland), the palatalized velar stops turned into affricates /tj, dj/ and merged with the sequences *t + j*, *d + j*. This stage is represented in OSw. manuscripts by occasional “misspellings” like: *kiuver* for *tiuver* ‘thief’ (Wessén 1968, 66). Finally the affricates turned into palatal fricatives: /dj/ > /j/; /tj/ > /ç/; /skj/ > /ʃ/, which yields a form like *iäf* instead of *giäf* in OSw. manuscripts. Some Sw. dialects (Dalarna, North Sweden, Finland) did not partake in the change from affricate to frica-

tive in the case of /dj/ and /tj/, which were either retained or slightly changed to /dz/ and /sts/ (North Ostrobothnia).

In the northern parts of Sweden (in this case north of Uppsala), Finland and Estonia, the velar stops were palatalized not only in word-initial position, but also word-internally, esp. before the suffixed article, e. g. *ryddjin* Mod.Sw. *ryggen* ‘back-DEF’; *bättjin* Mod.Sw. *bäcken* ‘brook-DEF’; *fistjin* Mod.Sw. *fisken* ‘fish-DEF’.

4. Gotland

The language of Gotland differed according to Noreen (1904, 22; 1913, 52–53) and Wessén (1979¹¹, 109) to such an extent from OSw. and ODan. that one is justified in calling it a Nord. *language* on a par with the other Old Scand. languages. The differences are considerable, indeed, but not so large as to call OGu. (*forn-gutniskan*) a language of its own. The main characteristics of the dialect are:

- the old diphthongs /ai/, /øy/ (> /oy/) and /au/ are retained: *stain* ‘stone’; *droyma* ‘to dream’; *auga* ‘eye’; OSw./ODan.: *sten, droma/dromæ, ogha/oghæ*.
- the reflex of PGmc **eu* is /iau/, in OSw. /iū/: *biauþa* ‘to offer’, OSw. *biüþa* (cf. Ralph 1988).
- OSw. *æ* and *ø* correspond with OGu. *e* and *y*: *mæla* ‘to speak’, OSw. *mæla*; *dyma* ‘to judge’, OSw. *doma*.
- short /u/ is retained, except before /r/, also in cases where OSw. shows a change /u/ > /o/: *ful* ‘people’, *sun* ‘son’; OSw. *folk, son*.
- word-initial /w/ is lost before /r/, as in OWN; OSw. changes /w/ > /v/ in this position: *raip̃i*; OSw. *vrēþe* ‘anger’.
- there is no ‘w-breaking’ of short /i/: *singe* ‘to sing’; *sinke* ‘to sink’; OSw. *siunga, siunka*.
- the velar stops are not palatalized before a front vowel.

115. Language contact during the Old Nordic period I: with the British Isles, Frisia and the Hanseatic League

1. The profile of Nordic language contact to the west and to the south in the Middle Ages
2. Contact to the west: with England, Scotland and the Orkneys
3. Contact to the south I: with Frisia
4. Contact to the south II: with the Hanseatic League (part I)
5. Literature (a selection)

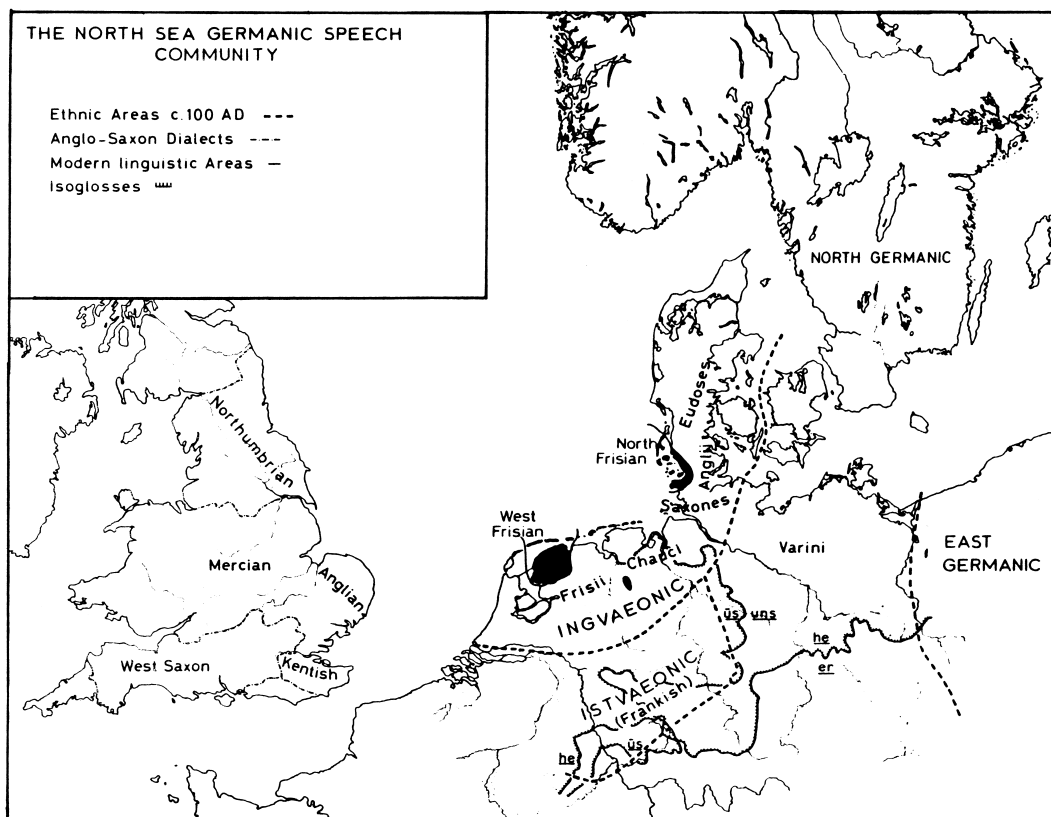

1. The profile of Nordic language contact to the west and to the south in the Middle Ages

1.1. All language contact which will be treated here is characterized by close genetic relationship. Therefore we are faced with (a) special forms of ad-, sub- and superstratum, (b) (pre-

dominantly oral) interdialectal communication, and (c) the possibility for receptive multilingualism and semicomcommunication due to mutual intelligibility.

1.2. The emergence of any pidgin and creole languages (in the traditional senses of these terms) should, however, *not* be expected because of the close genetic relationship between these Gmc dialects. The languages or rather dialects under investigation are thus characterized by common basic structural and, in many cases, also by lexical conformity which considerably increased during the contact period.

Linguistic compromises between idioms in terms of far-reaching reduction and radical

Map 115.1: From Markey (1975, 416) with the permission of Wilhelm Fink Verlag, Munich

simplification thus do not occur, though various interlanguage phenomena and many other (interdialectal) realignments can be observed. The question is more whether these restructurings were caused by language contact, or whether they are part of a common (Gmc) evolutionary process and inner (typological) drift, respectively (see Sapir 1921, §7; cf. e.g. Russ 1980 pro contact vs. Ringgaard 1986 contra contact).

1.3. “Language mixing”, whatever that actually may mean in these cases, must be considered too vague a term properly to define these special forms of linguistic convergence and accommodation between dialects of one and the same language family (cf. the discussion in Görlach 1986; or Hines 1991, though with a misleading use of “creole”).

1.4. Creoloids (Trudgill 1992, 21 f.), however, do occur because some of these languages have experienced certain forms of simplification and admixture, but they have undergone neither reduction (as is the case in pidginization between totally different languages) nor expansion (a natural consequence when a pidgin becomes a creole). When creoloids develop, mutual understanding is never endangered: Most speakers accommodate rapidly, either deliberately or more or less inadvertently when a new, quasi-dialectal variety with high social prestige and connected with economic, political, military or cultural power comes into use through contact with an influential group of (mostly) immigrant speakers (here: the ON-speaking Danish or Norwegian Vikings and the MLG-speaking German Hanseatic merchants, respectively).

1.5. Even the occurrence of jargons (Trudgill 1992, 41; 2000, 76 f.) as intermediate stages of more or less balanced bilateral linguistic contact can actually not be excluded, the result of which is a non-stable, non-focused oral variety. Jargons (like pidgins) typically occur in trading situations and/or when linguistic effectiveness is the prevailing concern.

1.6. This linguistic situation does, of course, not exclude the existence of a (supranational) lingua franca, which was Latin during the entire Middle Ages. Furthermore, Latin was not only the language of the church and of scholarship, but it was also used as a language for specific purposes, e.g. within jurisprudence and book-keeping.

2. Contact to the west: with England, Scotland and the Orkneys

2.1. The situation we are faced with at the beginning of the High Middle Ages is quite typical of eras with previous predominantly oral communication: During the (early medieval) OE period Scandinavian/Viking conquerors and settlers heavily influenced the Anglo-Saxon dialects primarily in the eastern and northern parts of England (eastern Mercia, East Anglia and Northumbria; in Scotland: the far northwestern parts and the Orkneys; and in Ireland: scattered parts in the west and south; see map 115.2). In England, this part of the country is usually called Danelaw, i.e. the territories under the rule of Danish law. But the results of this contact and the far-reaching consequences for the English lexicon were not to be seen to their full extent before the end of this epoch, i.e. at the beginning of the ME period, where, for the first time, we have access to a greater selection of documents belonging to different types of texts and dealing with a greater variety of topics. The spread of these originally Scand. elements to the southern dialects (esp. to London) did not take place, however, until the migrations of the 14th century.

Furthermore, it should be noted (see Hofmann 1955, 253–261) that lexical fusions (e.g. in *sōlmerca* ‘sundial’ < ON *sōl* and OE *-merca* [< *gemearcian* ‘to show’], but not < ON *merki* ‘sign’) and borrowings due to overt correlations such as OE *earl* – ON *iarl* or OE *manncyn* – ON *mannkyn* ‘mankind, people’ (a loan translation) occurred but were not primarily intentional. These two closely related dialects were in principle kept apart, as far as this can be judged from the written sources. But there are good reasons to suppose that informal communication in everyday life was quite different and must therefore have produced many compromise and/or hybrid forms (cf. *to bask* ‘to bathe oneself’ or *to busk* ‘to prepare oneself’ < ON *búa* ‘to live’, with the ON medio-passive suffix *-sk*; Barber 1993, 133). Examples of semantic split can be found, too: ON *dvelja* ‘dwell’ vs. OE *dwellan* ‘to lead astray’ (Barber 1993, 131).

Peters (1981) and Wollmann (1996) give comprehensive surveys of the (approx. 140) clearly attested Scand. loanwords in OE. The bulk of these loans are

(a) maritime: *cnear* (with vowel breaking!) < ON *knorr* ‘merchant-ship’, *snace* < ON

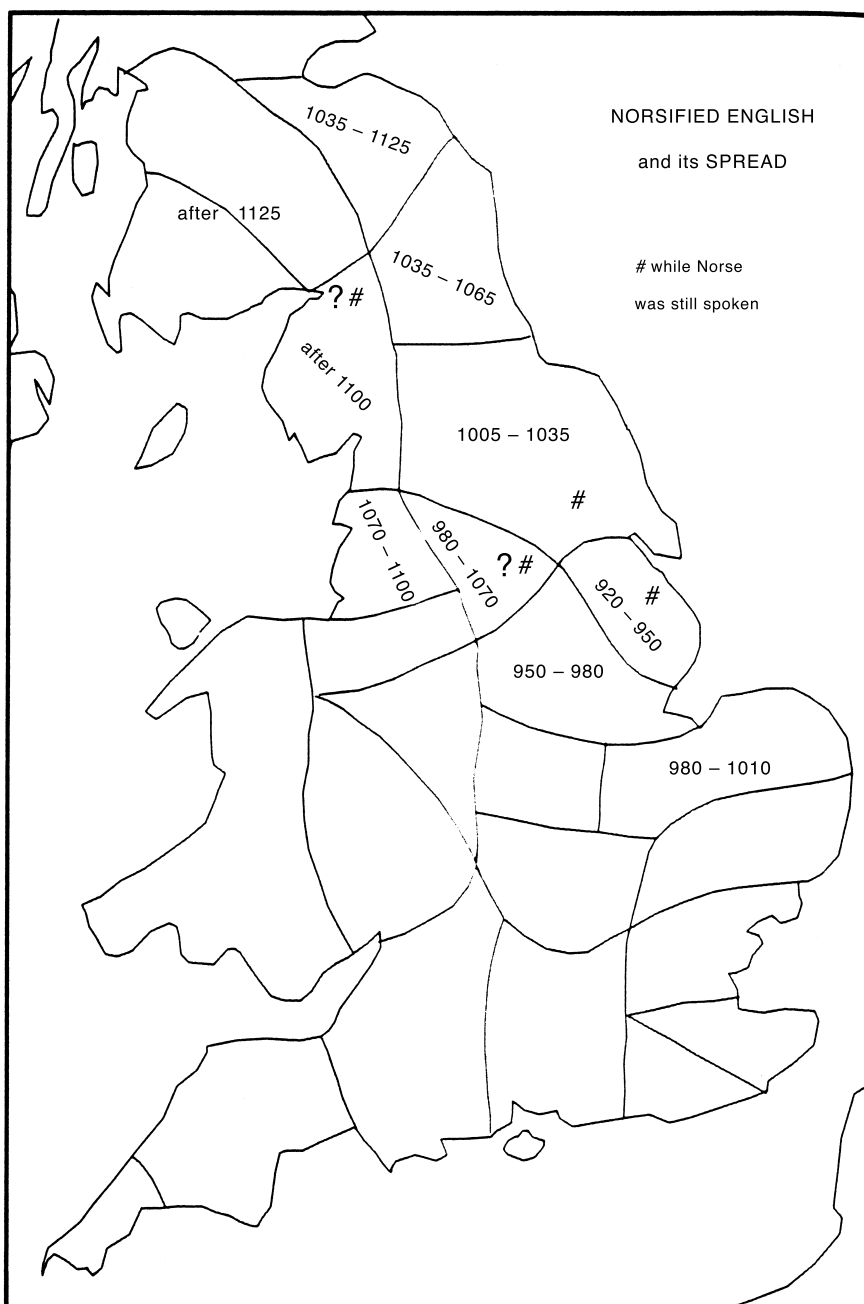

Great Britain in the Viking Age.

