Preface

1. State of Research and Aims of the Handbook

In recent years and decades, interest in language history has increased in general and also within the field of Nordic studies. Therefore, it seems appropriate to investigate the current state of Nordic language history and, where applicable, to attempt to rewrite it. For this reason, the series editors of HSK expressed a desire to the publisher and the undersigned to publish a new handbook on the history of Nordic languages – an idea which was well-received and the results of which are presented to the public here in this work. Whereas a synopsis of Nordic language history was previously lacking to a great extent (with the exception of both descriptions by Einar Haugen), the aim of this new handbook is to provide an extensive overall picture of linguistic developments in Scandinavian languages, embedded in a broad culture-historical context under consideration of all modern methods available today. In 230 articles written by renowned specialists and divided into 21 chapters, the Nordic language history is expanded in comparative descriptions vis-à-vis previous studies on the subject and enriched through new methodical approaches.

A glance at the Nordic language histories available today reveals different possibilities for describing language history. Despite their titles, most previous works (i. a. Wessén's standard work *Svensk språkhistoria*) are actually historical grammars which provide a one-sided list of facts about the phonetic, morphological and, in some cases, syntactic developments. These works neglect important linguistic categories such as the lexicon and fail to touch upon the culture-historical context, i.e. external language history at all, and do not include any summarizing standpoints.

The concept of the current handbook naturally rules out such a limited method of description as well as the stringing together of language history in an isolated observation of individual language levels (as is the concept of Haugen's *Scandinavian language structures*), or the division of isolated observations in the individual national language histories (as in Wessén's *De nordiska språken*). Despite the problems in practice, the most suitable principle seems to be that of a division into periods, each being dealt with under various different viewpoints such as level of description, methodical approach, external linguistic aspects and culture-historical embedding. This also calls into question the relationship between the conveyance of individual data and the weighing of systematic viewpoints, in other words, the question of to what degree language history can be conceptualized as a systematic history. In this regard, a handbook such as the current one must strive for a compromise in which it combines the conveyance of a large amount of individual data with an accentuation of systematic viewpoints, i.e., diachrony with synchrony, longitudinal sections with cross-sections (with cross-sections especially in more or less clearly defined periods such as Early Nordic, Old Nordic and present-day languages), so that the description of single historical facts continually flows into systematic-structural discussions, just as systematic aspects must also be considered within the discussion of diachronic developments. Such correlations also contribute significantly to the explanation of language-historical processes.

In a Nordic language history, the division into periods, which each attempt to combine diachronic and synchronic viewpoints, is complicated further by the fact that a comparative description of six languages (including *Nynorsk*) must be managed, and the conventional but also factually justified division of each language into periods deviates from that of the others at different points. For example, the period called *Olddansk* precedes the remaining Old Nordic, so that the period temporally corresponding with the rest of Old Nordic is often termed (*Ældre*) *Middeldansk*; the beginning of the 19th century is a much more drastic boundary for Norwegian than for the remaining Nordic languages, etc. Here, a middle course for all Nordic languages must be found by carefully weighing all relevant factors. In this, if possible, the special interests of individual readers must be taken into account by providing as consistent divisions as possible between individual languages, levels of description, etc., whereas more general, summarizing viewpoints will be discussed at the beginning and at the end of the handbook.

2. Method

The consideration of the various different aspects of the course of language history means that the linguistic facts are not only included in a culture-historical, but also in a broad scientific and science-historical context reaching from the positivist-comparative to sociolinguistics and text type linguistics, even to modern discourse analysis. The handbook is not committed to a certain method. The principle is method pluralism, in which the most important rule is simply to consider the most current state of research and which consists of an extensive search of methodical possibilities. This methodical approach results in an overall structure which is relatively loose, but at the same time, it also produces an overall picture which is illuminated from all sides, consciously taking certain overlaps between the articles into account. In addition to language-historical facts, this approach also necessitates a prominent meta-area which covers the relationship of Nordic language history to different linguistic theories in Chapters III–V, and which discusses the relationships to the various neighbouring disciplines ranging from archaeology to literary and translation history and to text edition in Chapter VI. It is an unavoidable fact that a language-historical description is traditional to a certain degree (a retrogressive language history, for example, might be original, but it would not lead to any substantial new realizations). In the current handbook, however, more modern approaches are also considered, which are partly integrated into the historical description (not only structuralistic, but especially also language typological, sociolinguistic, contact-linguistic or text-type-linguistic approaches), and partly into theoretical discussions about the relationship to language history (i.e., with regards to generative transformational grammar, pragmatics, phraseology, contrastive linguistics or computer linguistics).

The basis of data of the present language history is also very extensive and stretches from all kinds of written records (incl. poetic works) to present-day spoken languages (incl. dialects, sociolects, etc.). Since the time allotted for preparing the articles was proportionally limited, the description had to support itself to a great extent on the scientific literature which was already available. Nonetheless, the articles in this handbook present their own research results in several areas which had not been carefully examined until now (i.e., translation history). Another important task of the current handbook is to point out existing gaps in research.

As the exclusive use of English shows, this handbook is directed with regards to theory, method and terminology at an international readership with a scientific interest in the

topic. However, care has also been taken to ensure that the content of the handbook is also accessible to interested laypersons and scholars from other disciplines.

3. Contentual Concept

In accordance with the fundamental humane-scientific concept mentioned above, the contentual structure of the handbook is characterized by the attempt to combine internal and external language history as well as factual knowledge with theoretical considerations: in a general sense, to understand language history as part of an extensively understood cultural history. It seems sensible to divide such a structure into three parts: the central part of the individual language-historical description with the respective culture-historical references is flanked by a meta-area in Chapters II–VI and a description of general topics with regard to period and region in Chapters XVII–XXI. An introduction providing initial information about the Nordic language area, the genetic relationship of the Nordic languages to other Germanic languages, the relationship between diachrony and synchrony, the problems of the division into periods, and the basis of data on Nordic language history is followed by critical discussions of the research history until ca. 1950. The research history of the individual Nordic languages and the contributions of Scandinavian researchers to the international development of linguistics are dealt with in separate articles; in article 14 the contributions of non-Nordic researchers to Nordic language history are treated. The relationship of Nordic language history to the methods available today (since ca. 1950) is examined in Chapter IV with regard to theoretical possibilities as well as to currently available research results. Chapter V discusses the relationship between language history and dialectology, which is very intense in the Nordic language region. In the meta-area, the links between Nordic language history and the various aspects of political, social and cultural history (archaeology, history of realia, legal history, history of ideas, religious history, literary and translation history) are then discussed systematically (Chapter VI).

Chapters VII–XVI comprise the central part of the handbook, in which language-historical facts are described and analysed according to period and classified with respect to their historical and systematic contexts. This central part begins (Chapter VII) with a discussion of the relationship of the (Old) Nordic languages to the other Germanic languages and to other neighbouring languages, in which language contact plays an important role. The next chapter (Chapter VIII) presents an overview of Proto-Nordic, in which, in addition to the language system, lexicon, personal and place -names, special attention is paid to the question of its sources – hence also touching upon the origin and development of runic writing. As the use of the common term “Late Proto-Nordic” is avoided here, the period from the 6th century to Old Nordic (ca. 1100), which is so important from a language-historical viewpoint, is dealt with summarily and is associated with historic and culture-historical relationships and developments from the Vendel/Merovingian and Viking Ages, whereas special attention is paid to the sociolinguistic aspect already here (Chapter IX). In view of its long tradition, literary importance and its position as the starting point of all other language developments, three chapters are devoted to the period of Old Nordic (ca. 1100–1350). Chapter X begins with introductory descriptions of the cultural and historical conditions, as well as the distinction and structure of the term Old Nordic, followed by a discussion of its tradition with regards to the history of handwritten texts and the development of the Latin script. Chapter XI

covers various aspects of Old Nordic, from the phonological and grammatical system to the lexicon, text type structure and problems in translation. Chapter XII, entitled “The ecology of language”, describes the most important problems of the general living conditions of Nordic languages during the Old Nordic period, from the relationship between written language and dialects to various language contact situations and the development of Nordic languages outside of what is known today as Scandinavia.

The second part of the handbook begins in Chapter XIII with the transitional period between Old Nordic and Early Modern Nordic (ca. 1350–ca. 1550), a complex and problematic topic of discussion which must be divided up into several individual aspects. The central part is a detailed description of language changes, especially those which greatly influenced the structure of mainland Scandinavian languages. This central part is preceded by a few sections covering historic and culture-historical aspects (i.a., on the relationship between handwritten texts and letterpress printing) and followed by a few sections dealing with special aspects such as text type inventory, the language of translations, development of oral and written styles, language contact, language loss and the loss of standard language (in Norwegian).

Classifying those language developments which took place after the early modern period is problematic insofar that, with the exception of isolated cases such as 19th century Norwegian, no clear boundaries can be detected, at least not with respect to all Nordic languages. However, a cut-off in or at the end of the 18th century is justifiable, not only due to internal linguistic criteria (i.a., the emergence of logical syntax), but also because of the general living conditions of language (firm establishment of standard languages, increasing language cultivation and the efforts of grammarians). Chapter XIV, which covers this period, focuses on comprehensive descriptions of individual languages, which are supplemented by descriptions of sociolinguistic and dialectic variations with reference to a growing national standard language tradition. In contrast to the previous chapters, new findings are presented here in special sections about education and language cultivation and their importance for language development (i.e., grammarians).

As a period with a character of its own, including such crucial developments as the establishment of the middle class, urbanization and (the beginnings of) industrialization, the 19th century receives special treatment in Chapter XV with a focus on specific occurrences and problems which characterize the 19th century: to some extent contradictory ideologies such as nationalism and Scandinavianism and their effects on language (the establishment of the independence of Norwegian, the beginnings of Finland-Swedish as an independent language, Icelandic purism, the establishment of Faroese as a written language / the interrelations between Scandinavian languages, i.a., in the exchange of loanwords between Danish and Swedish), expansion of the spectrum of text types, relationships between standard language and forms from colloquial speech, stylistic developments in poetry and literary prose, and development of a middle-class conversational culture.

In Chapter XVI, which covers the 20th century, three events are in the forefront:

- a detailed description of the systems of modern standard languages in cross-sections, but taking into account the changes during the 20th century;

- problems in linguistic layering: written language vs. spoken language in a survey of their main characteristics, their interrelations, and their development during the 20th century: interrelation and development of dialects and regional languages in Sweden, Norway and Denmark during the 20th century; social stratification in individual Nordic languages, language of the media such as radio and television;
- tendencies since World War II, including future prospects for the history of Nordic languages.

In Chapters XVII–XXI, certain special aspects of historical development are discussed in summary within the scope of the entire Nordic language history. Chapter XVII describes the typological development, which led to the contrast between Mainland Nordic and Island Nordic and which affects phonology on the one hand, morphology and syntax on the other. In Chapter XVIII, the social stratification of the Nordic languages is analysed once again, this time from an overall perspective with regard to time and region. Chapter XIX describes the special languages which otherwise only receive brief mention in the previous sections:

- languages of socially correlating groups, such as students', soldiers', sailors', thieves' slang, etc.,
- technical languages and jargons, such as craftsmen's language, miners' language, scientific language, sports language, etc.,
- slang.

With regard to more recent language history, Chapter XX describes language cultivation and language planning in Scandinavian countries, also from an overall perspective. Chapter XXI discusses the various aspects of language contact again in summary and in consideration of internal Nordic correlations, and according to minority languages in Scandinavia and Nordic emigrant languages, especially those which spread to America.

4. General Comments

The overall concept of the current handbook is modelled after the volume *Historical Linguistics (Sprachgeschichte)* to a certain extent. It differs, however, insofar that the research-historical and theoretical-methodical parts are more strictly separated from the main empirical-historical part. The 230 articles were distributed among the editors as evenly as possible. Each of the editors focused on the approx. 40 articles which were allocated to them, whereas O. Bandle, as the main editor, reviewed all articles. The supervision of each article was allocated to one of the six editors such that the topics corresponded, where possible, to the individual linguistic-geographic affiliation and/or special area of interest and research of the editor. Finding enough authors with a certain interest in historical linguistics among the relatively small number of Nordic language experts seemed doubtful at first, especially since the editors were instructed not to allocate more than three articles to one author. Surprisingly, contributors were able to cover the entire work plan after all. Only later would some articles have to be omitted, partly due to failure to deliver promised manuscripts but also due to overlapping in content with other articles.

Although the search for authors led for the most part to satisfactory results, it was not altogether unproblematic. Since linguistic research in Scandinavian countries is tradi-

tionally carried out within national boundaries, it was difficult in some cases to find authors for the articles on the entire Nordic region. It was therefore partly necessary to divide these articles up according to individual Scandinavian countries or language areas. In this sense, the article originally planned to cross-linguistically discuss the translation language of the 19th century for the Nordic region was divided up into five parts, namely 168–172.

Allocating those articles dealing with internal and external language history, i.e., articles covering interdisciplinary topics (e.g., language and history, archaeology, etc.) also proved to be difficult. Finding suitable authors interested in working on the theoretical-methodical articles was also not always easy. Following the death of the contributor Kristian Ringgaard, it was decided to print Article 33 in its unfinished state, partly in honour of the deserving author, but also because it would have been impossible to find another author on such short notice for such a large field as Nordic dialectology.

It remains for the editors to thank several persons and institutions which have supported this work by active collaboration. Apart from the publishers' staff and the series editors this is above all Mrs Jean Hannah (Lausanne) who has carried out the control of the English language with unequalled perspicacity and in this way made the handbook easily readable for an English-speaking public. It remains also to thank the assistants of the Scandinavian department of the University of Zurich: lic. phil. Christof Reiber and lic. phil. Sonja Gisler for their unselfish work in connection with the production and control of the handbook which essentially lightened the chief editor's burden, and last but not least the editors would like to thank the editor of the "Thurgauer Namenbuch", Dr. Eugen Nyffenegger, for good advice in computer problems.

The editors hope to have accomplished a comprehensive work which for a pretty long time to come may serve as a substantial aid for linguistic research.

I. Introduction

1. The Nordic language area and the languages in the north of Europe

1. General overview
2. Old Nordic
3. From Old to Modern Nordic
4. The Fenno-Ugric languages
5. Greenlandic
6. Text examples
7. Literature (a selection)

1. General overview

The adjective “Nordic” in English has two different meanings. One is geographical, denoting a large area in the north of Europe. It consists of five independent states: from west to east, *Iceland*, *Norway*, *Denmark*, *Sweden*, and *Finland*. It also includes three territories which are largely autonomous without having acquired full independence: *Greenland* and the *Faroe Islands* (both under Danish sovereignty) and the *Åland Islands* (under Finnish sovereignty). The other meaning is linguistic, and in this sense, *Nordic* will in this work be synonymous with North Germanic and include *Swedish*, *Danish*, *Norwegian*, *Icelandic*, and *Faroese*. Besides these, the Nordic region consists of three non-Germanic, even non-Indo-European, language communities: *Finnish*, *Sámi* (both *Fenno-Ugric*) and *Greenlandic*.

The North Germanic languages are the proper theme of this handbook. But in this introductory chapter, a brief treatment will be given of the non-Germanic communities, too. The population of the Nordic countries had, except minorities in the outskirts, long been homogeneous, but this has changed since the Second World War (but see art. 230).

The present geographical range and number of users of these languages is roughly outlined here, starting with the “biggest” in terms of speakers:

Swedish is the national language of Sweden, where it is spoken by more than 95 per cent of the population, around 8.5 million people. It is also spoken by about 300,000 people in southern and western Finland; they constitute

a recognized linguistic minority and have equal formal status with the Finnish-speaking majority. In Åland, only Swedish is used and formally recognized.

Finnish is the majority language of Finland, spoken by about 5 million people. It is also spoken by the largest minority in Sweden, about a quarter of a million people, mostly recent immigrants, but including a long-standing population of about 20,000 in the border area in the north (Tornedalen). There is a small minority of Finnish speakers in northern Norway, too. In the ex-Finnish province of Karelia in Russia, there are about 15,000 Finnish speakers besides 80,000 speakers of the closely related language Karelian, and emigrant Finnish colonies in the U.S., Canada and Australia maintain their language reasonably well.

Danish is spoken by close to 100 per cent of the population in Denmark, about 5 million people. In Schleswig, which borders Germany, it lives in symbiosis with German; there is a German linguistic minority north of the border and a Danish one in the south (some 10,000s in both groups). In the Faroes and Greenland, Danish is a secondary official language.

Norwegian is spoken by close to 100 per cent of the population in Norway, a little more than 4 million speakers. There are two standard varieties of the language, *Bokmål* and *Nynorsk*, which are officially recognized as equal. Nynorsk is used mainly in western Norway and adjacent areas, probably by up to half a million people (according to a reasonable estimate; a census on language choice has never been taken), Bokmål by the rest in writing. Dialectal speech is more widespread than in any other Nordic country.

Icelandic is spoken by 100 per cent of the ca. 270,000 Icelanders.

Faroese is spoken by 100 per cent of the ca. 45,000 inhabitants in the Faroes (a few thousand Faroese live in Denmark).

Greenlandic is spoken by almost 100 per cent of the population in Greenland, almost 60,000 people. It is linguistically close to the Inuit languages of northern Canada.

Sámi is spoken by around 40,000 people (uncertain estimate) living in the north of Norway (about 20,000), Sweden (10,000–15,000), Finland (5,000), and Russia (2,000). There are several varieties classified as dialects or languages, but most are not mutually intelligible. The major variety is North Sámi, spoken by the largest concentrations of Sámi people in Finnmark in Norway, and also by a majority in Sweden and Finland.

We shall now give brief sketches of the “external” history of the languages; i. e. the historical development of the language communities more than the languages themselves. We start with a survey of the Old Nordic stage, then we look at the common developments of the language communities from late medieval to modern times, and after that we treat Danish, Swedish, Norwegian, Icelandic and Faroese separately before proceeding to the non-Indo-European languages.

2. Old Nordic

The term *Old Nordic* is used in this handbook for the totality of medieval North Germanic (while *Old Norse*, when used, will have its traditional meaning “Old West Nordic”, and will particularly denote the written language employed in medieval Norway and Iceland). Old Nordic was a single language (i. e. a continuum of mutually intelligible dialects), developed from Proto-Nordic and spoken in Denmark, Norway and Sweden (and areas populated from these countries) from the seventh till the fifteenth centuries. It is normally divided into two main branches: Old West Nordic (Norwegian, Icelandic) and Old East Nordic (Danish, Swedish and Gutnish). Old Nordic is the sole representative of the North Germanic branch as compared to West Germanic (Old English, Old Frisian, Old Saxon, Old High German) and East Germanic (Gothic). All the main branches of Old Nordic are represented in extant written texts, but the western branch (“Old Norse”), in particular the Icelandic variety, possesses a corpus of unprecedented abundance, especially from the thirteenth century when Icelandic literary culture was at the height of its creativity and productivity. This variety, which may also be called “classical Old Icelandic”, is therefore usually employed as the representative of the whole

language when examples are given in comparative treatments.

Old Nordic was originally spoken in present-day Denmark, Norway and Sweden, except the northernmost parts of the latter two countries, where Sámi was used. From this base, the Nordic peoples and thus their language expanded tremendously, probably from the seventh century onwards, and its geographical range was widest from the eleventh to the fourteenth centuries. The expansion first went northwards, where the Sámi were gradually pushed back until – in modern times – the whole coastal area of Norway was Norwegian-speaking. The expansion westwards from Norway commenced rather early, beginning with Shetland and the Orkney Islands, continuing southwards to the Hebrides, the Isle of Man and northwest England, culminating in the ninth century. In the ninth and tenth centuries the Faroes, Iceland and southern Greenland were populated by Norwegians. Eastern England was settled by Danes in the ninth and tenth centuries, while Swedes began colonizing the Finnish and Estonian coasts two centuries later. The Viking Age also saw the creation of Nordic aristocracies in parts of Ireland (Norwegians), Normandy (Danes) and Russia/the Ukraine (Swedes). These were assimilated after a few generations by the local populations, and during the later Middle Ages, Old Nordic died out in England, the Isle of Man, the Hebrides (probably during the fourteenth century), and around 1500 in Greenland. In Shetland and the Orkneys, the language (there known as Norn) persisted until the seventeenth and eighteenth centuries, when it was replaced by Scottish dialects. With these exceptions, the Nordic languages had reached their present geographical range by about 1500. Finland belonged to Sweden until 1809, while the three kingdoms Norway, Sweden and Denmark were united in the Kalmar union and also went through similar linguistic developments. Icelandic and Faroese had already constituted themselves as separate languages.

Nordic language is documented since early Proto-Nordic times in the form of runic inscriptions. From the ancient 24-character futhark used in the Proto-Nordic period, a newer, 16-character futhark developed, in which many of the characters represented different although related phonemes. There were two main types of this alphabet, viz. the Norwegio-Swedish and the Danish. In the twelfth century, new characters were developed

through the use of small points, again aiming at a more accurate grapho-phonemic representation. The written language seems to have been quite close to the spoken, although very formulaic. Standardization of an autonomous written language does not seem to have taken place, though there were clearly established spelling traditions. Runes were used far into Christian times with the result that a large amount of inscriptions is preserved.

The Roman alphabet was introduced with Christianity, and the indigenous language was written in this alphabet from the eleventh century in Norway and Iceland, from the twelfth or thirteenth in Sweden and Denmark. Latin was the most frequently used written language in the latter two countries. Different writing traditions developed, based on different ecclesiastical centres where writing was taught and practised. Today, a vast body of manuscripts from Iceland are extant, but the use of the mother tongue in writing was also well established in Norway – in different genres. In both these countries, the decisive influence came from England and probably Ireland. In Sweden and Denmark, which were more directly influenced by Germany, Latin remained dominant far into the Middle Ages. Laws were the first genres of written texts in the mother tongue; later, religious literature began to appear. The writing traditions were still mostly regional (Zealandic, Scanian, Western Götish etc.), but the linguistic differences between the existing varieties throughout the area seem to have been rather modest (although Danish was already moving more rapidly towards the “modern” phase of language development than the others). The introduction of printing in the late fifteenth century ushered in a new era.

No standard spoken language seems to have developed before 1500, although there may have been tendencies towards a more formal “courteous” language in the aristocracies. We must suppose that everybody spoke his or her dialect, and that these dialects were not too far removed from each other. Linguistic accommodation towards other varieties on the part of those who travelled was probably normal here as in comparable circumstances elsewhere, especially if the dialects were more different than we now tend to believe that they were.

3. From Old to Modern Nordic

3.1. General

The decisive period in the transition between the “old” and the “modern” stage of the Nordic languages seems to have been the fifteenth and sixteenth centuries. We can summarize the common developments in this way before turning to the separate languages:

(1) Linguistically, the old division between West and East Nordic was superseded by a much more fundamental split between Scandinavian and Insular Nordic (Icelandic and Faroese). Scandinavian experienced a radical simplification of its morphology and a strong Low German impact on its vocabulary, while Insular Nordic remained markedly conservative in both these respects. Within Scandinavian, Danish went furthest in its deviation from the Old Nordic patterns, and within Insular Nordic, Faroese accepted a degree of morphological simplification while Icelandic remained staunchly conservative.

(2) Old Nordic already consisted of numerous dialects, but it seems that the dialectal fragmentation of Scandinavian and Faroese increased markedly during this period, producing the patterns which still prevailed in the early parts of the twentieth century.

(3) The use of the Nordic languages in writing was strongly extended because of two developments: the introduction of paper and of the printing press. The first printer appeared in Denmark in 1482, in Sweden in 1483, in Iceland in the middle of the sixteenth century, and in Norway only in 1643. The consolidation of two Scandinavian monarchies – Denmark (with Norway, the Faroes and Iceland) and Sweden (with Finland) – made the use and spread of the written language more urgent than before, both for communication and for the integration of the peoples in the bureaucratically governed states. The churches were nationalized after the break with Catholicism (1527 in Sweden and 1536 in Denmark), and the Bible was translated into Swedish in 1526/1541 and Danish in 1550 (Icelandic in 1584). The Danish, Swedish and Icelandic written languages were gradually codified and stabilized from the sixteenth till the eighteenth centuries. Norwegian and Faroese were developed in the nineteenth and twentieth centuries under quite different historical circumstances.

(4) The written language was gradually spread among the people. In Iceland, literacy was widespread quite early, and in Denmark

and Sweden, common people increasingly learnt to read for religious reasons. The eighteenth century saw the introduction of a schooling system, where reading became a main component. The ability to write, however, was spread among the general population through an improved and extended “people’s school” only towards the close of the nineteenth century, when the modernization and democratization of society made higher formal qualifications necessary for most people in order to find a position and a livelihood and to function well in society.

(5) The development of standard spoken languages within the most prestigious layers of the population (the bureaucracy, clergy, high urban bourgeoisie) seems to have started gradually from the seventeenth century onwards. Only in the twentieth century have these varieties spread throughout the population because of radically altered socio-economic structures. In modern times, linguistic homogenization of the languages has taken place everywhere, rapidly forcing the dialects back to the margins of society (although Norway is a special case), while new differentiations have developed between generations, social groups, ethnic groups, professions, and sexes. Social equalization and increased mobility have led to a “de-formalization” of language which has also been promoted by the mass media.

(6) As a result of modernization, the languages have accepted vast quantities of loanwords from prestigious international sources: Latin, Greek, French, German. From the middle of the twentieth century, the strong impact of (American) English has “internationalized” the languages in their vocabularies and modes of expression more than ever before. Only Icelandic and in part Faroese have energetically and successfully resisted this influx of foreign words.

3.2. Danish

Danish underwent a number of phonological developments in the early Middle Ages which clearly set it off from its northern neighbors Norwegian and Swedish, among them the voicing of post-vocalic unvoiced plosives, the reduction of unstressed vowels in inflectional suffixes to a schwa, and the development of the glottal stop as a prosodic feature. Around 1500, some sources indicate that Danish was difficult to understand for Swedes, although one should be careful about accepting this as

a neutral description; it is contradicted by other sources. By 1500, the morphological simplifications and phonological revolution had run their course, and a more stable period set in; at the same time, the standardization of the written language began. Around 1700, a literary renewal started, ultimately leading to modern written Danish.

As a written standard language, Danish has for much of its history remained in a rather curious position, suppressing other languages (Norwegian, Faroese, Icelandic) as an imperial language in the Scandinavian union while at the same time having to assert itself at home against Latin and German dominance. The earliest extant records of Danish written in Roman characters date back to the thirteenth century; they are law texts from different parts of the country. While Latin was generally used for writing, laws were recorded in the mother tongue because it was important that common people knew them, and because they were already available through oral transmission in the vernacular. From the fourteenth century, legends, chronicles and religious literature were also written down in Danish, many of them being translations. This “Danish” in fact reflected local dialects; a standard language did not yet exist. But a certain dominance of Zealandic forms was visible already in the late Middle Ages: the administrative, ecclesiastical and commercial center of Denmark lay on Zealand (Roskilde, Copenhagen), and a Zealandic chancery style (inspired by German and Latin syntax) was developing.

The orthographic standardization of Danish began in the sixteenth century; the introduction of printing in 1482 and the Lutheran Reformation of 1536 were crucial events. Through the Reformation, Danish ousted Latin as the main ecclesiastical language. The Bible was published in Danish in 1550 (referred to as the *Bible of Christian III*) and became extremely influential both because it used a comparatively consistent orthography and because its style was unusually “pure”, inspired by “plain Danish” and purged of learned Latinisms and Germanisms. Another important text was the Danish Law of King Christian V, published in 1683. In the seventeenth century, the first grammars of Danish appeared, giving rules for “good Danish”, mainly based on upper-class Copenhagen speech. But at the same time, German was the prestige language of the court and the nobility. During the seventeenth and eighteenth centuries, French also acquired a prestigious posi-

tion. Around the middle of the eighteenth century, a language movement developed which resorted to purism in order to make the language more authentic and more intelligible to the general public. The movement was often inspired by German, however, and directed its aggression primarily against French and Latin words: examples are *Digter* 'poet' and *Forfatter* 'author', which were to replace *Poet* and *Autor* (German *Dichter*, *Verfasser*). This purist wave subsided after some decades, and since then, Danish has been rather liberal in accepting loanwords – at first mostly from German, French, Latin and Greek, and since the 20th century mainly from English.

The dominance of German declined towards the end of the eighteenth century. At that time, Danish became a field of study in its own right at school and at the university of Copenhagen for the first time. Orthographic standardization was largely completed before 1800, although discussions about spelling continued throughout most of the next century. The standard variety was firmly based on upper-class Copenhagen speech. With improvements in schooling, this variety began to penetrate the rest of the country as well.

The dialects of Danish have traditionally been divided into three groups: Jutish in Jutland; Insular Danish on the islands of Funen and Zealand and the smaller islands to the south of them; and "East Danish" in Bornholm and the southern Swedish territories of Scania, Halland and Blekinge, which belonged to Denmark until the middle of the seventeenth century. The so-called East Danish dialects could, however, just as well be called "South Swedish", since linguistically they are transitional between Danish and Swedish. Today, most of the traditional dialects have disappeared because of rapid urbanization and the revolution in communications and education during the last century. Only in West and South Jutland and in Bornholm are they still used by young and middle-aged people as well as by the oldest generation.

3.3. Swedish

Swedish emerged as a written language in the 13th and 14th centuries. The first kind of longer texts to be written down in Roman characters in the local language were the laws here as well, and both they and the language were regional; the oldest one was the Older Law of Västergötland from around 1225. While Latin was the dominant written language at the out-

set, Swedish was used for popular literature both of a worldly and a religious character. The use of Swedish intensified from the latter half of the fourteenth century, especially because it was employed by the Birgittine religious order (named after its founder, St. Birgitta), which was influential all over northern Europe for a period.

In 1526, the Swedish translation of the New Testament appeared. This event marked the dawn of a new era, the development of the modern independent Swedish state and the introduction of Lutheranism as its state religion. Printing had already been introduced in 1483. At this time, the structural transition of Swedish to its modern analytical stage had largely been completed, and the standardization and cultivation of Swedish as a modern written language, able to fill all the society's needs, began. In the preceding period, Danish and German had exerted a strong influence on the written Swedish chancery style. But the strong anti-Danish sentiments which accompanied Sweden's struggles for national liberation paved the way for a linguistic reaction. The codification of a Swedish written standard, based on the speech of central Sweden and in particular of Stockholm, was deliberately undertaken in such a way that its differences from Danish were stressed as much as possible. This is one of the reasons why the vowel *-a* is so dominant in Swedish inflectional endings. This *-a* had been weakened to schwa in many dialects, and this weakening had left traces in the written language. But the nationalistic reaction in Sweden encouraged the use of *-a* as one among several ways of emphasizing the distance between Swedish and Danish. The choice of the characters *ä*, *ö* and *å* instead of the Danish *æ*, *ø* and *aa* may have a similar explanation.

Like Danish, Swedish was deeply influenced in its development as a written language by the first complete translation of the Bible (*The Gustav Vasa Bible*, published 1541). Its language was based on the speech of the Stockholm district, and the translators aimed at some degree of orthographic standardization. In the worldly sphere, the chancery style became dominant as the monarchs of the Vasa dynasty (1523–1654) built up a centralized and efficient national bureaucracy. In the eighteenth century, new media (journals and newspapers) were to influence culture and society to an increasing degree, introducing a new and more oral and direct style of language, less Latinized than the conventional

style of the time. As in Denmark, a purist tendency appeared, but with less intensity. Stronger than this purism was the influence of French, which seems to have been more profound in Swedish than in Danish (where German was the main source of influence). The eighteenth century saw an increasing preoccupation with the cultivation of the Swedish language, reaching a climax during the reign of Gustav III (1771–92), who in 1786 founded the Swedish Academy.

The first signs of a standard spoken Swedish became visible in the seventeenth century. This variety had its main roots in the aristocratic speech used over a wide area of central Sweden, particularly Stockholm. In 1801, the Swedish Academy issued a standard spelling, as codified on its behalf by the poet Carl Gustaf Leopold.

Swedish has always been divided into many and very diverse dialects. The dialects have been retreating during the last several generations in Sweden, too. They have been maintained better than in Denmark, but less well than in Norway.

3.4. Norwegian

The first manuscripts in the Old Norwegian written language were probably written in the eleventh century, although the oldest extant ones date from the twelfth. The language was extensively used and (relatively) stabilized in a conservative form which did not reflect the changes in speech very well. It persisted until the middle of the fourteenth century. From then on, it gradually yielded to Danish as Danish power in Norway tightened its grip. The replacement of Norwegian by Danish was nearly complete in the early sixteenth century. When Latin yielded as an ecclesiastical language because of the Lutheran Reformation (1536), Danish took its place. Christian III's Danish Bible was introduced in Norway, too. The only Norwegian texts still used after 1536 were old law texts, ultimately dating from the thirteenth century, and these were replaced by Danish texts around 1600. Danish was the only written language employed in Norway from this time until the second half of the nineteenth century. In speech, Norwegian dialects were used, but in the cities, a Danish-based upper-class spoken variety gradually arose, especially for formal use, but it also strongly influenced the everyday language of the elite.

After the secession of Norway from Denmark in 1814, this situation continued, but it was felt to be increasingly problematic. Europe, including Scandinavia, had now entered the Romantic Age, and one of the new insights was that there was a deep connection between a nation and its language. The question arose of how Norway should attain linguistic autonomy. In the decisive period between 1830 and 1860, two methods to achieve this appeared. One was formulated by the self-taught linguist Ivar Aasen. After extensive research, he presented a comparative study of the dialects. Based on this material, he developed a standard written norm for modern Norwegian. This became the basis of the variety called *Nynorsk*. The other method is associated with its most prominent spokesman in the nineteenth century, the teacher Knud Knudsen: using the Danish written language as a basis and Norwegianizing it according to the norms of urban upper-class speech. The variety resulting from this approach was the basis of modern *Bokmål*.

At the outset, the Norwegian language struggle was a competition between these two policies and the language varieties resulting from them. *Nynorsk* was acknowledged formally by Parliament in 1885 as being on a par with Danish, and in 1892 it became possible to choose it as a language of instruction in primary schools. By 1920, it had been introduced as such in most of rural western Norway and the interior mountain valleys, where it still has its stronghold. The cities and towns, however, along with the populous southeastern part of the country, remained solid "Dano-Norwegian" territory. But this variety was transformed to suit Norwegian speech better through two linguistic reforms, in 1907 and 1917. From then on, it has been customary both in Denmark and Norway to view Norwegian *Bokmål* as a language distinct from Danish. The first book that was translated from *Bokmål* into Danish appeared in 1919.