Map 115.2: From Kisbye (1982, 32) with the permission of Akademisk Forlag, Copenhagen

snekkja 'swift-sailing ship', *stēoresmann* < ON *stýrimaðr* 'steersman' (a loan translation), (b) legal: *fēolaȝa* < ON *fēlagi* 'fellow, mate', *sac* < *sekr* 'guilty', and (c) societal: *bōnda/būnda* < ON *bōndi/búandi* 'husbandman', *swān* < ODan. *svēn* 'man, warrior' (not < *sveinn!*), *marc* (without vowel

breaking) < ON *mark*, *sceppa* < ON *skeppa* 'bushel'.

For further details, see the seminal investigations done by Hofmann (1955) for OE and Björkman (1900/1902) for ME; and for the various types and derivations of Scand.

Map 115.3: From Thomason/Kaufman (1988, 338) with the permission of University of California Press

names, esp. place-names, see Fellows-Jensen (1991) and the summarizing art. 224 by Sandred, which treats this matter in extenso.

2.2. Later, in the ME era, we are at once faced with numerous loans from Scandinavian, most of them expressing items from everyday-

life. This observation can be regarded as clear evidence for the dominance of the Vikings in their sphere of influence: They were in a position to replace many common OE terms of WGmc/AS origin in the core vocabulary. Owing to the great similarity of the varieties involved and the complete integration of all

loans from ON, we may positively conclude that the Anglo-Saxons and the Scandinavians formed a linguistically quite homogeneous society at the end of the OE era and before England was conquered by the French-speaking Normans (in 1066 A.D.). Finally, the once dominant Vikings became assimilated to the Anglo-Saxons (latest, however, in the northern parts of England; see map 115.3). Cultural divergency was of a minor nature and disappeared sooner or later, if it ever existed at all (cf. Kisbye 1982, 137ff.).

2.3. What actually happened in the Danelaw area can, however, only be inferred by cross-linguistic evidence (cf. Kisbye 1982, 42ff. and especially Thomason/Kaufman 1988, 275ff.):

(1) This period was clearly dominated by oral communication: The majority of the Vikings invading England were uneducated. Their administration was primarily based on military force without much need for elaborate administrative documents. The further decline of the (rather modest) Anglo-Saxon writing tradition was thus only a matter of time.

(2) The pre-existing typological and genetic closeness of the two languages involved made not only interdialectal communication possible but also gave rise to a linguistic restructuring of these Gmc dialects in contact, which may be called interdialectal convergence.

(3) The result of this far-reaching dialect contact was non-focused forms of a dialect-based Anglo-Saxon creoloid. But this final development probably underwent stages of balanced bilateral contact first, a situation which usually occurs when jargons emerge (cf. 1.5.). This means, e.g., that the same word order was accepted by either side, no matter what kind of wording was preferred. Even mixtures of both dialectal variants were obviously tolerated.

(4) This development came to an end when the Normans conquered England, introducing new forms of rule and administration based on Latin and French as written languages. This (indirect) revival of a rather weak writing tradition (cf. (1)) gave way to the establishment of a new literary tradition for writing local/dialect forms of ME.

The diglossic status of the ME dialects as low varieties did not change, however. Norman – a northern French dialect which later, in its vernacular form, was better known as Anglo-Norman – together with Latin (cf. Wright 1996 for the area of London) soon be-

came the new high variety due to the higher social and political status of the Norman invaders.

(5) Very characteristic of the origin of jargons is (morphological) simplification. And this is exactly what happened, but only in the development of the dialects in the northern parts of England (cf. Thomason/Kaufman 1988, 275ff.; see 2.6.).

(6) Finally and therefore marking the beginning of the new (ME) period, ON forms became completely absorbed by these (internally quite divergent) Anglo-Saxon creoloids: The embedded ON loans could, at this time, hardly be distinguished any more from the (still dominant) elements of the matrix language.

(7) The intensification of any genuine code-switching as a consequence of this linguistic change can, however, be excluded due to the quasi-dialectal nature of this contact. However, other forms of bilingualism (Gmc dialects – Latin) are not affected by this observation.

2.4. The grammatical side of the “Norsification” of Anglo-Saxon has been analyzed thoroughly in a case study by Thomason/Kaufman (1988, 282ff.). They pointed out that about two-thirds of the structural as well as lexical loans from Scandinavian could also have been part of any other contemporary English dialect: “The Norse influence on English was pervasive, in the sense that its results are found in all parts of the language; but it was not deep, except in the lexicon” (p. 302). Furthermore, personal and demonstrative pronouns in particular as well as auxiliaries were similar or almost identical in many of their forms due to the inter-Gmc dialectal relationship just mentioned. Under other circumstances, the replacement of function words and auxiliaries would, however, be considered an indicator of a “more intense” (level 3) form of language contact.

There are 57 items listed in table 6 in Thomason/Kaufman (1988, 293–295) which demonstrate these ON-based grammatical influences in ME on the following levels:

- (a) processes: e.g. no *i-* on perfect participles; but there is no such prefix in ON; cf. OE *ge-* /*je-*,
- (b) affixes: *umbe-* ‘around’; *-leik* ‘-ness’; *scap* ‘-ship’ vs. OE *-sċip*,
- (c) phonetic trait: #[f _] not #[v _],
- (d) copula: *ert* ‘(thou) art’, *er* ‘is’, *ere* ‘are’; *waare*/*woaren* ‘were’,

- (e) auxiliaries: *mun* – *munde* ‘must, will’; *sall* ‘shall’ – *sulde* ‘should’,
- (f) pronouns: *they* – *them* replacing OE *hī(e)* and *him*, respectively; *theire*; *sliik* ‘such’; *thir(e)* ‘these’; *same*,
- (g) noun plurals: *breedher* ‘brothers’, *dehter(es)* ‘daughters’; *hend* ‘hands’,
- (h) strong verbs: e.g. *give(n)* – *gaf* – *geeven* ‘to give’ or *gete(n)* – *gat* – *geeten* ‘to get’ vs. OE forms with /je-/,
- (i) quantifiers: *twinne* ‘two’, *faa/foa* ‘few’; *minne* ‘less’,
- (j) comparatives: *werre/werse* ‘worse’,
- (k) place words: *hedhen* ‘hence’, *whaare* ‘where’, *thaare* ‘there’; *til* ‘to’; *fraa/froa* ‘from’; *samen* ‘together’,
- (l) time words: *ay* ‘always’, *aar/oar* ‘before’, *after* ‘after’,
- (m) conjunctions: *ook* ‘also’, *at* ‘that; (for) to’; *sum* ‘as, so’, and finally
- (n) interjections: *yaa* ‘yes!’, *way* ‘alas!’.

2.5. To sum up, contact with ON did not cause or even stimulate any typologically or structurally significant simplification in English dialects. Rather, it added many new and/or prestigious variants to genetically closely related dialects, or it replaced outdated lexemes by forms with some sort of divergent pronunciation. Only in this respect does the Nordic-English dialect influence resemble the restructuring of the mainland Scandinavian languages under the influence of the (equally) prestigious Middle Low German language (see 4.). What actually happened was nothing more than the development of a West Gmc creoloid, an interdialectal expanded vernacular based on OE dialects due to Scand. language contact.

2.6. Special attention has to be paid to the situation in the northern part of England, roughly between the river Humber and the Scottish border, sometimes called the “Great Scandinavian Belt” (Kolb 1965; Samuels 1985; Nielsen 1998, 184ff.; see map 115.4). In this area, the ME dialects are simpler in their morphological structure than the other ME dialects. This development may be seen in connection with social upheavals but, in any case, it has nothing to do with the structure of ON itself. Bilinguals (ON–OE/early ME) living in some remote areas, where ON survived in closed communities until the 12th century (the assumption made in Samuels 1985, 278ff.; cf. also map 115.3), and the transition from focused bidialectalism to the use of diffuse, jar-

gon-like interdialectal variants in the next generation(s), together with the migration of these people away from their homelands up to Scotland may serve as a cross-linguistically tenable explanation for this development: Such scenarios may have as their result morphologically restructured and convergent languages or (here) vernaculars.

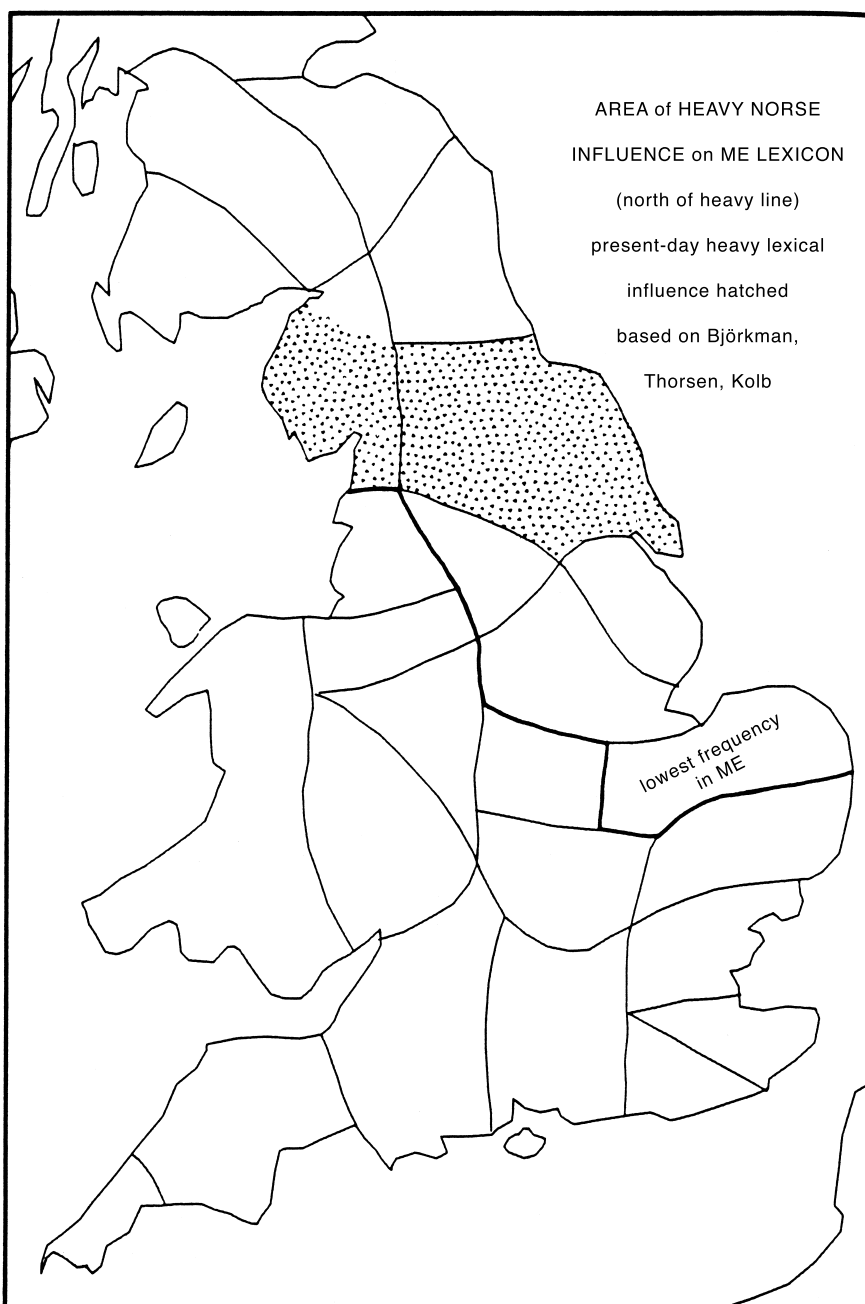

2.7. A further but rather controversial point of structural importance has not been touched upon yet: Both OE and ME came into contact with two groups of non-English speakers, both Scandinavian in origin (cf. Barber 1993, 127):

(1) Melberg (1949/1951, 785), representing the *opinio communis* of older research, e.g. has pointed out that NGmc shares a series of important innovations with WGmc, especially with AS: “Several varieties of breaking spread to the Southern Scandinavians from the Angles, Jutes, and Frisians” (p. 787; before 450 A.D.). Some hundred years later, in the Viking Age, this contact has come full circle because “[t]he Danes were the neighbours of the Angles and Jutes, who were to occupy Britain” (p. 793). These observations have been used not only to motivate some obvious NWGmc innovations such as the occurrence of several breaking processes in both branches of Germanic but also to explain the rather unspectacular integration of ON patterns and lexemes into OE.

More recent research, however, came to the conclusion that breaking/diphthongization occurred independently in the languages under discussion (see Nielsen 1984, 80). Thus, it seems that the parallel developments mentioned are due to common Gmc evolutionary processes rather than due to contact with neighbours. Anyway, the idioms in contact show similar phonological structures at approximately the same time, which facilitated the integration of Scand. loans into English considerably.

(2) The earliest contact with a French-speaking population in 1066 A.D. involved also – indirect – Nordic language contact because Norman (!) French represents a NW-French dialect with some Gmc (lexical) loans and, potentially, more but unknown (Scand.?) substrata.

(Other, esp. earlier forms of substrata in English, e.g. from Celtic or pre-IE-languages, can not be dealt with here; see Ureland 1978 or Vennemann 1999 with further references.)

Map 115.4: From Thomason/Kaufman (1988, 340) with the permission of University of California Press

2.8. Detailed research on language contact phenomena in the opposite direction (OE/ME > Scand.) is relatively rare (cf. Hofmann 1955). Eiriksson (1991) e.g. discusses the impact of English loans in Icelandic with respect

to fishing and trading terminology in the late Middle Ages: e.g. *doggur* 'dog' (a type of shark) and *hafurtask* 'haberdash' (but cf. Dan. *havaske*) (p. 151).

3. Contact to the south I: with Frisia

3.1. Contact with the Frisians is characterized by a more balanced form of linguistic exchange.

For a survey of the pre-OFris. developments and contact see Nielsen (1994): “the oldest of these [contacts] might go back to the pre-Carolingian era where Frisians and Scandinavians were neighbours, while others might stem from the time when Frisian traders played an important role in Hedeby and Birka” (p. 110).

Since the early Middle Ages, Frisian lexical loans have infiltrated into the southernmost Scand. dialects, probably to the same extent as the dialect of the Angles has left its traces in this Jutish-dominated border area of (the later duchy of) Schleswig. Later, many Dan. words were borrowed, especially into the insular NFris. dialects of Sylt, Föhr and Amrum. Mutual borrowings and parallels due to genetic relationship and/or common innovations were thus quite usual in this transitional area with its (more or less) multilingual population.

3.2. Nielsen (1981, 187ff. and 215–220) has given a (predominantly) morphological survey of parallels between the genetically related languages OE, OFris. and OSx. on the one hand and ON on the other. But the internal WGmc innovations common to OE and OFris. are more striking than the parallels between OFris. and ON no matter whether they are genetically related or due to language contact. Similarly, Hofmann (1979, 18f.) has pointed out that the linguistic differences between OFris. and ODan. were more significant than those between OFris. and OSx. or MLG.

3.3. In any case, all Frisians felt compelled to learn at least one of the local majority languages, either Danish, often represented by its vernacular variant Jutish, or Low German. Thus, a functional diglossic situation developed, often connected with personal relations.

3.4. Since the Frisians settled much earlier on the islands than on the mainland, the borrowed forms diverge considerably in the various dialects, depending on the time they entered these dialects.

In some cases, however, the ODan. consonants are still preserved (cf. ODan. **stēkæ* ‘to roast’ with /-k-/ > Ins.NFris. *stiakē*/*stiike* (-i) and Mainl.NFris. *steeke*/*stäike*/*stäke* vs. Mod.Dan. *stege* [‘sɔ̃(j)²] with the reduction

or the total loss of the former *k/g*-phoneme). Even function words were sometimes affected by Scand./Dan. influence: the original Frisian forms for negation, derived from OFris. *nā*, have totally been replaced by Danish-based equivalents (*ech/ich/ek/eg/ääch/äi/ää* < Dan. *ikke* (Hofmann 1979, 19).

Furthermore, cases of coincidental mergers in phonology between NFris. and Dan. can be observed (cf. *baage/bååge/boog* ‘to bake’ < **bāge*: either (a) < OFris. **baka* or (b) ODan. **bakæ* vs. *maage/määge/moog* ‘stomach’ < OFris. **maga*, but not < ODan. **maghæ*, cf. Mod.Dan. *mave*). Though fricativization might have its origin in Danish, this phonological change turns out to be more restricted in Frisian (only in intervocalic position) than in Danish (in final positions, too): see Mainl.NFris. *schap* (sg.) ‘ship’ – *schaawe* (pl.) ‘ships’ vs. Dan. *skib*/*e*, in both cases with obstruents, (ditto NFris. *spat* – *spaaase* ‘cut with a spade’ and *feek* – *fääge* ‘section’ vs. Dan. *spid* and *fag* (now: *j*/(*γ*) or Ø), respectively). Since this development did not affect the old long vowels, it must be taken for granted that these changes occurred before the beginning of the 14th century, i.e. before the restructuring of the syllables in Jutish/Scandinavian towards uniformly long syllables took place (see Haugen 1984, 326f.): cf. OFris. *gripa* > *grip*(*e*), ‘to grip’; *bīta* > *bit*(*e*), ‘to bite’ and *brūka* > *brük*(*e*), ‘to use’ vs. Dan. *gribe*, *bide* and *bruge*, respectively (all examples are from Hofmann 1979, 20f.).

3.5. As these few paradigmatic examples have shown, etymological investigations are faced with enormous problems in deciding whether a certain word has been borrowed (from Dan.) or not. Some of the problems are mentioned or discussed in Löfstedt (1963/1965–1969) and Århammar (1992). But even exhaustive collections of words summing up all (evident) loans from Danish (here) will not be able to give a reasonable explanation for these far-reaching lexical changes in North Frisian. Why, e.g., should we expect OFris. *sax* ‘a sort of knife’ or *fiūr* ‘fire’ to be replaced by their ODan. equivalents *knif* and *æld*?

Further, Dan. loans do not only, as the examples mentioned have shown, occur in the core vocabulary but also in those domains where the Frisians were supposed to be more advanced (cf. Faltings 1983). Any explanation which does not consider the North Frisians’ multilingualism must therefore fail: If their main trading partners or other contact per-

sons were only accustomed to Danish or Low German, the Frisian minority had to accommodate in order to be understood by the majority population(s) and thus to become successful in business. Code-switching is easier the more correspondences and parallels there are between the languages/dialects involved. So, the Frisians gave way on the one hand (incorporation of non-native but related words), but simultaneously they succeeded in reducing the burden of mastering two, or often, three linguistic codes on the other.

3.6. Cultural exchanges on various levels, however, can be found on both sides. Some examples in Andersen's (1995) lists, comprising only terms connected with eating, drinking and the household, show that loans from North Frisian and especially from Dutch were also to be found in the dialects of Jutland. This may demonstrate that a certain amount of cultural exchange even took place between the common people in Jutland and their contacts from the south/west (cf. Jut. *kastrol* 'casserole' or *beskojt* 'rusk/ biscuit' via Dutch; *strog* (*strog*) 'first milk after calving, spread on bread before baking' < Du. *strooken* 'to stroke [to milk]'; Jut. *bjæst/bjost* 'first milk' < NFris. *bjarst/bjürst*; Jut. *mukke* 'to crush with a hammer' < Du. *moker* 'big hammer' or Jut. *bak|skulde* < Du. *bakschol* 'fried plaice'). But much more research still needs to be done before we are able to determine the actual extent of the influence from the (south) western bordering population on West Danish/Jutish and Scandinavian in general.

4. Contact to the south II: with the Hanseatic League (part I)

4.1. The famous Hanseatic League or just the Hansa ('guild') started as a small and loose trading association of North German merchants. They succeeded in taking over the old (waterborne) trading routes in the Baltic via Visby on Gotland and the coastal connections in the North Sea area in the middle of the 12th century (see map 115.5). Their transnational activities were based on more advanced technology (a new type of ship) and a more effective organization (better logistics including commercial enclaves ("Kontore") in Bergen, London (see Lappenberg 1851) and Novgorod; unified commercial and, later, even uniform legal conditions). But no pivotal trading place (such as Haithabu was in the early

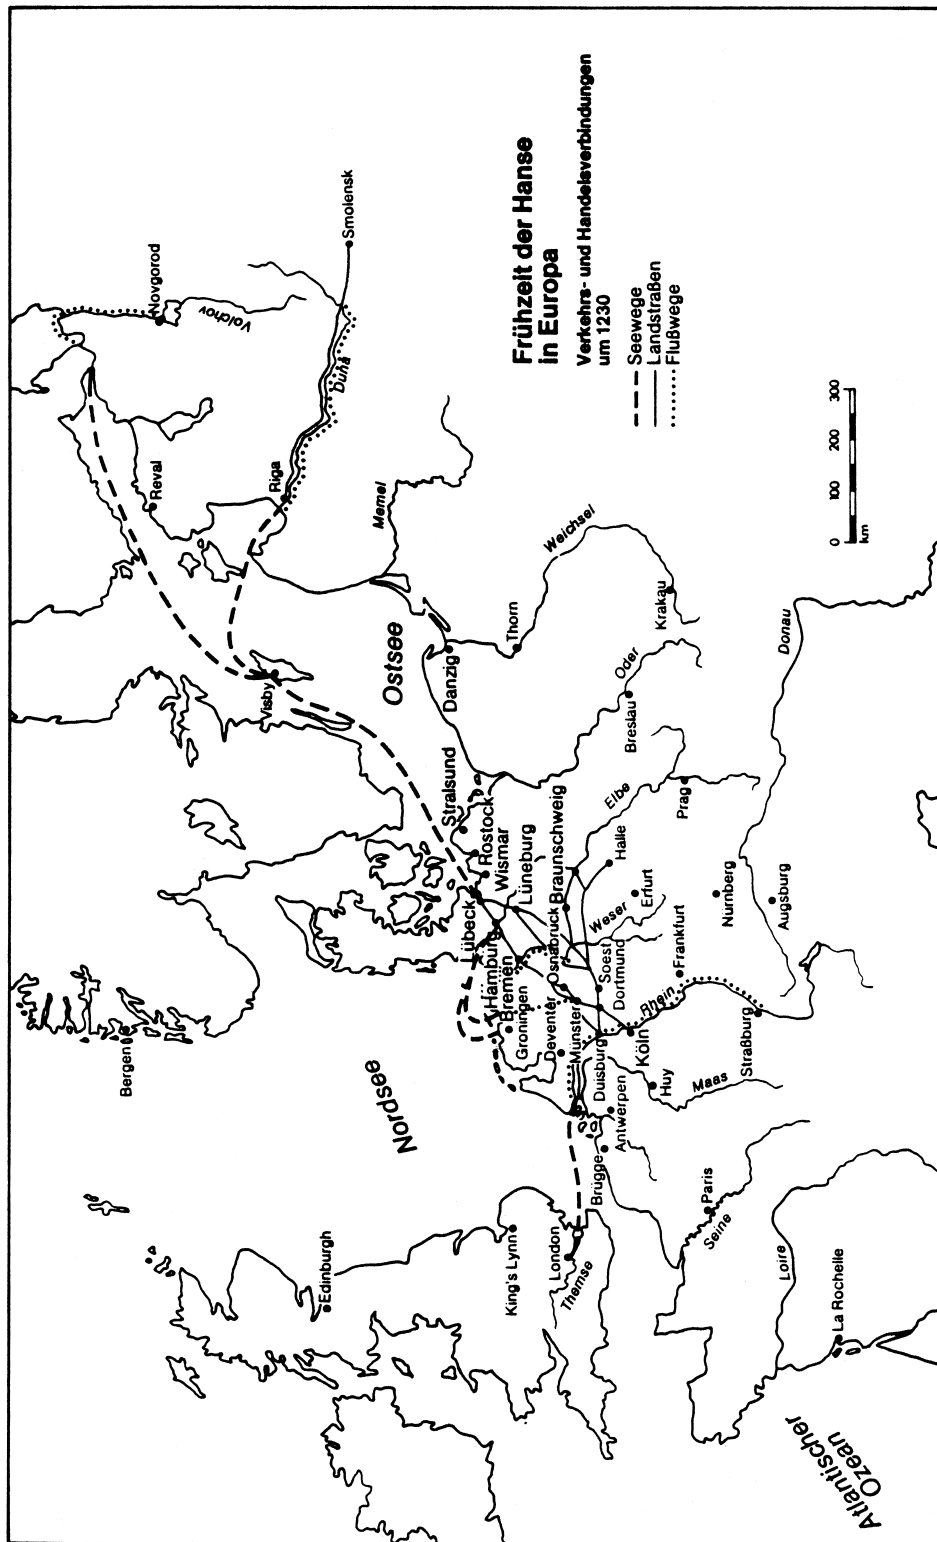

Middle Ages) emerged before the end of the 13th century. (Lübeck was founded in 1159 A.D.) This early period is best characterized by the term "Merchants' Hansa", which lasted from 1150 – 1250/1300 A.D., i.e. almost to the end of the era to be dealt with here. For the rise and decline of the Hansa as a mighty trading union and a precursor to a Northern European common market, see art. 135 which is devoted to the so-called "Hansa of the Towns" (part II).

4.2. The languages used in the early days of contact with the Hansa were Latin, as the (predominantly written) lingua franca of the Middle Ages (for legal documents of any kind, but also for book-keeping) on the one hand, and Middle Low German and Scandinavian for face-to-face communication on the other.

There is no evidence, however, that any trading jargon or a pidgin ever evolved. Since the vernacular languages were not standardized in those days, migrating merchants as well as their Scandinavian trading partners in the coastal towns were used to understanding many dialectal variants of their native language and often of the neighbouring dialects, too.