Although *Nynorsk* experienced a rapid expansion, *Bokmål* remained the majority written language. Since the linguistic difference between the two varieties was not so great, the idea arose of gradually bringing them closer together, aiming at amalgamation into a single Common Norwegian (*Sammorsk*) written language. Linguistically, this plan was supported by the fact that the dialects of the most populous areas of Norway had many core features in common with both written standards, so

that an amalgamation should be possible by using these dialects as a basis. In 1917 and 1938, two very ambitious linguistic reforms aiming at convergence on the levels of spelling, underlying speech forms, and morphology were issued after several years of debate and struggle. After World War II, a reaction set in against this policy, especially on the Bokmål side. A bitter struggle developed in the 1950s and early '60s concerning "Common Norwegian". At the same time, Nynorsk was ousted as an instructional language in many districts, but it retained its position in its heartland in western Norway, where it is still strong.

While a slow convergence, mostly in idioms and style, can be discerned in written usage, the official policy of amalgamation was given up – definitely or temporarily – in the 1960s. A partial reversal has even taken place in Bokmål through a reform in 1981 which allowed many traditional forms that had earlier been discarded, but both Bokmål and Nynorsk today exist in several sub-varieties, some traditional, some "radical" – i. e. approaching the other variety and the most common forms in the dialects.

No census has been taken of Bokmål vs. Nynorsk users, but 15–16 per cent of all school children are taught Nynorsk as their first written variety, the rest Bokmål. Many in the former category change to Bokmål later in life, but it seems reasonably realistic to assume that there are approximately half a million Nynorsk users, i. e. around 12 per cent.

The dialects of Norway are customarily divided into five main groups: Western, Central (comprising the mountain valleys of the interior), Eastern, Trønder (from Trøndelag), and Northern. Nynorsk was traditionally most closely related to the Western and Central dialects, but through the spelling reforms it has grown closer to the three other groups. Bokmål is a compromise between originally Danish-based upper-class speech and southeastern dialects. Dialects have a much higher prestige in Norway than in the other Scandinavian countries, and they are used relatively freely in most contexts.

3.5. Icelandic

Modern Icelandic is the most direct descendant of Old Norse, being structurally the most conservative language of northern Europe. The changes which justify the distinction between Old and Modern Icelandic have primarily taken place within phonetics and phono-

logy, and they were by and large completed during the sixteenth century. At the same time, the Scandinavian languages and Faroese had developed in very different directions, so that mutual intelligibility was probably lost around 1500.

Icelandic has been in continuous written use since medieval times. Its spelling tradition underscores this fact by preserving the phonetic characteristics of Old Norse without much regard for later developments, and this tradition was fixed during the formal spelling codification in the nineteenth century, which coincided more or less with the codification of Old Norse spelling in "normalized" text editions. Beside this fixed and traditional orthography, written Icelandic has been marked by strong traditionalism at other levels, too. There is a strong resistance against morphological and syntactic innovations which have entered the spoken language and become quite entrenched there, such as analogical plural forms like *læknirar* 'doctors' for the traditional *læknar* (sing. *læknir*), and the use of dative forms instead of the traditional accusative to mark the subject of certain verbs like *vanta* 'lack' and *langa* 'long for' or 'want'. Above all, the Icelandic written language has been cultivated on a strong puristic basis: a massive, almost industrial, creation of neologisms based on indigenous roots to replace or prevent the entry of loanwords has been carried out by official bodies (especially the Icelandic Language Council) as well as by private organizations. Among the countless examples, we mention some common ones: *skrifstofa* 'office' ("write-room"), *lýðveldi* 'republic' ("people-power"), *sjónvarp* 'television' ("sight-throwing"). In informal speech, however, loanwords, primarily from Danish and more recently English, have been and are more readily accepted, but they are considered inappropriate in writing and formal speech.

Icelandic is quite unique in having an almost uniform spoken language, too, without dialects. This, combined with the lack of minority languages, makes Iceland the linguistically most homogeneous nation-state in Europe, possibly in the world. There are a few established phonetic differences between the regions of the country, most of them on the sub-phonemic level. In addition, a generational split seems to be evident especially in the capital area, mostly regarding word choice, but to a certain extent also in some phonetic features.

3.6. Faroese

Faroese developed as a separate spoken language from late medieval times onwards. The oldest written records we have of modern Faroese date from the late eighteenth century, by which time it was considered a Norwegian dialect, but its characteristics show clearly that it was autonomous from Norwegian. It is often grouped together with Icelandic under some term, e.g. “insular Nordic”, but this grouping depends mostly on the heavily etymologizing orthography, which makes the written language appear very similar to Icelandic while not reflecting actual Faroese speech very well. Structurally, Faroese occupies a middle position between Icelandic and Scandinavian at the morphological level, while Faroese phonology is markedly distinguished from all the other Nordic languages.

Faroese is spoken only in the Faroes, where it is the mother tongue of the entire population and an official language on equal footing with Danish. Since Home Rule was introduced in 1948, a gradual Faroization of the national institutions has taken place, and the Faroese language is now almost universally used except in direct contact with Danes and Denmark (although in popular culture, Danish still dominates alongside English).

The Faroese orthography was created by the cleric V. U. Hammershaimb around the middle of the nineteenth century. Before that, some texts in Faroese (ballads, translations of parts of the Bible and the medieval *Saga of the Faroese*) had been published in a phonetically based spelling. Hammershaimb, however, based his system on the newly codified Old Norse and Icelandic orthographies, and thus created a highly etymological spelling. The effect of this was to give the language historical dignity, very important at the time, to underscore its relationship with Old Norse and Icelandic, and to impose a unity on the language without favoring one present-day dialect above others. Hammershaimb's orthography was accepted by the Faroese language movement, and today it is the only officially acknowledged (and in practice the only used) spelling of Faroese.

A purist language cultivation has been implemented here as in Iceland, but in the Faroes, purism has been less categorical and less successful. The spoken language borrows quite freely from Danish, and while a written style has been established which is much more restrictive about such loans and prefers

Faroese neologisms, many Danicisms are nevertheless accepted also in writing.

There are several different dialects of Faroese, but most of the differences between them are rather superficial, e. g. different pronunciations of certain vowel phonemes in certain environments. These differences are socially accepted on an equal footing, although there is a tendency towards dominance of the dialect of the capital, Tórshavn.

4. The Fenno-Ugric languages

4.1. General

The Fenno-Ugric branch of the Uralic language family is divided into two groups, Fennic and Ugric. The most important Ugric language is Hungarian, while the Fennic group contains several sub-groupings, including the two which are represented in Scandinavia: Sámi and Balto-Fennic. The two major Balto-Fennic languages are Finnish and Estonian. The Uralic languages not mentioned here are all spoken by small ethnic groups within the former Soviet Union.

The Fenno-Ugric languages are structurally quite different from the Indo-European ones. They are strongly synthetic; in particular, the nominal declension system is extensive, with a great number of cases fulfilling many of the functions served by prepositions in Indo-European languages. The languages are agglutinative rather than inflecting: the morphological functions are indicated by stable morphemes which are clearly distinguished from the stem form. This picture is somewhat complicated by the so-called “grade alternation”, a kind of regular stem change in inflected forms. But the entire morphological system shows a great degree of regularity.

4.2. Finnish

The Finnish language has been spoken in the south of Finland for at least 2000 years, and it has gradually pushed Sámi northwards. It has developed quite different dialects, which can be divided into a Western and an Eastern group, but the transition between them is gradual. In late medieval times, Finnish was used in writing for administrative purposes. Since the administrative center at that time was Turku, the Western dialects formed the basis of the written language. The basic structure of the language at that time was very similar to present-day Finnish. We have no documents

showing earlier stages of its development, so its history can only be tentatively reconstructed by comparing its forms and structure with those of the other Fenno-Ugric languages.

In the sixteenth century, Finnish was adopted as a written language on a larger scale. The cleric Michael Agricola (ca. 1510–1557) is regarded as the founder of this written language, although he did base his usage on earlier traditions. But he recodified the language, modernized it according to the usage of his own day and broadened its base by adopting elements from different dialects. Its basis remained Western Finnish, though. Agricola translated the New Testament into Finnish and wrote large amounts of ecclesiastical literature in it. He was a Lutheran, and may justly be regarded as the Finnish Luther as far as his impact on language is concerned. Both religious literature and legal documents were published in Finnish during the following centuries, even though the centralization and consolidation of the Swedish state in the seventeenth century led to a reduction in the official use of Finnish. But the church and the Pietist movement, which gained a strong grip on the Finnish population from around 1700 onwards, had to use Finnish in order to reach the people. Swedish was an upper-class language only (except in the coastal areas, where there was a Swedish-speaking population of farmers and fishermen).

After the Russian takeover in 1809, Swedish remained the administrative language of Finland, as it was the language of the upper class, the bureaucracy and the intelligentsia. Even though the Russian authorities themselves used Russian, they did not try to impose it by suppressing Swedish and Finnish. However, national romanticism and the linguistic revival generated by it surfaced in Finland, as it did in Norway, Iceland and many other European countries at about the same time. A milestone in this revival was the publication of the great epic cycle *Kalevala* by the folklorist Elias Lönnrot in 1835. *Kalevala* was actually based on a large number of different folk ballads containing related legends and myths. Its linguistic form was codified by Lönnrot, who instigated a break with the Agricola tradition. In the years preceding the publication of *Kalevala*, a heated discussion took place among the Finnish intelligentsia about the basis of a Finnish standard language. A strong current favored a move towards the Eastern Finnish dialects, which were more conservative and less “corrupted” by Swedish influ-

ence. Lönnrot did indeed adopt Eastern Finnish forms and words that until then had not been accepted, but like Agricola, he tried not to make the standard too one-sidedly Eastern or Western. In any event, his version was accepted and is the basis of modern standard Finnish.

Soon attention turned from discussions about norms to the larger struggle for linguistic equality. The economic and social prosperity enjoyed by the Finnish population around the middle of the nineteenth century led to increased self-reliance, even linguistically. Demands arose for a stronger position for Finnish; after all, the majority of the population still understood only this language. In 1863, under the regime of the reformist tsar Alexander II, Finnish was officially put on an equal footing with Swedish (with a transition period of 20 years). From then on, the position of Finnish was secure. A Finnish-speaking bourgeoisie evolved, and Finnish was taught to all officials and introduced at all levels of education. The modernization of the lexicon was carried out in a puristic spirit (although less so than for Icelandic).

In the constitution of independent Finland (1919), Finnish and Swedish received an equal position as “national languages”. However, since Finnish was spoken by almost 90 per cent of the population, it inevitably obtained a dominant position. The antagonism between the two language groups persisted until the Second World War but has to a large degree subsided since then.

4.3. Sámi

Sámi is actually not a single language, but rather several languages constituting a branch of the northwestern Fenno-Ugric language group. The different varieties within the branch are often called “dialects”, and this is defensible insofar as there generally are – or have been – no sharp boundaries between the varieties, only dialect continua. However, the intrusion of the majority populations (Scandinavian and Finnish) has destroyed these continua in many places, so that we now have a number of more or less isolated varieties often spoken by small populations spread over wide areas and interspersed among the totally dominant majority population.

It is customary to acknowledge nine Sámi “dialects”, but two of them are spoken only on the Kola peninsula (Russia). Two others (Enare Sámi and Skolt Sámi) are spoken in a

small area in northeastern Finland – Skolt Sámi also across the Finnish border, in Norway and in Russia. They are grouped together with the Kola varieties to form the East Sámi branch. The central Sámi area comprises the northernmost parts of Norway (Finnmark, Troms), Sweden (Lappland) and Finland (also called Lappland or, in Finnish, Lappi). In this area, North Sámi is spoken, a single language where all the dialects used are closely related and mutually intelligible. The North Sámi speakers are by far the most numerous, and their written standard language therefore is stronger and more vital than any of the others. Its core area, with regard to the number and concentration of its speakers, its official and social standing, and its linguistic and cultural vitality, is in the interior part of the Norwegian province of Finnmark. To the south of Troms and Swedish Lappland, we find four Sámi dialect or language areas: Lule Sámi, Pite Sámi, Ume Sámi and South Sámi. Ume Sámi is spoken only in Sweden, the three other groups both in Sweden and Norway. South Sámi is used as far south as Røros in Trøndelag, Norway. Neighboring varieties of Sámi seem to be mutually intelligible, except North Sámi in relation to East Sámi, where there is a real language boundary. But South Sámi and North Sámi are mutually unintelligible and are standardized as two very different written varieties, so they should be regarded as different languages.

Sámi first appeared as a written language in the seventeenth century in Sweden. The publication of written materials in Sámi was then viewed as desirable for missionary purposes, and Sámi language cultivation, both on the Swedish and the Norwegian side, was for a long period the prerogative of clerics and missionaries. During the eighteenth and nineteenth centuries, the Swedes tried to develop a Sámi spelling system based on the southern varieties, later also on Lule Sámi. The latter variety was used in the writings of Lars Levi Læstadius, a missionary and religious reformer who had a great impact on the creation of a distinctly Sámi form of orthodox Christianity. His conscious use of the Sámi language has contributed greatly to the ethnic and cultural self-esteem of the Sámi. On the Norwegian side of the border, the chief emphasis was on North Sámi. A North Sámi written language was codified in the nineteenth century, based on the pioneering work of the clergyman and linguist Knud Leem, who published the first grammar of the lan-

guage in 1748. Another clergyman, Nils Vibe Stockfleth, introduced a phonetic spelling in his grammar of 1840, employing several special characters for Sámi phonemes: č /tʃ/, š /ʃ/, ž /dʒ/, ƛ /θ/, ǫ /ð/ and ƞ /ŋ/. Thus he created an enduring tradition: the basic features of his spelling have been preserved in the subsequent reforms.

A scientific systematization of the orthography was carried out in the twentieth century. In 1951, a unified Norwegian-Swedish spelling system for North Sámi, strongly phonemically based and using Stockfleth's special characters, was authorized for use in schools. In Finland, however, another spelling system based on Finnish conventions was used. This split was not overcome until the Sámi took the matter into their own hands in the 1970s and agreed on a unified North Sámi spelling based on a compromise between those in use. This unified orthography has been official since 1978. Unified official orthographies have also been developed for South Sámi, Lule Sámi, and Enare Sámi. These orthographies, however, do not use special characters and diacritics; they employ digraphs to designate phonemes not covered by the conventional alphabet. In addition, diverse unofficial orthographies have been created for several of the varieties.

The official and social position of Sámi will be treated in articles 228 and 229; suffice it to say here that North Sámi in particular has flourished as a language of literature and the media since 1970, although it is still under heavy pressure from the majority languages.

5. Greenlandic

Greenlandic is a major branch of the Eskimoic language family (itself a branch of a larger family called Eskimo-Aleutic or Eskaleutic). Eskimoic has two sub-groups: Yupik in southwestern and southern Alaska, and Inuit in northern Alaska, Canada and Greenland. The Inuit dialects are mutually comprehensible. A written language was not developed for them until comparatively recent times.

Greenland was “rediscovered” by the Norwegian missionary Hans Egede in the early eighteenth century, and the creation of a Greenlandic written language for proselytizing purposes soon came to be viewed as an important task. The foundation of such a written language was laid around 1750 by Hans Egede's son, Poul Egede. Better knowledge of the language led to improvements in spelling

during the nineteenth and twentieth centuries. However, the Greenlanders themselves did not take part in the development of their written language; the process was led by the Danish ecclesiastical and political authorities. Only after World War II did a class of educated Greenlanders evolve, and from the end of the 1960s a cultural and linguistic autonomy movement made its presence felt. Until then, Greenlandic was used only as a necessary auxiliary language in the schools and in church. The early 1970s saw the development of Greenlandic language cultivation conducted by Greenlanders themselves. The traditional Greenlandic orthography – created by the German missionary Samuel Kleinschmidt in 1851 – was criticized because it was difficult to learn, and a spelling reform was introduced in 1973. When home rule was granted in 1979, Greenlandic became the main official language of Greenland, although Danish remains in an equal position and both languages are compulsory subjects in primary and secondary school. The social and legal relations between Danish and Greenlandic will be treated in art. 228.

The main dialect of Greenlandic, West Greenlandic, spoken by 90 per cent of the population, is used along the entire west coast. There are two other distinct dialects: in the extreme north a small group speaks North Greenlandic, and in the southeast two other small groups speak East Greenlandic. The latter dialect is particularly different from West Greenlandic, although a transitional dialect between these two is spoken around the southern edge of the island. From Egede's time until now, the written language has been based on West Greenlandic, as spoken in the central part of the west coast.

6. Text examples

Finally, we include a few verses from the Bible (Matt. 1:18–21) in the various languages as text examples.

Danish

Med Jesu Kristi fødsel gik det sådan til: Hans mor Maria var forlovet med Josef, men før de havde været sammen, viste det sig, at hun var blevet med barn ved Helligånden. Hendes mand Josef var retsindig og ønskede ikke at bringe hende i vanry, men besluttede at skille sig fra hende i al stilhed. Mens han tænkte på dette, se, da viste Herrens engel sig for ham i

en drøm og sagde: “Josef, Davids søn, vær ikke bange for at tage Maria til dig som hustru; for det barn, hun venter, er undfanget ved Helligånden. Hun skal føde en søn, og du skal give ham navnet Jesus; for han skal frelse sit folk fra deres synder.”

Swedish

Med Jesu Kristi födelse förhöll det sig så: hans mor, Maria, hade blivit trolovad med Josef, men innan de hade börjat leva tillsammans, visade det sig att hon var havande genom helig ande. Hennes man Josef, som var rättfärdig och inte ville dra vanära över henne, tänkte då skilja sig från henne i tysthet. Men när han hade beslutat sig för det, uppenbarade sig Herrens ängel för honom i en dröm och sade: “Josef, Davids son, var inte rädd för att föra hem Maria som hustru, ty barnet i henne har blivit till genom helig ande. Hon skall föda en son, och du skall ge honom namnet Jesus, ty han skall frälsa sitt folk från deras synder.”

Norwegian Bokmål

Med Jesu Kristi fødsel gikk det slik til: Hans mor Maria var trolovet med Josef; men før de var kommet sammen, viste det seg at hun var med barn, ved Den Hellige Ånd. Josef, hennes trolovede, som var en rettskaffen mann og ikke ønsket å føre skam over henne, ville da skille seg fra henne i stillhet. Mens han nå tenkte på dette, viste en Herrens engel seg for ham i en drøm og sa: “Josef, Davids sønn! Vær ikke redd for å føre Maria hjem som din hustru. For barnet som er unnfanget i henne, er av Den Hellige Ånd. Hun skal føde en sønn, og du skal gi ham navnet Jesus, for han skal frelse sitt folk fra deres synder.”

Norwegian Nynorsk

Då Jesus Kristus vart fødd, gjekk det såleis til: Mor hans, Maria, var trulova med Josef; men før dei kom saman, syntet det seg at ho var med barn, ved Den Heilage Ande. Josef, festarmannen hennar, var ein rett-tenkt mann og ville ikkje føra skam over henne; han sette seg føre å skilja seg frå henne så stilt han kunne. Medan han no tenkte på dette, syntet ein engel frå Herren seg for han i ein draum og sa: “Josef, Davids son! Ver ikkje redd for å ta Maria heim til deg som kona di. For barnet som er avla i henne, er av Den Heilage Ande. Ho skal få ein son, og du skal kalla han Jesus, for han skal frelsa folket sitt frå syndene deira.”

Icelandic

Fæðing Jesú Krists varð með þessum atburðum: María, móðir hans, var föstnuð Jósef. En áður en þau komu saman, reyndist hún þunguð af heilögum anda. Jósef festarmaður hennar, sem var grandvar, vildi ekki gjöra henni opinbera minnkun og hugðist skilja við hana í kyrrþey. Hann hafði ráðið þetta með sér, en þá vitraðist honum engill Drottins í draumi og sagði: “Jósef, sonur Davíðs, óttastu ekki að taka til þín Mariu, heitkonu þína. Barnið, sem hún gengur með, er af heilögum anda. Hún mun son ala, og hann skaltu láta heita Jesú, því að hann mun frelsa lýð sinn frá syndum þeirra.”

Faroese

Men við føðing Jesu Krists gekk tað soleiðis til: Tá ið María, móðir hansara, var trúlovað Jósefi, so kendist tað á henni, áðrenn tey komu saman, at hon var við barn av hinum heilaga anda. Men við tað at Jósef, maður hennara, var ein rættvísur maður og ikki vildi gera hana opinberliga til skammar, ætlaði hann í loyndum at skilja seg frá henni. Men meðan hann hugsaði um hetta, sí, tá sýndi eingil Harrans seg í dreymi fyrri honum og segði: “Jósef, sonur Dávids! Óttast ikki fyrri at taka Mariu, konu tína, til tín; tí at tað, sum hon ber undir belti, er av hinum heilaga anda. Og hon skal føða ein son, og Jesus skalt tú kalla navn hansara, tí at hann skal frelsa sítt fólk frá syndum teirra.”

Finnish

Jeesuksen Kristuksen syntymä tapahtui näin. Maria, Jeesuksen äiti, oli kihlattu Joosefille. Ennen kuin heidän liittonsa oli vahvistettu, kävi ilmi, että Maria, Pyhän Hengen vaikutuksesta, olin raskaana. Joosef oli lakia kunnioittava mies mutta ei halunnut häpäistä kihlattuun julkisesti. Hän aikoi purkaa avio-liittosopimuksen kaikessa hiljaisuudessa. Kun Joosef ajatteli tätä, hänelle ilmestyi yöllä unessa Herran enkeli, joka sanoi: “Joosef, Daavidin poika, älä pelkää ottaa Mariaa vaimoksesi. Se, mikä hänessä on siinnyt, on lähtöisin Pyhästä Hengestä. Hän synnyttää pojan, ja sinun tulee antaa pojalle nimeksi Jeesus, sillä hän pelastaa kansansa sen synneistä.”

North Sámi

Jesus Kristusa riegeádeapmi dáhpáhuvai ná: Su eadni Márjá lei lohpadallan Jovssehiin; muhto ovdal go soai leigga ealligoahtán ovttas, de šattai albmosii ahte Márjá lei máná vuostái Bassi Vuoiŋŋa bokte. 2. The Nordic languages in a Germanic perspective

1. The Modern Gmc languages and the Gmc language area
2. Distinctive linguistic features common to all modern Nordic languages
3. Internal relations within the Nordic language group
4. Language contact and mutual intelligibility within the Gmc language area
5. Literature (a selection)

In this article we will touch briefly upon the internal relationship between the different Nordic languages and discuss the relationship between the Nordic group and its Gmc neighbours. The main point of view will be contemporary and synchronic, but references will also be made to earlier stages as elements in understanding the present situation. However, the historical relationship between the different branches of Gmc and the placement of Nordic within the Gmc family in a strictly historical-genetic perspective will be discussed more thoroughly in later articles (cf. art. 62).

1. The Modern Gmc languages and the Gmc language area

In the terminology of the German sociolinguist Heinz Kloss, a distinction can be made between so-called “Ausbau languages” and “Abstand languages” (cf. Kloss 1978, 23–30; Vikør 1994, 52–55). An Ausbau language is what most people in everyday use would call a language (vs. “merely a dialect”). Closely tied up with the idea of “language” in this sense is obviously the existence of a written and normally also a spoken standard. Although the distinction “language” : “dialect” is far from clear-cut in all cases, it is nevertheless widely used in everyday speech.

1.1. The Gmc Ausbau languages

Taken in this rather popular sense, the following Gmc languages can be ranked according to their estimated total number of native speakers.

Table 2.1: Gmc languages and number of native speakers

LANGUAGE	native speakers in Europe	native speakers outside Europe
1. English	60,000,000	400,000,000
2. German	98,000,000	?
3. Dutch	21,000,000	?
4. Swedish	8,000,000	?
5. Afrikaans	?	6,000,000
6. Danish	5,000,000	?
7. Norwegian	4,000,000	?
8. Frisian	400,000	?
9. Yiddish	?	400,000 (?)
10. Icelandic	260,000	?
11. Faroese	44,000	?

(The source for the E, Du., and Yiddish language figures is Grimes 1992; other figures are from various official country sources. For Yiddish, Henriksen/Auwers 1994, 12 gives the grossly deviant figure “between one and three million speakers”; other figures may also vary somewhat in different sources.)

As can be seen from this table, E (of course) is the most widely spoken Gmc language in a global perspective, while German has the largest number of native speakers in Europe. This holds even when the non-Gmc European languages are included.

The following table suggests the main geographical extension of each language.

The table only shows countries and/or areas where the language in question is used by a majority of the population. For that reason

no mention is made of Gmc languages other than E e.g. in the United States, although most of them still are spoken by minority groups there as well as in other European overseas emigrant societies. For the same reason it has not been possible to designate any specific area for Yiddish.

The table also shows that there is one language which is not spoken by an indigenous population within Europe; viz. Afrikaans, the native language of the so-called Boers of South Africa. This language is clearly de-

Table 2.2: Gmc languages and their geographical distribution

LANGUAGE	USED BY A MAJORITY IN
1. English	Great Britain, USA, Canada, Australia etc.
2. German	Germany, Austria, (part of) Switzerland
3. Dutch	The Netherlands, (part of) Belgium
4. Swedish	Sweden, (parts of) Finland
5. Afrikaans	(parts of) South Africa and Namibia
6. Danish	Denmark
7. Norwegian	Norway
8. Frisian	West Friesland (The Netherlands)
9. Yiddish	?
10. Icelandic	Iceland
11. Faroese	Faroe Islands

Table 2.3: The Gmc Dialect Continua in Europe

DIALECT CONTINUA	AREAS SPOKEN
1. Continental Germanic	Austria, Switzerland, Germany, Northern Belgium and (most of) The Netherlands
2. English	most of The British Isles
3. Scandinavian	most of Denmark, Sweden and Norway; parts of Finland
4. Frisian	West Friesland
5. Icelandic	Iceland
6. Faroese	The Faroes

(Two additional very small dialect continua have not been included, viz. *East Frisian* (in Saterland) and *North Frisian* (in Schleswig-Holstein, both in Germany); cf. Henriksen/Auwers 1994, 15f. and Hoekstra/Tiersma 1994, 505ff.)

scended from Dutch and is still very close to Dutch in vocabulary and syntax, so that mutual intelligibility is largely preserved, despite considerable simplifications, particularly in morphology (e. g. loss of grammatical gender in nouns and past-tense forms of verbs; cf. Donaldson 1994, 480).

1.2. The Gmc dialect continua in Europe

A dialect continuum is an area within which neighbours everywhere understand one another's speech. More distant dialects within a continuum need not, however, be mutually comprehensible.

Within the Gmc language area in Europe the Table 2.3 6 dialect continua can be distinguished (again arranged according to number of speakers).

If we relate these dialect continua to the concept of Ausbau languages, the following picture emerges (dialect continua which do not correspond to any particular Ausbau language are italicized).

Table 2.4: Dialect continua and Ausbau languages in Europe

1. <i>Continental Germanic</i>
a. German
b. Dutch
2. English
3. <i>Scandinavian</i>
a. Swedish
b. Danish
c. Norwegian
1) Bokmål
2) Nynorsk
4. Frisian
5. Icelandic
6. Faroese

As can be seen from the table, two of the dialect continua contain more than one Ausbau language, viz. Continental Gmc and Scand. This brings the number of Gmc Ausbau languages within Europe up to 9 or 10, depending upon whether Norw. should be counted as one Ausbau language – *Norw.* – or two – *Bokmål* and *Nynorsk* (cf. e. g. Halvorsen 1997, 47; Askedal 1994, 219f.). This issue will be considered more closely in later sections (e. g. art. 182); at this point we will simply refer to the

official Norw. terminology, where a distinction is made between *språk* ('language') and *målform* ('language form'). According to this distinction, Norw. is one *språk*, while Bokmål and Nynorsk are two different *målforms*. The only linguistic domain where Bokmål and Nynorsk are totally congruent in their present-day shape is in *orthography*, cf. other intra-Scand. purely graphic or orthographic differences like Dan./Norw. *her* : Sw. *här* ('here'); Norw./Sw. *hatt* : Dan. *hat* ('hat') or Dan./Norw. *bakke* : Sw. *backe* ('hill').

1.3. The Gmc Abstand languages

An Abstand language ('language by distance') is a language which is distinct from other languages not for socio-political reasons (cf. Ausbau language), but because of linguistic distance from other languages. Different Abstand languages are thus linguistic codes where mutual intelligibility is excluded. Even different "dialects" of the same "language" in the everyday sense of the word may therefore in certain cases be viewed as Abstand languages, since they may be mutually incomprehensible. This is the case with e. g. the dialects in Upper Dalecarlia in Sweden, which are more or less totally incomprehensible to speakers of other varieties of Sw. (cf. Levander 1925, 46–48). In most cases, however, different dialects will be mutually comprehensible and hence belong to the same Abstand language.

If we now relate the concept of Ausbau language to the previously discussed notions of dialect continuum and Abstand language, we get the following Gmc Abstand languages.

Table 2.5: Gmc Abstand languages in Europe

1. German
2. Dutch
3. English
4. Scandinavian
5. Frisian
6. Icelandic
7. Faroese

By comparing table 2.4 and 2.5, we discover that the two Ausbau languages within the Continental Gmc continuum, German and Dutch, also constitute different Abstand lan-

guages in their standardized varieties, whereas all Scand. standard languages make up just one Abstand language. This conclusion emerges from the fact that speakers of standard German and Dutch never use their respective native languages when communicating (unless the participants have learned the language of their interlocutors as a foreign language), whereas Scandinavians (Danes, Norwegians and Swedes, including Finland Swedes) normally communicate with each other by means of their native languages (cf. Henriksen/Auwera 1994, 3; Vikør 1993, 112ff.). The Scand. areas thus demonstrate that several Ausbau languages within a dialect continuum may constitute just one Abstand language, whereas the Continental Gmc area shows a case where two Ausbau languages within a continuum at the same time are Abstand languages in relation to one another. The number of Abstand and Ausbau languages within a dialect continuum is consequently to a large extent determined by socio-political and historical coincidences.

2. Distinctive linguistic features common to all modern Nordic languages

The primary reason for regarding the Gmc languages as one group is of course primarily historical, because of their common PGmc origin more than two thousand years ago (cf. Haugen 1976, 97ff.). However, even in their modern forms the different Gmc languages exhibit several conspicuous similarities, which are largely due to their common origin but also to some extent to contact between differ-

ent groups in later centuries. In this section we will only discuss the internal relations within the Gmc group, not external relations to non-Gmc languages.

It is not very easy to point out linguistic peculiarities characteristic of *all* Nordic languages and at the same time lacking in the rest of the Gmc area. The following presentation includes both cases where the Nordic feature in question is unique within the Gmc group of languages as well as cases where the Nordic languages exhibit a unique combination of features all of which occur separately also in other Gmc languages. The following survey does not include features from non-standard Scand. dialects (e.g. Jutlandish, which exhibits quite a few contact phenomena with Continental Gmc).

2.1. Phonology

It is hardly possible to find any phonetic or phonemic peculiarity which would fit the definition given above. However, if we look at particular lexical items, there are a couple of common Nordic phonological innovations whose reflexes are still to be found all over the Nordic area, viz. the consistent elimination of initial /j/, and of /w/ before rounded vowels, as can be seen from these examples (cf. Haugen 1976, 154 f.).

2.2. Morphophonology

The consonant *-r* plays a prominent part in the morphology of all Nordic languages, viz. as the most common marker of present tense in verbs and plural in nouns (in Far. and Icel.

Table 2.6: Initial elimination of /j/ and /w/ in Nordic

"West Germanic"			Nordic	
English	Dutch	German	Norwegian	Icelandic
young	jong	jung	ung	ungur
year	jaar	Jahr	år	ár
yoke	juk	Joch	ák	ok
word	woord	Wort	ord	orð
wool	wol	Wolle	ull	ull
wolf	wolf	Wolf	ulv	úlfur
wonder	wonder	Wunder	under	undur

restricted to 2nd and 3rd person singular indicative in verbs and nominative in nouns). It is in this respect similar to the E *-s* (to which it is also genetically related).

This consonant is, on the other hand, practically absent from the morphological system of all other Gmc languages, except in the comparative of adjectives, where it is a general Gmc feature (West Gmc *-er*, Nordic *-ere/-are/-ari*); see Table 2.7.

2.3. Morphology

The most conspicuous common Nordic peculiarity in morphology is probably the suffixed definite article (cf. Vikør 1993, 34f.); see Table 2.8.

Another salient Nordic feature is the morphological so-called mediopassive ending in *-s* or *-st*, which has developed historically from a cliticized reflexive pronoun (cf. Vikør 1993, 35), e. g. Norw. (Bokmål) *han kalles Tjukken* 'he is called Fatty' (original meaning: 'he calls himself Fatty'). In addition, periphrastic passive constructions are also used like in other Gmc languages (e. g. *han blir kalt Tjukken*, which is almost synonymous with the former example).

A couple of morpho-syntactic peculiarities should also be mentioned. In all Nordic lan-

guages, adjectives show agreement in gender and number not only in (a) attributive position (like in Continental Gmc and Frisian), but also (b) as a predicative; e. g. Sw.:

- (a) en *stor* bil (common gender) : ett *stort* hus (neuter) : *stora* bilar/hus ('a big car, a big house, big cars/houses')
- (b) bilen är *stor* : huset är *stort* : bilarna/husen är *stora* ('the car is big : the house is big : the cars/houses are big')

Another distinctive common Nordic morpho-syntactic feature is the preservation of the old Indo-European distinction of reflexive and non-reflexive possessive pronouns in the 3rd person, a distinction which has been lost in all other Gmc languages (cf. Haugen 1976, 78); cf. Sw. *hon tog sin/hennes hatt*; Icel. *hún tók hattinn sinn/hennar* ('she took her (own)/her (somebody else's) hat').

2.4. Syntax

A common Nordic feature shared with the Continental Gmc languages (and Frisian) is the V2 principle, i. e. the obligatory placement of the finite verb as the second constituent in declarative sentences, as opposed to the ModE more or less dominant SV pattern (cf. König 1994, 553f.; Haugen 1976, 83f.; Nordic is re-

Table 2.7: The Nordic/E *r/s* correspondences

the mouse	de muis	die Maus	musen/-a	músin
the house	het huis	das Haus	huset	húsið

presented by Sw. and Continental Gmc by G in tables 2.9 and 2.10).