Thus, there are good reasons to assume that both sides very soon must have been aware that the Scand. languages were very closely related to MLG and its dialects, and that neither an interpreter (as in Russia) nor any forms of active bilingualism were mandatory to be sufficiently understood: The interlinguistic relations within the Gmc-speaking parts of the Baltic and beyond were based on mutual intelligibility and receptive multilingualism. This form of communication has also been called semicommunication (cf. Braumüller 1995) and has its obvious counterpart in modern inter-Scandinavian communication. Native command of either Dan./Swed./Norw. or MLG proved to be a sufficient precondition for this – by no means unique – form of receptive multilingualism (cf. the possibility for semicommunication between Slavic, Romance and Finno-Ugrian languages). Therefore, a Swede or a Dane may have considered MLG a potential or quasi-dialect of his/her own linguistic system and would consequently understand what the Hanseatic merchant wanted to say.

4.3. The following historical facts can be regarded as crucial preconditions for the overwhelming success of the Hansa:

Map 115.5: From Dieter Zimmerling, *Die Hanse*, Düsseldorf and Vienna: Econ Verlag 1984, p. 48 with the permission of the Verlagshaus Goethestraße, Munich (map: Jürgen Erlebach, Düsseldorf).

(a) At the beginning of the High Middle Ages, Scandinavia was quite underdeveloped in comparison to continental Europe with respect to economy, administration, Christianity, education and literacy in general.

(b) Northern Germany and its merchants played a mediating role and held a key position between the periphery (Scandinavia) and the centre of Europe (southern Germany, France, Italy).

(c) Low German was obviously a prestigious language or a high variety (not only for the upper classes), and it gradually acquired an important function when participation in the various advancements coming from the south was desired.

(d) All contact around the Baltic and the coastal regions of the North Sea was decentralized in nature. This led not only to contact on equal terms but also to a faster spread of loanwords and rapid transfer of other related linguistic structures in general.

4.4. Due to the close genetic relationship, loans and transfers of word formation elements (such as the affixes *an-*, *be-*, *for/för-*, *-het/hed*, *-else*) were possible without causing any integrational problems for the receiving linguistic systems. Both language/dialect groups in contact were also typologically similar, the consequence of which was the development of some sort of interdialectal continuum around the Baltic, i.e. between the linguistic varieties of Scand. and of MLG. The predominantly parallel structures in word order and in syntax were obvious, too: There was hardly any structure which could be regarded as inappropriate or definitely obsolete.

The price to be paid for the many lexical or structural loans from MLG was, however, a deep-seated typological restructuring of the Scand. languages according to WGmc patterns (cf. e.g. the increasing use of derivations with pre-verbs of the type OSw. *bestigha* (with a direct object) 'to climb up' vs. the inherited ON/OSw. type *stíga á* ≈ *stígha på* (with an intransitive/prepositional object)).

116. Language contact during the Old Nordic period II: with Eastern Europe

1. Introduction
2. Domains and sources of Scandinavian influence
3. Conclusion
4. Literature (a selection)

1. Introduction

Language contact between Old Nordic in Scandinavia and “the East”, i. e. the Finnic, Baltic and Slavic populations in what is now Russia, the Baltic States and – possibly – also Finland, or, generally speaking, language influence across the eastern part of the *Baltic*

Sea, is to be seen and explained in the context of political, economic, and social relations between these areas. It is clear from historical sources (Tacitus, Jordanes et alii) that we have to account for such relations as early as the first century B. C., when the Goths crossed the Baltic Sea, emigrating from Scandinavia to its southern shores, settling on both sides of the Vistula river, which they left later – beginning in the first century A. D. – following this river upstream, ultimately settling in (now) SW-Ukraine and the territories on the northern shores of the Black Sea. It is generally assumed that this period of time provides the historical

and ethnological background for many linguistic influences, in particular lexical borrowings from Proto-Germanic or Gothic into the Proto-Slavic and Proto-Baltic (possibly also Proto-Finnic) languages (cf. Kiparsky 1934; Stender-Petersen 1927). As the present article concerns only later borrowings and influences, i. e. from the Viking period, we will have to separate these from those of the Gothic (or Proto-Germanic) period, which will cause some difficulties methodologically, as we shall see later, when discussing individual items.

The immigration or invasion of Scandinavian Germanic-speaking people (merchants or warriors respectively) into East-Slavic territories is very well documented in Old Russian chronicles as well as in Byzantine (e.g. Scylitzes) and Old Nordic chronicles (Snorri's *Heimskringla*) and other documents, including runic inscriptions (cf. Düwel 1968, Krause 1993², Mel'nikova 1998, Sverdlov 1974) both in Scandinavia and Old Russia. This is so well known, though still discussed at length in much detail, that we need not repeat it here, restricting ourselves to the bare facts relevant to the question of language contact. We may refer here to the historical works by Birnbaum (1978), Forssman (1983²), Hellmann/Schramm/Zernack (1981), Lägheid (1984), Rüss (1981), Stender-Petersen (1934), Wührer (1976).

It is *communis opinio* that the number of Scandinavian people who immigrated into or invaded the East European territories – irrespective of the ethnic character of their population – was relatively small, though effective in military and political respects. The reason for this is that the motivation for these raids by the Vikings was not the occupation of new lands for settlers or great masses of population, but rather the famous glamour of oriental cities and treasures of gold and precious stones, which they hoped to gain by conquering these countries and towns. Old Russia, called *Garðaríki* in Old Nordic, i. e. 'country of towns', was only a transit country for these adventurers, who hoped for a better life after a short spell of extreme violence. Also the probably relatively small number of merchants who preceded or accompanied them were attracted by the tales of gold and silver, palaces and marvellous treasures of oriental countries and cities such as Miklagard (the 'great city' of Byzantium), Serkland ('land of silk' or 'of the Saracenes') and others.

The ethnographic and linguistic situations in these areas were by no means homogene-

ous, but included at least four major divisions: Baltic, (East) Slavic, Finno-Ugric and Turkic (cf. Schmid 1981, Vasmer 1941). All of these have many modern language descendants. Nevertheless, for cultural and linguistic reasons, we can observe phenomena of language contact almost exclusively in East Slavic: neither the Baltic nor Finno-Ugric nor Turkic peoples produced and left us written records from which we would be able to determine anything about the state of these languages at this time, e. g. during the 10th through the 12th or 13th centuries. Only Slavic documents were produced from at least the middle of the 11th century (1056/7). As strong as the political and military impact of the Normans upon the Slavic people may have been, the main cultural influence on the Slavs and their conquerors came from Byzantium: due to the strong influence of Christianity, finally adopted by the "Russians" in 988, they were totally acculturated by Byzantine Greek and (Slavo)-Bulgarian monks and priests, who imported religious ideas and books written in Cyrillic, i. e. a kind of Greek alphabet, in a (South)-Slavic language. (The term *Russian* (*rus-ŷsk-*) originally meant the Swedish tribe of the *roths* (*karlar*), Finnish *rotsi/ruotsi* 'Swede', but was later (in the course of time) applied to all inhabitants of the Kiev state, called *Rus'*, the vast majority of whom were Slavs ethnically and linguistically. Since the Normans (or *Varangians*, as they are called in the east) were pagans at the time they came to the east, they could not withstand this strong influence from the south: however, they accepted both the local culture and language, and finally were totally assimilated to the Slavic majority.

2. Domains and sources of Scandinavian influence

Except for some single runic inscriptions, we do not have any North Germanic documents created in these regions. So we must look for traces of the culture and language of the Normans which may have survived in a Slavic context, i. e. in written documents in the Slavic language.

Of course the Normans brought their names with them: *Rjurik*, *Igor'*, *Oleg*, *Ol'ga* etc. certainly are names of Germanic origin, some of which have survived until the present (cf. Vasmer 1971 vol. II, 814–71; Forssman 1983², 44–60; Strumiński 1996, 77–228; see 2.1-3). In addition we have a number of toponymic and

hydronymic items evidently coined by the Normans in “Russia”, e. g. the famous names of the Dniepr river rapids, mentioned by Porphyrogenetos (*De administrando imperio*) in Slavic (σπλαβηνιστί) and North Germanic (ῥωσιιστί!), and other names of settlements (towns) and rivers (see 2.2.). Nomina appellativa of North Germanic origin are to be found in Old Russian documents as well as in modern (North) Russian dialects and – to a minor degree – in contemporary literary standard Russian also (see 2.3.). A few borrowings from Old Russian into Old Nordic are discussed in 2.4. The question of whether there are Varangian traces in the morphology or syntax of North Russian dialects (the post-positive article, possessive perfect) is discussed by Panzer (1984) and will be briefly summarized in 2.5.

Though of minor importance here, it must be mentioned that some scholars assume there was Old Nordic influence also in literature (folklore), e. g. the tale of Igor, *byliny* etc. (Forssman 1983², 80–99), and law (*Russkaja pravda*). This, of course, is of considerable importance generally, as far as the social and cultural background of language contact is concerned; but as to the linguistic consequences (lexical borrowings) of such phenomena, we will need to deal with them only marginally.

2.1. Personal names

From Forssman (1983², 31 ff.) and Strumiński (1996, 159–62) we can compile the following list of Old Russian names with their Old Nordic equivalents (< means ‘coming from’; reconstructed forms are marked by *; pairs connected by ‘=’ may have gone the other way, i. e. from Slavic to Old Nordic).

The first Russian princes were:

Rjurik < *(H)rōrikR; *Sineus* < *Signiutr*; *Truvor* < *Pró(w)arr|Þorvarr, ONorw. *thrúvar* ‘true’; *Oleg* < *Helgi; *Igor* < *Ingorr|Ingvarr; *Ol’ga* < *Helga*; *Malfrid* < *Málfríðr*; *Rognedi* < *Ragnheiðr*; (*Vladimir*, *Volodimer* = *Valdimarr*); (*Jaroslav* = *Jarizleifr*).

Other *personal names* in Old Russian literature include:

(J)*Akun* < *Hák(u/o/a)n*; *Askold* < *HaskuldR|Hōskuldr; *Asmud* < *Asmundr*, *Asmóðr*; *Bern* < *Bjōrn*; *Blud* < *Bloði*; *Dir* < *Diuri*; *Friand* < *Frænde*; *Ikmor* < *Ingmarr*; *Ivor* < *Ingvarr*; *Ljut* < Icel.-Norw. name *Ljótr*; *Olma* < *Holmi*; *Olstin* < *Holmstæinn*; *Otvine* <

(OHG) *Otwini*; *Rogvolod* < *Ragnvaldr*; *Sfengos* < *Svænke*; *Sveneld*, *Svenald* < *Sveinaldr*; *Simon* < *Sigmundr*; *Tuky* < *Tóki*; *Tur(y)* < *Thóre*; *Uleb* < *Olef*, *Oleifr*; *Vōdmol/váth* ‘cloth’, *mál* ‘measure’, Sw. *vadmal* ‘cloth’; *Ždibern* < *Sig-Bjōrn*(?)

In the treaties made by *Oleg* and *Igor* with *Byzantium* in 907, 912 and 945 A.D., the following names of Old Nordic origin are mentioned (cf. Strumiński 1996, 162–6; 211 ff.):

907: *Farlof* < *Farulfr*; *Karl*; *Rulav* < *RōllabR|Hrolleifr; *Stemid/r* < *Steinviðr*?; *Ver/lemud* < *Vermu(n)dr*;

912: *Fost* < *FastuR; *Frelavc* < *Frilleifr*; *Inegeld* < *Ingialdr*; *Karly* < *Karli*; *Karn* < *karna* (from a runic inscription in Sweden); *Lidul(f)* < *Lidulif* < *Leiðulfr*(?) (*litulfr* in a runic inscription); *Ruald* < *Hróaldr*; *Rjuar* < *Hróarr*; *Truan* < *þróndr*, *þrándr*;

945: *Adulb* < *Auðulfr*; *Aðun* < *Audun*; *Aldan* < *Hálfðan*; *Alvad* < *Halvarðr*; *Bruny* < *Bruni*; *Emig* < *Hemingr*; *Fudri* < *Frudr*; *Fursten* < *Thurstain*; *Gomol* < *Gamall*; *Grim* < *Grimr*; *Gunar* < *Gunnarr*; *Gunastr* < *Gunnfastr*; *Iggvilad* (*Angivlad*) < *Ingivaldr*; *Kary* < *Kári/e*; *Prasten* < *Freysteinn*; *Sfandr* < *Svanhildr*(?); *Sludi* < *Slóði*; *Stir* < *Styrr*; *Sven* < *Sveinn*; *Šibrid* < *Sigfríðr*; *Sichbern*, *Sigobern* < *Sighjōrn*; *Tulb* < Sw. Dan. *Thólfr*, *Thulfr*; *Turubern* < *Þorbjōrn*, *Turdov* < *Þórðr*; *Turbrid* < *Þórfriðr*.

These lists are, of course, far from being complete; we restrict ourselves to citing only those examples which can be explained by Old Nordic influence with a high degree of probability.

2.2. Names of rapids, rivers, settlements

On their way from the Baltic Sea to Byzantium, the Varangians had to pass the famous rapids (ataracts) of the river *Dniepr*, situated between Dnepropetrovsk and Zaporoz’je. These rapids are mentioned in two forms by the Byzantine emperor *Porphyrogenetos* (912–959) in chapter 9 of his description of his empire (usually cited as *De administrando imperio*): the “Russian”, i. e. Scandinavian, and the Slavic names of these rapids (cf. Forssman 1983², 67–9; Strumiński 1996, 133–49):

- (1) (N)εσσουπιῆ (N)essupi = *ne sofí* (Forssman), *nesuþi (Strumiński) = *ne sþpi ‘don’t sleep’;
- (2) Ούλβορσί *Ulvorsi* (= *Hulmfors*) = Ὀστροβουνιπράχ *ostrovuniprach* (*ostrovnyjъ *prachъ*) ‘rapid of the island(s)’

- (3) *Γελανδρί Gelandri* (= *gællandi*) ‘roaring (rapid)’ (without Slavic equivalent);
- (4) (*M*) *Αειφόρ Aifor(s)* ‘always violent’ or (Strumiński) **maiwaR* ‘gull’; *Νεασήτ ne(n)asyt* ‘insatiable’ (Forssman) or *nejasyt* ‘gull / pelican’ (Strumiński);
- (5) *Βαρουφόρος Varufor(o)s* ‘wave rapid’; *Βουλνηπράχ vulnīprach* (**vb̥ln̥ɛn(ɔ)praxɔ*) ‘rapid of the waves’; (Whether Greek *-πραχ* corresponds to Slav. *prag-* ‘sill’ or to Slavic *prax-* ‘dust, mist’, etymologically the same word as ON *fors*, is not easy to decide in this context.)
- (6) *Λεάντι Leanti* = OSw. *leandi* ‘laughing’ (Forssman) or *(*h*)*lōjandi* ‘boiling hot’ (Strumiński); *Βερούτζη verutzi* (*vb̥ručii*) ‘boiling’
- (7) *Στρούκουν Strukun* = **strukum* ‘on the mainstreams’ (Strumiński); *Ναπρεζή naprezi*: derived from **na-pražie*, *prag-* ‘rapid’ (Forssman); *nastrezi* = **na striži* ‘on the mainstream’ (Strumiński following Falk). Porphyrogenetos translates both words as ‘μικρὸς φραγμός’, i. e. ‘little rapid’!

It is clear from these examples that the names do not always correspond in meaning, but they clearly document bilingualism and thus language contact in these geographical areas.

Other names of bodies of water and settlements are derived from the ethnic names *Varangians* (*væringr*), *Burangians* (*bu/yringr*) and *Kolbangians* (*kulfingr*):

Varegovo, *Varež(ka)*, *Varyzki*, *Varjaža*, *Verjažino*, *Verjažka* ...

Burjaži, *Buregi*, *Burigi*, *Burezi*, *Burjaki*, *Burjaz* ...

Kolbežycze, *Kolbjagi*, *Kolbižicy*

or from Scandinavian personal names:

Ašvidovo < *Asviðr*; *Bernovo*, *Bernjatino*, *Bemniški*, *Bernava*, *Bernoviči* < *Björn*; *Buchvostovo* < *Bôfastr*; *Djurbenevo* < *Dyrbiorn*; *Inarevo* < *Einarr*; *Ivorovo*, *Ivorovka* < *Ivarr*; *Jakunovo*, *Jakunicha* < *Hákon*; *Kondrikovo* < *Kynríkr*; *Redrikovo*, *Redruchino*, *Redriki* < *Ródríker*; *Rognedino* < *Ragnheidr*; *Sven* < *Svén*; *Sneberka* < *Snæbjörn*; *Stegrimovo* < *Steingrímr*; *Suchvostovo* < *Stófast/r*; *Turyborovo* < *Thorbjörn*; *Ulebovo*, *Olebino*, *Olibov* < *Oléf*, *Veliž* < *Vællinge*.

On the other hand we find only a few place-names of famous Russian towns in Old Nordic texts, e. g.

Hólmgarðr = *Nógarðr* (Novgorod); *Kænu-garðr* (Kiev); *Morammar* (Murom); *Surdalar* (Suzdal’); *Rostofa* (Rostov); *Palteskia* (Polotsk); *Smalizka* (Smolensk)

or names of Russian rivers: *Duna* (*Dvina*), *Nepr* (*Danpr*), *Nyja* (*Neva*), *Vína* (*Dvina*).

2.3. Loanwords (borrowings) from (Old) Nordic

As indicated above, we have different layers of loanwords from Germanic in contemporary Russian: *Kiparsky* (1975, 54–59) lists 55 *Common Slavic loanwords* from Germanic, distinguishing those from

Proto-Germanic: Russ. *glaz*, *duma*, *knjaz*, *skot*, *tyñ*, *chižin*, *chlev*, *cholm*, *šolom*.

Gothic: Russ. *bljudo*, *verbljud*, *kotel*, *kupit*, *-kusit*, *lečit*, *lest*, *lichva*, *osel*, *polk*, *stupa*, *steklo*, *chleb*, *chudožnik*, *car*, *čužoj*.

Balkan-Germanic: Russ. *bukva*, *vinograd*, *smokva*, *userjaz*’/g, *skut*.

West Germanic: Russ. *bondar*, *bočka*, *bronja*, *buk*, *grjadil*, *doska*, *izba*, *klej*, *korol*, *krest*, *luk*, *myto*, *petlja*, *penjaz*, *pila*, *plug*, *pop*, *post*, *remen*, *truba*.

Whereas Forssman (1983², 75–80) lists more than 100 “older Russian loanwords from Old Norse”, *Kiparsky* (1975, 95–7) in his critical survey restricts the number of loanwords from North Germanic in contemporary Russian to 34 „einigermaßen sichere“ (Strumiński 1996, 229–43 has only 30, personal names included); some of them, e. g. *knut*, *seledka*, *šelk*, *jaščik* are commonly used; *varjag*, *stjag*, *vitjaz* are used in historical novels only. The rest belong to a very specialized area of Russian vocabulary, as can be seen from the following list, comprising words used until the end of the 13th century (words occurring only in Russian dialects have been omitted):

berkovec < **birkisk* (*pund*) ‘164 kg (of Birka)’ (see *pud* below); *varjag* < *væringr* ‘confederate’; *vitjaz* < *vikingr* ‘hero’; *gol(u)bec* < *gulf* ‘box, crate, shed’; *grid*, *gridin* < *grīði*, *grimaðr* ‘member of the king’s bodyguard’; *lar* < **lári/lárr* ‘chest, trunk’; *pud* < *pund* ‘16.38 kg’; *Rus* < *Róths(karlar)* ‘Varangians’; *skala* < *skál* ‘scale’; *ti(v)un* < *thíonn* ‘official of Novgorod in the 12th century’; *šelk* < **silki* ‘silk’; *jabeda* < **embætti* ‘office’, NHG *Amt*.

Borrowings from later stages of Swedish and Norwegian (after 1300 A. D.) include:

akula < *hákall* ‘shark’; *vorvan* < *náh-valr* + *hvalrav* (?), ‘dolphin, seal, whale-oil’; *vyt* < *yta* ‘share’; *dorožka*, *doroga* < *dorg* ‘a kind of fishing-line’; *knut* < *knut* (*piska*) ‘knout’; *kragi* < *kragar* ‘cuff, gaiter’; *krjuk* < *krókr* ‘hook’; *sel’d* < *sild* ‘herring’; *skat* < *skat(a)* ‘ray’; *stjag* < *stænger* ‘banner, flag’; *šneka* < *snekkja* ‘a little fishing-boat in the Arctic Sea’; *ščery* < *skären* ‘the isles at the Swedish and Finnish coast’; *jakor* < *ankari* ‘anchor’; *jaščik* < **askR* ‘box, case’.

2.4. Old Nordic words borrowed from Old Russian

Strumiński’s list (1996, 246–54) comprises 15 items:

**dyblitsa/dyfliza* < **tīmīnica* ‘dungeon’, **GriikkiR* < *Griky*; **kassa/kaza* < *kaša* ‘gruel’, *læðia* < **lodija* ‘boat’; **LæsiR* < **l’ās’i* ‘Poles’; **poluta* < *polota* ‘palace’; **polyði* < **pol’ud’je* ‘Northmen’s winter tour of East Slavic regions for lodging and provisions’; **sabaló* < **sobolji* ‘sable skin (fur)’; **stóll* < *stol(u)* ‘banquet table’; **taparöks* < **topor-* ‘small war ax’; **torg* < **tuřgu*/torg ‘market’; **tulka* < **tu’l-kovati* ‘to interpret’; **tulkR* < **tũ lkũ* ‘interpreter’; **Waldimarr* < **Vol(o)dimēr* ‘ruler of peace’ PN; **warta* < **vor(o)ta* ‘gate’.

(Note that traditional Proto-Slavic **o* should be interpreted as the phoneme /ǎ/ in prehistoric Slavic in general; *o* is the historically attested form in Old Russian).

2.5. Morphological and syntactic borrowings?

There are some overt, but superficial, similarities – e. g. the use of the enclitic reflexive pronoun, Nordic *-s*, Russian *-s’(a)* (in its present form in Russian not earlier than the 15th–16th centuries!) as a kind of passive or medium voice form both in Nordic and Slavic languages, which may be due to its common Indo-European origin or to a parallel development on the basis of typologically similar structures and affinities of the semantic and noetic categories involved (cf. not only the well-known morphological, semantic and syntactic relations between mediopassive, reflexive and reciprocal forms, meanings, and constructions in Greek and Sanskrit, but also similar new phenomena in modern Italian, e. g. *vendesi (casa)*, *si apre lo sportello*, *la chiesa*

si chiude, or Spanish, e. g. *estos libros se venden mucho*). Apart from this, there seem to be at least two cases of structural parallels in Nordic and Russian languages or dialects which one might be inclined to attribute to language contact: the *postpositive article* and a special *possessive perfect*.

It is well known that the article in general, which developed from a demonstrative pronoun, is a widespread innovation in modern European languages; it appears in two forms: (a) preceding the noun or noun phrase in (Old) Greek and some of the Romance and Germanic languages (English, German, Dutch); (b) following it (postpositive) in Bulgarian, Macedonian, Rumanian, Albanian, i. e. in the Balkans, forming one characteristic feature of the so-called *Balkan group* (Sprachbund) of languages, and in the North Germanic languages from Old Icelandic through all modern Scandinavian languages. Most Slavic languages do not have an article at all, except those mentioned above with its postpositive variant (Bulgarian and Macedonian). Northwest Russian dialects show rudiments or traces of a development which could have ended up as a regular postpositive article: *reka-ta*, *izbu-tu*, *seno-to*, *otec-ot* ... But a detailed and comprehensive review of the evidence from these forms shows that they do not comprise a full inflectional paradigm of a postpositive article. This phenomenon is certainly independent of comparable structures in the Balkans, but because of its geographical distribution may very well be connected with Nordic language contact.

Even more complicated is the case of the possessive perfect, which is common today in all Romance and Germanic languages, in particular in the North Germanic. The Slavic languages are ‘be’-languages in this respect, i. e. they use the paradigm of *byti* ‘to be’ in order to create new periphrastic tenses (and moods). Only in peripheral dialects of Macedonian, Serbian, Croatian and Czech, which are or have been in contact with Romance or German languages or dialects, are ‘have’-perfects found. In Russian there is the further restriction that *imet’* ‘to have’ cannot be used for the concrete notion of possession nor for periphrastic purposes in general. ‘I have a house’ is *u menja dom*, literally ‘with me (is) house’, in Russian. This way of expressing possession is certainly a loan from Balto-Finnic languages (*minulla on talo*, modern Finnish literally ‘with me is house’). The curious thing is that this way of expressing possession in a

'be'-language combined with a passive participle in *-n-* or *-t-* is used in North Russian dialects for creating a new form of possessive perfect: *u menja proechano* 'with me (is) driven = I have driven', *u nego ženenosja* 'with him married = he has married', *u volkov korovu jideno* 'with the wolves the cow (accusative!) eaten = the wolves have eaten the cow'. These examples show that the object is in the accusative, and even intransitive verbs can be used this way. This seems to provide a strong argument for interpreting these forms as internal (semantic) 'have' perfects, expressed by a morphological (superficial) 'be'-structure (of Finnic origin).

It is true that "morphosyntactic and syntactic interference is of a much more fundamental nature than lexical borrowing" (Ureland 1979), but it is also true that it is much more difficult to prove these influences than lexical ones. Therefore we must restrict ourselves to demonstrating language contact using this more superficial, but clear evidence, refraining from speculative theories about very complicated developments in deeper linguistic structures.

2.6. Law, literature, and folklore

Representatives of the Normannist school of historical research hold the opinion that not only the *Russkaja Pravda* (i. e. a code of 'Russian Law'), but also literary works such as the famous *Slovo o polku Igoreve* ('Tale of Igor') and even the so-called *byliny*, heroic tales from the times of the Old Rus' (Vladimir and his friends and companions), show many traces of Nordic influence (cf. Forssman 1983², 24–7, 80–99), but this seems by no means certain or provable from the evidence of exact or literal parallels in the texts. This may have arisen from the general similarity and parallels of social and political structures of these cognate societies. In any case, they will remain fruitful territory for comparative cultural research in these areas.

3. Conclusion

We do have well-documented evidence of Scandinavian influence on East Slavic in the domains of personal and geographical names as well as in many lexical borrowings, especially concerning local and specialized vocabulary in non-standard varieties of Russian, but much less in the contemporary standard lan-

guage. Deeper impact on the morphological or syntactic structures is restricted to historical or local items and is of a problematic nature. This is due to the enormous influence of and nearly exclusive orientation of the Russian standard language towards Greek, (Old) Church Slavonic, and – in the last three centuries – Western European languages (Latin, French, German, English), whereas the Nordic influence is a nearly forgotten episode from the earliest period of Russian history. This result would, of course, not change with more extensive investigations into toponymic or dialectal materials of North Russian origin.