The dominant VO pattern is, on the other hand, a Nordic feature shared with E, as opposed to the frequent OV structures in Continental Gmc (including Afrikaans and Frisian; cf. Eisenberg 1994, 381 ff.; De Schutter 1994, 466; Donaldson 1994, 499; Hoekstra/Tiersma 1994, 522f.).

3. Internal relations within the Nordic language group

The term “Nordic languages” suggests that they constitute a well-defined entity within the Gmc group. However, as can be deduced from

the absence of this term in the tables 2.1–2.5, this is not self-evident from a strictly synchronic point of view, despite their undeniable AN unity up to about 500 A.D. Tables 2.4 and 2.5 show that the Nordic languages today are distributed over three different dialect continua and three different Abstand languages and five or six different Ausbau languages.

The division into three dialect continua/Abstand languages is, of course, the linguistic consequence of the emigration – mainly from Western Norway – to the Faroe Islands and Iceland in the 9th and 10th centuries (Baldur Jónsson 1997, 162f.; Poulsen 1997, 179). However, by the time of the emigration from Norway some minor dialect differences were already appearing within the AN dialect con-

Table 2.9: V2 and SV pattern

	S	V	A

	he	has	seen	the house
	he	has	seen	the house
Cont. Gmc (ich weiß, dass)	er	V fin hat	O das Haus	V inf gesehen
	er	O das Haus	V inf. gesehen	V fin. hat

tinuum, dividing the western part (\approx Norway) from eastern (\approx Denmark and Sweden; cf. Haugen 1976, 198 ff.). In accordance with the standard model for showing genetic linguistic relationships, the so-called Stammbaum model, the relations within the Nordic branch of the Gmc language family tree can be represented in this way.

As an illustration of the linguistic similarities and differences between the modern Nordic languages, this model of course is highly misleading, since it suggests a closer relationship between the three “WN” Abstand languages than within the Scand. dialect continuum. A different model, which is explicitly dedicated

to the classification of the non-standard dialects, is presented in Bandle 1973.

A more adequate way of describing the development and present state of the Nordic standard languages emerges from the application of the so-called wave model, where successive linguistic innovations are thought of as waves on a water surface (in the following table represented as vertical lines; cf. Norde 1997, 11 ff.).

This model suggests that the rather insignificant east-west differences during the Viking Age were superseded by a more fundamental north-south division later during the Middle Ages, which in turn was supplemented some

Table 2.11: Nordic languages according to the Stammbaum model

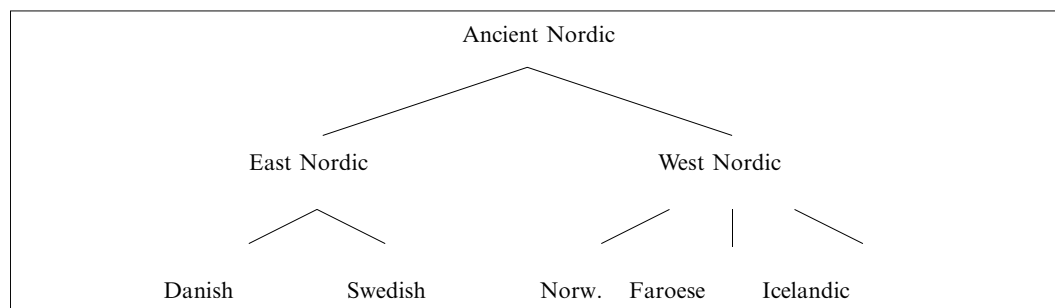

Table 2.12: A synchronic classification of Nordic languages at different stages

Stage 1: The Viking Age (from ca. 800 A. D.)

West Nordic	East Nordic
(Norwegian)	(Swedish and Danish)

Stage 2: Late medieval times (from ca. 1200 A. D.)

North Nordic		South Nordic
Norwegian (Faroese, Icelandic)	Swedish	(= Danish)

Stage 3: Modern times (after ca. 1500 A. D.)

Insular Nordic		Scandinavian		
Icelandic	Faroese	North Scand.		South Scand.
		Norw.	Swed.	Danish

centuries later by an even deeper split between the insular emigrant languages and Scand. (the number of vertical lines between each language is supposed to give an indication of their linguistic difference).

The most salient feature of the old east-west split was the monophthongization in EN, which is still reflected in several phonemic contrasts in specific lexemes between the modern Nordic languages (cf. Haugen 1976, 200f.).

One important effect of the second split is still reflected in the morphophonology of the modern languages, viz. the South Nordic (= Dan.) reduction of all unstressed vowels. This is why Dan., like all Gmc languages outside Nordic (and Swiss German dialects), exhibits only the reduced vowel ([ə]) in grammatical endings as opposed to a contrast between at least two (normally /e/ and /a/) or three (/e, i/, /u, o/ and /a/) different vowels in the rest of the Nordic area (cf. Vikør 1993, 37).

Despite these and other differences reminiscent of splits at stage 1 and 2 within the Nordic area, the main division between the modern Nordic languages should be the one indicated for stage 3 above; cf. Table 2.4. Dialect continua and Ausbau languages in Europe, where Icel. and Far. are represented as dialect continua of their own, whereas Dan., Norw. and Sw. are all part of one and the same continuum (cf. Løland 1997, 20ff.).

3.1. Common Insular Nordic features and special Icel. archaisms

From a modern point of view, the structural peculiarity of the Insular Nordic languages can be said to consist of a combination of the Nordic type of word order (cf. 2.4) with a German type of morphology. This means that Insular Nordic as well as German has an inflectional system with several *cases* in nominals – four in Icel. (nominative, accusative, dative and genitive); three in Far. (genitive only in written usage; cf. Lockwood 1964, 28) – agreement with the subject in number and person for verbs, and subjunctive mood (mainly Icel.), whereas Scand. has no case inflection except for some relics in personal pronouns (cf. also E *I – me* etc.), and no agreement in verbs and no subjunctive mood.

Historically, this means that the Insular Nordic languages (esp. Icel.) have remained closer to the Old Norse stage, whereas the Scand. group has moved in a “general West European” direction.

An archaic syntactic feature found only in Icel. among modern Gmc languages is the presence of certain so-called impersonal constructions, viz. sentences without any nominal element in the nominative case (1) or without any nominal element at all (2) (cf. Braunmüller 1998, 176):

- (1) *mig* (1 sg.acc.) *vantar* (3 sg.) *peninga* (acc.pl.) = ‘I lack money’
- (2) *nú rignir* ‘now it rains’; cf. art. 108.

Table 2.13: Reduced vs. “full” vowels in grammatical endings

Icelandic	Faroese	Norwegian (Nynorsk)	Swedish	Danish	English
Plural of nouns (<i>nominative</i> in Icel. and Far.)

sendir	sendir	sender	sänder	sender	‘sends’
bítur	bítur	bit	biter	bider	‘bites’

Table 2.14: Consonantal differences between North and South Scand.

Danish	Swedish	Norwegian (Bokmål)	English
gade /ga:ðe/	gata /gɑ:ta/	gate /gɑ:te/	'street'
lækker /læɡø/	läcker /læker/	lekker /leker/	'delicious'
lægger /læɡø/	lägger /læger/	legger /leger/	'lays' (pres.)
ryk /røɡ/	ryck /ryk/	rykk /ryk/	'pull'
ryg /røɡ/	rygg /ryg/	rygg /ryg/	'back'

Icel., although less conservative in phonology than in morphology and syntax, also exhibits some conservative phonological features not found in other Gmc languages; e. g. the phonemic contrast between initial /hl/, /hn/ and /hr/ versus /l/, /n/ and /r/; e. g. *hlaupa*, *hnakki*, *hringur* (cf. E *leap*, *neck*, *ring*) : *laus*, *nasir*, *riða* (cf. E *loose*, *nose*, *ride*). Also the contrast between the phonemes /θ/ and /t/ has been neutralized in all other Nordic languages (but not in E; cf. *thin* : *tin*): Icel. *þak* ('roof') : *tak* ('grasp', noun) = Far./Norw. *tak-tak*, Sw. *tak-tag*, Dan. *tag-tag*.

3.2. Common Scand. features and Dan. versus "North Scand." (= Norw. and Sw.)

All the Scand. languages are, generally speaking, very similar with respect to syntax and morphology. Lexical differences are also rather moderate, Dan. and Norw. Bokmål being the closest relatives as far as vocabulary is concerned.

Phonologically, however, Dan. differs sharply from Norw. and Sw., which in turn exhibit several "North Scand." similarities (cf. Braunmüller 1998, 24 and 60). One salient prosodic difference is the tonal accent in the Northern group as opposed to the so-called *stød* in Dan., which is although in general agreeing in function similar to a glottal stop (cf. Braunmüller 1998, 76ff; Kristensen 1986, 48ff; Mårtensson/Fjeldstad 1982, 50ff; Lundebj 1973, 72ff); e. g. Sw. *anden* (accent 1, 'the duck') : *anden* (accent 2, 'the spirit'); Dan. *ånden* (*stød*, 'the spirit') : *ånden* (no *stød*, 'the breath'). Both tonal accent and *stød* are exclusive Scand. features within Gmc; neither is ever indicated in standard orthography.

Segmental quantity in the North and South is also different, Dan. always lacking phonetic

length in consonants, like most of the Gmc languages, whereas consonants in North Scand. as well as in Insular Nordic usually are somewhat longer after short than after long vowels (cf. Braunmüller 1998, 29ff).

On the segmental phonological level, there are also significant qualitative differences both in vowels and consonants between the North and South. A characteristic feature of the North Scand. vowel system is the presence of two high front rounded vowels, /y/ : /ʉ/ or /u/ (cf. Askedal 1994, 221f.; Andersson 1994, 272), as opposed to Dan. with just one high front rounded vowel, /y/ (cf. Kristensen 1986, 20f); e. g. Norw./Swed. /ly:s/, /lʉ:s/ : Dan. /ly:s/, /lu:s/ ('light, louse').

In the consonant system, two conspicuous differences are the absence of the phoneme /ð/ in North Scand. and the lack of contrast between voiced and unvoiced stops in medial and final position in Dan.; cf. these examples.

So-called retroflex consonants are also dominant within North Scand. but entirely absent in Dan., whereas uvular *r* is general in Mod. Dan. but restricted to the southern part of Sweden and the southern and western part of Norway (cf. Chambers/Trudgill 1980, 187ff.).

4. Language contact and mutual intelligibility within the Gmc language area

The similarity between the different branches of Gmc has been noted by people since medieval times. However, it is not entirely clear to what extent the relatedness of these languages has made it possible at any time since their initial split more than two millennia ago for speakers of e. g. a Nordic language to communicate by means of the native tongue with speakers of other Gmc languages (cf. Jahr

1995, 18ff.). At the present time this is obviously not the case; communication with people from outside the Nordic area today normally is conducted through the medium of E. E is also the preferred intra-Nordic lingua franca for most younger native speakers of Icel., whereas Far. speak Dan. with Scandinavians.

However, there are two historical periods during which one would suspect that some kind of semicommunication may have taken place on a fairly large scale between Gmc languages across the Nordic/non-Nordic borderline. This contact has also left its distinctive impact on the modern descendants of two of the languages involved, i. e. E and Scand.

4.1. Nordic influence on OE

The first period runs from the inception of the Viking raids in the British Isles before the year 800 up to some time after the Norman conquest in 1066. The considerable number of Nordic loanwords in Mod. standard E and even more so in North Eastern British dialects testifies very convincingly to an intense linguistic contact between the native Anglo-Saxon population and a probably rather numerous population of Nordic-speaking immigrants (cf. Nielsen 1998, 165ff.). By the end of the contact period, there is good reason to believe that this linguistic borrowing may have facilitated mutual intelligibility between the languages to a considerable degree.

The number of Scand. loanwords in Mod. standard E is estimated at 600–900; if dialect words are included, another 600 may be added to this figure (cf. Nielsen 1998, 181f.), which may not seem very high. However, one should remember that these borrowings comprise parts of the core vocabulary of nouns, adjectives and verbs, and even grammatical words like pronouns (*they, them*), prepositions (*till*), conjunctions (*though*) and auxiliaries (*am* and *are*). It is evident that ModE seems “less foreign” to Nordic-speaking people today because of these Scand. borrowings, just as it has become “more foreign” due to the later (and much stronger) Norman Fr. influence (cf. art. 115).

4.2. Low German influence on Scand.

The second period during which there was extensive oral communication between Gmc languages across the Nordic/non-Nordic borderline, is particularly the last three centuries of

the Middle Ages, when the Hanseatic league reached its peak of power. This contact took place mainly within Scandinavia itself, and primarily in the towns where the Hanseatic merchants had their trade stations, i. e. in places like Bergen, Stockholm and Visby. This contact with Low German has left a much deeper impact on all modern Scand. languages than the aforementioned influence by Scand. ever exerted on E. Loanwords of German (primarily Low German) provenance run into several thousands, accounting for perhaps between one third and one half of the everyday vocabulary (cf. Jahr 1995, 10). It is no exaggeration to say that most sentences in any modern Scand. language will contain several lexical items from Low German, and it is possible to create quite natural sentences where everything except the morphology and a few grammatical words is borrowed from Low German, e. g. (lexical items inherited from Old Nordic are italicized both in the original and in the literal translation; the sentence is taken from Hødnebo 1971, 41) Norw. (Bokmål): Skredderen tenkte *at* trøya passet fortreffelig, men kunden klaget *og* mente *at* plagget var kort *og* tøyet simpelt *og* grovt.

[Tailor-the thought *that* jacket-the fitted perfectly, but customer-the complained *and* meant *that* garment-the was short *and* material-the unsophisticated *and* coarse.]

Many of the most frequent derivational affixes in Mod. Scand. are also borrowings from Low German, e. g. prefixes like *an-*, *be-*, *er-*, *för-/for-* and suffixes like *-else* and *-het/-hed*, the last of which is still very productive in all Scand. languages.

There is no doubt that the Low German influence on the Scand. languages has been tremendous as far as lexical items and derivations are concerned. Whether this contact with Low German is also responsible for the major changes from Old Nordic to Mod. Scand. in morphology and syntax is less obvious. At any rate, there are few examples of transfer of Low German inflectional elements or syntactic patterns into Scand., the most salient of which is probably the so-called *garpegenitiv* in Norw. (i. e. constructions with resumptive possessive pronouns instead of genitive; e. g. Du. *Jan z'n huis* = Norw. *Jon sitt hus* (John's house'; cf. Norde 1997, 55ff.). It has been suggested, however, that the extensive morphological simplification of Scand. has also been induced by contact with Low German (cf. Jahr 1995, 11ff. and art. 115 and 135).

4.3. The present situation

Unfortunately, we have no reliable record of how communication with non-Nordic speakers was conducted in earlier centuries. It has been assumed, however, that there must have been some kind of semicommunication, with extensive use of convergent strategies, which eventually led to the permanent adoption in the vernacular of linguistic elements from the “superior” immigrant language (i. e. Nordic in the British Isles, Low German in Scandinavia; cf. references in 4.2.).

As mentioned above, speakers of Nordic languages today never rely on mutual comprehensibility when communicating with speakers of other Gmc languages if a lingua franca is at their disposal. Linguistic distance is, of course, very hard to measure in any objective way, but it seems reasonable to assume that there is a close connexion between linguis-

tic proximity and ease of learning as a foreign language. Because of the extensive use and knowledge of E today, people in the Nordic countries nowadays probably tend to regard E as being closer to Nordic than any other languages. However, this can hardly be true, particularly if we confine our scope to the Scand. branch. It is well known among teachers of Scand. as foreign languages that speakers of Continental Gmc (Dutch and German), other things being equal, reach a higher level of proficiency with less effort than speakers of other foreign languages, including E. This is no doubt mainly a result of the influence from Hanseatic German, which has led to a very high degree of lexical correspondence between Scand. and Continental Gmc. As a consequence of this, it is probably true to say that the Mod. Scand. languages are closer to

Table 2.15: Inherited words in some Nordic and West Gmc languages

Dutch and German than to Icel., as far as vocabulary and word formation are concerned.

However, phonological and phonetic factors probably also play an important part in establishing a feeling of proximity between Continental Gmc and Nordic, particularly Scand. This can be seen from a comparison of e. g. some common inherited lexical items in Nordic and West Gmc (examples given in orthographic and phonemic transcription).

More important, however, than the similarities in the common Gmc vocabulary are probably the phonological correspondences in the common borrowed vocabulary from Latin and Greek, where the phonetic similarity between Scandinavian and Continental Gmc is even more conspicuous (all the Icel. terms are native neologisms and therefore, of course, completely different).

There can be little doubt that the Scand. and Continental Gmc forms of these and numerous other borrowed items are much more closely related phonetically than the etymologically corresponding, but phonetically far more deviant E forms (and, of course, entirely different from the puristic Icel. neologisms). There is, therefore, good reason to assume that correspondences in this part of the vocabulary are a significant factor in establishing the aforementioned feeling of proximity between Continental Gmc and Scand.

3. Diachrony and synchrony in Nordic language history

1. Introductory remarks. Ferdinand de Saussure
2. Saussure and modern linguistics
3. Language history and synchronic methods
4. Conclusion
5. Literature (a selection)

1. Introductory remarks. Ferdinand de Saussure

As everybody interested in linguistics knows, the dichotomy between diachronic and synchronic methods has dominated large parts of 20th century linguistics. Ever since Saussure (1916) there have been lively discussions on which of the two methods is most adequate and in which connections.

After half a century of neogrammarian traditions with their diachronic oneness (Paul 1880), Saussure's theory was felt quite revolutionary and it had profound consequences, probably the most serious of which was the establishment of structuralism. As is well-known, Saussure distinguishes (among other things) between *langue* and *parole* and between synchronic and diachronic points of view, *langue* meaning the abstract system of a language behind the concrete realisation of it in individual speech; the synchronic view focuses on the more or less static system and the interrelations between its members, "où tout se tient", while the diachronic view is primarily interested in the development over time of individual linguistic phenomena. The connection between the two dichotomies is that the synchronic view is concerned with *langue* (system), the diachronic with *parole*. Although Saussure was aware that both points of view could be applied to the study of language (in the form of static vs. evolutionary linguistics), it is obvious that he gives priority to the synchronic view/method. He maintains (at that time with full justification) that synchrony has been totally neglected in modern linguistics and that – as a consequence of that – the linguist must ignore diachrony in order to understand a language's static condition. There is no connection between the two methods; a diachronic phenomenon is an isolated event not related to systems, and its impact on the system is more or less accidental.

Because of his emphasis on synchronic linguistics, Saussure has for a long time been identified with this method, so he has often –

although not quite justifiably so – been considered the father of European and even American structuralism. As is well-known, modern linguistics is widely dominated by synchronic or even structuralist methods and in consequence, historical linguistics has for quite a long time and in many language areas been thrust into the background. Saussure's standpoint, the devaluation of diachronic linguistics, was quite extreme, but at that time, in the midst of well-established historical-neogrammarian traditions, it must have been felt as something refreshingly new and inspiring, so it is easy to understand how he won many followers – not least since his theories got support from American structuralism. Thus it was a long time before historical linguistics experienced a revival and again competed with structuralism and other synchronic methods.

In Nordic linguistics the problem of synchrony vs. diachrony has been acute as a consequence of general methodological developments, but with quite different manifestations in the different Scandinavian countries. In Denmark, structuralism had a comparatively early breakthrough (especially in the form of glossematics, but also other, more moderate methods such as Diderichsen's) and has also been relatively long-lived, while Sweden and Norway only took it up several years after the 2nd World War and Iceland even later.

2. Saussure and modern linguistics

As will be shown in art. 6, before Saussure and structuralism some approaches to synchrony had already been made in historical linguistics, not only in a German standard work like Paul (1916–20), but also in the pioneering work of the Swedish "neogrammarian" Adolf Noreen (1903–24). But on the whole, works on Swedish language history and also dialectology followed a purely diachronic line right up to recent times. Even in Danish linguistics, which otherwise was dominated by structuralism to an especially high degree, such a well-known handbook as Brøndum-Nielsen (1928–73) is so traditional in method that it could be called a relic of a distant past (Haugen/Markey 1972), and in Sweden such a "classical" work as Wessén (1941–56) is actually, in spite of its title, a pure historical grammar in a neogrammarian style,

without any structural viewpoints or embedding in a sociocultural context.

But especially during the last twenty to thirty years, new theories and methods have been introduced also in Nordic linguistics; linguists have both discussed and applied new points of view and methods. Besides structuralism, other branches of “modern linguistics” have also been practised and the synchronic approach has become dominant. Hovdhaugen et al. (2000) draw a border-line around 1965 for the breakthrough of synchronic methods in Scandinavian linguistics, a breakthrough which at that time implied a new interest in general and theoretical linguistics, and the 1970s and beginning of the 1980s may to some extent be considered the heyday of modern linguistics also in Scandinavia. But at nearly the same time, it became obvious to many scholars that synchronic method on its own cannot meet all demands for linguistic knowledge in general and for language history in particular.

Criticism was therefore raised comparatively early against Saussure’s dichotomy and one-sided emphasis on synchrony. From the many examples I shall only mention here Coseriu (1974), who points out explicitly that Saussure’s rigorous contrasting of the two points of view is wrong, that on the one hand sound change is also system-bound, while on the other hand the grammatical system is also dynamic, that language changes and develops all the time and that it always changes as a system: the dichotomy of synchrony vs. diachrony is simply a matter of perspective. As in other European and even American linguistics, diachrony has therefore to some degree experienced a revival, and the trend has – to some extent – turned again from descriptive to historical linguistics, from abstract to concrete, from competence- to performance-based linguistics, from theory to empirical studies. Starting in the 1980s, we may thus reckon with new diachronic approaches in Scandinavian linguistics as well, a typical example being Sweden, where periodic conferences on *Svensk språkhistoria* were started in 1987 by Ulf Teleman, who had begun his academic career as generativist. But at the same time it is obvious that there can be no question of simply returning to the good old neo-grammarians traditions. The manifold theories and methods of modern linguistics have not been advanced for nothing, and our problem is therefore how to combine them with – more or less traditional – historical linguistics.

The motivation for combining these approaches does not need to be given in detail. Some critical points will be mentioned later on, here only what seems to me the main point, will be emphasized. Language is a human characteristic, to speak (and write) is a human activity, and therefore it is wrong to treat language as a sort of mathematics (as glossematics does). To be sure, it is right what has been said about studying language systems is correct: that only by looking at the system do the mutual relations among the individual elements really become perceptible; but only by putting them in relation to human beings and human existence can we learn something about man and his historical and socio-cultural conditions; in so far also historical stages of language are worthwhile analysing and not only present-day language which many of the modern methods are preoccupied with. Only diachronic linguistics provides us with access to language in a historical and socio-cultural context, which is one of the principal aims of language history. On a more general level: it is only through diachronic linguistics that we are able to learn something about how a language lives, how it changes and how it functions in different variants. What Vennemann (1976) says, may be correct: that empirical language study needs control by theory, but the relations between theory and practice should be mutual; theories alone have failed as often as purely empirical studies.

3. Language history and synchronic methods

But how can diachronic and synchronic linguistics be combined in the practice of writing language history? That diachronic facts can throw light on synchronic problems and vice-versa is obvious and has often been demonstrated since Gilliéron (1915–21) made his pioneering studies of French dialect words. Some examples from the Nordic languages may suffice here. As quite a simple example we can mention the irregular dat.sg. *hendi* of the fem. Old Nordic noun *hönd*: the form in *-i* and with umlaut goes back to the *u*-declension, which the word originally belonged to. More complicated are the interrelations between syncope, umlaut and breaking in Proto-Nordic: it may be quite obvious that breaking is a sort of umlaut, but what is the internal connection between umlaut and the loss of a final *-i* (etc.), which occur more or less simul-

taneously? Here a synchronic explanation may help us: the sound change $a > e$ etc. is probably earlier than the loss of the final vowel, but it was not marked before the new vowel became a phoneme because of this loss. Still more complicated is the interplay of diachrony and synchrony against the background of socio-cultural developments in the case of noun declension. As is well-known, the four cases of Old Nordic were reduced to two in the course of more recent developments, with a basic form and an agglutinated genitive in *-s*. This is one feature in the dominant tendency of deflexion, which in its turn is to be seen in the light of interplay with the development of a more fixed word order and increasing use of prepositions. This development in its turn is a part of the more general development from synthetic to analytic language structure and its socio-cultural context: the general evolution of European languages and German influence in particular.

3.1. The interplay between diachronic and synchronic linguistics

Explanations of synchronic problems using diachrony and of diachronic features using synchrony in individual cases is one thing, but it is quite another thing to incorporate synchronic aspects and/or methods into historical linguistics on a larger scale. Here there are several different possibilities for doing this, but until now these have only to a limited extent been tested in Nordic linguistics.

One of these possibilities is simply to utilize both historical description and the description of specific modern and historical language stages in mutual interplay, in other words, to alternate between diachronic, longitudinal sections and synchronic cross-sections for certain periods. To be sure, the description may be concentrated on these cross-sections, but this would only be practicable in the form of a tight sequence of cross-sections, e. g. at perhaps 200 years' intervals. Indeed some scholars like Coseriu (1974) tend to use such a method, but most language historians prefer, in some form or another, the combination of cross- and longitudinal sections, the exclusive concentration on a long chain of more or less abstract systems being difficult to carry out in practice.

Some sort of a combination of diachronic and synchronic linguistics had already been practised in the early days of historical linguistics, not only by its founders such as Rask or Jacob Grimm, but also e. g. by Rydqvist

(1850–83), the founder of Swedish historical linguistics. While systematic aspects were widely neglected after that and then, in the era of structuralism, the historical dimension was no longer felt to be up-to-date – with the exception of the Prague-School –, most representatives of recent linguistics have emphasized the importance of some synthesis of diachrony and synchrony, although in many cases without any concrete directions for how to put this into practice. In this connection, not only comparative but also contrastive aspects may be emphasized: different methods may be used for contrastive analyses – taxonomic, generative-transformational, as several linguists have recommended, or just simpler methods of comparison – but anyway, the comparative-contrastive aspect is of special importance in a language history, which comprises five-six different languages developed in parallel. Munske (1972) is perfectly right in pointing out the importance of a “multilateral contrastive linguistics”.

I shall not, however, go into these problems, but instead point to the preconditions for combining diachrony and synchrony, historical and descriptive linguistics as formulated above: periodization and its terminology. Every language historian aiming at an alternation between the two aspects has to decide what sort of periods to use in describing synchronic cross-sections and how to define the periods in between. Naturally, views on how Nordic language history should be divided into periods diverge quite a lot, not least because of the different patterns used: whether they are comprehensively Nordic or confined to one national language's history. A typical example involves the different periods in Haugen (1976) and Skautrup (1944–70), the former being a history of all the Nordic languages, the latter a detailed, minute history of a single national language, the former comprising five periods (Proto-, Common-, Old-, Middle and Modern Scandinavian), the latter no less than nine. As many linguists have pointed out, we must also be aware that every division into periods is to some extent arbitrary; there are no real borderlines between periods, and treating different chronological stages of language in different sections means abstraction to some degree. The divisions in this handbook are not quite consequent as regards their criteria: some of the periods are more or less clearly defined by language structures (Proto-Nordic, Old Nordic, Modern Nordic), others rest on important changes

(Early Modern Nordic, 19th century, Modern Nordic from 1900). There are also problems surrounding the terminology for the periods, e. g. the periods of Danish parallel to Old Nordic in the other languages, according to the most important handbooks (Brøndum-Nielsen, Skautrup): Olddansk (Runedansk), Middledansk (beginning long before the “middle” period of the other languages), with Gammeldansk in different meanings.

An alternation between “static” periods and “dynamic” historical development in between is not necessarily bound to one specific method. Also more or less traditional methods can give valuable results (as can be seen in several previous Scandinavian language histories); in particular, the diachronic sections may be described in a rather traditional way, while in the systematic cross-sections a structuralist or even generative-transformational disposition may be more important. A more essential question is whether such a synthesis should be given in a purely internal-linguistic framework or consider also external, socio-cultural circumstances. In the former case, we would achieve what Germans call a *Systemgeschichte* (‘history of linguistic structure’, also called ‘structural diachrony’ or ‘synchronic diachrony’, cf. Jäger 1984), in the latter, what I would call a real language history. In Nordic historical linguistics both patterns have been realized: the former not only in many more or less traditional works, but also in a relatively recent book like Haugen (1982), the latter e. g. in a standard work like Skautrup (1944–70), but to some extent also in Haugen (1976). The present handbook aims at covering all the aspects mentioned here: a combination of longitudinal and cross-sectional descriptions with references in every imaginable direction: from diachronical accounts to previous and following systems, from synchronic systems to preceding (and subsequent) developments, and from internal linguistic facts to external, non-linguistic conditions. It goes without saying that such a pluralist view also implies a combination of more or less traditional, newer synchronic and recent linguistic methods.

3.2. Language history and modern theory

During the last few decades different attempts have been made to modernize Nordic language history in the sense of integrating modern theories and methods into the historical framework. As examples, I shall only mention

J. T. Faarlund (e. g. 1990), who combines historical method with modern syntactic theory, – B. Pamp (1971), who on the whole keeps to traditional diachronic methods, but uses a strictly systematic-phonemic pattern in the history of phonology, – Ch. Platzack, who to begin with carried out several studies in modern formalized variational linguistics and now is the chief Swedish representative of generative grammar with a historical perspective (see his own art. 19).

I shall not, however, go into these studies, but instead concentrate on the question of how some of the primarily synchronic methods which have enjoyed special attention during recent times may be used in historical Nordic linguistics.

3.3. Language history and modern methods

One of the most extensively discussed of the methods which are primarily synchronic (or panchronic), but which have also been applied to historical linguistics, is generative-transformational grammar. When it made its breakthrough, via Chomsky around 1960, it was purely synchronic, being essentially an abstract theory of language as a logical procedure from deep structure to surface structure, but in the course of the 60s some of the generativists began to claim to be able to apply this method also to historical linguistics – in spite of the fact that its shortcoming right from the beginning involved a contradiction between theory and reality: Generative grammar always operates with an ideal speaker who stands outside historical and social conditions, and thus it misses an essential dimension of linguistic reality, moreover: it fails to explain language change at a deeper level, the deep structure always remaining invariable. As a point of departure for historical generative grammar, King (1969) may be considered, whose chief argument consists of certain rules or rule categories, which he maintains to be general: rule addition, loss of rules, restructuring and generalization of rules. King pays special attention to children’s language acquisition and draws from it certain far-reaching conclusions as regards language change, conclusions which right from the beginning met severe criticism. The following objections may be raised against King and other generativists: (1) Rules may be logically suitable, but to take them without reservation to be historical – it is wrong, – (2) Among others Sigurd (1966) points out in 1966, synchronic rules *can* reflect

the chronology of innovations, but if they do, it is a mere coincidence, – (3) King's assertion that historical changes correspond to children's general tendency for rule generalization goes too far: children's processes of language acquisition are much more complicated, and King's argument is too simple.

The generativists' historical ambitions are not wrong in themselves. Labov (1966) showed that generative formalized method may throw light upon sociolinguistics' historical dimension and Lightfoot (1979) and others, not least Platzack and his disciples, who apply generative theory to historical linguistics, are certainly more convincing, but the basic contradiction between the ideal speaker and historical reality remains, so generative grammar's "explanatory force" is not as strong as Ralph (1972) proclaimed. The generative theory and method may be worth taking into consideration in certain cases in Nordic language history too, but it must be practised with care and a critical eye.

Another branch of modern linguistics which has attained considerable attention in recent times is pragmatics, which has its origin in the 1960/70s, when generative grammar became less popular (German scholars speak of "die pragmatische Wende" in the 1970s). It deals with several different aspects of language, the common basis of them being the study of language usage, with special reference to communication. Two aspects may be of special interest to the language historian: (1) speech act theory and discourse analysis, – (2) theory and history of the types of text. Both aspects are performance-oriented and, as in generative grammar, the methodological approaches were originally purely synchronic or theoretical, but in spite of difficult source problems, there has been an increasing historical interest in this branch during the last twenty years, so that today we can speak of historical pragmatics which is at least in the making. Needless to say, it is not yet applicable in a general survey of language history; although Jan Svensson has published a *Kommunikationshistoria* (1988) and the German specialist Cherubim (1984) has formulated a comprehensive programme for pragmatic studies, research work in general has been restricted to single problems until now: it is too difficult to trace all the situational contexts which can have played a part in the course of time. To be sure, there might be speech situations from earlier times which are relatively easy to get grip on (e. g. polite address), but

it is easy to see why historical pragmatics still has had only limited results.

What might achieve better results is the history of types of text which is situated in between pragmatics and text linguistics, a field that by now is relatively well established in Nordic linguistics (e. g. in Denmark), but where there is still a lot to be done – at least if we take "types of text" in the widest sense, comprising morphology and syntax, vocabulary, metaphors, rhetorical devices, text constitution etc. and if we consider both written and colloquial texts.

Research on texts and text types based on cultural and social history has some aspects in common with sociolinguistics. Sociolinguistics can be considered the most important branch of modern linguistics, but here again we meet the problem of the relations between synchronic and diachronic aspects. As is generally known, the origins of modern sociolinguistics lie in synchronic linguistics, but earlier linguists were also aware of language's social dimensions without knowing much about a sociolinguistic theory. To be sure, it has also in more recent times been claimed that historical sociolinguistics – due to deficient sources – has only limited possibilities and that researchers should thus concentrate on the 19/20th centuries, but not least Nordic linguistics has produced examples of language histories – such as Skautrup (1944–70) or Haugen (1976) – which to a considerable extent consider social stratification.

As a great number of Swedish, Norwegian and Danish studies show, sociolinguistics is today a very well-established branch of Nordic linguistics, and therefore there are several chapters on it in this handbook. It is for the most part concentrated on the modern languages and dialects, but that scholars are well aware of sociolinguistics' historical dimension is at least testified by several studies on the sociolinguistic development in certain places (or areas) in the recent past (cf. e. g. Steinsholt 1972). No doubt, Nordic sociolinguistics will in the long run not neglect older times and, in a wider context, it is to be hoped that more studies will be carried out which – like Karker (1993) – can be characterized as a "sprogets kulturhistorie".

4. Conclusion

As has been pointed out on several occasions (e. g. in *Brytpunkt* 2000), Nordic linguistics has for a long time relied on more or less tra-

ditional methods. For longer than in other language areas, it has been dominated by diachronic approaches; with the exception of Danish linguistics, the historical aspect has been overwhelmingly strong. During the last few decades, however, most theories and methods of modern linguistics have been introduced in the Nordic countries and synchrony has been fully accepted. But nearly at the same time, there has been a revival of interest in the historical dimension, and thus the dichotomy between diachrony and synchrony has, on a new level, achieved some sort of a balance.