117. Language contact during the Old Nordic period III: The impact of Christianity on Old Nordic

1. Introduction
2. Sources, methods and problems
3. The Christian vocabulary
4. Christian imagery
5. Changes to the language of poetry
6. Christianity and types of prose style
7. Literature (a selection)

1. Introduction

The influence of Christianity on Old Nordic began at different times and proceeded at varying degrees of intensity in the different Nordic areas. To some extent, Christianization increased linguistic homogeneity in the Nordic countries. However, there is also evidence that the new religion caused increased linguistic differentiation, as shown in section 3. below. In the West Nordic area the new *religious terminology* was much more influenced by the indigenous vocabulary than was the case in the less tradition-conscious eastern areas. The vernacular gained a new prestige through conveying the message of the Church as well as information about its organizational structure to the people. The use of the mother

tongue in rituals, spiritual guidance, preaching and prayer gave it a new status and new power (Hjelde 1990, 412ff.) and changed people's notions of their own language. The vernacular was adapted in order to function within a new and hitherto little-known area of experience. There was a need for new concepts, and innovations as well as continuities had to be marked.

Necessarily, leading representatives of the new faith came to have a decisive influence on the change in word stock and phraseology. The linguistic changes were reflected in the vocabulary pertaining to Christianity as well as in changes in the way of writing the vernacular. These two fields are focused on below.

2. Sources, methods and problems

Our knowledge of what happened to language in Scandinavia as a result of Christianization comes mainly from extant medieval texts. Written evidence for the period until 1150 is sporadic. In the case of Denmark and Sweden, the lack of contemporary sources for the period before 1225/1250 – with the exception of

the runic evidence – makes it necessary to try to work backwards or to draw on Old Nordic source texts. The latter approach is, however, an uncertain one, since it presupposes parallel developments in Christian influence on East Nordic and West Nordic.

The stock of loanwords and new coinages within the field of religion may tell us something about the role of language in the process of Christianization. However, the method of counting the oldest known recordings of words will be of very limited value because of the scanty and random character of extant source materials. *Religious coinages* based on foreign words are difficult to determine when there is a close relationship between source and target languages and the pronunciations were inaccurately recorded.

A study of the change of word meanings as well as of the disappearance of old vernacular words is important to our theme. A close examination of word contexts may correct our understanding of their original meanings. *Runic evidence* may shed some light upon when, how and why words and phrases were incorporated into vernacular vocabulary. *Scaldic language* is, in this context, of particular interest because of its conservative character. When we arrive at a period that is richer in written sources, we are able to draw safer and more nuanced conclusions about word frequency, change in word stock and word meanings.

It is a problem that many texts are only available in relatively late written versions in which the scribes have altered features of style and text to conform to contemporary conventions. However, increased knowledge of how scribes worked will enable us, to some extent, to reveal aspects of style and expression from earlier periods. Our knowledge of Christian literature in Latin provides valuable background information. However, we need to conduct a number of investigations to translated material, collating it with the original texts to arrive at a clear picture of terminology as well as stylistic nuances.

3. The Christian vocabulary

Early in the process of Christianization the new religion gained ground in plain, popular runic prayers and messages. Such inscriptions frequently reveal influence from the formal ecclesiastical language of the requiem mass and funeral liturgy. We see this in the case when the old domestic word *ljós* 'light' and the bor-

rowed term *paradis* are combined to bless the soul of a dead person.

A number of established words changed or expanded their meanings. Words that formerly described concrete phenomena now acquired abstract meanings. Many words gained new complexities of connotation. The kinship word *faðir* 'father' could now indicate spiritual relations and values. The Old Norse religion lacked the concepts expressed by the verbs 'to venerate' or 'to pray'. The verb *biðja* 'ask for' became a standard word to describe the act of praying to the Christian God.

The extended or new connotation could become the word's central meaning and even express *theological concepts*. This happened with the verb *trúa* 'to put one's trust in', 'to adapt oneself to'. The word could in pre-Christian times indicate a relationship with the ruling "powers". As a central Christian term, this verb gained a new dimension, due to the nature of its new object. However, the semantic content of the word itself remained by and large unchanged. The notion of *trú* 'belief' was also expanded; the noun became a technical term for Christianity as well as for Christian belief, but the word preserved its strictly ethical orientation.

One of the old words that was given an extended meaning was the verb *hjalpa* 'help', 'comfort'. It now came to refer to the divine consolation that lies in the forgiveness of one's sins (Walter 1976, 124f.). The noun *goð* 'god' appears in pre-Christian contexts mainly in its plural form. It was a generic, vague concept. In a Christian context it came to indicate the notion of the Church's one masculine god. Frequently, however, the new or expanded meaning of a term was uncritically confused with the old one. Thus *dís* 'goddess' came to be used to denote females in general.

The new *Christian terminology* was obviously also used by the devotees of the old religion, as when the god Thor was referred to as *hinn almátki áss* 'the almighty god'. Thus Christian terms apparently could be used to defend or even legitimize the old religion.

Another result of Christianization was that expressions referring to heathen mythology were replaced by less loaded terms; the word *blótdrykkja* 'sacrificial feast' was thus replaced by *hátíðardrykkja* 'feast banquet'.

There arose now a need for words to characterize the old cult and its devotees from a Christian point of view. The concept of *heiðinn* 'heathen', 'a dweller of the heath' was a Germanic word most probably coined dur-

ing the time of the spread of Christianity, as a contrast to *kristinn* 'Christian'.

Some vernacular words mirror the Christian *change of values*, such as *hörgrbrjótr* 'breaker of heathen sanctuaries' and *végrimmr* 'cruel to sanctuaries'. These words took on positive connotations expressing courage, strength, will-power and possibly even faith. On the other hand, a number of old words, such as *harðgeðr* 'hard-minded' acquired negative, pejorative meanings. The expression *sitja úti* 'to sit outside', which described behaviour important to the old religious practice of divination, could in a Christian context refer to the behaviour of a harlot.

The meanings of old heathen words were sometimes distorted by their rendering in a Christian context. For example, the pre-Christian noun *gandr* was previously assumed to indicate a stick, but the use of it in scaldic metaphoric language reveals that it originally meant 'a detrimental being' (Marold 1988). The pre-Christian verb *blóta* most probably did not have as its central meaning 'to sacrifice' as indicated in Old Nordic texts, but might better be rendered as 'to honour' or 'to show respect for'.

In order to satisfy the internal linguistic needs of the new religion, new words were coined by using the resources of the existing vocabulary. This was often achieved by coupling two already familiar words. The noun *siðr* 'custom' could thus be used in making a number of such compounds; e.g. together with *bót* 'improvement' it featured in *siðbót* 'reformation of life or religion' as a vernacular equivalent of the Latin word *moralitas*. It was also possible to combine indigenous and borrowed words, as was done in the Christian calendar. Thus the borrowing *messa* 'mass' became an element of a new word indicating a Mass day, e.g. *allraheilagramessudagr* 'All Saints' Mass-Day' and *gauksmessudagr* 'Cuckoo-Mass-Day'.

Suffixes were also employed to help create a local ecclesiastical vocabulary. Derivatives of verbs were particularly productive, especially by the suffix *-ari*, which is to be found in *nomina agentis* such as *græðari* 'healer' and the synonyms *lausnari* 'releaser' and *frjálsari/frjálsare* 'saviour'. The suffix *-else* also served in the production of the new religious terminology, especially in East Nordic, e.g. in the nouns *rögelse* 'incense' and *vighilse* 'consecration'.

Religious prose literature became a flourishing field for *adjective substantivization*, and it

is mainly in such a context that this form of word conversion gained ground in Scandinavia. The suffix *-leikr*, as in *þríflegleikr* 'a thriving condition' frequently was used to create nouns from abstract adjectives. Many of these substantivized forms in the translated texts obviously entered the language because the translators either consciously wished to remain close to the original Latin or were unable to liberate themselves from the texts they were working from. However, from the beginning of the 14th century, we see that words coined in this way were gradually replaced by Low German *loanwords*.

What was new and different with Christianity and the Church was not infrequently expressed by means of borrowings of Latin or Greek origin. Even unassimilated words from these languages became elements of the vernacular, e.g. the word *nón*. Originally referring to one of the canonical hours (*nona hora*), it found its way into everyday language as an indication of mealtime. Many central Christian concepts and ecclesiastical terms thus found expression through loanwords, e.g. *engill* 'angel', *djöfull* 'devil' and *altari* 'alter'. Frequently other Germanic languages were intermediary links. The central term of the Church's doctrine of sin, the Latin *peccatum*, was in Scandinavia usually expressed by the Old Saxon loanword *synd*.

Many words came into East Nordic and West Nordic respectively from different neighbouring languages in somewhat similar forms, e.g. *kross* in West Nordic and *kors* in East Nordic from the Latin word *crux*. In West Nordic many religious borrowings came from Anglosaxon, a process that mainly went on before 1066. This influence is clearly to be observed in the most common dogmatic terms. In eastern Scandinavia, however, the borrowings from German-speaking areas were far more frequent. Thus the noun *þrenning* from *þrennr* 'triple', cp. the Anglosaxon *þrinis*, was chosen for 'the Trinity' in West Nordic, while the corresponding term in Old Swedish became *träfaldoghet*. In West Nordic the old and well-known word *skírn* 'cleansing' indicated Christian baptism, while in East Nordic the vernacular noun *dop* 'dip' was used, its new meaning referring to the Christian act of baptism.

During the process of translation and word formation it became usual to define, explain or supply loanwords by means of synonyms (Berulfsen 1964, 160ff.). Thus a Nordic word and a borrowing might be found side by side.

The loanword *prestr* 'priest' and the Norse *kennimaðr* 'teacher' made such a word pair. The borrowing *skript* 'the Scripture' originating from Latin could be supplemented by and explained with the help of the indigenous *heilög ritning* 'Holy Writ', and the Latin noun *sacramentum* could be used alongside the old Anglosaxon word *húsl* to denote the Eucharist. Even triple renderings occur.

Specific and subtle theological concepts were frequently paraphrased, bringing the risk of oversimplification. Translations were not infrequently inexact, even when efforts were made to increase precision by means of word pairs. This is the case when the expression *kraptr ok tákn heilags holds* 'might and token of the holy body' is used as a rendering of the Latin *virtus sacramenti*. On many occasions it seems that literal *loan translations* or *calques* were created, as e. g. the rendering of Latin *elementa* as *höfuðskepnur* 'head-creations'. One of the translators even managed to produce a rendering that preserved the Augustine distinction between *posse non mori* translated as *mátti maðrinn þat at deyja eigi* 'man had the possibility of not to die', and *non posse mori*, translated as *má hann eigi deyja* 'it is not possible for him to die' (Astås 1993, 153 f.). We see that the vernacular was experimented with, stretched and adapted in order to convey subtle differences and nuances.

Calques could be used to produce vernacular versions of notions of faith or church doctrine. The Nordic adjective *heilagr* 'holy' was coupled with the noun *andi* 'breath' to describe the third element of the Trinity. The compound noun *himinriki* 'the kingdom of heaven', which rendered the Latin *regnum caelorum*, is another example. The prefix *sam-* and the noun *vit* 'sense' were joined in a new compound, denoting 'reason' and 'moral consciousness'. In the 13th century the vernacular loan translation *samvitvka* was coined. This was the last of several attempts to translate the Latin concept of *conscientia* (Widding 1961). In the next century the Old Nordic coinage was exclusively used to convey the meaning of 'moral consciousness'. This development perhaps illustrates the slowness by which new notions gained ground. It would thus seem that it took a long time before the meaning and significance of the new words that came with Christianization were firmly established.

In accordance with ecclesiastical tradition, *legal terminology* often provided a source of *new words*. Thus the legal term *bót* renders the

central Latin term *poenitentia*, and the nouns *lausn* 'release' or *aflausn* 'that which frees one from obligation' render Latin *absolutio*. Through such application to Christian laws and concepts of social order, vernacular legal terms frequently took on *transcendental meanings*.

The struggle of the Church against the old cult was mirrored in legal language by a number of terms with negative connotations for behaviour associated with the old religion. The very language of the law became, through *canonistic literature*, influenced by Roman law. In this way, Christianity contributed to establishing the vernacular as a medium of administration, especially within the area of ecclesiastical law.

Christianization brought a number of words from the cultures represented in the Bible. Among these were botanical words such as *ísópi* 'hyssop' and words describing fragrant substances such as *mirra* 'myrrh'. *Christian names*, first and foremost those of important saints, became known in Scandinavia through Christian missionaries and literature, and came into use from the middle of the 11th century. These names would receive their Nordic variations, so that we have forms such as *Páll* 'Paul' and *Jón* 'John'.

When names of oriental, Greek or Latin origin entered the vernacular, it was not uncommon that the *spellings* and *inflections* of the original text were preserved, giving inflected forms such as the genitives *Simeonis* and *Judae*. The influence of Latin is also to be observed in the use of *abbreviations* that were a feature of Latin writing conventions, e. g. *pp* for *páfi* 'pope'. The name of Jesus Christ is frequently abbreviated in accordance with the impact of Latin scribal tradition or spelled in part with Greek letters (*H, ζ, ρ, ζ*). Greek word endings may occur in group names, e. g. in the form *pigmeos* 'Pygmies'. An evident influence from Latin is that new letter combinations such as *ch* also entered vernacular word forms.

4. Christian imagery

The Church brought the power and the richness of its verbal imagery, illustrating and concretizing its message through vivid and dramatic contrasts such as light/darkness, good/evil, life/death etc. It is evident that these metaphors were easily integrated into the vernacular. We find especially rich examples in popular translations, such as the two homily books and *Elucidarius* (Hallberg 1987, 121).

Christian imagery expanded and enriched the language and led to the formation of new words, such as the many compounds that begin with the genitive *andar-* ‘belonging to the spirit’. Metaphors are frequently expressed by compounds, such as *hugskotsauga* ‘the mind’s eye’ from Latin *acies mentis*, an expression of the soul’s ability to behold the divine (Hjelde 1990, 159, 279). Death may be spoken of as *dauðadyrr* ‘the gates of death’ (Astås 1989, 80). Biblical metaphors are important as models, the most frequent one in extant Old Nordic literature appearing to be that of Christ as ‘the Lamb of God’, cp. John 1:29.

The vast majority of religious *metaphors* in Old Nordic had their counterparts in the Latin originals and show evidence of the influence of the translators on the vernacular. But original contributions inspired by foreign influences are also to be found. Medieval imagery is sometimes further elaborated through translation. Thus in Old Nordic we sometimes find a mix of biblical imagery and domestic ideas, as in the expression *skjaldmær dróttins* ‘the Lord’s shield-maid’, cp. Eph. 6:14–17.

In Old Nordic *religious prose*, life is frequently spoken of by means of images from nature or as a journey. Metaphors appealing to the senses are also used. Sin is depicted by a colourful range of metaphors denoting fear and unhappiness: stains, dirt, arrows, stings, snares, chains, hooks, baits etc. Heroes of the faith may be depicted as crusaders against evil forces, and a martyr may be characterized as ‘a wild warrior of God’. The first compound of the latter imagery is inherited from a pre-Christian age, but its significance is new. The struggle against evil may be seen as a *hólm-ganga* ‘holm-going’, i. e. ‘single combat’.

Such metaphors enriched the language by providing a more nuanced vocabulary for expressing *religious feelings* and *spiritual matters*. Other contemporary Old Norse prose may seem rather poor and simple when contrasted with the imagery of religious texts (Hallberg 1987, 167).

Through metaphorical imagery, words and their contexts were given a different and more elevated significance, and Scandinavians learned to understand Christian allegoric modes of expression.

5. Changes to the language of poetry

In a Christian context much of the traditional linguistic ornamentation of the scalds was unsuitable. Poetic metaphors (*kenningar*) that re-

ferred to heathen gods gradually disappeared, and a degree of stylistic simplification also took place. The scalds now avoided using words that would offend the Christian court. However, traditions were strong and not all *scalds* were willing to put aside the many mythical names that were part of their poetic vocabulary. This was a gradual process, and there were setbacks. Over the course of time many pagan kennings were recast so as to be acceptable in a Christian context. Christian phrases were incorporated into *scaldic poetry* and we can sometimes glimpse the scald’s Christian orientation expressed in his choice of words (Fidjestøl 1993, 100).

In scaldic poetry from an early stage of Christianization we meet the influence of the new religion in the manner in which pagan allusions could be turned against paganism itself (Edwards 1983, 34). Christianity has also left its traces in the language of the poetic Edda, not least in the lay of *Völuspá*, where use is made of words and *theological motifs* from Christianity, cp. e. g. *svört verða sólskin* ‘the sunshine darkens’ in stanza 41 with Rev. 6:12 *et sol factus est niger*.

With their own materials they made their own versions of what they learned from their Christian neighbours. While they were learning, they were also practicing, steadily, subtly and flexibly, their own ... arts (Dronke 1993, 127).

This comment applies not only to the scalds in a time of transition, but to the whole process of the linguistic changes caused by the influence of Christianity in the centuries to come.

In scaldic vocabulary many of the newly-coined or low-frequency words that describe feelings and attitudes stem from the new religion, e. g. the adjectives *mjúklyndr* ‘meek-tempered’, *ást-skýrðr* ‘enlightened by love’ and *almíldr* ‘altogether graceful’.

The influence of Christianity on the formal aspects of scaldic language was felt from an early date. The change from oral to written poetry that followed Christianization led to a breakdown of the traditional system of genders within oral scaldic tradition (Fidjestøl 1991, 33).

But Christianity also led to a renewal of *poetic style*. A new aspect was added to the scaldic conventions when Christian scalds included a prayer to God that He might hear the poem. Other new features from the 1150s onwards are use of direct speech (*Plácítús-drápa* 1) and citations from a written text (*Leiðarvísan* 8).

When the new *runhent metre* with end-rhymes occurred in scaldic poetry, perhaps as early as in the 10th c., it was most probably directly or indirectly inspired by rhymed Latin Christian poetry. However, end-rhyme poetry had only a very limited success during this period. Another scaldic meter that seems influenced by Christian poetry is the *hrynhent*, a variant of *dróttkvætt*, which in the 14th c. became one of the most important metres of Old Norse. This established new rhythmic principle in all likelihood was inspired by octosyllabic Latin hymns or prayers.

6. Christianity and types of prose style

Scholasticism stressed the importance of a clear style, simple exposition and lucid argumentation (Angenendt 1997, 46). Ecclesiastical formula books gave guidance in how textual discourse should be structured and promoted awareness of verbal definitions. Obviously this had an influence on the vernacular in Scandinavia. In texts translated into or written in the native tongue we meet the conscious alternation between general statements and concrete exemplification, a stylistic feature that came with Christianization. We also see how translators and authors could make use of paraphrase as well as free renderings. They knew parallelism, antithesis, prefiguration, isocolon, chiasm, and the use of synonyms as well as other *rhetorical techniques*. All four types of Medieval Latin prose-rhythm (*cursus*) are to be found in the two West-Nordic homily books (Jakob Benediktsson 1968, 20).

The language of preaching was characterized by ecclesiastical rhetoric rooted in the classical tradition. The plain, simple style modelled on Christ's words in the Gospels could be adapted to vernacular sermons and homilies. However, when something unusual was to be conveyed or it was necessary to heighten the attention of an audience, translators could employ a more ornamental, amplified style. The translators clearly understood the importance of *variatio sermonis* as well as *amplificatio*.

Since two stylistic types within Nordic prose, *popular style* and *learned style*, were tentatively identified (Nygaard 1896), there has been a debate on the styles and stylistic features of Old Nordic. This classification and description presupposes that the sagas had been written down on the basis of oral retell-

ings in which people's own stylistic conventions were given expression. Vernacular texts considered to have been influenced by Latin were categorized as "learned style". It was argued that both types of style developed during the 12th c., but in different literary genres. However, it has proved problematic to contrast the styles with each other.

In the case of "popular style", earlier also termed *saga style*, one is today cautious about describing it as an originally indigenous stylistic form. Research suggests the strong probability that influences from Lives of the Saints, translated from Latin, lie behind the masterly narrative style that characterizes the best Icelandic family sagas. Even such a common element in Nordic prose as inversion may have come into use as a result of Latin influence, e.g. *satt mællir þú* from the Latin *verum dicis*. On the other hand, the local oral style has in all likelihood influenced the language of translated works. We may see this in the way in which the long Latin sentences in the Lives of the Saints are broken down.

There are striking differences between the simple, paratactic expression of "popular style" and the elaborate, hypotactic style of translators and authors devoted to "learned style". However, this division did not become marked until the last decades of the 13th and the first part of the 14th c. Basically it is the degree and extent of Latin influence that distinguishes "learned style" from "popular style".

In its oldest form, "learned style" closely adheres to the formulations and constructions of the original Latin texts, which were translated as far as possible word for word and meaning for meaning. Translators even kept the original Latin word order, as far as was possible. This could result in somewhat artificial and ponderous language. However, as time went on, translators became less bound to the original texts and developed renderings that were better adapted to domestic linguistic conventions. On the other hand, features from Latin grammar won legitimacy in vernacular texts. The "learned style" gradually came to be used in the whole of the Scandinavian region.

Perhaps the clearest evidence of the Latin influence on Old Nordic style is the frequent use of participial constructions. They may mirror the Latin ablative absolute, as in the formulation *at lifandi dróttningunni* 'while the queen was still alive' or Latin gerundival expressions, as when *þess er oss leitanda* renders the Latin *querendum nobis est*. Other features

that seem to originate from the impact of Latin are the use of the preterite participle as a substitute for a relative construction, and the use of inflected pronouns to express as exact a relationship as possible.

A distinctive trait of “learned style” is the Latin-inspired use of an accusative with the infinitive instead of an independent clause. Also obviously derived from Latin is a frequent use of adjectives as nouns as well as the use of reflexive verbs to express the passive. A predicative use of the present participle of transitive verbs in an active sense is also a characteristic of the “learned style”. The use of the preposition *fyrir* in the meaning ‘through’ or ‘by means of’, corresponding to Latin *per*, is yet another feature of this style. In translated literature using this form, a frequent use of Latin words and phraseology can be noticed. Superlatives and hyperbolic expressions are also common features, and attributive adjectives are numerous.

Today’s researchers generally operate with a four-fold classification, the additional categories of *court style* and *adorned style*, *ornate style*, *florid style* having been suggested. These two latter categories can be regarded as developments of the two original types, developments that conformed to contemporary tastes and needs. Thus, a categorization in terms of periods is preferred to definitions based on literary genre.

“Court style” is the term used to describe a prose style that manifested itself in Norway at the end of the 12th c. In addition to rendering chivalric French poetry and prose, this stylistic form was also used in the translation of religious literature from Latin. Although “court style” has as a rule been regarded as developing from the “learned style”, a number of differences have also been emphasized (Jónas Kristjánsson 1985, 556). Many of the features of “learned style” were employed in a more frequent and advanced manner: e. g. alliteration and assonance as well as the use of synonyms occur more abundantly. Other features were used more restrictively, e. g. antitheses and participles. Although the style can sometimes appear monotonous, its prose rhythms often have a poetic quality. While “court style” was appreciated as exemplifying refined narrative art at the Norwegian court, the Icelanders stuck to their own “popular style”.

“Adorned style” characterizes Nordic religious literature in the period from 1280 to 1380. It has also been termed “the younger

learned style” and has been characterized as an inflated version of the earlier/older “learned style”. However, this style was not merely learned, but also florid (Widding 1979). It was more deliberately applied than was the “learned style”, and in translations it deviated frequently from the original, inspired as it was by the trends of Latin rhetorical prose. It can appear turgid, with a plethora of multisyllable words, long-winded narrative and comprehensive ornamentation. Pathos and rhetorical power are combined here. Striking features of this style are its many new literary words, frequently formed along common Scandinavian patterns, and an abundance of metaphors. The stylistic form was considered elevated and exquisite, capable of increasing the reader’s veneration for the subject dealt with. The development of this style has been linked to the interest of the Benedictines of northern Iceland in disseminating the Saints’ sagas (Sverrir Tómasson 1985); the vast majority of researchers regard it as a distinctively Icelandic phenomenon.

It is evident that religious literature has greatly influenced the development of written Old Nordic (Paasche 1935, 20). The styles and changes in stylistic form referred to above mirror a process within Old Nordic literary language. This process strives to develop a language pregnant with meaning, a language that satisfies the demands of both the Church and the wider lay public. Translators and authors move from copying and imitation to the production of independent vernacular texts. Latin style patterns and vocabulary exert a growing influence on syntax and style in the direction of an artificial and learned form. However, there is a parallel development in which old local words and linguistic features assert themselves. To draw any exact conclusion as to which elements are “foreign” and which are “local” is beyond the scope of our present state of knowledge.

118. History and development of Old Nordic outside the Scandinavia of today

1. The Viking expansion and its linguistic consequences
2. Linguistic sources
3. Scandinavian outside the Scandinavia of today: characteristic features and development
4. Literature (a selection)

1. The Viking expansion and its linguistic consequences

During the Viking Age (A.D. ca. 750–1050), Scandinavian-speaking peoples migrated to many different parts of Europe. The firmness with which their language became established in the territories they colonized depended on a number of factors: the presence of an indigenous population, the size and density of the Scandinavian settlement and the relations between incomers and natives. In the Faroe Islands and Iceland there was no pre-existing population. When these were settled in the early and late ninth century respectively, chiefly by Norwegians and Norwegian elements in the British Isles, a West Nordic form of speech perforce became totally dominant, notwithstanding a probable Gaelic-speaking presence among the immigrants. West Nordic must also have been the sole language of the small Greenland settlements, established from Iceland at the beginning of the eleventh century, since contact between Norsemen and the native Inuit appears to have been minimal. Shetland, Orkney and north-eastern Caithness, the target of Norwegian invasions and settlements during the ninth century, saw the swift and total replacement of the native Pictish by West Scandinavian language and culture, a process probably complete by the middle of the tenth century, if not earlier. A similar fate has been proposed for the Hebrides and Man, but although a thoroughgoing Norwegianisation of Man and the Isle of Lewis is plausible, accomplished in the first half of the ninth century, most now agree it did not lead to a (temporary) extinction of the native Gaelic. Norse immigration into Ireland in the middle years of the ninth century, which involved Danes as well as Norwegians, appears to have focused chiefly on a small number of coastal settlements, most notably urban centres such as Dublin, Wexford and Limerick. These for a time doubtless resounded to varying forms of

Scandinavian speech, but the impact of Scandinavian on Ireland as a whole was not great. Danish settlement in the eastern half of England, which ultimately led to the establishment of the Danelaw, belongs chiefly to the latter half of the ninth century, and a Norwegian/Danish influx into the north-west to the tenth. Although for a time a large part of the country was under Scandinavian rule, the settlers were too few in number and too thinly spread for their language to gain a dominant position. This is even truer of Normandy, where Scandinavians seem rapidly to have gone native following a period of settlement early in the 900s. Viking activity in the east goes back at least to the eighth century, but it appears to have been in the ninth that Scandinavians, mostly from Sweden, began to navigate the Russian rivers in considerable numbers and establish themselves in towns such as Staraja Ladoga, Novgorod and Kiev. As with the Irish centres, these may have been largely or at least partly Scandinavian speaking for a time, but in the vast hinterland indigenous speech must have continued more or less unaffected by such settlement. An eastern form of Scandinavian also became established in coastal areas of Finland and Estonia, but most see this as the result of a much later expansion, twelfth and thirteenth-century into Finland, thirteenth and fourteenth into Estonia. As such it belongs more properly to the history of Swedish, and will not be discussed further here.