According to that state of affairs the concept of this handbook is made.

1. Preliminaries

In the historiography of the Nordic languages, there are four works which explicitly state in their titles that their subject is the whole Nordic language area looked upon as one entity. However, most histories of the separate Nordic languages also have some kind of Nordic perspective in their outlook, and the more so for older than for younger periods. In this presentation, both kinds of works will be considered.

One reservation underlined by some language historians, and by general historians as well, is that the periods established do not represent any objective reality, in so far as there are no hard and fast lines separating one period from another. The set of characteristics that can be given to any one period does not stop at the chosen line of division, but continues from one period to the next, some of the same phenomena being found on both sides of the line. Statements to this effect may be seen as comments on the periods used or on the very principle of periodization. In the works examined here, such a stance is taken by Indrebø (1951, 31), Petersen (1829, 55), Sverdrup (1943, 78) and Wessén (I 24).

In spite of the unanimity expressed on the arbitrariness of periodization, there is much agreement in the use of periods for each separate language. This may be due both to the material treated and to scholarly traditions. Historiographic traditions are not necessarily a bad thing, and we confidently believe that the authors have not engaged in unconscious copying or, even worse, in conscious plagiarizing. On the other hand, a readiness to abstain from very original or idiosyncratic viewpoints may always be an asset, provided that it does not violate creativity or originality. There are more discrepancies in the use of periods between the languages, but apart from some naming differences, there is much consensus

on a rough scheme of division. One specific parallel in Nordic language historiography is the fact that most historians recognize three main periods, i. e. an old and a modern one (with some sub-periods) separated by one period in the middle. This will be treated further below.

Before leaving, for the time being, the principles underlying the periodization of language history, we should not forget another side to this question, the pedagogical value of structuring past time into discrete units. Mæhlum (1998a, 17; 1999, 135) emphasized this point in the following way: "Such a structuring and systematizing of past time into periods as distinct as possible will have an obvious *heuristic* value".

In language history, the use of periods will be connected to which mode of language is under consideration, especially whether oral or written language is the focus. Today's complex society is to a large extent founded on an extensive, one might say an all-pervasive, use of the written medium. The present situation has, of course, a definite historical background, and the different stages of development will be of interest as historical facts. Scholars treating Nordic language history may have placed their stress somewhat differently, but the general rule is that both spoken and written language have been considered.

A natural line of demarcation can be drawn between an external and an internal history of a language. The external history treats linguistic ecology, i. e. the conditions or presuppositions laid down by society in its relations to language. The internal history deals with linguistic essentials, such as elements of phonetics, maintenance or change of the phonological and grammatical structure of language, and changes in the lexicon. The language histories differ somewhat in this respect. Indrebø and Skautrup give broad surveys of society as a background for their presentation of language. Seip and Wessén, on the contrary, pay little or no attention to society, presupposing a knowledge of it or, as a matter of course, taking the various aspects of language as their only object of interest.

A *sine qua non* of all historical presentation is that it must make reference to temporal events. Some definite year or span of years will be chosen as a dividing line between the language periods. Frequently, important histori-

cal events are chosen as division markers. For example, Söderwall's (1870, 3) second epoch coincides with the establishment of the Kalmar Union and his third with its disintegration (1397–1521). In the history of Norwegian, the dreadful outbreak of plague in 1349–50 known as the Black Death (in Sweden as the Big Death) was chosen as a line of demarcation by several language historians. This was not only because of its impact on society at large, but because it was supposed to have had specific effects on the language itself; we will shortly return to a discussion of this. Another event having both societal and linguistic consequences was the Reformation. Its sociological and linguistic aspects went hand-in-hand, as the reformers' insistence on using the mother tongue as the medium of religious instruction had major consequences for the use of language in the all-important religious sphere. In the wake of the Reformation came translations of the Bible, production of religious literature of various kinds and a gradual increase in literacy. Phenomena taken from external or internal language history may be chosen as period markers. Undoubtedly, general historical facts are used the most. If both kinds of characteristics are employed in the same presentation, this may seem illogical and be open to criticism. An example in the Norwegian tradition is that the Syncopation Period, whose defining characteristic is the development of vowels, comes directly before the Viking Age period, which takes its name from general history.

2. Histories of Nordic

The first Nordic language history is the one N.M. Petersen published in 1829–30: *Det danske, norske og svenske Sprogs Historie*. There are two parts or instalments, the first and largest one treating Danish, the mother tongue of the author. The second part deals with Norwegian and Swedish, in that order. Petersen (1829, 55) recognized four periods for Danish, running from 1100 to 1700 A.D. At the close of the last period, the language had become Modern Danish. He saw the development of Danish as a gradual transition from Old Icelandic to Danish. To some extent, his periods for Norwegian and Swedish parallel those of Danish.

Adolf Noreen was the first scholar to write a language history with the adjective *nordisch* in its title. At its time of publication (its first edition appeared in 1891), his epoch-making

grammar of Old Icelandic and Old Norwegian was only six years old (its first edition appeared in 1884), and in his language history he also concentrated on the earliest periods (Noreen 1913/1923). For another and younger Swede, Bengt Hesselman, in his voluminous work *Huvudlinjer i nordisk språkhistoria* (1948–52), periodization was no problem, because his method was a diachronic, contrastive one. He discussed and contrasted linguistic forms taken from two historical stages, i. e. modern dialectal forms in their relation to Old Nordic. Thus, he had no reason to treat the history of Nordic as a continuous process with several periods.

Eventually, in 1976 Einar Haugen published a history of all Nordic languages, covering both oral and written forms. One of his critics wrote that his integrated Nordic presentation was, characteristically, quite special (Ohlsson 1978, 149). However, a criticism might be made of his use of periods. The book opens with “the prehistoric era”, before 550 A.D., when the language was *Proto-Scandinavian*. After that follows *Common Scandinavian* (-1050). The Greek prefix *proto-* ‘first’ is generally used to refer to the transition from prehistory to history. *Proto-Scandinavian* corresponds to the Scandinavian term *urnordisk*. But so does the term *Common Scandinavian*, which is itself a bit misleading, as the split between East Nordic and West Nordic traditionally dates from that period (but cp. Bandle 1973, 19). Haugen's remaining periods are *Old Scandinavian* (-1350), *Middle Scandinavian* (-1550), and *Modern Scandinavian* (1550-).

3. The relationship between Germanic and Nordic

Periodization is problematic from the beginning, as we do not know exactly when Nordic became a separate branch of Germanic. Noreen (1913, 3) mentioned both the established fact that there were already Nordic-speaking people when Christ was born, and the loose supposition that they had also been present in the fifth millennium B. C. According to Skautrup (I 15), the general supposition of scholars is that Proto-Nordic became a separate branch of Germanic in the first two centuries before Christ. Indrebø (1951, 20) stated that Common Germanic lasted until the fourth century before Christ or a bit longer, and that Proto-Nordic carried on to about 500 A. D. Wessén (I 7) did not go back further than

Proto-Nordic, which, on the basis of runic inscriptions, he established as encompassing the period between 300 and 800 A.D. In neither edition of his language history did Seip (1931; 1955) write much on Germanic as a background to Nordic, and even what little he included was removed or changed by Saltveit in the final German edition of the book (Seip/Saltveit 1971, 1), in which a short chapter on Nordic and Gothic replaced it.

Some authors point out that Proto-Nordic was a real language and not just reconstructed, like Proto-Germanic or Indo-European. This means that Proto-Nordic corresponds to other known languages such as Greek or Sanskrit. The sources for the language are not rich, but they are still sufficient for it to be possible to ascertain how the language worked, both phonologically and grammatically. The furthest back the sources go is to the time when North Germanic had become so different from its sister branches that it could reasonably be characterized as a separate language. Scholars do not agree on when this occurred. Neither are they unanimous about the relationship between the branches of Germanic, not even whether there were two or three branches, or which of the three possible ones were closest to each other. Now it seems that the arguments put forward in favour of grouping North and West Germanic together, in contrast to East Germanic, have prevailed (Haugen 1976, 109ff.).

The relative chronology for Germanic and Nordic became topical recently when Torp (1998) rescued from nearly complete obscurity a forty-six-year-old work written by the Oslo scholar Håkon Melberg (1949–52). This voluminous (951 pages) treatise was devoted to what on the face of it seemed to be a rather limited subject, i.e. the signification of the nominal phrase *Danish tongue*, which in Icelandic and Norwegian written sources from the Middle Ages was frequently used with the same meaning as *norræna*, that is Old Norwegian and Old Icelandic taken together. Certainly, Melberg's work is an impressive piece of scholarship not only because of its length, but also due to the erudition, the depth of imagination and the analytic abilities the author demonstrates. Despite these positive qualities, one cannot say that his claim was proved. Melberg maintained that the *Danish tongue* was "the language of the Danes who founded Denmark and, from about A.D. 175 to 575, conquered and occupied permanently the Scandinavian peninsula". This would supply

the fundamental structure of the origin of the Scandinavian nations and languages:

It explains all the major historical features of Scandinavian speech – the fact that Scandinavian speech constitutes a separate unit within Teutonic; its extension in time and space and the general direction of its expansion; its early linguistic affinities; its sudden and universal revolutionary transformation; its universal homogeneity after the transformation; and its first dialectal cleavage. (II 916).

In Torp's opinion, the great asset of this theory was that it could explain one problem which he himself had always looked upon as nearly unexplainable: the fact that Proto-Nordic was so homogeneous in spite of its chronological and geographic range. Other reasons may certainly be adduced to explain this, but no conclusive ones. The problem of homogeneity would be lessened if, as implied in Melberg's theory, the language of the Danish conquerors was transferred to Norway and Sweden within so short a period that a split into dialects was less probable. We should also keep in mind the paucity of the sources and the fact that the capacity of the runic alphabet to express both phonemic and sub-phonemic characteristics was not very good. Certainly, more dialectal variations would have appeared if all linguistic essentials had been adequately revealed by the extant sources. This line of reasoning would also apply if Proto-Nordic had not been identical with the *Danish tongue* but was simply, as is postulated in the older historical linguistic tradition, the northern branch of Germanic, which was derived from Common Germanic and separated from the other branches some centuries earlier than was assumed in the theory of migration from Denmark to Norway and Sweden during the reign of King Frode.

Both Skautrup (I 15) and Wessén (I 24) have Proto-Nordic ending about 800 A.D., followed by Old Danish (Runic Danish) and Runic Swedish respectively. Seip and Indrebø distinguish the Syncopation Period from an earlier sub-period of Proto-Nordic but do not agree as to its exact timing, with Seip fixing it from 500–800, and Indrebø from 500–700. Indrebø's claim that the Proto-Nordic Period came to a close one century earlier than other scholars takes into consideration the fact that the runic inscription of Eggjum from about 650 was written in syncopated word forms, introducing something definitely new.

4. Tribal migration and syncopation

The causes of syncopation were discussed by Mæhlum (1991). She was primarily concerned with its alleged connection to the Germanic tribal migrations, calling attention to the fact that Norwegian archaeologists and prehistorians recently have had other thoughts about tribal migrations, as there were no or very few finds to support this. She asserted that the new view on migration must have consequences for its supposed concomitant of social unrest, which had been used as an explanation for syncopation. She found it a bit strange that tribal migrations were supposed to have taken place in quite opposite directions in ancient Scandinavia. One might also mention the curious coincidence that most migration voyages seem to have started in some remote Jutland province, such as Himmerland or Thy. Nevertheless, some evidence supports the claim that tribal migrations took different and even quite opposite directions. It is a manifest fact that wandering Germanic tribes clashed with Romans in several places in Southern Europe, and it is even better attested that the Angles and Saxons who invaded Britain came from Jutland and the Netherlands. There were, in fact, two waves of migration, starting in the second and the fourth centuries. In addition, data supplied by early historians and other evidence indicates that the Goths who resided in Poland about 100 A.D. had come from Sweden by crossing the Baltic. The claim that migrating tribes went northwards has some onomastic evidence to support it (such as the county names *Rogaland* and *Hordaland*) as well as the existence of kingdoms in Lejre, Uppsala and Western Norway. For his part, Skautrup (I 14) treated tribal migrations rather cursorily, stating that not all residents of a place left. Seip and Wessén did not mention tribal migrations at all, but Indrebø used them as an explanation for syncopation. Haugen reported fairly elaborately on the Germanic migrations southwards.

Quite rightly, syncopation was ascribed great importance in the process of language change in Nordic, but no one was able to state its cause(s) with any degree of certainty or probability. Of course, Wessén and others made a good case for claiming a connection between syncopation and the Germanic placing of dynamic stress on the root syllable of a word, but it is unlikely that this was the only cause, and it offers us no ultimate explanation, but rather just leads to a search for the cause(s) of the stress rule.

5. The term Old Norse

The fact that old West Nordic literature was partly Norwegian and partly Icelandic was given due consideration in the title of Noreen's classical textbook *Altisländische und altnorwegische Grammatik*. A number of works from the 19th century written in English had titles of this kind, e. g. *A Grammar of the Icelandic or Old Norse Tongue* (Rask 1843). Other works disregarded the distinction between Norwegian and Icelandic, as demonstrated by titles like *An Icelandic-English Dictionary* (Cleasby/Vigfusson 1874) or *The Order of Words in Old Norse Prose* (Bernstein 1897). Irrespective of the texts' national origin, Norwegian writers such as Fritzner and Hægstad applied the word *gamalnorsk* 'Old Norwegian' to them. In English, the term *Old Norse* became the usual one for reference to the old language of Norway and Iceland. The unqualified word *Norse* denotes 'Scandinavians', 'Norwegians', 'any of the western Scandinavian dialects or languages' and 'the Scandinavian group of Germanic languages'. Etymologically, *Norse* is supposed to be the obsolete Dutch word *Noor(d)sch*, signifying both 'Scandinavian' and 'Norwegian', which is derived from Dutch *noord* 'North' (Klein 1966–67; Webster 1976). In this handbook (Old) Norse is generally synonymous with (Old) West Nordic.

6. A middle period?

Swedish language historians cite the Classical Old Swedish period as lasting from 1225 to 1375 (Noreen 1913, 42; Wessén I 44; Bergman 1968, 29). What defined the period was the fact that its written literature was rendered in the Latin alphabet. At the close of this period, Swedish developed into what Noreen called *mittelschwedisch*, which corresponds to *middeldansk* and *mellomnorsk*. Wessén and Bergman called the same period *Younger Old Swedish*, which, irrespective of its name, lasted until 1526, i. e. the year of the Reformation and the translation of the New Testament, which introduced New Swedish. Wessén stated that in the Younger Old Swedish period there were great changes in the language. These were not limited to the sound system but affected nearly all aspects of language. Wessén mentioned three such changes: the increase in vocabulary with the influx of Low German loanwords; Latin's great influence on style and syntax; and simplification of word inflection.

The oldest extant Danish texts, which date back to just before 1300, are younger than the oldest Swedish ones. The Danes Dahlerup and Skautrup divided Danish more or less similarly. Unlike the Swedes, they did not use the age of the oldest texts as a basis for periodization, looking on the time after Runic Danish, from 1100 to 1350, as one period, called *Oldest Danish* by Dahlerup (1921, 18) and *Older Middle Danish* by Skautrup (I 181). The basis of the written norm for Danish was laid during that period (I 216). In Skautrup's system, the interval from 1350 to 1500 was *Younger Middle Danish*. Characterizing this period, he said that the external history of the language was more interesting than the internal one. The vocabulary was greatly enlarged, but the speech fields did not change, and the constituent traits of the written norms were clear (II 28). On the other hand, many characteristics of the language varied greatly. Old and new, individual and general traits were found side by side in the same source, indicating that the writers were insecure in their choice of forms. Coming from official institutions, law texts and formal letters had a more stable norm than those of a private origin (II 40).

Comparing the terms for some corresponding periods used by the Dane Skautrup and by Swedish language historians (Noreen 1913 excepted), we note that the terms *Middle Danish* and *Old Swedish*, despite their different defining adjectives and some discrepancy in exact delimitation (1100–1500 and 1225–1526 respectively), both cover a two-part period between the very old form of the languages and the modern form. Skautrup's choice of the adjective *middle* was more appropriate than the Swedes' use of *forn*. Harmonization might be obtained in various ways, none of them quite satisfactory, the best one probably being that both Danish and Swedish reserve the term *middle* for the period between 1350/1375 and 1500/1526. This would correspond to the traditional use of the term in Norwegian.

The three-part division of language history was used not only by scholars treating Nordic material, but also by those writing on other Germanic languages, cp. Sverdrup (1943) for German and Baugh (1959) for English language history. Supporting the factual basis of this division, Baugh wrote (p. 189) that "The Middle English period was marked by momentous changes in the English language [...]". This shows that as far as English is concerned, the division into three parts was firmly

based on the material itself. Historians of Norwegian, Swedish and German expressed themselves in the same vein. Yet, the motivation given by the material may have been strengthened by the analysers' sense of symmetry, and it should also not be forgotten that these traditional divisions had a venerable origin, having been introduced by Jacob Grimm (1819–37). There is some reason to believe that respect for his authority had some influence in this matter. Nevertheless, not all today's historians of language accept the desirability, let alone the necessity, of postulating a middle period.

For the project of writing a Nordic language history, the incongruity between the historiographic traditions of the Nordic countries in the use or non-use of a middle period represents a complication. In a pan-Nordic perspective, a two-part division would be an advantage, as it also works for Icelandic, for which the dividing line between old and new is generally drawn in the middle of the 16th century (Magerøy 1981; cp. Bandle 1956, 4, 9; Jón Helgason 1931) but which is based on other criteria, as Icelandic retained its synthetic structure (Benediktsson 1962, 488).

Despite the differences in terms, Danish and Swedish language historians agree in considering the time span between 1350/1375 and 1500/1526 worthy of being separated from the periods before and after it so as to constitute a period of its own, but not a major period. This is so even though the linguistic situation in the two countries seems to have been quite different, as Denmark enjoyed stability both in speech and in having an established written norm, whereas there was linguistic instability in Sweden. The Middle Norwegian period, coinciding chronologically with Younger Middle Danish and Younger Old Swedish, is traditionally looked upon as a time of great linguistic change, the period in which Old Norse developed into New Norwegian, when the synthetic inflectional system was broken down and a new analytic one came into being. In all three countries, the period was also characterized by the importation of great numbers of words from Low German. In Norway, the cumulative effects of developments in several linguistic spheres were recorded by Seip (1931, 157), who stated that the language of letters changed abruptly about 1370. In his opinion, the cause of the change was that the clergy, who upheld the writing tradition, were so decimated by the Black Death that the old writing habits were no longer transmitted to new gen-

erations of writers. Indrebø, too, held the Black Death responsible for the change in the written language in the 14th century, taking the Plague itself to mark the introduction of a new language period. Seip placed the beginning of the Middle Norwegian period at 1370, Indrebø at 1350. Indrebø determined that the period ended in 1525, Seip/Saltveit in 1530.

7. The Black Death

The historian Benedictow, who recently treated the Black Death and its effects in a doctoral dissertation, found that there was about the same decline of population in Norway and England, and probably in Denmark, “between the pre-plague period and the second half of the fourteenth century” (1992, 113). The Swedish sources are less clear, but probably the Plague had similar effects in Sweden, whereas Finland enjoyed a prosperous period during the fourteenth century. Iceland was not hit by the Black Death, either, but had outbursts of plague at different junctures. In view of what is reported for Denmark, it is rather strange that Skautrup, with his broad view of society as the background to language, did not mention the Black Death at all. It is less remarkable that Wessén and Bergman were silent, as they did not pay so much attention to social issues.

There is every reason to believe that the Great Plague affected writing in the way Indrebø and Seip assumed. It is less obvious that the pestilence had much influence on speech, because spoken language was of course transferred from the older to the younger generations as usual during the Plague period, even though the number of speakers decreased because of the high death rate. However, spoken language might have been influenced by the greater societal mobility brought about by people searching for a living in regions where the soil was more fertile than where they grew up. Other circumstances attributable to the Plague might also have caused people to move from one place to another. If all inhabitants of some settled area died, which is reported for various districts, entire dialects might have disappeared.

Such possible linguistic consequences of the Black Death were not considered by Mæhlum, who instead, in two scholarly contributions (1998a; 1999), criticized Norwegian language historians for including the Black Death as a period-determining factor. In her opinion, there never was any distinct period worthy of

the term Middle Norwegian. The best argument supporting her view comes from Rindal (1993), who found a continuous linguistic development from the oldest to the youngest manuscripts. According to him, there was no new linguistic departure in the period called Middle Norwegian to justify this term. He based his claim on a general impression of the language of letters from Hamar in the period 1350–1525 and on occasional observations in the linguistic literature which showed that many changes in the language pre-dated 1350. Even if we want to do justice to all kinds of new information and points of view, we would do well to not draw conclusions too hastily, remembering that all previous language historians proposed one distinct period between the old language and the modern one. There is no reason to think that Hægstad, Seip, Indrebø, Hødnebo, Skard and others did not know the sources well, that they interpreted them too ideologically, wishing to make Old Norse more worthy and dignified than it really was, that they put in an extra period to obtain symmetry, or that they just followed the example of predecessors writing on other languages.

8. The Modern Period

Whether or not we include a middle period, the fact remains that at the time of the Reformation, all the central Nordic languages, based on internal criteria, had attained a stage that was clearly different from the language known to us through the written sources from the Middle Ages. Undoubtedly, this justifies proposing a new language period starting at the Reformation. Following the rough chronology we are using here, there is reason to say that the period beginning with the Reformation is the one that is still with us. An appropriate term covering its whole time span would be the Modern Period. In the words of the language historians, *Old Nordic* had become *Modern Scandinavian* (Haugen), *New Swedish* (Wessén, Bergman) and *New Norwegian* (Indrebø). Making finer distinctions, Skautrup (II 120) used the terms *Older New Danish* for the period 1500–1700 and *Younger New Danish* for the period 1700–1950. The chief characteristic of the language of the Modern Period, as compared with the period(s) coming before it, was that various other means of linguistic expression, such as a fixed word order and more use of prepositions and grammatical words, had replaced a language

characterized by inflectional endings. To simplify, the two stages represented synthetic and analytic language structure, respectively. As to the universality of the Modern Period, one reservation should be noted. It should be remembered that in the three countries mentioned (and also in Finland), dialects persist which have preserved much of the same synthetic structure that characterized Old Nordic (cp. also Modern Icelandic).

Skautrup (II 120) reports that Wimmer, in lectures delivered in 1872–73, expressed the view that at no time during the Modern Period could such linguistic changes be observed to make it justifiable to propose a new major period. In spite of this, historians of all Nordic languages divide it into sub-periods. From a Nordic perspective, it is rather difficult to do this, as the smaller time spans defined as periods generally coincide with historical events or cultural epochs which may differ considerably from one country to another. Thus, Skautrup included a period called “the Time of Learning”, which covered the 17th century, Bergman distinguished *Younger New Swedish* (18th century) from *Today’s Swedish* (19th century), and Indrebø made a division of *New Norwegian* in 1814 because of the great political events of that year. An attempt to draw common conclusions for all Nordic based on language would probably not succeed, and it would become evident that the division criteria really were and had to be cultural or historical more than strictly linguistic.

5. The data basis of a Nordic language history

1. Introduction and general considerations
2. The pre-literary period
3. The manuscript era
4. The post-Reformation age of printing
5. Literature (a selection)

1. Introduction and general considerations

A comprehensive language history has a variety of different research objects (cf. Ottósson 1992, 15–20). One is the written language as such, with elements alien to spoken language. Another object is the spoken *parole*, i. e. instances of language use in speech. The most central object of language history, however, must be the *langue*, the core language system for the spoken language. Superimposed on the core language system are text norms (in a wide sense) for written and special spoken genres, using different grammatical devices and especially different lexical resources than natural speech. Although various developments in the *parole*, as well as the superimposed norms and contact with other languages, can be of paramount importance for the development of the *langue*, these new features must then be incorporated by the language system, and in that process the immanent properties of the system, its limitations and preferences, are decisive. In this article, I will concentrate on what may be called the primary sources for language history, and on some essentials of the interpretation of these sources. When trying to exploit the various kinds of primary sources for earlier language stages, we face two fundamental problems (Ottósson 1988). One may be called the corpus problem, the fact that we often cannot produce or elicit the data that we wish. This calls for care in evaluating the scope of conclusions one can draw from what

one has, especially when one has exhausted the potential sources. The other, the bias problem, lies in the fact that we do not get a random sample of the language but a systematically biased one. Thus, one must evaluate whose language and what sort of language the sources reflect.

There are in principle three main types of primary sources for previous language stages: texts in the language, direct statements about the language, and various kinds of indirect evidence, mostly comparative (Ottósson 1988). Of the texts, manuscripts and printed books are the most central, but inscriptions are also important, in our case runic ones. Poetic texts have special properties which can provide information about e. g. stress, and rhyme and sometimes alliteration can reveal the real pronunciation of the poet, where the orthography is imprecise or conservative, or where his pronunciation is dialectal. However, poetry has its own rules which may or may not reflect the language system closely. This is obvious with respect to word order and vocabulary, and one can expect poetic license on other points such as morphology as well. But even phonological aspects are “filtered” through the metrical conventions (Benediktsson forthc.; Ståhle 1975), e. g. which sounds are considered so similar that they rhyme. – Direct descriptions of the language by a native speaker usually either take the form of grammars or, more commonly, lexical works: dictionaries, glossaries and the like. Works on poetics and orthography can also provide valuable phonological information. Common to all such descriptions is the danger that they may not describe actual language in all respects, but rather language as the author wants it to be, e. g. in only selecting words for a dictionary which are considered good lan-

guage. Grammars tended until recently to be unduly influenced by the traditional grammatical description of Latin. – Indirect evidence is an often underrated source of information. This applies to both comparison with related languages, aiming at reconstructing a common ancestor language, and with other stages of the same language, to put the attested forms into a context of development. The study of loans into other languages as well as from them can also be instructive. The phonological form of loanwords in the Nordic languages in conjunction with the time of their borrowing can also help date sound changes.

The importance of different kinds of sources varies a great deal with the different language components. Establishing the pronunciation of individual phonemes at any particular language stage is particularly tricky. For writing in the Latin alphabet, a starting point is provided by the pronunciation of the individual letters in Latin at the time when the vernacular writing tradition started. Comparison with modern pronunciation (from the earliest records based on the methods of modern phonetics) is also fruitful. In making sense of that comparison, our knowledge of commonly occurring sound changes is essential. The particular value of poetry to phonology has already been mentioned. One type of evidence which involves considerable interpretation is much used in phonology – the relative chronology of sound changes. For example, the change of Old Danish original *g* to *w* (*laga* > *lawe*) must have happened before *k* changed to *g*, otherwise this new *g* would have merged with the original *g* and yielded *w* as well. – In determining the meaning of words, old dictionaries as well as parallel texts in other languages (typically a Latin original) are especially important, because one cannot always determine the meaning of a word on the basis of context alone, e. g. for plant names. The meaning of a word in the modern language can also be of great help. The corpus problem is particularly acute with respect to the lexicon because it contains so many units. Many semantic fields, specialized as well as everyday ones, may be poorly covered in the sources. Comparison between the modern language in all its varieties and related languages may prove that a word has existed continuously in the language from the very beginning, even if it is not attested at earlier stages.

Evidence from modern dialects plays an important role in Nordic language history, in

particular the huge archives resulting from the systematic collection of material in the mid- and late 19th c. and into the 20th c. (Hesselman 1948–53; Bandle 1973). This material can in many cases provide more detailed information about earlier language changes than the contemporary sources, e. g. on the phonological environment of sound changes. In many cases, the living dialects give the researcher the opportunity to elicit information not found in the archives or the old sources, thus alleviating the corpus problem somewhat. This is especially valuable with respect to the vocabulary. Furthermore, dialect evidence can often help localize changes better than the written sources, and it gives information about the language in areas not covered by the sources. Evidently, the geographical distribution of linguistic features changes over time. However, traditional dialectologists developed an interpretive method which can, to the extent that it is sound, be of help in reconstructing the spread of a feature. Thus, certain more isolated areas can be seen as relic areas, and words for certain types of things spread more readily than others, supplanting forms resulting from regular sound change. – Place-names have by their nature special value for the history of the lexicon and for phonology, apart from the circumstantial fact that they are often attested early (Hesselman 1948–53; Dalberg/Sørensen 1979). Such names, by virtue of their strictly local denotation, are particularly well protected from influence from neighboring dialects and the standard language. Their value is enhanced to the extent that their origin can be dated typologically: Certain types of place-names have been dated to particular periods, e. g. Danish names in *-lev* and Norwegian ones in *-vin* to the Proto-Nordic period (e. g. Skautrup 1944, 25–29). In such cases, words preserved in compound place-names can substantially supplement the vocabulary of periods with sparse sources (e. g. Proto-Nordic) or poor coverage of particular semantic fields (e. g. in Old Danish). Place-names can also help in mapping the geographical spread of a word or a sound change in earlier periods. Compound place-names show a variety of rare sound combinations across the juncture, which may help delimit the phonological environment of individual sound changes. Furthermore, as the relative semantic opacity of such place-names makes them less subject to restitution of their individual parts, they may show sound changes in a purer form than other words.

2. The pre-literary period

For the Proto-Nordic and syncope period preceding the Viking age, the couple of hundred runic inscriptions, starting around 200 A.D., are by far the most important source of evidence, although only some of them have been reliably interpreted (Knirk et al. 1993). Since they are very short, comparative evidence from Gothic and other Germanic languages, and from later Scandinavian, has been crucial in interpreting them. Another important source are loanwords in Finnish, which were borrowed in the centuries around the birth of Christ and have remained remarkably little changed from the time of borrowing. Around 400 have been identified, e. g. *kuningas*, *kulta* (Skautrup 1944, 22). In Sami, around 600 loanwords from the Proto-Nordic era have been identified, but these are much more altered.

From around 800, after the advent of the so-called younger futhark, the runic inscriptions become much more numerous and remain the most important kind of source for Mainland Scandinavian for centuries (Knirk et al. 1993, with ref.). This alphabet is much less refined than the earlier one, as it has fewer letters while the number of vowel phonemes has increased. Over time, this is sometimes remedied in part by diacritics (*stungnar rímar*). In Denmark, there are several hundred inscriptions in this alphabet, with the highest concentration in the period ca. 950–1025. In Sweden, there are more than 2,500 inscriptions, 2,000 of them before 1100 A.D., with the highest concentration in Uppland. The Norwegian Viking Age inscriptions are the least numerous by far. Most of the inscriptions are short, and their rather uniform content detracts from their value as sources. Another kind of source consists of the many names in foreign language texts. This is an especially valuable source for Danish, e. g. *Necrologium Lundense* from the 12th/13th c., and Saxo Grammaticus ca. 1200 (Skautrup 1944, 198–207). – In the British Isles, there are some dozens of Norse inscriptions from the Viking Age and into the 12th c., with a concentration on the Isle of Man (Knirk et al. 1993). There are hundreds of Nordic place-names from the Viking Age in both English-speaking and Celtic-speaking areas, and many loanwords especially in English. However, these elements can be hard to interpret, as they have been Anglicized or Celticized and then followed the development of the language. The spelling of

Nordic words in Irish texts has been used as evidence for pronunciation at the time, but the conclusions are uncertain.

For Icelandic (Ottósson 1988), the only important texts from this period are old poems. Although some Eddaic poems go back to before 1000 and preserve linguistic features that are archaic in relation to the oldest preserved manuscripts, their relatively free metrical form makes them susceptible to modernization in oral tradition. More important are the scaldic poems dating as far back as the mid-9th c., by Norwegian and later predominantly Icelandic poets. The corpus from before 1100 is extensive, more than 1,500 verses. Because of the strict metrical form of the poems, they have commonly been assumed to have been preserved intact in oral tradition from the moment of composition. Although this may appear doubtful in principle, the extent to which these poems exhibit a coherent development, as shown especially by Finnur Jónsson and more recently Hreinn Benediktsson (forthc.), may be taken as an argument for the assumption. However, the vocabulary is not representative of the everyday spoken language.

3. The manuscript era

3.1. General

No other type of primary source from the period between the emergence of manuscripts in the vernacular and the advent of printing comes close to manuscripts in importance. However, evidence from dialects and place-names compensate for restricted geographic and lexical coverage (cf. sect. 1.). Before 1300, by far the largest portion of manuscripts comes from Iceland, and Norway has a fair share. After 1350, the volume and variety of Swedish manuscript books increases greatly, after 1450 for Danish ones, whereas Norwegian codices become scarce after 1350. In using manuscripts as a primary source for language history, two kinds of information are crucial, information which is usually not explicitly stated in the manuscripts themselves (Ottósson 1988). Firstly, the manuscripts must be dated, and if possible localized. In the best cases, the scribe or at least his scribal milieu can be identified. Sometimes what is known from other sources about the history of the manuscript helps in these respects. In most cases, however, paleographic and other features of the manuscript, such as orthographic peculiarities, must be compared to those of

manuscripts which can be dated by other means. From periods for which there are many original diplomas preserved (see later in sect. 3.1.), it has in a number of cases been possible to identify a hand in an original diploma with one in a manuscript and sometimes to identify a scribe with a known biography. The other kind of necessary information when using manuscripts has to do with exemplars. The question is where individual linguistic elements originated in the chain of copying (and/or redaction) from the original author to the manuscript in question, and how representative they are for the language of the scribe (or the author). Typically, rather little is known for certain about the transmission of the text, and often we have imprecise knowledge of the time of the original composition or translation. To minimize these unknown factors, it is advisable to try to choose manuscripts where the distance from the original is short, in time as well as in space (because of dialect differences).

It is commonly assumed that in matters of orthography, including the phonological form of words, the scribe's norm tends to predominate, although individual forms may be lifted from the exemplar. For grammar and the lexicon, one may assume less revision, although there was a tendency to replace obsolete elements. For phonology there are special problems having to do with the great variation in orthography, especially for vowels without a counterpart in Latin (Benediktsson *forthc.*). It is necessary to know the system of phonemic-graphemic relationships in individual manuscripts in order to be able to evaluate individual examples. Thus, the form *hauldr* does not provide evidence for diphthongal pronunciation in a manuscript where *au* is regularly used for *o*, but it does in a manuscript which reserves *au* for the diphthong. Vowel length is not regularly marked in the manuscripts, so here other evidence such as comparison with related languages and later language stages is crucial. In Danish and Swedish manuscripts, consonant length is regularly marked medially but not finally. Icelandic manuscripts in particular use abbreviations abundantly. The abbreviations are often ambiguous, e. g. *s* for either present *segir* or past *sagði*, so that the full form chosen in the edition cannot be taken at face value. The power of the scribal norms was strong, also in Iceland, where not only clerics but also well-to-do farmers wrote manuscripts. At the time when regional laws predominated the manu-

script production in Denmark and Sweden, regional differences were clear, but after that time, there was a marked tendency for a common norm for each country. Thus, one may assume that there was increased distance between the norms and the spoken language of the scribe, and the spelling of less trained scribes is often more instructive linguistically than that of trained ones. One aspect of this normalization is conservative orthography. When sound changes lead to merger, inverse spellings may be instructive, i. e. unsuccessful attempts at maintaining the original distribution of sounds, e. g. writing *y* in words with original *i* after *y* was unrounded. A prominent feature of the text norms is Latin syntactic influence, especially in religious translations in all the Nordic languages (cf. Skautrup 1947, 55ff.). Some of these syntactic elements disappear after 1500, indicating that they remained restricted to the written language. – One particularly interesting genre is the diplomas, which are witnessed records of all sorts of legal actions and transactions. Many of these are preserved in the original, and have the big advantage that they are in most cases both dated and localized. Usually, the scribe does not identify himself, but is most often mentioned as a witness or party in the diploma, so that comparison of the scribal hands can identify him. It can be hard to determine whose language is reflected in individual diplomas, as in many cases the text is dictated to the scribe, often by the recipient, the beneficiary of the legal act. The rather uniform content of diplomas and the extensive use of formulas in them detract from their value as linguistic sources, and the Swedish and Danish diplomas especially are heavily influenced by Latin syntax. However, diplomas contain a wealth of concrete and specialized words rarely found elsewhere. Furthermore, they sometimes contain purportedly direct quotations from the spoken language, especially in court case testimonies. The Icelandic and Norwegian diplomas from this period have been edited, although the editions are for the most part not absolutely accurate. Middle Norwegian diplomas, being almost the only sources from that language period, have been used fairly extensively, Icelandic diplomas rather little. Rather few of the diplomas in Swedish and Danish have been edited, and the existing editions are old; cf., however, *Gammeldanske diplomater* (8 vols.) covering the time between 1364 and 1435 (mimeographed in Copenhagen 1959–69). Diplomas have largely been ig-

nored in the investigation of the history of these languages, although the Danish ones would help considerably in filling the gap in the sources between 1350 and 1450.

One may assume that runic script was used much more than Latin script by the common man in Scandinavia in everyday communication before the spread of paper and later printed books (Spurkland 1998). This is indicated especially by the many hundred Bergen inscriptions from the period 1150 to 1350, but also from smaller finds in a number of other cities in Norway, Denmark, and Sweden. The total volume of the inscriptions after 1100 is so small that the text could be printed on 15 pages. However, these inscriptions are originals and generally represent the language of the carver. Although runic script had some traditional spelling conventions of its own, these were weaker than those for Latin script, making the inscriptions more orthophonic in some respects. Thus, runic inscriptions provide valuable comparative material for the time when we have manuscripts with Latin letters. For the Nordic language in Greenland, from which no manuscripts are preserved, the ca. 75 inscriptions from the centuries before 1300 are our sole source (Stoklund 1993).

3.2. Icelandic, Norwegian, and Faroese

The oldest preserved manuscript fragment from Iceland is from the mid-12th c. (Ottósson 1988; 1992). Many manuscripts and fragments of varied contents are preserved from the 13th c., and their number and variety increases greatly after 1300. The oldest datable original diploma is from 1311, but they do not become numerous until around 1400. Of language descriptions, one only needs to mention the four grammatical treatises, especially *The First Grammatical Treatise* from the mid-12th c. Icelandic manuscripts, especially from the 14th c., show rather strong Norwegian influence, but this is for the most part limited to the written norm. – Old Norwegian manuscripts are much fewer in number than the Icelandic ones (Seip 1955). The oldest fragments are from the second half of the 12th c. From the 13th c. we have not only four regional laws, but also translations and original literature, whereas the first half of the 14th c. offers mostly law manuscripts. There are some dozens of original diplomas from the 13th c., and their number increases almost exponentially over the course of the 14th c. and remains high

through the Reformation (Indrebø 1951). However, Swedish and later especially Danish influence is very strong in the diplomas, so that it can be hard to discern the genuinely Norwegian elements. – Medieval records of Faroese are sparse, mostly some entries from the mid-14th c. to around 1500 in a Norwegian law manuscript (Matras 1960). In addition, half a dozen texts from around 1300 on have been claimed to show some Faroese features. In view of this sparsity, the oldest post-Reformation texts, not least the traditional ballads, and indeed the modern dialects may be said to be the most important sources for medieval Faroese, on which the fragmentary medieval evidence is highly dependent for its interpretation.

3.3. Danish, Swedish, and Gutnish

The oldest manuscript in Old Danish is from ca. 1250, and until the mid-14th c. the manuscripts mostly contain laws for the three main parts of the country (Skautrup 1947; Brøndum-Nielsen 1928–1973). The rather many manuscripts from the mid-15th c. onward mostly contain religious translations. In diplomas, there was a transition from Latin to Danish in the period 1378–1425. From around 1400, Swedish elements are rather common, in diplomas and especially the literature connected to the Birgittine order. – The oldest fragment in Old Swedish (Noreen 1904) is from the mid-13th c., and until the mid-14th c., the manuscripts mostly contain laws for regions (seven of them) and cities. From the late 14th c., religious translations are prominent in Swedish manuscripts (Åström 1993). Diplomas in Swedish become common after the mid-14th c. – Old Gutnish is only fairly well documented, with one important manuscript from ca. 1350 and a number of runic inscriptions (Noreen 1904).

4. The post-Reformation age of printing

4.1. General

The most important change in the Nordic countries around 1500 with respect to linguistic primary sources was the advent of printing. The first printed books in Danish (*Den danske rimkronike*) and Swedish (*Aff dyäfwlsens frästilse*) appeared in 1495, and the first one in Icelandic in 1540, the New Testament. The whole Bible came out in Swedish in 1541, in

Danish in 1550, and in Icelandic in 1584. No books were printed in Norwegian until the 19th century, and the same goes for Faroese. Orkney and Shetland Norn apparently never became a written language, our sole sources of these dialects being rather short antiquarian records from the 17th-19th c. as well as numerous loanwords in Scots and English (Barnes 1998). The printshops were powerful centres for establishing norms for the language used in them, and especially in standardizing the orthography. To capture more of the linguistic variety at the time, it is therefore important to take other sources into consideration. As before, persons less versed in the written norm provide insights into the spoken language (e. g. Skautrup 1947, 179f.). An important development besides printing was the somewhat earlier spreading of a much cheaper writing material, paper, which became common in Sweden and Denmark from around 1400, but probably spread more slowly in Norway and certainly in Iceland. The Reformation also brought change with its tenet that every Christian must have direct access to the Holy Scripture, in turn stimulating the dissemination of religious books. The Reformation started in Sweden in 1527, and was decreed in the Danish realm in 1537. It is most convenient to count from around the Reformation here, as it was established all over the Nordic language area at about the same time.

As the historical linguist is most interested in the spoken language, the emergence of a standard spoken language transcending the local dialects is of vital interest, in particular the way in which this is reflected in the sources. This process is imperfectly understood and disputed, but it seems to have happened essentially in the 17th and 18th c. in Sweden and Denmark. Various phases must be distinguished. The preliminary phase consists of the formation of a special language register connected to reading aloud and used for solemn occasions such as sermons, lectures or court rituals. This register forms the basis, in the next phase, of a language variety used also in conversation among the upper classes, which in the final stage is learned as a first language by the child. All along, a certain degree of standardization is required, but there may still be some variation allowed. A more or less standardized register for reading aloud probably had already emerged in the late Middle Ages, and it was certainly strengthened by the norm in printed books. In Swedish, it seems certain that a Swedish spoken language with a clear

norm had emerged in Stockholm and the surrounding region before the mid-18th c., and it probably existed in a less clear form already in the late 17th c. (Widmark 2000; Wessén 1960, 80, 105f., 118). In Danish, the phases of the development may have begun roughly at the same time as in Swedish, although there seems to have been more variation in the standard spoken language throughout the 18th c. (Skautrup 1947, 315ff., 332f., 406f.; 1953, 181ff.; cf. Haugen 1976, 358f.). In Norway, a standard spoken language, based on written Danish, most probably emerged later, not earlier than the second half of the 18th c., as it depended to some degree on the standardization of spoken Danish. By the mid-19th c. this language variety is known to have acquired a fairly firm standard (see sect. 4.4.). Icelandic is a special case because of its minimal dialectal differences, and Faroese has not acquired a standard spoken language even today.

After the Reformation, more personal genres emerge or increase greatly, creating more room for spontaneous language use. These include private letters, rarely preserved before the late 15th c., later also diaries and autobiographical works. It must be kept in mind, however, that guides to letter-writing became popular soon after printing commenced, so that spontaneous and colloquial language must be sought outside the parts of the letters that are covered by the models (Skautrup 1947, 209). Furthermore, even in such works of a more personal nature, religious discourse tended to follow closely the models in the edifying literature which predominated in printed books for a couple of centuries after the Reformation. The element of daily spoken language and, a fortiori, of core language, in these texts must be seen against the background of the interaction of dialects and the emerging standard language. In actual practice, in evaluating the colloquial character of a text from earlier centuries, researchers have depended a great deal on the systematic differences between written and spoken language which they have become aware of as ordinary language users (cf. Ståhle 1975, 8). These are to a great extent matters of style, such as simple syntax, straightforward expressions rather than rhetorically embellished ones, and elements appropriate to face-to-face communication (e. g. interjections), which may be tacked onto the standard written norm. To get closer to the core language, comparison with all varieties of the older language, as well as modern dialects, is

necessary. After the Reformation, syntactic elements from High German were added to the earlier Latin ones in all the Nordic written languages, such as final position for the finite verb in subordinate clauses. Some of these imported features apparently remained alien to the spoken language (Skautrup 1947, 60, 203, 357f.; 1953, 36).

After 1500, much more is known about the primary linguistic sources than before. In particular, the authors of most sources, at least the larger ones, are known (cf. Skautrup 1947, 135). This is due to the explosive growth in the volume of written documents made possible by the advent of paper. Another side of this coin is the fact that whereas most of the pre-Reformation texts have been published (except for Danish and Swedish diplomas), vast amounts of manuscript material from after the Reformation remain unpublished. These are i. a. government documents and materials in the archives of all sorts of business and industrial enterprises, which are especially valuable with respect to the vocabulary of daily life (e.g. Skautrup 1947, 140ff.; 1953, 78). Such unpublished documents have been systematically utilised for *Svenska Akademiens ordbok*, and to a certain extent for the Icelandic dictionary project, but the Danish historical dictionaries (*Ordbog over det danske sprog* and the one by Kalkar) are not based on any systematic excerption directly from manuscripts.

4.2. Danish

In the first half of the 16th c., many books were printed in different parts of Denmark, but in the second half, as the number of printed books multiplied, printing was concentrated on Copenhagen (Skautrup 1947, 124–126). The orthographic norm established in the printshops, mostly by Christiern Pedersen in Malmö, was in various ways closer to the spoken language than the language of the earlier manuscripts, whereas the chancery stuck to the old forms (Skautrup 1947, 176–188, 320). The reformers used a more popular language than was usual either before or after their time and the same can be said about the translation of the Bible (Skautrup 1947, 156, 205f., 212ff.). As for genres especially close to the spoken language, private letters from the gentry abound from the early 16th c. onward, with colloquial elements clearest in letters from women (Skautrup 1947, 141f., 205, 209, 276, 310ff., 424). A large portion of the

early letters remains unpublished (esp. from the 1600s), although collections of letters by a number of distinguished persons have been published, e. g. Christian IV. Especially interesting are the letters of Queen Elizabeth to her husband, Christian II, from 1523–24, because she represented her pronunciation of Danish, which she had learned by ear, using French orthography. The volume of preserved private letters from after 1700 is vast, and what has been published stems mostly from learned and literary persons, but it does include women (Skautrup 1953, 10, 78). Of autobiographies (Skautrup 1947, 146, 277f., 313f.), the earliest published one, from the late 16th c., is by the official Rosenkrantz. Especially noteworthy is the autobiographical work of Countess Leonora Christina, *Jammers Minde*, from 1674–1685 and later, providing presumably accurate quotes from colloquial language as used by the upper and lower classes. The first independent and original play (Skautrup 1947, 159f., 204), by Ranch, was printed in 1585. In school comedies from the 17th c. one can find elements of peasant language (Skautrup 1947, 291f., 310).

The first Danish dictionary (Skautrup 1947; Jacoby 1990) was Christiern Pedersen's Latin-Danish one, *Vocabularium ad usum Dacorum* (1510), containing ca. 8000 Danish words. A number of other Latin dictionaries followed before 1700, of which Rhode's 1672 translation of Comenius' glossary in *Orbis sensualium pictus* is noteworthy for its large vocabulary. Materials for a Danish dictionary were first collected in the 17th c., culminating in Moth's unpublished giant dictionary from 1680–1709, which is especially rich for the contemporary vernacular, including peasant language. His work inspired others to collect material, not all of which has been utilised in published dictionaries. The earliest grammars of Danish, published in the late 17th c., by Pontoppidan 1668 and Syv 1685 (Skautrup 1947, 285, 351), are especially valuable for morphology. Earlier, the phonetician Aarhus in his *De literis* (1586), gave valuable information on contemporary pronunciation (Skautrup 1947, 189, 193f.). In the mid-18th c., Høysgaard wrote detailed works which are especially valuable with respect to pronunciation and syntax (Skautrup 1953, 13–16). Works on orthography, especially from the 18th c., often contain valuable information on pronunciation, e. g. an anonymous one from 1727 entirely written in an orthography close to the pronunciation, with accents (Skautrup 1953,

13; cf. the later edition by Caroline C. Henriksen, *Dansk rigssprog, en beskrivelse fra 1700-tallet*. København 1976).

As for texts intended to be written in dialect, they are rare before the 19th c., although there are strong dialect features, not least Jutish, in some texts which can be isolated by comparison (Skautrup 1947, 314f., 291). After Moth's previously mentioned giant effort, the chancery in 1743 asked district officials for reports on their regions, including conspicuous words and locutions (Skautrup 1953, 78). Much material was sent to *Videnskabernes Selskabs Ordbog* from 1807 on, and the lexicographer Molbech received collections from many collectors at his request in 1811, dealing with phonology and grammar as well as vocabulary (Skautrup 1953, 88ff.). A part of this material was made public in *Dansk Dialect-Lexikon* (1841), containing around 6,500 words alien to the common language, and some of the collections received are still preserved.

4.3. Swedish

In the period following the Reformation, two main currents can be discerned in written Swedish, Bible language and chancery language, both diverging in important ways from spoken language. The language of the Bible deviated by being morphologically conservative, but it avoided Danisms carefully. This provided the norm for the printed books emanating from the various printshops in Sweden. The chancery language is characterised by general Danish influence from the preceding period, which excluded archaic morphological forms, and by more Latin influence in the syntax. Of the wealth of material written in the period following the Reformation which remains unpublished, chancery texts are prominent, although Gustav Vasa's copy-book has been published (Ståhle 1975, 181, 9). Also many poetic texts, i.a. occasional poetry from the 16th and 17th c., remain in manuscript form (Ståhle 1975, 10, 37–40, 452–456). Of texts close to the spoken language (cf. Noreen 1903, 135–156), private letters increase drastically in number from the early 16th c., but only a small selection is published, mostly from government officials and learned men until 1700. An early example is Hemming Gadh's letters to a friend from 1498–1520, and later in that vein one has e.g. Gustaf II Adolf's letters to his mistress Ebba Brahe around 1615, and the letters of the nobleman Ekeblad to his brother 1639–55. Especially

close to the spoken language are letters from women of the court and the gentry, but less is preserved and published of those (cf. Ståhle 1975, 182). There are some diaries preserved from the late 1500s onward, mostly from kings, officials and learned men, but also from people like the minister Gyllenius (1622–75). Diaries and letters from soldiers in the war of 1700–18, from various layers of society, have been edited in many volumes. There are a few autobiographies preserved from before 1700. Agneta Horn's *Beskrivning över min vandringstid* from ca. 1660 has been taken by some to show contemporary colloquial language in the Stockholm region. Swedish dramatic tradition is quite rich from early on (Larsson 1988, 13–16, 19–46), and already in the late 16th c. one can find quite colloquial style there, e.g. in *Doctor Simon* (Ståhle 1975, 34). In the 17th c., colloquial elements are mostly concentrated in interludes and rustic scenes (cf. Ståhle 1975, 182f.), but putative colloquial forms become much more generally applied around 1680 (Wessén 1960, 105f.), like in some dramas by Börk in 1688. Gyllenborg's *Swenska språttöken* from 1737 shows elements of standard spoken Swedish (Widmark 1969), and Ristell's *Några Mil ifrån Stockholm* from 1787 marks the temporary triumph of the educated colloquial language of Stockholm on the Swedish scene.

The first Swedish grammars (Noreen 1903, 183–267) are from the late 17th c., by Aurivillius 1684 and Tiällman 1696. Two 18th-c. textbooks for Germans benefit from the contrastive perspective: Heldman's *Versuch Einer Schwedischen Grammatica* (1738) and Sjöborg's excellent *Schwedische Sprachlehre für Deutsche* (1796), containing a wealth of information on colloquial language. Other important grammars from that period include Sahlstedt's *Swensk Grammatika* (1769) and Botin's *Svenska språket i Tal och Skrift* (1777), as well as Moberg's *Försök till en lärobok* (1815). Some works on poetics and metrics give useful information on phonology, such as Arvidi's *Manuductio ad poesin svecanam* (1651), which includes a rhyme dictionary, as well as Nicander's *Öförgripelige Anmerckningar Öfwer Swenska Skalde-Konsten* (1737). Considerable information of that kind can also be extracted from the numerous contributions to the orthographic debates which arose from time to time from the end of the 17th c. These include Aurivillius' *Cogitationes de Lingvæ Svionicæ ... recta scriptura & pronunciatione* (1693) and Hiärne's *Orthographia*

Svecana (1716). Sweden has a rather rich lexicographical tradition from early on, which has been systematically investigated in recent years, see esp. Jacoby (1990); Hannesdóttir (1998, with refs.), cf. Noreen (1903, 183–267). All of this material, including unpublished work, has been utilised in *Svenska Akademiens ordbok*, which is approaching the end of the alphabet. The first printed lexicographical work for Swedish was *Variarum rerum vocabula* (1538), a rather comprehensive Latin-Swedish dictionary, thematically arranged and containing many rare words. Schroderus published a revised version of Comenius' phrase book *Janua linguarum* in 1640. More in the style of modern dictionaries were Grubb and Gothus' so-called *Lexicon Lincopense* of 1640, as well as Spiegel's *Glossarium Sveo-Gothicum* (1712). Schulze finished a colossal contemporary dictionary in 1755, but it was never published. Weste's *Svenskt och fransyskt lexicon* (1807) is particularly useful i.a. for its information on accent.

From the beginning of the 17th c. onward, there are a number of short texts preserved where the authors tried using dialect, with various degrees of success, and around the mid-18th c., such texts increase greatly in number (Noreen 1903, 156–180). The oldest texts in dialect are some rustic scenes in plays from the beginning of the 1600s, and such scenes occur into the 18th c. The bulk of older dialect texts, however, consist of wedding poems from the late 1600s through the mid-18th c. (Hesselman 1937). In the beginning, Dalecarlian was the most prominent dialect in these genres. As for descriptions of dialects (Noreen 1903, 268–286), Bishop Benzelius inspired many collections of dialect words from different parts of the country in the first half of the 18th c., i.a. Neogard's Gutnish collection with observations on the dialect. Most of this material has not been published, but it formed the core of Ihre's *Swenskt dialect lexicon* (1766), supplemented by collections initiated by the latter. The first detailed dialect monograph was Sven Hof's excellent *Dialectvs vestrogothica* (1772), which included a many-faceted grammatical introduction.

4.4. Norwegian

Over the course of the half-century after the Reformation, the last vestiges of the old Norwegian writing tradition disappeared, with especially some peasants' diplomas from Telemark holding out the longest (Indrebø 1951).

But there were a large number of Norwegianisms in what Norwegians wrote in Danish in the 16th c., and to some extent in the following centuries, not least in the vocabulary. What little there is of Norwegian dialect texts from the Reformation until 1814 has been edited by Venås (1990). From the mid-1600s on, a number of wedding poems in dialect are preserved, and this dialect literature increased with time and became more varied. Most parts of the country are represented, but the West and Telemark have contributed the most. Of works about the dialects (cf. Jacoby 1990, 731–736), the first one to be published was Jenssøn's *Den Norske Dictionarium* (1646), a high-quality glossary of almost 1000 words from Sunnfjord. Moth (cf. 4.2.) received a number of Norwegian dialect glossaries in response to a query in 1697–98. In the wake of a questionnaire from the Danish chancery in 1743 (cf. 4.2.), a number of independent glossaries were compiled, including Leem's *Een liden Glosebog* from 1743–48, with around 4000 mostly West Norwegian words. In the late 18th c., several important dialect glossaries were compiled but not published. Hallager's *Norsk Ordsamling*, published in 1802, incorporated various older collections into a West Norwegian base, and included a grammatical sketch with general characteristics of Norwegian phonology, morphology and syntax. The work of Ivar Aasen from the 1840s onward concerning dialect words and grammar revolutionized the situation, as he systematically investigated all the genuine rural dialects with remarkable thoroughness. Much information about the Danish-based upper-class colloquial language ("den dannede dagligtale") is found in the works of Knud Knudsen from the 1850s onward, and it emerges especially in Ibsen's late dramas from a bourgeois milieu from the late 1800s.

4.5. Faroese

Faroese language records (Werner 1964) are quite sparse from the Reformation until the 1770s, when Svabo started collecting material for a Faroese dictionary (published in 1966) and writing down traditional ballads in archaic language but reflecting dialect differences. Others continued collecting ballads in the following decades, and most although not all of that material has now been published. The earliest texts in contemporary Faroese were Schrøter's gospel and saga translations from 1822–32. In 1846, Hammershaimb in his text

editions laid the foundations of the present etymologically based orthography, and in 1854 he published the first real grammar of the contemporary language. It was only in the 20th c. that extensive and varied literature in Faroese emerged. A certain archaizing tendency in the accepted norm has led to the use of written forms that are unknown in the spoken language.

4.6. Icelandic

In Iceland (Ottosson 1988; 1992) there was only one printshop from the beginning in the mid-16th c. until 1773, printing almost only religious literature. Other kinds of literature, including popular poetry, were transmitted in numerous paper copies, to the detriment of text quality. The development of the printed norm after 1600 has scarcely been investigated. The extent and variety of printed material in Icelandic increased greatly from the late 18th c. From the mid-19th c., all that was published was intended to adhere to the puristic norm which had become accepted, including certain archaic elements. Before that, purism in various forms had influenced the writings of many authors, with the great manuscript collector Árni Magnússon introducing Old Icelandic as an ideal and a corrective. Purism inevitably led to certain differences between written and spoken language, while its elimination of foreign elements in syntax and vocabulary brought the two closer together. However, there has not been much effort made to ascertain the properties of the spoken language of this time. There are a number of private letters preserved from the 17th c., and a great many from the late 18th c. onward, and a fair number have been edited. Autobiographies and stories from one's own life become common in the 17th c. Dramas aiming to show popular discourse are not preserved until the late 18th c., and they are few in number. In many editions through the mid-20th c. of previously unpublished texts, the language has been corrected in accordance with the puristic norm, affecting especially post-classical inflections and word forms. The first grammars of Icelandic, the one by Runólfur Jónsson published in 1651, and the long unpublished one by Jón Magnússon (d. 1738), are especially valuable for morphology. Rask's grammar from 1818, although revolutionizing the analysis, suffered from a basic confusion of the classical and modern language. The earliest dictionaries, from the 17th

c., were geared to the needs of those reading the old literature. The unpublished giant and chaotic dictionary of Jón Ólafsson from Grunnavík, from the first half of the 18th c., is basically synchronic, as is the first published one, by Björn Halldórsson (1814).

II. Perspectives in research history I: From the beginnings to the middle of the 20th century

6. Previous attempts at writing a Nordic language history

1. Preliminary remarks
2. Some general problems of writing language histories
3. The most important Nordic language histories. A brief overview
4. Conclusion
5. Literature (a selection)

1. Preliminary remarks

The problems of writing language histories have been acute at least since the breakthrough of historical and comparative linguistics around the turn of the 18th century. Here, I shall not discuss the foundation of this new scholarly method in Scandinavia (see arts. 15 and 16), but shall begin with the first language histories in a proper sense at the beginning and around the middle of the 19th century.

2. Some general problems of writing language histories

2.1. The scope of the investigated material varies quite a lot in the existing Nordic language histories. Most of them concentrate on phonology and morphology (a typical example is Noreen 1889); an extreme is Hesselman (1948–53), who during his lifetime only succeeded in writing some 300 pages on the weakening of unstressed syllables (apart from an introductory overview). On the other hand, authors such as Skautrup (1944–70) and Bergman (1968) distinguish themselves by a variety of approaches, e. g. Skautrup includes not only syntax and stylistics, personal and place-names, but above all social stratification, a topic which has attained especially high currency during the last decades. Other authors confine themselves to adding syntax to phonology and morphology, thus remaining within the limits of internal linguistics; a typical example is Wessén (1941–56). Special studies of a still more limited scope, including

dictionaries, will in general not be mentioned in the following survey.

2.2. Another problem is the combination of diachrony and synchrony (see art. 3). It is self-evident that diachrony has to be the dominant principle, but how shall we combine it with synchrony which is such an important aspect in modern linguistics?

The problem has been acute ever since Saussure and the breakthrough of structuralism. The diachronic approach has long been dominant in Nordic linguistics, longer than in other language areas, but the relation between the two aspects was felt to be a problem by language historians long before that. To be sure, the Neogrammarians on the whole kept to Hermann Paul's axiom that the historical method was the only scholarly approach to language; however, not only did Paul himself take present-day German as a point of departure in his *Deutsche Grammatik* (Paul 1916–20), but Nordic language historians also tried to combine the two approaches in one way or another. Rydqvist (1850–83) already confronted Old Swedish and Modern Swedish sounds and forms and drew the diachronic lines between them, and Noreen's (1903–24) pioneering achievement was that he strictly separated descriptive and "etymological" phonology, primarily treating the former. There may be different ways of combining the two approaches, but the most practicable method is probably an alternation between periods which can be treated synchronically and those which can be treated best diachronically. As mentioned in art. 3, the precondition for this is that we have some idea for periodizing a language history.

2.3. To be sure, every periodization is more or less artificial, linguistic development being continuous and in reality not amenable to borderlines (cf. in particular Coseriu 1974), but

according to a more pragmatic interpretation we can discern more static from more dynamic periods. The Old Norse period e. g. certainly is comparatively stable, if we take into account the rich and relatively uniform Old Icelandic tradition, and also “classical” Old Swedish with its well-preserved morphological system appears to be more static than the disintegration and restructuring that followed (although one must admit that this difference is somewhat abstract and artificial). But in fact, periodizing is to some extent a matter of opinion, and in the course of time different propositions for periodizing Nordic language history have been put forward. While Rydqvist (1850–83) because of the lack of material from the epoch between Old Swedish and Modern Swedish hardly had any other choice than confronting the two main stages of Swedish, Söderwall (1870) was already able to divide Swedish language history from the introduction of Latin script into four epochs, to be sure mainly on general historical grounds (Old Swedish; “Kalmar union” = late Middle Ages; Reformation until the mid-18th century, mid-18th century until Söderwall’s own times), a pattern which has remained the basis for the periodization of all Nordic languages. The pattern has, however, been widened and differentiated, above all by incorporating Proto-Nordic from its beginnings (2nd c.) to about 1050, and by considering special developments in the different national languages. Thus, Proto-Nordic in most language histories has a subdivision, called by different names, such as Late Proto-Nordic/“Spätturnordisch”, the period of syncopation and umlaut or the like (ca. 500/550–800), the following period being called the Viking period (above all in Norwegian language history) or respectively Runic Swedish, Runic Danish. The history of the Icelandic language which has not developed far from Old Icelandic (apart from its phonology) most simply may be divided into Old and Modern Icelandic, while the term Middle Icelandic is not generally used. The periodization of Danish and Norwegian language history differs most from the Swedish pattern. Danish differs from the other Nordic languages in so far as the weakening of unaccented syllables and the typological restructuring on the whole belong already to pre-literary times (ca. 800–1100: Old Danish/*Olddansk*, *Runedansk*), and the period corresponding to Old Nordic/Old Norse in the other languages is differentiated by the term *Ældre Middeldansk* (1100–1350), while minor differences from Swedish in the

subdivisions of New or Newer Danish play a more subordinate role. Due to special historical conditions, periods of Norwegian language history are only partly comparable to the other Nordic languages: after Middle Norwegian (1370–1530), which still may be compared to “middle”, i. e. transitional, periods in other Nordic languages, Norwegian died out as a written standard languages, and therefore the whole period up to the beginning of the 19th century may be called the Danish period. The time of national revival which followed with the development of two Norw. standards is of different character than the corresponding period in the neighbour languages, a time full of both internal and external linguistic events which require special attention. Moreover, the criteria which periodizing rests upon, are in part different in the different Nordic languages: for Swed. and Dan. this essentially is the development of the standard (a new standard in Swedish, the stabilization and refinement of the older standard in Danish), for Norw. the destandardization, for Icel. the changes in the phonological system.

In view of such a confusing picture, which is complicated even more by some periodization problems which in recent times have been a matter of debate (e. g. the definition of Proto-Nordic: does it end in 500, 550 or 600?), we understand that some language historians renounce any strict periodization and keep to the most current periods (e. g. OSw./ModSw. as in Pettersson 1996). And it is obvious that the problem is especially difficult in a language history which covers the whole Nordic area: here some sort of a compromise between the different languages and between the different criteria is unavoidable. To be sure, a firm basis may be found in the notions of Proto-, Old and Modern Nordic: they are fairly clearly defined and can be treated synchronically, as more or less coherent systems, whereas the periods in between may be better treated diachronically. In this way a combination of diachrony and synchrony, of descriptive and historical linguistics, may be achieved; moreover, the method can be refined even more by pointing to preceding and succeeding systems in the diachronic parts and by referring to diachronic developments as explanations for synchronic phenomena. Through such a practice, a reasonably well-rounded picture of the dynamic/static interaction which constitutes language history may be achieved. It remains to be seen how far these principles have been

realized in the language histories hitherto published. As mentioned in art. 3, periodization is not quite consistent in this handbook. The basic periods are really synchronic, defined by systems, but divisions have also been made between purely diachronic periods, the editors having felt the need to signal breaks in a long development without being able to establish synchronic systems.

2.4. Apart from the problem of combining diachrony and synchrony, different approaches have been used in methodology in previous Nordic language histories. To be sure, methods of language history have not been discussed much in Nordic linguistics until recent times, and those actually applied in Nordic language histories do not bear witness to deeper methodological reflections. A “classical” work such as Wessén (1941–56) (at least in its original version) did not even have an introductory chapter where methods could have been discussed, and especially Norwegian language histories (in particular those by Nynorsk authors as Hægstad (1906–42) or Indrebø (1951)) have been severely criticised for having followed not only pragmatic principles, but above all the national ideology (cf. Hovdhaugen et al. 2000).

Comparative aspects are also rather rare, as are contrastive methods, since historical contrastive linguistics has been launched only in recent times. To be sure, it was natural for Rask and his generation to concentrate on the systematic comparison between different languages (also within the Nordic area), but since pan-Nordic language histories are rather few, comparative/contrastive aspects are in general not very well-developed, most of the existing works having concentrated on one language, so that comparison with neighbour languages is more or less accidental. Of comprehensive Nordic works, that by Haugen (1976) uses consequently the comparative approach, while the recently published Barðdal et al. (1997) pretends to do this as well, but is spoiled by other serious weaknesses.

Most of the Nordic language histories are more or less traditional in a chiefly neogrammarian sense: not only the works of the pioneers of neogrammarian methods such as Noreen and Kock, but also more recent works, e. g. Wessén (1941–56), which keeps to the principle of sound laws and analogy throughout, while Pamp (1971) is structuralist in phonology, but traditional in the other areas. A major question concerns the relation

between internal and external features of a language’s historical development: how far the description – be it diachronic or synchronic – is purely linguistic and how far it also considers socio-cultural facts as being relevant to linguistic development. In fact, there are not quite few Nordic language histories which more or less exclusively focus on internal developments. Although neogrammarians on the whole were not unaware of social influences on language, a pioneer like Noreen kept largely to internal linguistics: Noreen (1913) has a long introductory chapter in form of “a general historical survey”, exclusively dealing with facts such as extension of the Nordic language area, sources and the like before immediately going over to the history of the individual sounds and inflexions. A similar case is Wessén (1941–56) which, to be sure, on several occasions considers the mutual relations between standard and colloquial language, but otherwise is a pure grammar. In fact, quite many papers and books, which are called “language histories” are in reality “historical grammars”: this type of language history has been so common in Scandinavian linguistics that Inge Lise Pedersen (1995) states that at the university of Copenhagen as late as in the 1960s language history was essentially defined as historical grammar. It might be worthwhile to remember this difference when studying Nordic linguistic history: both genres may be scholarly disciplines in their own rights, but we must be aware that pure grammar is not language history. And we may also agree with Pedersen that language history and research on colloquial language belong more closely together than before, but that the ultimate goal of a Danish (and Nordic) language history on sociolinguistic grounds cannot be achieved yet. In contrast to historical linguistics in Copenhagen, Pedersen points to Skautrup, professor at the university of Århus, whose large-scale Danish language history (1944–70) may serve as a model, combining precise linguistic data and general cultural-historical background or, as Petersen puts it, describing language history as sociolinguistics. Skautrup’s work is not very modern in method, but for internal aspects, it goes beyond the normal traditional framework by trying to give a coherent description of sounds and sound systems, standard language and linguistic variants, different linguistic levels etc., while for external influences it is remarkable in embedding social and stylistic strata in political and socio-cultural facts; this pattern represents a

unique Nordic language history and indeed may serve as a point of departure for further research. Of course, socio-cultural relations play – in some way or another – a part in other Nordic language histories as well: already Rydqvist (1850–83) made many references to Swedish dialects, Söderwall (1870) pointed to special forms in OSw. chancery language, and in particular in Norw. language history (especially Indrebø 1951) the political and socio-cultural background plays a comparatively great part, due to the significant political and social conditions which to a high degree determined the fate of the language, in particular in the 19/20th c. – facts that do not diminish Skautrup's unique achievement of a systematic sociolinguistic approach.