2. Linguistic sources

Our understanding of the Viking settlements and their linguistic consequences is based on a combination of archaeological, historical and linguistic evidence. The linguistic sources take various forms: (1) runic inscriptions of Viking-Age and medieval date found in the Scandinavian colonies; (2) verse composed or supposedly composed in Orkney and Greenland; (3) diplomas written in Orkney and Shetland; (4) records of spoken Scandinavian from Orkney and Shetland; (5) words and phrases of Nordic origin – personal and place-names especially – in vernacular and Latin-language manuscripts from areas of Viking settlement; (6) Scandinavian personal and place-names

still in use in those areas; (7) loanwords and other relics of Scandinavian speech likewise still current.

Inscriptions in Scandinavian runes have been found and are still being found in most of the areas settled by Scandinavian speakers during the Viking Age. Excluding Iceland and the Faroes the latest figures for pre-Reformation inscriptions are as follows (an exact number cannot always be given because of uncertainty about the status of some finds): Greenland ca. 80; Shetland 7; Orkney ca. 50; Scotland 15; Man 33; Ireland 17; England 15. Runic inscriptions have also been found in Russia, but it is harder to put any sort of figure on these, partly because of greater uncertainty about status and partly because not all the material has been fully published. A fragment of a runic stone has recently come to light in Finland, but otherwise this country is devoid of runic inscriptions of certain pre-Reformation date, as are Estonia and Normandy.

The Eddaic poem *Atlamál* is called “the Greenlandic” in the manuscript in which it is preserved and there are suggestions that the twelfth and thirteenth-century Scaldic poems *Krákumál*, *Jómsvíkingadrápa* and *Málshátakvæði* (the latter two attributed to the Orkney bishop, Bjarni Kolbeinsson) contain specifically Orcadian words and linguistic forms of probable Orcadian or “Island” provenance.

Various Scandinavian-language diplomas are preserved, dating from the period 1299–1586, which give either an Orkney or a Shetland locality as their place of origin or whose Northern-Isles provenance can safely be inferred from their content. These are fewer in number than has often been supposed: four from Orkney, eleven from Shetland. Linguistically they are not very informative, their language in most respects differing little from that of contemporary documents in Norway.

Records of spoken Scandinavian from Orkney and Shetland are also sparse. The chief sources are a thirty-five stanza ballad, known as *Hildinakvadet*, a Lord’s Prayer and a list of thirty words, all collected on the Shetland island of Foula in 1774, and an Orkney Lord’s Prayer known only from a printed version published in 1700. Odd snatches of Northern-Isles Scandinavian, ranging in time from the 1500s when the language was still commonly spoken to the late 1800s almost 100 years after it had died out, complete the picture.

From all the areas of Scandinavian settlement, place-names of Scandinavian origin are found. However, their frequency and medium of preservation differ greatly. Such Greenland names as survive come almost entirely from Icelandic and Norwegian manuscripts, the Greenland settlements having left virtually no written record other than the runic. Evidence of Scandinavian place-nomenclature in Russia comes chiefly from written sources including Scandinavian runic and manuscript writings; few of the names seem to have survived beyond the Middle Ages. In Orkney and Shetland in contrast some 90 per cent of current place-names are of Nordic origin, the remaining 10 per cent being later Scots or English. Parts of the Hebrides, especially the more northern islands, still have concentrations of Scandinavian names, and the same is true of north-eastern Caithness, sections of the western littoral of Scotland, Man, Normandy and those areas of England that experienced Scandinavian settlement (in England in particular a great many of the names are also recorded in medieval sources). The position in Ireland is markedly different: there only a few place-names, medieval or modern, betray a Norse origin.

Scandinavian personal names are likewise known from all the areas of settlement. They are preserved as names of people in medieval documents and occasional modern reflexes, and as elements of medieval and/or current place-names. The frequency of their occurrence and medium of preservation parallel quite closely those of the Scandinavian place-names of each area.

Loanwords of Scandinavian origin are widely attested in the one-time Viking colonies. Modern standard and/or dialectal English, French, Irish, Scottish Gaelic and Russian contain Scandinavian loans in varying numbers, and they also occur in written sources from areas where these languages or their forerunners were spoken. The greatest concentration of Scandinavian loanwords found in nineteenth and twentieth-century vernaculars comes from Orkney and Shetland: some 10,000 from the former, 3,000 from the latter. About 600 appear in standard English, and a further 600 can be added if northern dialects are taken into account. Standard French has few, but the dialects of Normandy and the Channel Islands host a greater number. Modern Irish, Scottish and Manx Gaelic show a remarkable paucity of Scandinavian loans, as few as 20–30 in Irish; in Scottish

Gaelic, however, the position is as yet poorly documented and further research may lead to a revised verdict. The occasional Scandinavian loan is found in Russian, but can sometimes be difficult to distinguish from words borrowed from other Germanic languages.

All the above sources suffer from drawbacks. Complete sentences, and thus information on syntax, occur only in the runic inscriptions, the Eddaic and Scaldic verse and the Scandinavian recorded in Orkney and Shetland. Inscriptions of the Viking Age suffer from having been written in the sixteen-character younger *futhork*, which provides only the crudest guide to phonemic contrasts; for this and other reasons interpretation can often be difficult. *Atlamáil* is hard to date and may, despite its manuscript's assertion, have no connection with Greenland. Like the three Scaldic poems of possible Orcadian provenance, it was preserved in Iceland, and all four clearly chiefly reflect Icelandic scribal tradition. None of the spoken Scandinavian of the Northern Isles, as far as we know, was recorded by native speakers, and the important Foula material was copied down by a man who knew no form of Scandinavian at all. Varying degrees of linguistic interference clearly also affect Scandinavian names and loanwords preserved in foreign environments.

3. Scandinavian outside the Scandinavia of today: characteristic features and development

In accordance with the differing quantity and quality of the sources, the following points can sensibly be made about the types of Scandinavian language used outside the Scandinavia of today, about the ways in which they developed, and the manner and the time at which they met their end.

3.1. Greenland

Runic inscriptions (our chief source) exhibit a mixture of Icelandic (e.g. retention of /h/ before /l/ and /r/) and Norwegian features (e.g. /θ/ > /t/, retention of the distinction between /ø:/ and /æ:/). A Greenlandic innovation may have been /θ/ > /t/ initially in some pronouns (e.g. **tana** 'this'), where Norwegian, ultimately at least, came to have /d/, and Icelandic retained /θ/. Norse died out in Greenland with the passing of the last inhabitants of the eastern settlement about 1500.

3.2. Orkney, Shetland and Caithness

Few obviously local features can be found in the runic inscriptions of Orkney, Shetland or Caithness. Of the ca. 50 from Orkney, some 30 are almost certainly the work of visiting Norwegians (and possibly Icelanders). The Scandinavian-language diplomas from the Northern Isles reveal certain phonological, morphological, syntactic and lexical peculiarities, e.g. apparent monophthongisation /au/ > /u(:)/, confusion of /m/ and /n/ in final position, an inability by one scribe to master the Old Norse inflexional system, and in a Shetland diploma of 1586 the Scots-inspired phrase *aff theris egitt* 'of their own', and the Scots loans *sergenn* 'sergeant', *cont* 'count', *minister*. In most respects, however, these texts mirror faithfully the development of the written language in the mother country, Norway. Records of the spoken Scandinavian of the Northern Isles, known locally as Norn (from *norrænn* 'Norwegian', 'Norse' or *norræna* 'Norwegian/Norse language'), show phonological and syntactic similarities with Faroese, though some of the phonological features are shared with Icelandic and West Norwegian dialects. Thus /rn/, /n:/ > /dn/ and /rl/, /l:/ > /dl/ (e.g. Norn *fadlin* 'fallen') are general West Nordic, but the intercalation of /g/ (Faroese /gv/) after the reflexes of Old Nordic /o:/ and /u:/ (Norn *sheug* 'sea'), /m/ > /n/ in weakly stressed position (Norn *honon* 'him [dat.]'), and /θ/ > /h/ in initial position in certain pronouns and adverbs (Norn *ita* (< **hitta*) 'this') seem to be restricted to Faroese and the Scandinavian of the Northern Isles. The West Scandinavian and Faroese flavour of Norn phonology is particularly strong in the Foula material from the 1770s; it is less prominent elsewhere, and we probably have to reckon with considerable dialectal variation. In one variety or another, and doubtless increasingly influenced by Scots, the language seems to have persisted in Orkney till about 1750, in Shetland a while longer – perhaps among one or two of the oldest people till ca. 1800. Regarding Caithness we cannot be as precise; estimates place the demise of Scandinavian there in the fourteenth or fifteenth centuries.

3.3. The Hebrides and the Scottish mainland

Sources for the Scandinavian spoken in these areas are sparse and the study of them far from adequate. Eight of the thirteen runic inscrip-

tions from Scotland outside Caithness (all but one from the west) seem likely to have been carved by Norwegians passing through, and the remainder exhibit nothing that can be identified as characteristic of “Scottish” or “Hebridean Norse”. Apart from personal and place-names, often heavily Gaelicised, and loanwords in Gaelic, there is nothing to guide us. From the onomastic evidence we can draw the conservative conclusion that the Scandinavian spoken in Scotland and the Hebrides was a type of West Norse, but theories about the presence of preaspiration, for example, based on the identification of this feature in certain dialects of Gaelic, rest on very uncertain foundations. With evidence so scarce, judgements about the length of time spoken Norse persisted in parts of Scotland have little value: the thirteenth, fourteenth and even the fifteenth century have been mooted.

3.4. Man

Although argued by some that Gaelic became extinct on Man as a consequence of the Norse settlement (to be reintroduced later), most now accept that it survived, resulting in a long period of Norse-Gaelic contact. Some have seen the Scandinavian runic inscriptions as evidence of such contact. Not only do many of those mentioned in them bear names of Gaelic origin, there is here and there evidence of a breakdown in the Old Norse inflexional system (manifested as unexpected case endings or a lack of them altogether), by some attributed to uncertainty following prolonged language contact. Beyond these suggestions of intermixture, the totality of the linguistic evidence from Man does little more than confirm a strong West Norse presence. The date at which Scandinavian finally ceased to be spoken on the island is currently estimated at soon after 1300, but there are indications it may have died out a century or so earlier.

3.5. Ireland

The Scandinavian loan-words and names taken into Irish do little more than confirm a one-time Scandinavian presence. No safe conclusions can be drawn about the type or types of language spoken by the incomers. The runic inscriptions suggest both an East and West Nordic input, which is in accord with the historical evidence, but since the majority are on loose objects from the trading town of Dublin, it is difficult to know whether they were carved

by permanent residents or visitors from abroad. It is generally considered that Scandinavian speech lasted in Dublin and certain other of the Irish towns until shortly after the Norman invasions began in the 1160s. The reasons for this are partly socio-historical – the self-contained nature of many of the Nordic centres – partly linguistic – the observation that most of the handful of Norse place-names found in Ireland seem to have passed directly from Norse into English.

3.6. England

Scandinavian in England was both of the East and West Nordic variety. Linguistic evidence of the dichotomy comes not least from place-name elements, where we find, for example, the predominantly East Nordic *-thorpe* (ON *-þorp*) heavily represented in the Danelaw, and typical West Nordic elements such as *-sett* and *-scale* (ON *-setr*, *-skáli*) in the north-west. The runic testimony is less conclusive: inscriptions with unambiguously East or West Nordic features are few, and one or two of these, like the St Paul’s stone, can probably be ascribed to followers of Knútr the Great – people who had come direct from Scandinavia. There is nevertheless an East Nordic flavour to several of the inscriptions from the south-east, and indications of West Nordic tradition in one or two of those from the north-west. What happened in the language contact situation between Scandinavian and Old English is disputed. Some argue the languages were mutually comprehensible, others that a pidgin was developed, and yet others that there was widespread bilingualism. Some kind of intimate contact seems assured by the hundreds of everyday words borrowed from Scandinavian into English (e.g. *egg*, *window*, *die*, *take*, *ill*, even the pronoun *they*). It is impossible to say for sure when Scandinavian died out in England; doubtless at different times in different places. Several of the runic inscriptions from the north-west seem to be twelfth-century, and are no longer in classical Old Norse: they have sometimes been taken to represent Scandinavian in its final stages of decline in England.

3.7. Normandy

The personal and place-name material points to a Scandinavian of largely East Nordic type. The relatively small number of settlers and their linguistic isolation make it unlikely that

Scandinavian speech survived more than a couple of generations in Normandy. There is no evidence of its existence in the milieu around William the Conqueror.

3.8. Russia

Historical sources indicate that the Scandinavian settlers in Russia came mostly from Sweden. Their language is thus likely to have been of East Nordic type, though this is not immediately obvious from the runic inscriptions or the personal and place-names that have survived. As in Normandy, the thinness of the Scandinavian-speaking population and its linguistic isolation suggest early abandonment of the native idiom, but the fact that settlement was largely in towns, as in Ireland, may have helped Scandinavian to survive a little beyond the first and second generation.