3. The most important Nordic language histories. A brief overview

If we look at the various existing Nordic language histories, perhaps the most conspicuous fact is that the majority of them is limited to one of the Nordic languages. In *Brytpunkt* (2000) the authors claim several times that, on the one hand, more easily readable handbooks at language history should be written, and on the other hand, that more research than previously should be done in a general Nordic instead of a narrow national framework. It is generally acknowledged that work in Nordic humanities has hitherto been strongly limited to national boundaries, and therefore it will be useful in this overview to separate pan-Nordic language histories from works confined to one specific language. That the present work aims at a comprehensive perspective, is self-evident.

3.1. National language histories

The state of this art is quite different in the different Nordic countries. While in Iceland and the Faroe Islands works covering the whole language history are practically still lacking, the Danes have a fine, though perhaps in some respects somewhat outdated reference book in Skautrup (1944–70) and Sweden and Norway have several shorter, quite useful, but not especially outstanding handbooks.

3.1.1. Icelandic

Icelandic language history exists mainly in an Old Norse, viz. OIcel. – ONorw. frame-work.

There is a multitude of such handbooks, in general in the form of grammars not only for scholarly purposes but also for practical use in the context of Old Norse literature.

Here the “classical” work is still Noreen (1884) (5th ed. 1970), a thorough reference book on ONorse phonology and morphology on a diachronic basis: although strictly neogrammarian in method and based on partly outdated material, it is still the most comprehensive and reliable grammar of the ONorse languages, indispensable for every deeper understanding of ONorse. To be sure, there is no syntax in it, but in this field many generations of scholars and students have relied and still may rely on Nygaard (1905), a pioneering work for its time which among other things also paved the way for ONorse stylistic research.

Besides Noreen numerous shorter handbooks on ONorse grammar have appeared, one of the first (after Rask) being Wimmer (1870), which, thanks to a German translation gained international attention. But the most weighty of them was probably Heusler (1913), which not only gives clear and exhaustive information about the ONorse phonological and morphological systems, but also includes an excellent syntax section. Most of these handbooks are in the neogrammarian tradition, some more synchronic in approach (e. g. Iversen 1922, which also includes syntax), some more diachronic (Wessén 1958), and most of them aim to be used by students; there are only a few which deserve special mention: (1) Some of the most recent examples of this genre claim to be innovative in method, although in the traditional framework of sounds, inflexions and syntax. The authors of Hanssen/Mundal/Skadberg (1975) claim to give a historical description of 13th c. ONorse according to recent linguistic theory and terminology, but in reality only the phonology is partly in accordance with this programme (e. g. the notion of phoneme or the well-known explanation of umlaut through phonemizing of earlier allophones), while the alleged backward perspective in phonology and inflexions is only in part carried out. – More consistent in carrying out its innovations is O. E. Haugen (1993), which in phonology tries to combine synchrony and diachrony by emphasizing both aspects (e. g. on umlaut-phenomena) and in morphology abandons the traditional class division according to Proto-Nordic stem-suffixes in favour of a purely synchronic inflexional typology, the advantage of which, how-

ever, may not be self-evident. – (2) As indicated by the title, Gutenbrunner (1951) more than the usual ONorse grammars, follows the diachronic approach, tracing the historical development of sounds and inflexions until ca. 870 in a rather traditional but informative way, though not neglecting synchronic aspects. – (3) A nearly unique position is held by Hægstad (1906–42, here *Islandsk/islenzka* 1942). Hovdhaugen et al. (2000) are perfectly right in reproaching Hægstad for not having a method: being mainly motivated by ideological considerations, he cannot even be called a neogrammarian. On the basis of a large amount of material, mainly from OIcel., he mentions more or less at random a lot of linguistic features – both phonological and morphological – in order to show that Icelandic is part of the southwestern branch of Norwegian. It is only at the end that his analysis becomes really interesting, when he presents his results and tries to define the dialect-geographic position of (Old)Icelandic and its historical background in emigration from Norway, dialect mixture and subsequent levelling. This is interesting in itself, but we cannot call it an Icelandic language history. The dialect-geographic relations between Icel. and Norw. is also the subject of two more special and also more systematic studies, which deserve to be mentioned here because of their language historical implications: Chapman (1962) and Bandle (1967). Both of these argue for the thesis that common innovations rest on diffusion and not so much on a common predisposition; moreover, Bandle claims to have found traces of original dialect mixture in the Icelandic vocabulary; cf. also Sandøy (1994).

As mentioned before, an Icelandic language history does practically not exist yet, but its absence may be compensated for by a single small book like Sveinsson (1991), moreover by some collections of historically oriented papers edited by Halldór Halldórsson (1964) as well as by the monograph by Bandle (1956).

3.1.2. Faroese

Like Icelandic, a comprehensive history of Faroese has not yet been written, but in this case it is due to the poor sources from older times and to the fact that the Far. language only in recent times has received more attention. As we learn from Hægstad (1906–42, here 1917), Hamre (1944) or Hagström (1967), until Svabo at the end of the 18th c. wrote

down ballads and composed his dictionary, sources consisted chiefly of single words or names in documents otherwise written in Danish, but nevertheless several attempts have been made at drawing conclusions from this material, in particular in the field of phonology. The most complete analysis is given by Hægstad in connection with the western Norwegian dialects, but it has the same shortcomings as Hægstad's work on Icelandic: lack of systematizing and method. As in the Icel. work, Hægstad's chief concern is to show the relationship between Faroese and the north-western Norw. dialects, but here, contrary to the Icel. case, he also considers the vocabulary, claiming to be able to prove that Faroese vocabulary is a mixture of different Norw. dialects, while its phonology is definitely western Norw. in character.

While Hægstad's research is not satisfactory methodologically, some younger scholars have tried to describe various specialized areas in more thorough investigations. Hamre (1944) aims at filling the gap in Faroese language history between the Middle Ages and Svabo's documentation by investigating the sound system, and Hagström (1967) examines the fate of the weakly stressed vowels *i* and *u* which has led to a complicated pattern of different mixtures in the modern dialects. Others have contributed with minor studies (e.g. Christian Matras, Jørgen Rischel and Otmar Werner).

3.1.3. Norn

The dialectal status, origin and death of Shetland and Orkney Norn have often been discussed, but these studies are often not very reliable guesswork. A famous exception is Jakobsen (1928), whose introductory chapter yields valuable information on the history and relationship of the language, and in recent times it has been Michael Barnes more than anyone else who has done very good work in this field, e.g. in the excellent little book *The Norn language of Orkney and Shetland* (1998), which gives a thorough critical survey from colonization around 800 to the demise and death of the two variants around the mid-18th century or perhaps, (for Shetland Norn) the 19th c., including their survival in words and names up to the present day.

3.1.4. Norwegian

If we look at historical linguistic work carried out in Norway during the last 100–150 years, we notice a multitude of important books and papers ever since the pioneering work of Ivar Aasen, which, however, concerns dialectology more than language history. Indeed, Norwegian linguistics had its grand epoch at the end of the 19th and the beginning of the 20th c., when a breakthrough occurred in onomastics with Oluf Rygh, when Hjalmar Falk and Alf Torp wrote their major works on language history and Marius Hægstad wrote his monumental *Vestnorske maalføre fyre 1350*. In more than one case this was pioneering work at that time, but seen from today, their innovative character has faded. Falk and Torp have become famous both for their etymological dictionaries (1903–06 and 1919 respectively) and their analyses of the history of Dano-Norwegian phonology and syntax (1898, 1900), but neither of them has accomplished a Norwegian language history of wider range, and Hægstad's work, imposing as it is for its wealth of material, suffers, as has already been mentioned in connection with Icel. and Far., from the lack of method, though one must admit that he was a real pioneer in descriptive historical linguistics.

The first attempt at writing a complete Norw. language history was Indrebø (1951), which covers all the periods from Proto-Nordic to the present. Written in an extremely conservative Nynorsk, it is, however, not easy to read for foreigners and moreover, it is quite traditional in method, although one might acknowledge that to a pretty high degree it takes account of the external language history in the form of socio-cultural relations.

Before that, probably the best known Norwegian language history had been published: Seip (1931), but as expressed in the title of the book, this work does not cover the whole history of Norw., ending around the death of the Norw. written language. It was later supplemented by Seip/Saltveit (1971), so that it can be said to be another complete language history, comprising also the Dano-Norwegian period in Early Modern times and the national revival from 1814/1830 onward. The new parts are, however, quite short and follow exactly the method of the previous book, with surveys of every single period from the language's external situation through sources to the language's internal system. These surveys are on the whole in the neogrammarian tra-

dition, in a way synchronically arranged, but mainly concentrating on the diachronic developments from one period to another. Seip's work cannot be called innovative, and it is at some points spoiled by his stubbornly maintained opinion that many of the so-called Danish forms in reality were genuine Norwegian ones. Seip's personality had a central position in his time, not least because of his fate during the German occupation, but has now lost much of its fascination.

Besides the two central language histories, several minor handbooks of Norw. language history have been published: from Lundeby/Torvik (1956) through Skard (1963ff.) to Ernst Håkon Jahr, who – besides several books on more special historical topics – has published shorter overviews of Modern Norw. language history and edited collections of papers in that field (see Jahr 1989). Language policy plays a prominent role in the shorter accounts mentioned, while linguistic methods in most cases are traditional, the purpose of several of these books being elementary.

3.1.5. Swedish

Perhaps the most extensive research work has been done in the field of Swedish language history, but most of it has been carried out in minor studies on special problems, and the works which have a wider range and may rightly be called language histories are nearly all in the neogrammarian tradition, which in Sweden has been even stronger than in the other Scandinavian countries.

In spite of the promising beginnings of relatively modern historical-comparative research with Johan Ihre (Noreen 1903–24 vol. 1, 212), it took a comparatively long time until the breakthrough of a really modern historical linguistics around the mid-19th c. Rask's pioneering work certainly became known also in Sweden at an early date, the first pan-Scandinavian language history by Petersen also had a Swedish section (1830) and not much later Rydqvist's volumes (1850–83) began to appear, but this work, which is often quoted as the first of the Swedish language histories, has various shortcomings which make it doubtful whether it is right to call it modern. In many respects, it comes up to the knowledge and methods of its time, but sometimes lapses into pure speculations; and moreover it suffers from a serious lack of material between Old and Modern Swedish. Rydqvist

may therefore be called a pre-neogrammarian rather than a real neogrammarian.

The real breakthrough of Swedish neogrammarian historical linguistics came a short time afterwards with the two “grand old men” Adolf Noreen and Axel Kock. As early as 1870, K. F. Söderwall had modernized Swedish language history in his book on *Hufvud-epokerna*: his focusing on sounds and inflexions, his periodizing into four epochs – Old Swedish, Late Middle Ages (“Kalmariunionen”), Early Modern Swedish (Reformation to mid-18th c.) and mid-18th c. to the present – and to some extent also his consideration of external linguistic features have remained as a model for both language history and historical grammar, although Söderwall’s name soon was overshadowed by Noreen and Kock, who thanks to their contacts with the Leipzig school of linguistics introduced the neogrammarian method into Sweden and in this way exerted a lasting influence in Scandinavia. Of the two scholars, however, only Noreen wrote a more comprehensive language history (Noreen 1889), which is incomplete in so far as it concentrates on the Old Nordic period(s) and in fact is a historical grammar rather than a real language history. Noreen is more generally known for his grammars of Old West Nordic (1884) and Old Swedish (1904), which have kept their position as neogrammarian classics until the present day, while Kock has become famous for more specialized studies, in particular on Swedish (and Nordic) accentology.

Many younger Swedish scholars have followed the historical tradition founded by Noreen and Kock, but none of them has produced the large comprehensive language history one might have expected in view of the strength of this tradition. The refined neogrammarian Bengt Hesselman tried to write a pan-Nordic language history (Hesselman 1948–53), but died before he could complete it (see below). Wessén (1941–56) did complete his *Svensk språkhistoria*, comprising the history of sounds, inflexions, word formation and syntax, so it is still an important handbook for students and researchers and may in some respects still be called a classic, but it nevertheless has its shortcomings. Keeping to a dry neogrammarian tradition, Wessén has neither a theory nor a methodology of his own; both his periodization and the division into levels of description are purely traditional; his explanations are entirely in the neogrammarian spirit of sound laws and analogy

and what is perhaps most deplorable: the embedding of linguistic features in a cultural and social context is minimal, so that the character of the whole work is that of a historical grammar rather than a language history. To be sure, Wessén’s manual has several good qualities (arrangement of phenomena in groups such as vowel changes, assimilation etc., comparison with West Nordic phenomena, relations between standard and colloquial language), but on the whole it is unsatisfactory and a real, comprehensive Swedish language history is still to be written.

During the last decades, however, several short handbooks on Swedish language history have been published. They are in general more or less popular or elementary, but most of them have wider methodological perspectives than the purely internal-linguistic one. Bergman (1968/1984) is not only very readable, but as well as treating sounds, inflexions, syntax and vocabulary, also considers social stratification, language cultivation etc. Pamp (1971) which has university students and interested laymen as a target audience, is, however traditional in general, consequently phonematic in the phonological parts and in the introduction has a number of valuable general remarks on linguistic change and phonological, morphological, syntactic and semantic developments, while Pettersson (1996), one of the best of these short handbooks, starts with an overview of methods and research history from Bureus to the newest trends at the end of the 20th c., and in the central parts of the language history she applies not only systematic, but also e. g. sociolinguistic aspects (on the resurgence of historical linguistics in Sweden cf. Teleman 2000).

3.1.6. Danish

On the whole, work on national language history has perhaps not been so intensive in Denmark as in Sweden and Norway, it has instead to a high extent been concentrated on a single scholar’s, Peter Skautrup’s, achievement. As mentioned in art. 15, Danish scholars have made important contributions to language history at the dawn of modern humanities, above all in the works of Rasmus Rask and N. M. Petersen (see below), but after that not many books on Danish language history appeared. Danish linguists were not inactive in the latter part of the 19th and the first decades of the 20th c.; we can mention such illustrious

scholars as Ludvig Wimmer, Vilhelm Thomsen and later also Lis Jacobsen, and from 1901 Verner Dahlerup began to prepare his great dictionary (ODS). Dahlerup also wrote one of the first short handbooks of Danish language history which came up to modern standards, comprising both internal and external language developments (the genre was then continued by authors like Bertelsen (1913) and Oxenvad (1933), who, however, never reached the same level).

But the overshadowing standard work on Danish language history, both in size and quality, is Skautrup (1944–70). Let us have a brief look at one chapter of it: “Younger Middle-Danish” (Yngre middeldansk, 1350–1500). After a rather detailed account of the historical, economic and cultural frame, there follows an overview of the sources which is so comprehensive that it may be called a complete survey of that time’s repertoire of text types. Then follows an account of the language situation in general and of orthography, sounds, inflexions and word order in detail, and before the author comes to a conclusion, he treats (in a separate chapter) some special aspects, in particular stylistic and sociological ones. Without being pedantic, in the chapter “Younger Danish” (Nyere dansk, 1750–1870) Skautrup keeps to the same pattern, but adapts his account to the much more complicated situation of e. g. the social conditions of the language. To be sure, Skautrup is in general traditional in the description of language, but modern as to the variety of aspects included, and although traditional – with his background in the 30s and early 40s –, he incorporates systematic aspects to an extent which is unusual for his time; he considers a multitude of aspects hitherto mostly neglected, not least stylistics, social history and even language psychology. All in all, his language history may still be called a genuine classic, probably the last large work written by a single man in the field of linguistics.

Karker (1993) is of the opinion that Skautrup in a way is out of date but has no ambition to replace it by his own work: this book is just a short handy manual, rather elementary in concept and remarkable for its ever present exemplification with concrete texts. When speaking of Danish language history after World War II, one should also mention Diderichsen (1968), remarkable already as a historical work by a structuralist, but unfortunately unfinished because of the author’s untimely death.

Otherwise, Danish historical linguistics has almost been at a standstill during recent decades and also sociolinguistics’ acceptance has been rather slow, probably because of the dominant position of structuralism/glossematics. But now, both language history, sociolinguistics and parole linguistics in general may be about to enjoy a comeback (cf. Hansen 1983).

3.2. Comprehensive Nordic language histories

In *Brytpunkt* (2000) the authors time and again call for pan-Nordic perspectives. This is justified by the fact that there are relatively few works which cover all the Nordic languages. Rask, as the founder of historical-comparative linguistics and endowed with wide knowledge and ingenious analytic capacity, undoubtedly had the prerequisites for writing such a work, but did not do it, probably because of the lack of material at his disposal and partly because of his somewhat onesided interest in formal linguistics. It was therefore Jacob Grimm who for the first time dealt with the majority of Nordic languages in his *Deutsche Grammatik*, which in reality was a Germanic grammar: although he covered them in different chapters, he arranged the material in such a way to suggest a general development from Old Norse to modern Swedish and Danish. Of Scandinavian scholars, however, it was N. M. Petersen, a Dane and a school friend of Rask’s, who was the first to accomplish a language history covering the whole of the Nordic language area (1929/30). Written for the award of the “Society for the advancement of Danish literature”, it was originally arranged synthetically (comprising all the modern Nordic languages together), but for publication it was divided into a Danish, Norwegian and Swedish part. Referring to Rask as his teacher and predecessor, Petersen emphasizes in the preface his historic-diachronic method, aimed at an account of the linguistic development on historical grounds from Old Nordic as the proper “mother tongue” to the various modern Nordic languages. He operates from a well-balanced combination of diachrony and synchrony, makes comparisons with other (Old) Germanic languages (in particular with “Mösogothic” and Anglosaxon) on the one hand and masters to an admirable degree the many problems of more recent language history on the other hand. His dividing of Danish

language history into four periods is not too far from later scholars' opinions (although the terminology may not be fully adequate); he has e. g. a good understanding of the different kinds of umlaut or the general development of Danish from a synthetic type of language to a simplified one through weakening of endings and functionalizing of word order or word combinations, and he also considers the possible reasons for these developments. It is therefore not surprising that his language history remained an important reference book for quite a long time.

In the meantime, the interests of research and of university teaching focused more and more on national language history on the one hand and on the old languages, in particular Old Norse, on the other, so it was quite a long time before new comprehensive Nordic language histories were published. In a way, Noreen (1889) may be called an exception, being an overview of at least several language stages and including all the Nordic languages, but for the most part it concentrates on the old languages up to the Old Nordic period; otherwise it is characterized by the well-known qualities of Noreen's works: solid knowledge of the language material, reliable neogrammarian methods, consciousness of systematic aspects, which, however, decrease towards the end. Characteristically, the main part of the book is more of a historical grammar than a real language history, but in a fairly long introductory chapter the general historical development is described. Although the 3rd edition in 1913 is revised and enlarged, much of it is out of date today. Another Nordic language history, Hesselman (1948–53), is therefore more up-to-date and has become a standard work in spite of the fact that it is incomplete. This work is in more than one respect remarkable: (1) it is largely built upon innovative material – from modern Nordic dialects, other colloquial language and place-names (as well as language material from older texts, runic inscriptions, loanwords etc.) – (2) it is largely focused on modern dialect geography, – and above all (3) it concentrates not on the general history of sounds but on very special phonological developments such as weakening of sounds (*ljudförsvagningar*), sound changes (*ljudväxlingar*) and sound shifts (*ljudförskjutningar*). The author gives not only exact descriptions of these phenomena but in most cases also explanations of many difficult details, and he does not focus only on the phonological features mentioned,

but includes a multitude of other phenomena which can throw light on the chief problems. Thus Hesselman's work has for several generations served as a general reference book on Nordic language history, although the author could not complete it before his death.

In spite of some severe criticism it has met, Haugen (1976) may still be considered the best pan-Nordic language history. It is comprehensive, concise and combines in an intelligent way diachrony and synchrony; it is only sometimes a bit too compact, so that it might be difficult to survey the phenomena in question. But in its multitude of points of view and its energetic composition it is an excellent piece of work: it considers both internal and external linguistic factors, it follows linguistic and stylistic stratification and even language cultivation, and it considers always the languages' socio-historical relations. It is obvious that Haugen in many ways endeavours to apply a strict structural method, but he is not always successful, keeping in many respects to rather traditional methods, but although this has been criticized, he has written a useful book which moreover has been improved and supplemented in a German edition (1984).

Some years later, Haugen published another overview of the history of the Scandinavian languages (Haugen 1982), this time much more focused on linguistic structures. After a short general introduction about some preliminary questions of e. g. "Methods and points of view", there follow separate longitudinal sections on phonological, morphological, syntactic and lexical structures, each of these chapters alternating between synchronic descriptions (of Proto-Scandinavian, of what Haugen calls "Common Scandinavian" ca. 550–1050, of Old Scandinavian and of the modern languages) and diachronic developments between these periods. Relations between the different levels of description are mentioned by cross-references, but the chapters in question are nevertheless quite isolated; this kind of organization may have made the author's work easier, but the readers never get a clear picture of *all* Scandinavian language structures at different times. Haugen's work also has other shortcomings: in addition to a series of factual mistakes or inaccuracies there is a methodological weakness. The goal of a structural (structuralist) language history is most strictly realized at the beginning (above all in the phonological section), but gradually gives way to a more or less traditional method. Nevertheless, the chief result, that there has

been a fundamental restructuring in the modern Scandinavian languages (apart from Icel.), is convincing and (on the whole) the book represents an impressive attempt to achieve a concise synopsis of a varied and difficult material.

The same cannot be said about another attempt at writing a synthesis of Nordic language history: Barðdal et al. (1997), the authors of which claim to have achieved an entirely new kind of language history, without chronological order, a real synopsis consequently arranged according to topics. In fact it is a puzzling piece of work and, in addition, full of factual errors. The authors of *Brytpunkt* (2000, 32) are perfectly right in wondering, why such a book could be published.

Two other works touching upon a Nordic language history, will only be mentioned in passing here. Bandle (1973) describes the division of Nordic dialects on the basis of their historical development, maintaining that we can discern three main dialect areas (West, South and North or Northeast Scandinavia), which, of course, in turn consist of various minor areas. – Braunmüller (1991/1999) has, on the whole, no ambitions to write language history, but declares his method as descriptive-structuralist. His book includes, however, plenty of historical information, to mention only one example: the opposite typological developments in the modern Scandinavian languages and in Insular Nordic.

4. Conclusion

As the result of this survey we can state that for minor areas and specialized problems, much valuable research work has been carried out in Nordic language history, but as regards more comprehensive surveys, much is still to be done. Moreover, in most cases working methods have been traditional, for the most part in the sense of neogrammarian patterns. The present handbook therefore tries to fill two gaps: by including a multitude of factual information and by considering all the methodological possibilities modern linguistics has at its disposal.

7. Outline of research on Nordic language history before 1800

1. Introductory notes
2. Early interest in language history
3. The battle for the most prestigious Nordic language history
4. Culmination of the search for prestige, and coming to one's senses, in the 17th and 18th centuries
5. Some names of interest in research on language history, 1500–1800
6. Literature (a selection)

1. Introductory notes

In the following, the notions “research”, “Scandinavian” and “language history” will all necessarily have a rather tentative and vague character. The time limit “before 1800” indicates that there is a shift in attitude to the topic after that time, and it is common knowledge that the era of Romanticism introduced history – and not least language history – of a new type, characterized by ideas about language as something essential for nations. Like nations, languages were looked upon as organisms. During the 19th c., research on language history became a more and more specialized task, methodologically dependent on comparative historical linguistics, with Scandinavian language history developed as a sub-branch of Germanic language history, which in turn is part of Indo-European language history. Perhaps this has given a false impression that nowadays we have all the answers to language history in general, and that earlier attempts in this genre all failed in a most ridiculous way. Thus the study of research on language history before 1800 has often been regarded as an activity engaged in only for amusement. However, if we try – at least for a moment – to abandon this view, skilfully established by representatives of 19th c. research, it will be possible to find more of interest than we first thought.

2. Early interest in language history

It is impossible to know when human beings in Scandinavia started to think about their language in a theoretical way, or about their language history. Let us assume that old texts are a prerequisite for language history study, not necessarily in written form. Even so, there is a period of about 1600 years when older and younger written texts might have been compared in Scandinavia, before 1800. E. g.

the famous Icelandic historian Snorri Sturluson showed an interest in language history and language change when discussing metric forms and explaining old words and expressions from heathen poetry in his “Younger Edda” (from about 1225).

Another piece of evidence of an early interest that we can connect with the notion “language history” is the *Gutasaga* from the Baltic island of Gotland. Here not only is the myth of the original settlement of the island rendered but also the later fate of the population – a third of them had to emigrate eastwards due to overpopulation. In the Greek empire they found people who spoke a related language. Kinship with the Goths, probably hinted at in the *Gutasaga*, was a source of Scandinavian pride and self-esteem in mediaeval times elsewhere in Scandinavia as well, most ostentatiously demonstrated in connection with a council in Basel in 1434, where the archbishop of Sweden, Nils Ragvaldson, asked for an honourable place based on this kinship. During the following centuries the kinship between *göter* and *goter* formed a typical “Scandinavian leitmotiv” in almost everything that concerns language history writing.

3. The battle for the most prestigious Nordic language history

In the 16th and 17th c., scholarly interest in the local way of writing, the runes, must be regarded as the triggering factor for research on Scandinavian language history. Olaus Petri, the Swedish Lutheran reformer, is said to have decorated his house in Stockholm with a runic inscription: *skäggiot haka klädher icke väl i dansa* [almost nonsense: ‘a chin with a beard does not suit well in the dance’]. Together with “genuine” runic inscriptions from his childhood environment in Uppland, this awoke an interest in contemporary as well as historical grammar in the young Johan Bure (Johannes Bureus, 1568–1652).

With Bure another Scandinavian language history leitmotiv is introduced, and very forcefully: the antagonism between Denmark and Sweden over the right to the most glorious linguistic and historical past, reflected in the title of a work printed by Bure in 1636 (now lost): *Specimen primariae lingvæ Scanzianæ*, which included an attack on the Danish editor of mediaeval romances, Anders Sørensen Vedel

(1542–1616, *Et hundrede danske viser*, printed in 1591 and later; in 1575 Vedel had printed a Danish translation of Saxo's *Gesta Danorum*). Vedel was called a liar, and Bureus (on false grounds) accused him of having embellished the romance "Ebbe oc Aage de Helledede saa fro" with faked old morphological forms. The romance deals with the historical connection to Scandinavia of the Langobards, and this made the philological question politically sensitive.

Bure continued to fight against supposed Danish attempts to claim Nordic history and language history for themselves. Ole Worm (1588–1654, a physician and antiquarian) also dared to publish thoughts about the origin of the runes (1636, *Runir seu Danica litteratura antiqvissima*), as well as an illustrated collection of all known Danish runes (1643, *Danicorum Monumentorum libri sex*). Worm also supported the "Icelandic Renaissance" characterized by new editions and translation of Icelandic sagas and Eddapoetry. In *Runa Redux*, published in 1644, Bure scrutinized this from a Swedish point of view, and his philological argumentation is supported by four songs with demagogic polemic against Worm and Denmark.

4. Culmination of the search for prestige, and coming to one's senses, in the 17th and 18th centuries

As already mentioned, two main characteristics of early research in language history have contributed to later condemnation and contempt: (1) the Gothic heritage, and (2) the bias created by the rivalry between the traditionally leading Nordic political power – the kingdom of Denmark – and the newcomer on the political scene – the kingdom of Sweden established by Gustav Vasa in 1523. It is much easier to perceive the political interest in a great linguistic past, rather naively demonstrated by Bure and his followers, with its culmination in the *Atlantica* by Olov Rudbeck, than it is to find exactly the same tendencies which are much more indirectly demonstrated in the 19th c. and later. The technically much more sophisticated and elevated discussions about branches and labels in the huge Indo-European Stammbaum – North, West and East Germanic, East and West Nordic and so on – sometimes make us forget that these are chiefly arbitrary labels and backward projec-

tions of later linguistic and political conditions, adapted to the past. Awareness of such arbitrariness can be regarded as one important outcome when studying the earlier attempts at writing language history.

To some extent the 17th and 18th c. language historians were no less aware of linguistic facts or the mechanisms of language change than the neogrammarians. But their labels were different, and we therefore have to analyse them carefully. Urban Hiärne (e. g. 1717, 76) uses the term "Nordic languages" in the same sense as 19th c. philologists use the term "Germanic languages", and with the same precision. When reading older authors carefully, drawing the limit at 1800 may turn out to be less important nowadays than it used to be.

Much research remains to be done before a fair picture can emerge and the right attributions of sound and lasting achievements within the area of language history can be made – if ever. Traditionally the Swedish 18th c. scholar Johan Ihre (1707–80) has been much praised for his contribution to comparative historical linguistics, just as the Dane Rasmus Rask (1787–1832) was – the latter is covered in art. 15. Ihre can be taken as an illustration of how historiographic mechanisms often work in a haphazard way. In a later period or scientific paradigm, when scholars are convinced that their modern way of looking at things, in the case of language history, is the only correct one, it is very tempting to return to older representatives of the science to look for predecessors. In the 19th c. and later, Ihre could easily be recognized as a forefather of Indo-European language history, both with regard to methods and results. However, many of Ihre's sound ideas about language history are inherited from Hiärne's publication *Orthographia Suecana* (1717). In this work and in his unpublished *Oförgripelige Tanckar* (about 1720) he attempted a periodisation of the language history of Swedish, which is still taken up by language historians, authors who probably never read Hiärne's work. Gösta Holm (SBL, Ihre) points out that much of what has been said about Ihre being the first to discover the Germanic consonant shift is an exaggeration, partly because similar observations had already been made by the Swede Erik Benzelius Jr. in material used by Ihre. Probably this is meant as a criticism of Jan Agrell's (1955) *Studier i den äldre språk-jämförelsens allmänna och svenska historia fram till 1827* (UUÅ 1955, 13).

5. Some names of interest in research on language history, 1500–1800

5.1. Denmark/Norway:

Ole Worm (1588–1654) is the oldest of the Danish scholars, whose achievements within the area of language history will be commemorated here at some length. Like many of those worthy of being focused on, he was a physician, with a background not only in the humanities but also in the natural sciences. To a large extent he received his university education outside Denmark, at Marburg, Giessen, Strasbourg, Basel, Padova, Montpellier, Paris and Leiden, just to mention a few of his destinations from 1605 until he finally matriculated at Copenhagen University in 1610. There he made his career as a teacher, passing over different chairs until in 1624 he settled down as a professor of medicine.

Worm goes back too far to be entirely connected with “The new philosophy” of empiricism in his works within the natural sciences. Yet his early interest in ancient Scandinavian history is to a large extent empirical, in the sense that he was eager to see and describe, and make public, all kinds of documents from earlier periods. His first publication in the area, *Fasti Danici* (1626), deals with old calendars. A runic calendar (a manuscript from Gotland, 1328) was described and interpreted as being from Jutland. This shows a certain lack of insight into language history, but otherwise his treatment still has value, especially as the original manuscript has been lost. The same goes to some extent for his main publication within runology, *Danicorum Monumentorum libri sex* (1643), where he collected, described and interpreted all 144 runic inscriptions known at that time in the Kingdom of Denmark, including Norway and the later Swedish provinces of Skåne, Blekinge and Halland. One of them, Runamo in Blekinge, has later been shown to be no inscription at all but rather a natural formation in the cliff. Nevertheless, his format for presenting the runes has been used by all later serious publishers of runic monuments in Scandinavia: illustrations (Jon Skonvig has to be credited for many of them, partly using a new technique – carving in tin), detailed information about the physical context of the inscriptions and how they were found, and the rendering and translation of the texts (into Latin in those days).

It must of course be emphasized that Worm’s opinions about the history of runic script as well as many of his interpretations have been superseded by later runologists. For Worm the runes were derived from Hebrew script, in accordance with the common opinion of the time that Hebrew was the mother of all languages. Worm continued his philological work as a collector and publisher of old documents. In 1642 he published part of the runic manuscript of the *Skånske Lov*. He was also convinced that “nowhere in the Nordic countries was the language of the runic inscriptions conserved more purely than on the famous Danish island of Iceland”. Therefore, when publishing some Old Icelandic poems (*Egils Höfuðlausn* and *Krákumál*), he printed the text with runic fonts.

As can be deduced from this short outline of Worm’s works within Nordic philology, he introduced two important and necessary methods, which were developed by later generations of philologists: critical analysis of original texts, and accuracy in presenting them in their original contexts.

Ole (Oluf) Borch (1626–1690) is another of those early physicians who combined natural sciences with linguistic and philological interests. Between 1660 and 1665 he visited Leiden, London, Paris, Florence, Rome and other universities in Europe. There he met famous scientists and scholars such as Robert Boyle, Steno, Bourdelot; in Rome he had discussions with Christina, the former Queen of Sweden. Back in Copenhagen he held several chairs at the university, where he could develop his ideas and interests in many fields, as one of the last great Danish polymaths.

Here only his *Dissertatio de causis diversitatis lingvarum* (1675) will be mentioned. His monogenetic view of the origins of language followed the general opinion of his time, but he added some factors after Babel that might influence linguistic variation and change, such as contact with different neighbouring languages, climatic impact on speech organs, neglect and different onomatopoeic interpretations of natural sounds.

The younger Swedish fellow physician Urban Hiärne (both received their medical degrees from Angers in France) visited Borch a couple of times when passing through Copenhagen. Their contact offers early counterevidence to the general view of animosity between scholars from Denmark and Sweden. Probably linguistic change was among the topics discussed between them, in an empiric

and scientific spirit. They both provided insights into mechanisms involved in language change. However, the contemporary more or less axiomatic view that both the earth and mankind were about 6000 years old was an obstacle to their attempts to develop a more realistic model of the origins of language, language history and language change, just as it was for realistic thoughts about geology.

Peder Syv (1631–1702) acquired a contemporary reputation for his *Nogle betenkninger om det Cimbriske Sprog* (1663), helping him to acquire a post as “Philologus regius lingvæ Danicæ” (in 1683). Syv used the term “Cimbric” for what has later been labeled “Germanic”, hinting at a connection with the Cimbrian people, known for their attacks against Rome, where they were finally beaten by Marius in 101 B.C. Together with the Teutonic people they were supposed to have emigrated from Jutland. In a similar manner to the way, about 15 years later, the Swede Olof Rudbeck tried to provide the Swedes with a glorious linguistic history, so Syv gave Denmark a central role through the Cimbric notion, although in a much more modest way. Most of *Betenkninger* deals with orthographic and morphological questions in connection with contemporary Danish, where Syv held opinions which were soon partly opposed by other Danish grammarians such as Henrik Gerner and Erik Pontoppidan. *Betenkninger* also played a role for the Swede Samuel Columbus, who used parts of it in his *En svensk ordeskötsel* (1678), published in the 19th c., which was highly esteemed by e. g. Adolf Noreen for its insights into language theory. The works of Syv and other old Danish grammarians have been published by Henrik Bertelsen in an admirable edition, making them easily available to modern readers.

“DG” (probably Hans Oluvsøn Nysted, 1664–1740, born in Norway) was brought to light by Caroline C. Henriksen when in 1976 she published a treatise on an anonymous manuscript from early 18th c. Denmark (GKS 789 fol., *Dansk Rigssprog – en beskrivelse fra 1700-tallet*). The main purpose of the anonymous author was to describe his contemporary Danish, but he also had some interesting things to say about language history in general, as well as about the connection between Danish and its neighbouring languages or dialects.

Henriksen starts by putting the author’s thoughts into a framework of early international theories about language and languages.

She quotes from the manuscript the author’s serious doubts about the monogenesis of languages, including the common theory about Hebrew as more or less identical with “Adamic”, the language used by the first humans. This “standard” view had been advocated by Peder Syv (1663, 1). Like Georg Stiernhielm and others, DG did not accept the myth of Babel as the truth about how the world’s diverse languages arose from one original language. His opinion, repeatedly stated throughout the manuscript, is rather that no language can be said to come from another, e. g. Latin from Greek, which was often maintained in earlier attempts at writing language history. “In the same way as an infinite number of melodies can be created from a finite set of musical tones, numerous languages can be formed on the basis of the limited set of ‘letters’, i. e. sounds, available to human speech.” DG was not willing to put a label on the original and lost language. “It was simply scrambled by God to form each individual language in existence [...] This mixing process explains how language can show similarities and still not derive directly from one another.” (77). Henriksen states: “He admits that the languages he finds around him are not in the same form as they were originally, but this he attributes to corruption through neglect and contact with each other.” (78). Thus he could work on re-establishing some original versions of the languages created through mixing by God from the unknown first language. At the same time he seemed to accept the view also held by Stiernhielm – and probably initiated by Isidore of Seville (c. 570–636) – that Europeans descend from Japheth.

In spite of this somewhat confusing idea about prehistoric language history, he shows a very clear notion about the relationships between contemporary languages and dialects:

[...] these neighbouring languages, Danish and Norwegian, are “con-languages” to each other, i. e. they are to a very large degree identical, with the exception of a few words, expressions, and changes in the places of letters, which they like every languages and dialect everywhere have for themselves [...] (79).

It is not easy to render his thoughts, which are formulated in a very special idiolect, but he also rejected the idea that Italian or French should be derived from Latin. The same goes for his comparisons of dialects within the kingdom of Denmark when discussing certain

regularities in differences between Danish, Jutlandic and Norwegian.

Here it seems possible to draw parallels with the core structural thoughts about “time dialects” which cannot be changed, formulated by Urban Hiärne (ca. 1720). Whether their views have a common source, or whether one was influenced by the other, is impossible to say. It is a fact, however, that neither of them liked the notion of one language emerging from the other. Languages just exist. Hiärne seemed to be theoretically more aware of this partly parallel existence, as can be seen in his term “time dialect” (See Hiärne below).

5.2. Sweden/Finland/Baltic provinces

Johan Bure or Johannes Bureus (1568–1652) has been mentioned earlier in this article (see 3.), primarily for his part in the dispute between Sweden and Denmark. He made his career as an official in the Swedish government under the father of King Gustav II Adolf, Karl IX. Bure was his herald at the declaration of war against Denmark in 1611. In a monograph from 1911, Hjalmar Lindroth promoted Bureus as “the father of Swedish grammar”, and this title obviously includes the same position in Swedish language history research as well as dialectology.

Bure was born in Uppland, close to Uppsala, in the part of Sweden with most runic monuments. In a way his role in Swedish language history became the same as that of Ole Worm in Denmark. Bure was also inspired by the interests and ideas of the Renaissance. However, he was mainly self-taught and never had an opportunity to study at universities abroad. He began work in many fields, but most of what he started was never completed, e. g. he spent a lot of time registering runic inscriptions. Together with assistants he collected about 200 inscriptions in Sweden, more than those published for Denmark-Norway by Worm, but this represented a much smaller proportion of available Swedish runic inscriptions, and only a part of the collection was published by Bure.

Just as Bure used his self-attained knowledge of Hebrew for studies of kabbalistic literature, thus showing an inclination to mysticism, so also was his interest in runes highly devoted to the magic of the runic messages. He wanted to revive the practical use of runic script and invented a cursive variant for this purpose. This enthusiasm for the practical use of the autochthonous writing tradition was

also partly shared by Worm, but Bure was much more intense about it. Bure was of the opinion that the runic script evolved from Hebrew.

Like Worm, Bure was eager to publish old manuscripts, but only got one into print: *En nyttigh bok, om konnunga styrilse och höfdinga, fordom för någre hundrade åhr, af en förståndigh svensk man skrifvin, och nu nyliga framkommen* [...], 1634. The original manuscript has been lost, and much later philological discussion has been devoted to the accuracy of Bure’s edition.

Georg Stiernhielm (1598–1672) received European recognition as a scholar, and not least as an expert in language history, although certainly no human endeavour was foreign to him. Probably he regarded himself foremost as a scientist and mathematician. He seems to have been the first to use the decimal system in Sweden, and he reformed the systems for weights and measures (published in *Archimedes reformatus* in 1644). A few years before his death he was elected a foreign member of the Royal Society of London.

Perhaps his greatest achievement within language history was his establishment of a historical relationship between Finnish (including Sami and Estonian) and Hungarian, neither of which had any known relationship to neighbouring and surrounding languages. He published this discovery in the *Prefatio* of his edition of the Gothic Bible by Wulfila, edited from Codex Argenteus (1671), but unpublished documents (in KB, Stockholm) reveal that he had been working intensely on this hypothesis much earlier. The background of this was that for several decades starting in 1630 he served the Kingdom of Sweden as a Dorpat Court of Appeal judge in Livonia (now southern Estonia). His knowledge of Hungarian seems to have come mainly through a dictionary by Molnár. Finnish was not very well described at the time, but Stiernhielm must have mastered it, or rather Estonian, to some extent, mostly perhaps from his daily contacts with Estonian peasants. Now, neither this pioneering work, nor his edition of Wulfila and interest in the Gothic language, make Stiernhielm a hero within the area of the history of the Nordic languages. His interest in Old Icelandic and Swedish manuscripts also had mainly a practical purpose.

Stiernhielm’s main impact came through his poetry, both in Latin and as “the father of Swedish poetry”. His interest in establishing

a poetic tradition in his mother tongue seems to have been concentrated on a rather short period in the 1640s and 1650s. He became admired for (and can still be admired as) an inventor and introducer of new words to make his poetry powerful and indigenous. Some of these words have survived to this day, but most of them must be regarded as belonging only to his own poetic language. His ambition was to avoid French and other loans from the Romance languages. As a member of the Baltic aristocracy, he never hesitated about using loans from German, but his first priority was to create or use words and/or word formation elements from the Old Nordic languages and dialects, and – like most of his contemporaries – he regarded them as part of a common Nordic heritage. Thus the later division between West and East Nordic seems not to have bothered him at all. During this period he also tried to find Swedish equivalents for grammatical and rhetorical terms, probably inspired by similar attempts in Germany.

Much has been written about his language philosophy. It certainly also turned out to be helpful in his poetic work, which is full of alliterations, which carefully follow his theory about language roots, related to Pythagorean ideas and presented in his *Radix Ma* (1649). For example, the consonant *m* (pronounced with close lips) has an original connection to something closed, secret and dead: *Döden molmar i mull allt vad här fagert och fint är*. He traces such roots in most languages as a kind of linguistic universal. His theory often results in good poetry, and perhaps Stiernhielm can be regarded as a predecessor for some of Roman Jakobson's theories in *Kindersprache, Aphasie und allgemeine Lautgesetze*. Since he found Swedish very rich in such language universals, it had to be closely related to the first language, he concluded.

But Stiernhielm's language philosophy did not provide a helpful method for discovering language history clues. Much less for him than for his contemporaries (such as the Dane Peder Syv) the Bible, or the myth of Babel, was the theoretical framework from which a kind of Stammbaum must be established, assuming dialect splits had occurred during the few thousand years that had passed since the creation of the world. The Dutch scholar Goropius Becanus had already found a way around Babel, making it possible for Dutch to be a direct descendant of the language of Adam and Eve. Stiernhielm also avoided Babel, claiming that the first split originated

with the sons of Noah: Sem and Cham were the fathers of the Semitic languages (Hebrew, Arabic and Syrian) and the Chamitic (Egyptian, Ethiopian, Phoenician), while Japheth was the originator of Latin, Greek, Persian, Germanic and Slavic. This group, for which Stiernhielm used the word "Scythian", roughly corresponded to the Indo-European language family in later terminology. In such a macro-perspective, there was not much space for subtle subdivisions of the Germanic and Nordic languages, and Stiernhielm explicitly, as well as in his neologisms, regarded German and Swedish as

två fullbördige Systrar, af een Moder, den ur-
äldre förste iaphetiske-Skythiske Moderen födde
– och är i sielfue ätten ingen skildnat: fast
synas något serskilde i deras bonad, och Mun-
lagh. Kunne därföre otalige många Tyske ord up-
tagas, därmed vårt Tungemåål at rikta och be-
pryda: allenast at the blifua lämpade, och lagade
till vårt Mååls wijs, och Muns-art.

For two sisters such as German and Swedish, from the same Scythian mother, there are no significant differences, only superficial ones, and therefore he felt free to incorporate and adopt whatever he needed from German. To a Swede working in the Baltic provinces, this harmonization of German and Swedish was certainly an attractive solution to practical everyday language problems.

Olof Rudbeck senior (1630–1702) has to be mentioned because of his contemporary national and international fame as the author of *Atland eller Manhem* (in Latin *Atlantica*; volume I 1679, volume IV 1702, in print at his death). Here most of what later on has been criticised and ridiculed as characteristic of fanciful older Nordic language history writing has been gathered into one huge work. Its central thesis is that Sweden was the lost Atlantis. A great deal of intellectual energy was used to convince the reader that Sweden had played a central role in the past of all mankind, by hazardous etymologies of Swedish place-names and works, tracing them back to the world of classical Greece, but in the conviction that Greek had borrowed them from Swedish. The runes of course represented the oldest alphabet and became the prototype for the Greek and Latin alphabets. For example, the Swedish mountain Helagsfjället had given its name to Helicon in Greece, and so on. What Stiernhielm had started in a comparatively modest way was taken here to megalomaniac perfection. At the same time Rudbeck also

sometimes worked empirically and in a scientific way, being a pioneer in the field of archaeological excavations.

Rudbeck's central position in Swedish cultural life, as a famous physician, technician and scientist, and a leading personality at the university of Uppsala as its rector for long periods, made him a central figure for a group of scholars in Uppsala all working within the same paradigm, the so-called *Rudbeckians*, including his son, Olof Rudbeck Jr. To strengthen their theories, even faked "old" texts were constructed by Rudbeckians. Mixed in with these "hyperborean" ideas, no doubt some interesting results can be found, e. g. within the area of archaeology, but the whole enterprise was soon condemned.

Urban Hiärne (1641–1724) was taught medicine by Olof Rudbeck in Uppsala in the 1660s. However, Rudbeck's supernaturalistic ideas cannot be noticed at all in Hiärne's linguistic contributions: *Orthographia svecana* (1717) and *Oförgriplige Tanckar* (ca. 1720; forbidden by the censor to be published; first in print in 1991).

Like Stiernhielm, Urban Hiärne has an important background in the Swedish provinces east of the Baltic. His father was born in Värmland but spent most of his life as a Swedish vicar in the province of Ingria, where Urban was born, and his father ended up as "prost" in Nyen. There Hiärne spent his early years. The multilingual environment of Nyen, where St. Petersburg was built later, was important, but at that time it was a young Swedish freetown in the easternmost part of the kingdom. Swedish, German, Finnish and Russian were all spoken in Nyen, and this was the basis for Hiärne's later reputation for being one of the most polyglot scholars of his time. During his career, first as the private physician to Governor General Claes Tott in Riga, he completed his language knowledge with Polish. In 1669 he went to London on his own initiative to learn more. As a young physician he thus was fortunate enough to be elected member of the Royal Society of London, and he spent an entire, receptive year there. Linguistics, not least phonetics, was at that time an important issue for famous members like John Wilkins (*Essay towards a real character and a Philosophical Language*, 1668) and John Wallis (*Grammatica Linguae Anglicanae*, 1653, with a universal phonetic introduction, *De loquela*), and in 1669 William Holder published his *Elements of speech*. A quarrel between Wallis and Holder about who

was to be credited with having taught the deaf Alexander Popham to speak started at that time, no doubt making phonetics and linguistics a hot subject in London.

After a year in London, Hiärne moved on to the other scientific metropolis of Western Europe, Paris. During almost three years in France, he of course learnt French, just as he had learnt English in London. He studied chemistry and medicine, but in *Orthographia svecana* (65), written about 45 years later, he revealed another activity from his time in Paris: he had tried to make a speaking head, i. e. artificial sound production.

Returning to Sweden, he made a career as a physician, focusing on introducing spa cures in Sweden, which made him rich and socially successful. He became the leading physician and pharmacist of his time, responsible for the health of both Karl XI and Karl XII. His skill was used in almost all scientific activities of the Swedish Great Power, including mineral exploration and mining, and investigations of both natural and historical resources of the kingdom. In that connection he travelled a great deal in Sweden, not unlike Linneus some decades later. But his workplace was the capital Stockholm, not the universities of Uppsala or Lund.

His capacity as a linguist was first used for establishing an orthography for the revised Bible edition at the beginning of the 18th c. (*Karl den XII:s bibel*). Another important personality, Bishop Jesper Swedberg (father of Emanuel Swedenborg), had a quite different approach to this. The quarrel between these two forms the background for several linguistic publications in Sweden during the first decades of the 18th c., (*Schibboleth, Hedersförsvar* and *En kortt Svensk Grammatica* by Swedberg). Hiärne's linguistic works were triggered by this debate: Hiärne defended his own interpretation of the old orthography, where gemination of vowels to mark vowel length, together with the abundant use of the letter *h*, is essential, where Swedberg rejected both these features and advocated a modern spelling where vowel length was only indirectly marked to some extent by gemination of a following consonant when the preceding vowel was short, and which abandoned many cases of etymologically correct but no longer pronounced letters <t/d + h>. Swedberg's orthography was victorious in the long run. In the morphological aspects of the quarrel, where Swedberg stuck to the inherited inflectional system for nouns and verbs used in the Ref-

ormation Bible, Hiärne was in favour of a modern, simplified morphology, in accordance with contemporary colloquial Swedish.

Interesting here are the scientific results from this struggle about the shape of a written Swedish language. No doubt Hiärne's theoretical background from his youth in London and Paris, and his knowledge of both contemporary and historical language stages, resulted in partly very modern and interesting statements about language universals, language change and language typology. He was, for example, very interested in historical changes triggered by language contact situations, not only when explaining the relations between Latin and Italian, but also when trying to explain the development of medieval Swedish. The simplification of Swedish phonology with regard to the abandonment of <th> /þ/ and <dh> /ð/, was, according to Hiärne, due to difficulties for Germans in Sweden in pronouncing those dental fricatives.

On the whole, Hiärne "uses the present to explain the past" to an extent that makes him an early sociolinguist in his treatment of language history. Although when old Hiärne personally found developments in spoken Swedish, emanating from the linguistic melting pot of the capital of Stockholm, disgusting, he was very aware of these tendencies. Like later dialectologists, he was fond of resemblances with old language known from written sources, and surviving features in remote dialects: Icelandic, Dalecarlian, the dialect of Åland and so on. Implicitly, a kind of "Wellentheorie" can be found in his treatment of the Nordic dialects.

In his last contribution to linguistics, *Oförgripelige tanckar*, he seems to advocate a theoretical attitude to language change which is very similar to the most rigid structuralists of the 20th c. In it he presents the notion "time dialects". Each time dialect has an extension in time and space, but they cannot be changed, he says, because then we simply have a new structure, a new time dialect. Focusing on historical morphology, he tries to establish and illustrate some of the most important time dialects, which partly overlap each other: Old Swedish (from heathen times to the Early Middle Ages), Newer Swedish (Late Middle Ages?), Danish Swedish (characterized by endings in -e-) and Newest Swedish. The distinctions are not quite clear and the morphological patterns presented by him are to some extent abstractions and his own creations. But his basis for establishing them was

no doubt the result of his lengthy study of manuscripts and texts from different periods.

Finally, the empirical nature of Hiärne's work must be emphasized, taking into account the fact that language history was more or less a hobby, but a very serious hobby, of the first active Swedish member of the Royal Society. His activities in most of the scientific fields of the time characterize his work as the result of an early Swedish one-man academy for improving natural knowledge, including linguistics – just as Francis Bacon, the early ideologist of the programme followed by the Royal Society, clearly regarded linguistics as part of science.

Johan Ihre (1707–1780) was born in Lund into an academic family. He started his own academic career in Uppsala, where he matriculated in 1720. For three years (1730–33) he studied abroad (Jena, Utrecht, Leiden). In 1737 he received his first chair in Latin at Uppsala University. By 1738 he exchanged it for the chair founded by Johan Skytte in rhetoric and politics. He stayed in Uppsala and played an important role as a teacher to generations of students and as a productive author, mostly in linguistic subjects, over forty years. Several times he held the rectorship.

In 1755 he applied for the post as the official historiographer of Sweden, but it was given to Olof von Dalin, also well-known as an author and editor of the political magazine *Then svenska Argus*. Dalin deserves a mention in this connection for his ironic treatment of the etymologies of the Rudbeck school, but Ihre was the man who reestablished the reputation of linguistic studies at Uppsala University through his own scholarly activities, above all in the field of etymology. His most well-known contribution is *Glossarium Suiogothicum*, published in 1769 after years of preparation. It is this etymological dictionary, with its Proemium, which has given Ihre his reputation as a forefather of the 19th c. language history paradigm, developed by Rasmus Rask and Jacob Grimm and others. In *Dissertatio Academica De Mutationibus Linguae Sueogothicae* (1742), Ihre published his periodization of Swedish language history, discussed in sect. 4.

Ihre also believed that Scythian was the first language, with a close connection to Gothic. With the Gothic Bible, *Codex argenteus*, kept in Uppsala University library, it is obvious that Gothic studies were close at hand in Uppsala, and Johan Ihre and his pupils published several philological dissertations about Gothic.

8. Research in Danish language history 1850–1950. An overview

1. The roots and development of the Danish language
2. Old sources and new dictionaries
3. The Danish dialects
4. Runes and chronology
5. Standard Danish
6. Descriptions of the Danish language
7. Literature (a selection)

Language history is a discipline which embraces all aspects of the language and all stages of its development. It involves both the structure of the language and its usage. Danish scholars, however, have concerned themselves particularly with phonetics and morphology and the sound developments that can be observed in older Danish texts.

In the 19th century and the first decades of the 20th century, Danish philologists were first and foremost historically orientated, but from the 1930s other and newer currents have left their mark on research into the Danish language.

Since the end of the '60s philological and language historical research in Denmark have not been particularly popular, although attention has been drawn several times in the '90s to the fact that there are many and significant gaps in the description of the history of Danish (cf. e. g. Rischel 1996), and there are also indications that interest in the history of the lan-

guage is beginning to experience a much-needed renaissance (Holmberg 1995).

1. The roots and development of the Danish language

1.1. The origin of the Nordic languages

In spite of his comparatively short lifespan, Rasmus Rask (1787–1832) managed to achieve the status of one of the most eminent figures in the history of philological research. In company with the German scholars Franz Bopp and Jacob Grimm, he created the methodical basis for modern comparative linguistics, and by employing this method on the Germanic languages, he demonstrated that the Nordic languages form a separate linguistic group which differs in significant ways from other, closely related groups of languages. In so doing, Rask was protesting against the view that the Nordic languages formed a sub-division of the German dialects and that Danish was a kind of corrupt Low German, a view which first and foremost found expression in earlier German research. Rask thus established Nordic Philology as an independent field of study, with the Nordic languages as its subject. He also made his own contribution to this subject by writing a grammar of Ice-

landic, *Vejledning til det Islandske eller gamle Nordiske Sprog* (1811), and as a continuation of this a Danish grammar (printed in 1820), in which he demonstrated how the simplified Danish inflexional system can be explained on the basis of Icelandic accident with its abundance of forms.

Rask's major work, however, is his monograph on the origin of the old Nordic language. This was an entry for an essay competition arranged by the Royal Danish Academy in 1811, although Rask did not submit his entry until 1814 (published in 1818). The monograph is epoch-making in that it includes the first closely reasoned presentation of the discipline of comparative linguistics with a formulation of principles which remain valid to this very day, as well as many important, concrete discoveries, including an introductory presentation of the rules which are now referred to as the First/Germanic Sound Shift or Grimm's Law.

In his linguistic method, Rask was not under the influence of either earlier or contemporary researchers. He, for his part, however, inspired and influenced Danish philologists for several generations and this to such a degree that many of them had to struggle to free themselves from his views on language where these proved to be wrong. This struggle continued until the end of the 19th century.

1.2. The development of the Danish language

Rask's monograph from 1818 established a historical perspective that made it natural to study the development of a language from its ancient to modern form. This task was carried out in an exemplary manner for its time by N. M. Petersen (1791–1882) in his pioneering work entitled *Det danske, norske og svenske Sprogs Historie under deres Udvikling af Stam-sproget* 1–2 (1829–30), where he describes the development of the literary language from the earliest times to about 1700 against its cultural-historical background. For several generations of scholars, this work formed the basis for the historical study of the Nordic languages.

As is evident from the title, Petersen – like Rask – considered Icelandic to be the parent language of Danish and the other Nordic languages, and this prevented him from arriving at the correct view of the development of the language and the relationship between its various stages of development. In addition, Peter-

sen – unlike Rask – was inspired by the Romantic period's view of history, and this led him to several peculiar explanations of linguistic phenomena. For example, he assumed that the weakening of stops took place as a result of "the oppressed and downtrodden condition of the people, especially the humbler people". It should be noted that Petersen was not the only one to accept uncritically Rask's mistaken view that Icelandic was the parent language of Danish. It is an error that left its mark on Danish philology for most of the 19th century, even though a few voices during that century, including those of Christian Molbech (1783–1857) and Israel Levin (1810–83), claimed that Danish was an independent language with its own development that needed to be studied without constant reference to Old Icelandic and other ancient languages.

2. Old sources and new dictionaries

2.1. Editions of texts

Since 1820 much effort has been spent by several scholars on the editing of old Danish texts. These editions are often provided with valuable introductions, descriptions of the language, glossaries and notes, but many of the 19th century's editions of texts have naturally been superseded by more recent and philologically more correct ones.

Some of the 19th century's editions, however, still remain the only available ones. This is the case, for example, with the oldest Danish Bible translation (1828, ed. Christian Molbech), *Holy women* (1859, ed. C. J. Brandt), *Mandeville's travels* (1882, ed. Marcus Lorenzen) and the leech-book in the Arnamagnæan manuscript 187,8° (1886, ed. V. Sâby).

2.2. Danish place-names and personal names

An important event for language studies at the University of Copenhagen was the establishment of a Chair of Nordic Languages. This occurred in 1845, and since then the subject has become increasingly specialised. Fields such as dialectology and name-studies have been cultivated as independent disciplines, while the literary side of philology has gradually come to forge closer and closer links with the study of literature.

The first holder of the chair was N. M. Petersen. He was interested in research in literature and culture, and he was above all a

historically orientated scholar with a good knowledge of the old Danish source material. In a pioneering monograph (1833), he created a firm basis for research into Danish place-names, with clearly formulated criteria. Later in the century, Oluf Nielsen (1838–96), Johannes Steenstrup (1844–1935) and other historians followed his lead, but it was only during the course of the 20th century that name-research freed itself from the embrace of historians and became established as an independent discipline. Several scholars contributed to this development, but the work of Kristian Hald (1904–85) was particularly important for the subject, for example his popular survey of Danish place-names (1965). It was also in the 20th century that the more systematic collection of place-name forms and the publication of Danish place-names and personal names began, with the appearance of such works as *Danmarks Stednavne* and *Danmarks gamle Personnavne*.

2.3. Dictionaries

The foundation of *Ordbog over det danske Sprog* 1–28 (1918–56) goes back to the 19th century. The first step was taken in 1882, when Verner Dahlerup (1859–1938) began to record the words that he found missing from the 2nd edition of Christian Molbech's *Dansk Ordbog* 1–2 (1854–59). The kind of work that Dahlerup had in mind at the time was a book to supersede Molbech's dictionary, which in the 19th century was considered to be a true expression of the good and correct linguistic norm and which functioned as the orthographical guideline until 1889 – the year when the first official orthography was published. Over the course of time Dahlerup's original plan expanded, and in 1915 the dictionary project was taken over by The Danish Society for Language and Literature (DSL), which led to radical changes. The aim was now to produce a comprehensive, descriptive account of standard Danish from about 1700 up to the date of publication. After the Dictionary was finished, work continued under DSL's auspices to supplement it so that each individual volume describes the language of the time down to 1955 in a more or less similar way. So far three supplementary volumes have appeared (1993–97).

A pioneering work from the 19th century is Christian Molbech's *Dansk Glossarium eller Ordbog over forældede Ord af Diplomer, Haandskrifter og trykte Bøger fra det 13de til*

det 16de Aarhundrede [Danish glossary or dictionary of obsolete words from charters, manuscripts and printed books from the 13th to 16th centuries] 1–2 (1857–66). In this the words are elucidated with the aid of detailed examples, recorded in their original spelling and with indications of source and dating. Molbech did not include the words occurring in old Danish legal texts. This defect was remedied when G. F. V. Lund (1820–91) published a dictionary of old Danish legal language under the title *Det ældste danske skriftsprog ordforråd* 1877.

The standard dictionary of older Danish, however, is *Ordbog til det ældre danske sprog* 1–5 (1881–1918). This was compiled by Otto Kalkar (1837–1926) and explains the words and expressions which occur in Danish texts from 1300 to 1700. The words are elucidated with quotations from the sources, but it is in particular the vocabulary that differs from that of contemporary usage which is included in the dictionary – an error that Kalkar attempted to remedy in the final supplementary volume.

A handbook of more recent date, which explains the etymology of the general Danish vocabulary, is *Dansk etymologisk ordbog* (1966/1989), compiled by Niels Åge Nielsen (1913–86). This has, in several respects, been superseded by Jan Katlev's *Politikens Etymologisk Ordbog* (2000).

The only dialect dictionary to cover the whole country (with the exception of Bornholm) is Christian Molbech's *Dansk Dialect-Lexikon* (1833–41), but unfortunately this only contains words, expressions and phrases which were not found in the written language and in general usage. All the later dialect dictionaries have concentrated on individual dialects or groups of dialects, e. g. the great dictionary of the Jutland dialects, which was compiled by a priest, H. F. Feilberg (1831–1921), and published under the title *Bidrag til en ordbog over jyske almuesmål* 1–4 (1886–1914). This dictionary takes account of the whole vocabulary of Jutland, but Feilberg has also to a certain extent presented and explained the “cultural monuments concealed in the language”, and his dictionary therefore became a main work of reference for the words and objects employed by the common people of Jutland. In this connection, mention should also be made of *Ømålsordbogen*, an ambitious dictionary of the dialects of Zealand, Lolland-Falster, Funen and the surrounding islands. This is, like Feilberg's work,

more than just a dictionary – it is also an encyclopædia of the material culture of the agricultural population. The dictionary covers a period of approximately two centuries, with the main stress on 1850–1920. Five volumes have appeared so far (1992–2000).

3. The Danish dialects

Rasmus Rask showed an early interest in the Danish dialects, especially in the dialect of Funen, with which he grew up. He realised from the beginning the necessity of examining dialects using the same methods that were employed for the literary languages. Rask never completed his studies of the dialects, but he heralded a new era for dialectology, and his studies of the Funen dialect were later collected and published by Poul Andersen (1938).

After Rask, dialect research was first taken up again by K. J. Lyngby (1829–71), who was the first “roving” dialectologist in Denmark. Every summer from 1854 to 1861 he spent recording material in Jutland. He also collected material with the aid of questionnaires sent to various informants, and he devised a special phonetic script for his recordings in the form of a simple and easily read notation only intended for describing the phonetic nuances that play a significant role in the language. Lyngby’s notation was, incidentally, also employed by Feilberg, who, however, found it less suitable for recording some of the dialects. It was later replaced by a more precise phonetic script, *Dania’s phonetic script*, also known as *Dania*, which was devised by Otto Jespersen (1890). *Dania* is still predominantly used in Danish works which indicate pronunciation, but over the course of time it has been somewhat simplified and brought up to date.

Lyngby had plans for compiling both a Jutlandic grammar and a Jutlandic dictionary, but his early death prevented these plans from coming to fruition. Some of the material he had collected was employed in his *Bidrag til en sønderjysk Sproglære* (1858) and in his doctoral thesis on *Udsagnsordenes bøjning i jyske lov og i den jyske sprogart* (1863), in which he demonstrated that all the dialects of Jutland are Danish dialects of Nordic origin. Further sections of Lyngby’s material were later exploited by other scholars. Some of his material, for example, is included in Feilberg’s dictionary, and his Jutlandic grammar was eventually edited and published by Anders Bjerrum (1942).

Lyngby has occasionally been described as “the father of Danish dialectology”, and although he was active in various fields of research, it is within dialectology that he made his most valuable contribution. His published work is not voluminous but it is of great significance, for example because he applied the basic views and methods of comparative philology to dialectology. He claimed that the individual dialects were independent languages and that, with respect to their origin, they were to be ranked alongside with standard Danish. The idea that border dialects were mixtures of two languages, as both Rask and Petersen had thought, was openly rejected. The oldest dialectal differences were in the opinion of Lyngby not much older than the time of the oldest law manuscripts, and he considered all theories which claimed that dialect differences resulted from the settlement in Denmark of different tribes to be fanciful.

From 1863, Lyngby was employed on the teaching staff at the University of Copenhagen, from 1869 as professor. His influence on the students was great, but as a dialectologist he had no immediate successor. There were others who occupied themselves with dialects at the end of the 19th century, but it was still the historical form of presentation that Lyngby had employed in his description of Jutlandic that was the preferred one. It was not until the 1940s that Danish dialectologists changed track. In 1944, for example, two dialect monographs appeared which differed from earlier ones in both being structuralist. These are Anders Bjerrum’s doctoral thesis on *Fjoldemålets Lydsystem* and Ella Jensen’s book about the Houlbjerg dialect. These two publications were the first of a long series of structuralist descriptions of the sound systems of individual Danish dialects.

A dialect-geographical and linguistic-historical work of great significance is *Kort over de danske folkemål med forklaringer* (1898–1912), which was compiled by Valdemar Bennike and Marius Kristensen. It consists of 104 dialect-geography maps and an account based on linguistic history of the development of the individual dialects with respect to phonetics and phonology. The maps show clearly and conveniently the distribution of a sound, a group of sounds, a morphological phenomenon or in some cases an individual word.

4. Runes and chronology

The name of Ludvig F. A. Wimmer in particular is associated with runology, but before Wimmer (1839–1920) became a runologist in earnest, he wrote an important work that was a kind of proclamation for historical linguistics in Denmark, carried out according to the methods of comparative linguistics (1868). For Wimmer himself, this stringent method led to a necessary rejection of the established view that Old Icelandic is the parent language from which all Nordic languages can be derived. He had found in the runic inscriptions words and inflexional forms which – as compared with Gothic and other older languages – had undergone fewer changes than the corresponding forms in Old Icelandic. He was therefore compelled to assume that a parent language had existed from which both East Nordic (Danish-Swedish) and West Nordic (Norwegian-Icelandic) had developed. He proved that this Primitive Scandinavian language can be seen in the oldest runic inscriptions, which he dated to the period from ca. 200 to ca. 650. In this way he showed that Nordic at the very beginning of the Christian era was an independent language that was different from Gothic and other Germanic languages. This result was not only of linguistic significance – at that time it also had linguistic-political relevance. His conclusions also supported Lyngby's demonstration of the fact that the Jutlandic dialects were characteristically Nordic. It is among Wimmer's contributions to our knowledge, therefore, that he discovered and described the oldest language in Scandinavia, but he had to share the honour for this discovery with the Norwegian Sophus Bugge, whose first papers on the oldest runic inscriptions appeared almost at the same time as Wimmer's.

In an important monograph, Wimmer also treated the question of the origin of the runic script and its development (1874), but his major work is the great edition entitled *De danske Runemindesmærker 1–4* (1893–1908), for which he began to collect material in 1876. In the many subsequent years, he travelled round the country in the company of an artist and examined all the Danish rune stones. He succeeded in interpreting most of the inscriptions, although runologists have subsequently been able to improve and correct his results.

In addition to the drawings of the monuments, Wimmer's great work on runes contains descriptions of the individual inscrip-

tions, transcriptions and interpretations. One point to which posterity has had to adopt a critical attitude is his runic chronology, which includes a period without inscriptions between 650 and 800. His runic work has since been superseded by *Danmarks Runeindskrifter 1–3* (1941–42), which was edited by Lis Jacobsen and Erik Moltke in collaboration with Anders Bæksted and Karl Martin Nielsen. Unlike its predecessor, this work includes the Primitive Scandinavian inscriptions, inscriptions on loose objects from later periods etc. *Danmarks Runeindskrifter* also contains a dictionary and associated grammar and a subject index with commentary.

Two more recent surveys of the Danish runic inscriptions have been written by Erik Moltke (1976) and Niels Åge Nielsen (1983).

5. Standard Danish

5.1. The written standard language

The question of the development of Standard Danish has been treated in a number of publications from the end of the 19th century. Lyngby and Wimmer considered that there was no difference between written and spoken Danish in the period of the oldest Danish texts. For them, Latin was the written language of the medieval period, and they were therefore convinced that if anyone wrote in Danish, then he would write exactly as he spoke. Christian Molbech, Oluf Nielsen and others criticised this view. Nielsen expressed himself as follows:

In Scania, as in Jutland, people attempted to write in the Zealand dialect, in Scania by making their language younger, in Jutland by employing older forms than the ones they used in speaking. It is therefore necessary to conclude that there was already a striving towards a common written or standard language at an early period (Nielsen 1882, XXXI).

The conception of an early Common Danish written language was readily accepted by scholars such as P. K. Thorsen (1851–1920) and Marius Kristensen (1869–1941). Kristensen, however, could not accept that this written language had been derived from the spoken language of Zealand, although he was willing to recognize its age and significance. It is, incidentally, this recognition and a firm belief in the age of the dialects and the fixed nature of their boundaries that lie behind his attempts to localize a manuscript with the aid of some few dialectal forms. The article in

which he attempted to prove that the scribe of *Rydårbogen* [Annals of Ryd] came from Nørreherred in Djursland has achieved proverbial status (Kristensen 1909). This method was also employed by others but the belief in the age of the dialects and the stability of their boundaries paled over the course of time, and since the end of the 1920s there have been no Danish philologists who would base a localization simply on comparisons with modern dialects (Bjerrum 1965, 55ff.).

Lis Jacobsen (1882–1961) also took part in the debate about Standard Danish. In her doctoral thesis (1910a), she argued for the viewpoint that the Danish written language is built on the language of the medieval chancellery, which she considered to be a continuation of the language in Erik's law for Sjælland. Her work was greeted with general acclaim, but Paul Diderichsen (1905–64) in his *Fragmenter af gammeldanske Haandskrifter* (1931–37) presented a body of material which shows that significant dialectal features are not found in religious literature either, and he therefore argued that the Danish written language does not have its roots in the language of the chancellery but in that of religion. Verner Dahlerup (1896, 9) thought that the basis for the Danish written language in *Christian III's Bible* (1550) was the language of Sjælland and that the language of the chancellery may have functioned as an intermediate link. Peter Skautrup does not seem to have said what he thought to be the basis for the medieval language form, but he ascribed crucial significance to the art of printing in the development of the written standard language, and he considered that the individual person with greatest influence on this was Christiern Pedersen – “the founder of standard written Danish” (Skautrup 1947, 176).

5.2. Standard spoken Danish

While Lyngby and Wimmer considered that the medieval scribes wrote as they spoke, Verner Dahlerup (1896, 37), Lis Jacobsen (1910b, 211) and others thought that everyone at the end of the medieval period, of all classes, still spoke a language that was more or less characterized by dialectal features. Johs. Brøndum-Nielsen (1881–1977) argued against this view by pointing to the fact that the humbler characters in a comedy from 1607 had a more dialectally marked language than did those of higher rank. He has also shown that there were several layers of spoken language in the 17th

and 18th centuries and therefore considers that there must already have been a more or less dialect-free language spoken by people of rank, the nobility, the clergy etc. during the medieval period (Brøndum-Nielsen 1950, 25f.). Skautrup also (1944, 280) put forward the suggestion that people in certain circles at that time may have spoken a more or less dialect-free language, but he drew attention to the fact that the linguistic source material does not give any decisive support for this idea.

Our knowledge about the spoken language in older times is not great, and this is particularly true of the period from 1500 to 1800, when Danish standard pronunciation consolidated its position. Standard Danish, with special reference to the language in Copenhagen from ca. 1840 to 1955, however, has been described in detail by Brink/Lund (1975). They base their description on an authentic body of sound material, and they document among other things how so many sound changes have taken place in recent spoken Danish that each generation has its own distinctive stamp. This work has given rise to much debate, for one thing because the authors – inspired by Otto Jespersen (1860–1943) – have employed a detailed, phonetic description instead of the more traditional phonemic description which was inspired by Louis Hjelmslev (1899–1965).

6. Descriptions of the Danish language

6.1. Sound, form and syntax

Some of the historical grammars of Danish contain a description of the syntax and/or the morphology during a specific period, a certain text or text-group. To this category belong Johs. Lollesgaard's *Syntaktiske Studier over det ældste danske Skriftsprog (for ca. 1300)* from 1920 and Paul Diderichsen's structuralist description of the sentence structure in *Skånske Lov* (1941). Other historical grammars only contain discussions of the phonetics and morphology, e. g. both the structuralist descriptions of *Skånske Lov* (1966) and *De sjællandske Love* (1967), which were compiled by Anders Bjerrum (1903–84), and Johs. Brøndum-Nielsen's major work, *Gammeldansk Grammatik* (1928–74), which describes the period ca. 800–1525. In the Preface to vol. 1 (1928), Brøndum-Nielsen emphasizes his indebtedness to Swedish philologists, to works by Axel Kock, Adolf Noreen etc. Kock and

Noreen were influenced by the neogrammarians, who were responsible for the theory of the invariance of the sound laws. Two of GG's eight volumes contain a detailed description of regular sound changes, and the many exceptions to the rules are treated in circumstantial detail in note after note. The remaining volumes contain a detailed description of Old Danish morphology. The main stress here is also placed on the changes in the language. The description is accompanied by a wealth of examples with indications of sources and references to the relevant literature. It would appear from the Preface to vol. 1 (1928) that GG was originally to have included Old Danish syntax, but this plan was later abandoned.

Aage Hansen also made a significant contribution to the history of Danish sounds in his book on *Den lydlige udvikling i dansk fra ca. 1300 til nutiden 1–2* (1962–71), but here it is only the sound changes that have led to the formation of modern Standard Danish which are described. Hansen does not attach great importance to explaining special cases and exceptions in the way that Brøndum-Nielsen does in GG. This is partly due to the different aim of his book, but it also reflects the fact that Hansen studied under Otto Jespersen, who was an avowed opponent of neogrammatical theories. As far as the dating of changes is concerned, Hansen follows a special principle. He considers the early examples of a sound change to be variants and claims that a change has not been completed until the new form has become universal. Since the written standard is conservative, this will often lead to a very late dating. Skautrup looks upon the matter in a different light. This is evident from his datings, which on the whole tend to be earlier than Hansen's, and from his statements, for example about the weakening of stops where he writes that "the first time an instance of weakening is registered in the written language, the change must have been realised and have been audible in the spoken language" (Skautrup 1944, 229).

In this connection, Hansen's *Moderne dansk 1–3* (1967) must also be mentioned. This work, which contains syntactic studies of Standard Danish, also includes linguistic sources from the 19th century.

6.2. From ancient language to modern language

Several philologists have provided surveys of the history of the Danish language. This is the

case, for example, with Verner Dahlerup (1896). The undisputed major work on the history of the language, however, was written by Peter Skautrup (1896–1982). This is *Det danske sprogs historie 1–5* (1944–70), which contains a description of the language in Denmark from the time of the oldest literary monuments to about 1950. Skautrup based his account on a series of descriptions of periods, and the individual descriptions have more or less the same structure: the historical background, the sources, the linguistic situation, the linguistic system (orthography, sounds, inflexions, syntax etc.), linguistic spheres, word-formation and the vocabulary. Seen from Skautrup's viewpoint, the history of the language is first and foremost an historical discipline, and the advantage of linking the history of the language with the general history of the speech community is documented particularly in his chapters dealing with the history of words, style and genres. For the description of the language system, however, the close coupling of language and community is more of a liability than an advantage.

The most recent account of the Danish language from ancient times to the present day is a work by Allan Karker (1993). This account, which only deals with the written language, is based on authentic text samples and aims to show in outline the development of the language, the cultivation of new genres and typical tendencies in the usage of the language. Karker is also the man behind *Politikens sproghistorie* (1996), a book whose roots go back to the 1950s, for it is a revised edition of the survey of the history of the language that was included in all the editions of *Politikens Nudansk Ordbog* from the very first one in 1953 to the 15th in 1992. It consists of a series of chronological sections discussing the history of sounds, inflexions, syntax and vocabulary.

6.3. From Rask to Wimmer and beyond

The Danish Society for Scandinavian Philology has marked its 25th, 50th and 75th anniversaries by taking stock of research into the Danish language. This stock-taking has so far resulted in three publications which contain bibliographical information of a more or less complete nature. The theme for the first publication, *Fra Rask til Wimmer* (1937), covered Danish researchers into the mother tongue in the 19th century. The theme for the second volume was the research disciplines included

under the subject “Danish” (Larsen/Lisse/Nielsen 1965), and the latest volume in the series deals with the most recent results of this research (Holmberg/Frederiksen/Ruus 1989).

9. Research in Swedish language history 1850–1950. An overview

1. Introduction
2. Phonology, morphology and syntax
3. Word formation
4. Loanwords
5. Dictionaries
6. Literature (a selection)

1. Introduction

This account of research into Swedish language history during a period of approximately one century, from 1850–1950, is divided into four main parts: phonology, morphology and syntax; word formation; loanwords; and dictionaries. The many contributions which have been made to the fields of research covered by these divisions mean that the selection is inevitably partly subjective. Generally speaking, most attention is devoted to works from an earlier stage of the period. The motivation for this is partly due to considerations of historical aspects, but mainly, at least as regards sound change, because a great many of the problems with which later research was concerned were identified during this period.

2. Phonology, morphology and syntax

The founder of research into modern Swedish language history is Johan Erik Rydqvist (1800–1877), librarian at the Royal Library in Stockholm. His tutors were Jakob Grimm, Franz Bopp and Rasmus Rask. His greatest achievement was the six-volume *Svenska språkets lagar* (1–5, 1850–74, vol. 6 published in 1883 by K. F. Söderwall). He did not, however, manage to produce the comprehensive description of Swedish he envisaged. Medieval Swedish was described in detail, as was 19th-century Swedish, including the dialects – Rydqvist was well aware of the importance of dialects in language history and acquired an ever-increasing understanding of them; however, the interim period was described only sporadically or hardly at all. The absence of syntax is notable. Most important is the section on morphology, which set a precedent for later works, and the comprehensive contribution to lexicography. Even for its time, however, the section on phonology has palpable defects.

The first Professor of Scandinavian Languages in Uppsala, commencing in 1859, was Carl Säve (1812–76). Säve achieved his

greatest results as a dialect researcher, primarily studying the dialects of Gotland and Dalarna. Dialectology was put on a firm academic footing by Säve and his students. Säve's successor, in 1877, was Mårten Richert (1837–86), who made a significant contribution in introducing comparative modern language research to Uppsala. His most important work is his doctoral thesis, *Bidrag till läran om de konsonantiska ljudlagarna i äldre och nyare språk 1–2* (1863–66).

The first Professor of Swedish in Uppsala was the multi-talented, learned, independent and ingenious Leonard Fredrik (Frits) Löffler (1847–1921). Adolf Noreen (see below) said of him that he was “the first at Uppsala University to apply a strictly scholarly method of research to the field of Scandinavian Languages”. Löffler began his academic writing as a dialectologist and phonetician. His doctoral thesis from 1872 was entitled *Om konsonantljuden i de svenska allmogemålen*. Löffler pointed out that the dialects are often surprisingly old-fashioned but also that they quite often show evidence of younger features than standard Swedish, which according to him is due to the fact that they follow “general linguistic laws” more consistently. Löffler emphasised that the dialectal evidence must also be taken into consideration in language history and etymological research into standard Swedish. An excellent example of this focus is his article *Ordet eld belyst af de svenska landsmålen* (1881).

Inspired by his studies in Leipzig during 1874–75, Löffler devoted himself to investigations of older Germanic and Scandinavian language history during the late 1870s. Of especial importance is his work *Bidrag till läran om i-omljudet* (1875–76), where he comes to the now generally accepted conclusion that *i*-mutation of short *e* is pan-Germanic and older than that of the back vowels. Löffler also discusses mutation and breaking in his *Om v-omljudet af ĭ, ī och ei i de nordiska språken* (1877). He was the first to observe that *w*-mutation seems to be more common than pure *u*-mutation. There is no doubt that Löffler, through his writings from the 1870s, was a real pioneer in modern language research in Sweden.

Contemporary with Löffler was Fredrik Tamm (1847–1905), who during the last two decades of the 19th century held Löffler's pro-

fessorship. He was at the pinnacle of contemporary research in the fields of word formation and etymology (see sect. 3 and 5).

Adolf Noreen (1854–1925) dominated research into Swedish language history at the end of the 19th century and the two first decades of the 20th. In 1887 he became the third incumbent of the professorship in Scandinavian languages at Uppsala University. Noreen spent most of 1879 in Leipzig, the Mecca of the neogrammarian school, and his later academic production is affected by the influences and trends he encountered there; among much else, he studied Lithuanian under August Leskien, who had some years earlier proclaimed the invariability of sound laws. Noreen maintained close contact with German language research, and he remained faithful to the neogrammarian school all of his life.

Noreen's first great achievement was in dialect research. In his dissertation, *Fryksdalsmålets ljudlära* (1877), he discusses the dialect of his home district in Värmland. His work, the first in Sweden to apply the new phonetic findings, was a model of meticulous detail and clarity in systematisation, which influenced a great number of dialect theses several decades into the 20th century. Of Noreen's other dialectological works from the 1870s and the beginning of the 1880s, *Färömålets ljudlära* (1879) and *Dalmålet* (1881–82) can be mentioned here. The latter was an important pioneering work as concerns research into the complicated, diversified and partly inaccessible linguistic world of Dalarna, and has been of great significance for Swedish and Scandinavian language history.

Noreen's scholarly production during the 1880s includes a number of investigations of language history, for example *Om behandlingen af lång vokal i förbindelse med följande lång konsonant i de östnordiska språken* (1880) and *De nordiska språkens nasalerade vokaler* (1886). The latter is one of Noreen's best works, in which he basically solves a complicated problem in linguistic phonology, building partly on information about nasal vowels in 12th-century Icelandic from the author of *The First Grammatical Treatise* (in Snorri's Edda), partly and not least on observations from the dialect of the province of Dalarna.

Noreen is most famous as a language historian thanks to his handbooks *Altisländische und altnorwegische Grammatik* (1884; 5th ed. 1970), *Geschichte der nordischen Sprachen* (1889–91) and *Altschwedische Grammatik*

(1904). Both grammars occupy a leading position among grammatical descriptions of old Germanic languages; they continue to be indispensable tools in any academic study of Old West Nordic and Old Swedish. In the first, which deals with Old West Nordic, the historical perspective is extended to include the common pre-historic ancestor of the Scandinavian languages, Proto-Nordic, as it first appears in runic inscriptions in the older, 24-letter futhark. In the Old Swedish grammar, Noreen also refers to runic inscriptions, in this case the plentiful Viking Age material, for evidence of language development.

Noreen's most spectacular academic achievement was the great, unfortunately unfinished work *Vårt språk* (1903–24), in which he records his view of language and presents a basic outline of grammar. The work comprises four main sections: a general introduction and sections on phonology, semantics and morphology. In each of the last three sections the account is divided into an introduction as well as a synchronic-descriptive and an etymological-diachronic part.

Rydqvist's successor as language historian and lexicographer can be said to be K. F. Söderwall (1842–1924), Professor of Scandinavian Languages in Lund from 1886–1907. A masterpiece for its time, one of his works *Hufvudepokerna af svenska språkets utbildning* (1868) was the only overview of this subject for a long time. See also section 5 about Söderwall as a dictionary compiler.

While Adolf Noreen dominated Scandinavian languages in Uppsala at the end of the 19th century and beginning of the 20th, Axel Kock (1851–1935) did the same in Lund, where he was Professor of Scandinavian Languages from 1907–16. Kock was indubitably a neogrammarian. The emphasis of this school on the importance of finding universally applicable rules for language change appealed to him. Nevertheless, he took an independent stance against neogrammarian teaching, and was sceptical of the thesis of the invariability of sound laws.

Kock's doctoral thesis, *Språkhistoriska undersökningar om svensk accent 1* (1878), examines the different forms of accent (expiratory and musical) in Swedish and their distribution and use in simple words, but also discusses their appearance and change from the Old Swedish period. With this work, Kock had already laid the foundations of his reputation as a language researcher. In part 2 (1884–85) of this work, he investigated the ac-

cent in compound words, and he later discussed issues concerning Scandinavian accent in several articles. He provided a comprehensive account, in which the historical perspective is expanded, in *Die alt- und neuschwedische accentuierung unter berücksichtigung der andern nordischen sprachen* (1901). Notable in his work *Studier öfver fornsvensk ljudlära* 1–2 (1882–86) are the studies of the old terminal vowels *a*, *i*, *u*, resulting in a formulation of the rules for vowel balance (“vokalbalans”, a term coined by Kock) and vowel harmony, which has won general acceptance.

Kock’s various studies of mutation and breaking occupy a central position in his academic writing. He gave a comprehensive account in *Umlaut und Brechung im Altschwedischen. Eine Übersicht* (1911–16). Kock’s theory of the process of Scandinavian *i*-mutation has been the subject of most attention, but at the same time also of much debate and criticism. According to Kock, *i*-mutation occurred in three stages. In an older phase the loss of *i* would have caused mutation in long syllables (the older *i*-mutation), while in a younger phase the *i* remaining after syncope would have caused mutation in both short and long syllables. In the interim *i* would have been syncope after short root syllables without causing mutation. Kock later expanded his theory (1892) with the assumption of an *iR*-mutation, which would explain mutation of back vowels in short syllables in cases such as (OWN) pres. sg. *tekr* (< **takiR*) and adv. (comp.) *betr* (< **batiR*). As far as breaking is concerned, contrary to the earlier understanding that the diphthong OWN *jō*, OSw. *io*, occasioned by breaking of *u*, could be explained as the result of *u*-mutation of *ia*, Kock instead maintained that the development, through epenthesis, was *e* > *e*” > *eu* > *eo* > *io*. Kock summarised his many studies of Swedish vowel development, supplemented with new findings, in the great work *Svensk ljudhistoria* 1–5 (1906–29).

Otto von Friesen (1870–1942), Professor of Swedish at Uppsala University from 1906–35, launched his academic production with comprehensive and thorough studies of the older grammar of the Germanic languages, particularly their sound shifts. His doctoral thesis, *Om de germanska mediageminatorna med särskild hänsyn till de nordiska språken* (1897), is an extraordinarily learned investigation of the cause of the long consonants in words such as Sw. *gubbe*, *krabba*, *kudde*, *bagge*, *tagg*, *vagg*. According to von Friesen, these result

from a lengthening in late PGmc before the *n*-suffix, above all (or perhaps exclusively) in substantive *n*-stems. This notion of von Friesen’s was later contested by Elof Hellquist, however (see sect. 3), who in the two works *Några bidrag till nordisk språkhistoria* (1903–04) and *Några anmärkningar om de nordiska verben med mediageminata* (1908) showed that it was primarily a matter of the relatively late onomatopoeic lengthening of *b*, *d*, *g*. Several of von Friesen’s best works deal with the morphological and phonological changes of older Germanic and Scandinavian languages, including works such as *Till den nordiska språkhistorien* 1–2 (1901–06), which largely investigate the development of Proto-Nordic *ai* before *y*, *u*, and *Om det svaga preteritum i germanska språk* (1925).

Bengt Hesselman (1875–1952) was another outstanding figure in Swedish language history during the first half of the 20th century. After holding the professorship in Scandinavian Languages in Gothenburg for a short time (1914–19), he succeeded Adolf Noreen as Professor of Scandinavian Languages in Uppsala. Hesselman’s first work was concerned with syllabic quantity. In *Skiss öfver nysvensk kvantitetsutveckling* (1901), he discusses the development in words with originally short root syllable, and he takes up a related topic in his doctoral thesis, *Stafvelseförlängning och vokalkvalitet i östsvenska dialekter* (1902). From an early stage, Hesselman was an acknowledged authority in Swedish dialect research. One of his main works in this area is *Sveamålen och de svenska dialekternas indelning* (1905), where he asserted that the dialects of central Sweden are clearly distinct from those of the provinces of Götaland and Norrland. In the dialects, Hesselman saw the key to a full understanding of standard Swedish, as well as much of language history. A clear example of a problem in historical linguistics solved with recourse to dialects is *De korta vokalerna i och y i svenskan. Undersökningar i nordisk ljudhistoria* (1909–10). This work investigates the transition from OSw. *i*, *y* to *e*, *ö*, which Hesselman shows is dependent on the phonetic environment and as a result is chronologically and geographically distributed.

In the work *Några nynordiska dialektformer och vikingatidens historia. En undersökning i svensk och dansk språkutveckling* (1936), Hesselman discusses the form *hjär*, standard Sw. *här* ‘here’. *Hjär* is assumed to have arisen from *hēr* through diphthongisation of Germ. *ē*². According to Hesselman, the diphthongisa-

tion would have taken place in Hedeby in Schleswig, where there was a Swedish colony, under the influence of Frankish and possibly also of Old Saxon or Old Frisian. From there, the form would have spread to the Viking Age Swedish empire, with centres in Birka and Uppsala.

Hesselman confronted a classic problem of Proto-Nordic phonology in *Omljud och brytning i de nordiska språken* (1945). Contrary to Axel Kock, who postulated a three-phase development of *i*-mutation (see above), Hesselman suggested a different process. The basis of his theory is that this mutation (as with mutation caused by *a* and *u*) is part of a uniform and continuous process during the entire pre-literary period from around the middle of the first millennium. Mutation of back vowels in root syllables, both long and short, occurred if there was a sharply articulated terminal *i* during the mutation period. Mutation occurred prior to Proto-Nordic syncope, with which it has no direct connection. As far as breaking is concerned, Kock maintained that it occurred during different periods, an older and a younger; the younger breaking would have been more frequent in East than in West Scandinavia. According to Hesselman there is no phonetic contrast between the various areas of Scandinavia.

An unfortunately unfinished work by Hesselman, the pinnacle of his scholarly writing, is *Huvudlinjer i nordisk språkhistoria* (1948–53), in which he intended to provide a comprehensive treatment of the most important matters relating to the changes in colloquial language in the Scandinavian area. The discussion was based on an enormous selection of material, much of which had not been used earlier in research into Scandinavian language history; not least, testimony from Scandinavian place-names and modern Scandinavian dialects was considered. In the completed parts of the work only sound shifts are discussed, with a focus mainly on sound weakening and loss. Hesselman emphasises that sound changes occur in sentences and that since weakening is dependent upon sentence rhythm, it first occurs in the sentence.

Methodically and theoretically, Hesselman comes closest to being classified as a neogrammarian. He was hardly a pure example, however, and he was wary of an uncritical approach to neogrammarian theses – especially in *Huvudlinjer*, where he distanced himself from these. He was sceptical of concepts such as “sound laws”.

Emil Olson (1876–1937), Professor of Scandinavian languages at Lund University from 1917 until his death, is probably most famous for his work on Old Swedish word formation (1916), see sect. 3. Other contributions to language history worth mentioning include his book *Studier över pronomenet den i nysvenskan* (1913) and his article *Till frågan om uppkomsten av den s.k. tredje svaga konjugationen i svenskan* (1913). The question of how the third weak conjugation arose was later (1948) discussed – and probably definitively solved – by Valter Jansson, Professor of Swedish at Uppsala University from 1947–73, whose greatest achievements were as a philologist and a researcher of place-names. Foremost among his works on place-names is *Nordiska vin-namn. En ortnamnstyp och dess historia* (1951), which is to a great extent a phonological investigation.

Elias Wessén (1889–1981), Professor of Scandinavian languages at what was then Stockholm University College from 1928–56, submitted his doctoral thesis in Uppsala in 1914. This was entitled *Zur Geschichte der germanischen n-Deklination* and was followed by a number of investigations of Scandinavian and Germanic morphology and phonology. Wessén’s greatest achievement as a language historian was, however, to produce a number of handbooks. The most famous is *Svensk språkhistoria* in three parts: (1) *Ljudlära och ordböjningslära* (1941), (2) *Ordbildningslära* (1943), (3) *Grundlinjer till en historisk syntax* (1956). Several editions have been published of parts 1 and 2, and two editions of part 3. This work is of great merit, not least because of its numerous references to relevant literature. The same can be said about *De nordiska språken*, which was also published in several editions, the first in 1941.

Erik Neuman (1883–1959) investigated a subject integral to language history in his dissertation submitted at Uppsala University in 1918, *Utbredningen av vokalbalansen a : å i medelvenskan*. Neuman shows that a significant number of Old Swedish manuscripts have an orthography with terminal *o* or *aa* after a short root syllable, but with *a* after a long root syllable.

Natan Lindqvist (1882–1963), Professor of Swedish at Uppsala University from 1936–47, made a great contribution to language history through his research into the language of the Swedish Bible during the Reformation, the earliest example of which was his doctoral thesis, *Studier över reformationstidens bibelsven-*

ska (1918). He was also the most prominent figure in work on dialect geography in Sweden. This branch of research, often with a partly diachronic perspective – an example of which is the compilation volume *Ordgeografi och språkhistoria* (1936), with contributions from seven Uppsala-based researchers – was introduced seriously into Sweden in the 1930s. Lindqvist, then head of the newly-established Dialect Archive in Lund, initiated a large dialect geography work which appeared in 1947 entitled *Sydväst-Sverige i språkgeografisk belysning. 1. Text. 2. Kartor*. The second section contains 125 maps, primarily of word distribution, but also of various phenomena relating to phonology, morphology and word formation. With the help of these maps, Lindqvist was able to distinguish a southwest Swedish core language area, bordered by a diagonal line stretching approximately from east Blekinge to northern Dalsland. Lindqvist also made an important contribution to research into language history and etymology with his illustrative studies of the phonological, morphological and semantic changes frequently undergone by words on the fringe of their area of distribution. Articles especially worth mentioning in this context include *Urspårade ord i dialektgeografisk belysning* (1934) and *Ordgränser och ordförändringar* (1938).

Examples given above of the work of Frits Läffler (1881) and Adolf Noreen (1886) illustrate the advantage of using the evidence of later Scandinavian dialects when dealing with phonological problems in olden times. A few further examples may be mentioned.

A study based primarily on principles of dialect geography and of great importance to Swedish and Scandinavian language history is the dissertation of Natan Lindqvist's disciple Lennart Moberg (b. 1914), *Om de nordiska nasalassimilationerna mp > pp, nt > tt, nk > kk med särskild hänsyn till svenskan* (1944). The material comprises words and place-names containing the relevant consonant groups. Moberg, who was Professor of Scandinavian languages, particularly place-name studies, at Uppsala University from 1960–61 and Professor of Scandinavian languages there from 1961–81, investigates the “syllabic” theory and concludes that in areas where Swedish is spoken it is often safer to reckon instead with assimilation in unstressed position.

Also from 1944 is John Svensson's doctoral thesis *Diftongering med palatalt förslag i de nordiska språken*, submitted at Lund Univer-

sity. This thesis is also largely dependent on material from contemporary Scandinavian dialects, and principles of dialect geography are often applied. Contrary to the accepted teaching that the breaking diphthongs arose through epenthesis, Svensson maintains that the terminal vowels were irrelevant to breaking, which instead arose through the spontaneous diphthongisation of *ē* via development of a *j* in front of the vowel (*ie*).

Ture Johannisson (1903–90), Professor of Scandinavian languages in Gothenburg from 1945–70, was awarded his doctorate in 1939 for his thesis *Verbal och postverbal partikelkomposition i de germanska språken*, a subject which primarily belongs to word formation (see sect. 4). Johannisson made a contribution to research into Scandinavian syntax in his work *Hava och vara som tempusbildande hjälpverb i de nordiska språken* (1945), which investigates the appearance and significance of the compound past tense, primarily in Old West Nordic and Swedish but to some degree also in Danish and Norwegian. Johannisson shows that Old Swedish and older Modern Swedish clearly deviate from Old West Nordic in that the Swedish *vara* construction, unlike those in Old West Nordic, had perfect or pluperfect significance.

Karl Gustav Ljunggren (1906–67), Professor of Swedish at Lund University from 1952 until his death, contributed to several branches of Scandinavian philology, including research into syntax. His 1932 dissertation, entitled *Studier över förhållandet mellan verbalpartikel och verb i fornsvenskan*, also includes the Viking Age runic inscriptions in the Old Swedish material. The thesis is mainly an examination of indigenous separable verbal particles of the type (modern Swedish) *bortföra, ingå, avtaga, tillkomma* alongside *föra bort, gå in* etc. *Studier över verbalsammansättningar i 1500-talets svenska* (1937) is a continuation of his doctoral thesis. A third great work by Ljunggren is *Adjektivering av substantiv i svenskan. Undersökningar i svensk ordbildnings- och betydelselära* (1939), in which the author investigates under what conditions the transition from noun to adjective takes place and the frequency of such transitions in modern Swedish. The results are then to a rather great extent applied to older material.

A contribution to the understanding of adjectival syntax is made in the doctoral thesis of Carl-Eric Thors (1920–86), Professor of Swedish at Helsinki University from 1963–84), *Substantivering av adjektiv i forn-*

svenskan (1949). Thors discusses the appearance of the adjective used as a noun in Old Swedish, delimits different types of such adjectives and discusses whether and where these might be attributable to foreign influence.

Contributions to research in Swedish syntax during the time period discussed here are rather rare, particularly in comparison with those dedicated to phonology. A number of works have already been mentioned. In the following some further examples will be presented, in chronological order.

Two dissertations have investigated the passive in Swedish: Paul Öhlin's *Studier över de passiva konstruktionerna i fornsvenskan* (1918) and Gösta Holm's *Om s-passivum i svenskan* (1951). Öhlin finds it probable that a passive form with *s* resulted from an indigenous development but that to encompass more than only a few verbs it must have had outside support, in this case from Latin. Holm's aim was to establish the degree to which the Swedish *s*-passive is indigenous and how far it is dependent on a Latin prototype. Holm (b. 1916), Professor of Scandinavian languages at Lund University from 1961–81, concludes that the *s*-passive is completely indigenous in origin. He shows certain types of *s*-passive to be dialectally genuine, a finding contradicted by earlier research. Others belong exclusively or predominantly to the written language and these are partly attributable to Latin models. The dissertation is ground-breaking, not least because for the first time it investigates a certain syntactic problem over the entire Swedish dialect area.

Old Swedish word order was the subject of two doctoral theses: Alf Wenning's *Studier över ordföljden i fornsvenskan* (1930) which charts the position of verbal adjuncts in the sentence in older and younger Old Swedish, and Carl Larsson's *Ordföljdsstudier över det finita verbet i de nordiska fornspråken 1* (1931) which, despite its title, largely examines conditions in Old Swedish.

In his doctoral thesis *Konjunktiven i fornsvenskan* (1933), Gösta Mattsson investigates the degree to which the subjunctive is indigenous and how far – and in which genres – it is dependent on foreign influence. Anders Sundqvist's comprehensive doctoral thesis, *Studier i svensk moduslära* (1955), provides the first overview of the extent to which the subjunctive has been maintained and developed in the Swedish dialects.

Märtha Ahlberg's doctoral thesis, *Presensparticipet i fornsvenskan. En syntaktisk studie*

(1942), is an investigation of the use and function of the present participle during a time of radical changes in Swedish, many of these directly or indirectly dependent on increasing contact with other languages, primarily Latin and Low German. Ahlberg also discusses the form of Latin participle constructions when they are converted to Swedish.

Gustaf Lindblad, Professor of Scandinavian languages at Stockholm University from 1956–72, was awarded his doctorate in Lund in 1943 for his thesis *Relativ satsföregning i de nordiska fornspråken*. The thesis may be characterised as a general outline of the main trends in Old Scandinavian syntax, and it is the first which is based on all representative material: as well as runic inscriptions, it includes approximately 150 of the oldest Scandinavian, primarily Old Swedish, texts.

The perspective in Lage Hulthén's doctoral thesis, *Studier i jämförande nunordisk syntax* (1944), is almost exclusively synchronic; only rarely does the author find it necessary to apply a diachronic perspective. In his role of programmatic synchronicist, the author devotes much attention to matters of terminology.

There is at most only sparse information about syntactic conditions in the many dialect theses. One work which deals exclusively with dialectal syntax is Gudrun Lundström's dissertation, *Studier i nyländsk syntax*, completed at what was then Stockholm University College in 1939. The dissertation sets out to investigate in principle all the syntactic areas independently. Comparative material is taken from Old Swedish and current standard Swedish in Sweden and Finland. Comparisons with other dialects are not undertaken.

3. Word formation

The list of researchers who investigated word formation in Swedish during the relevant period should begin with Fredrik Tamm (cf. sect. 2 and see also sect. 5). Tamm studied older word formation in a work which is regarded as a classic, *Om fornnordiska feminina, afledna på ti och på iþa* (1877). He paid great attention to word elements borrowed from foreign languages, especially German. Pertinent writings include *Tränne tyska ändelser i svenskan* (1878) and *Om tyska ändelser i svenskan* (1880).

Elof Hellquist, Professor of Scandinavian languages in Lund from 1914–29, was awarded his doctorate in 1890 for his dissertation *Bidrag till läran om den nordiska nominalbild-*

ningen. Another work of his from the 1890s is *Om nordiska verb på suffixalt -k, -l, -r, -s och -t samt af dem bildade nomina* (1898). The first edition (1922) of his *Svensk etymologisk ordbok* (sect. 5) began with a section on Swedish word formation, with the suffixes listed alphabetically.

A classic work in Swedish word formation is Emil Olson's (see sect. 2) *De appellativa substantivens bildning i fornsvenskan* (1916). It continues to be an indispensable tool for researchers studying historical word formation and/or etymological problems. Walter Åkerlund's doctoral thesis, *Studier över adjektiv- och adverb bildningen medelst suffixen -liker och -lika i fornsvenskan* (1929), examines the suffix which in the younger periods of all Germanic languages has become one of the most productive elements in word formation, despite being only to a limited extent the subject of detailed study.

Ture Johannisson's doctoral thesis (mentioned in sect. 2), *Verbal och postverbal partikelkomposition i de germanska språken* (1939), investigates how the intensifying adjective particles Sw. *ut-*, *av-*, *ur-*, *för-* and their correspondences in other Germanic languages as well as the West Germanic "nimis-particle" *G zu*, *E too* achieved their importance. Johannisson succeeds in showing that the intensifying particles were originally attached to verbs. Their function and importance later increased so that they also could be used in adjectives and noun compounds. The particle composition had thus entered its postverbal stage. In verb compounds the particles were unstressed and were often lost, while in noun compounds they carried the stress and were therefore preserved.

Elias Wessén's *Svensk språkhistoria 2. Ordbildningslära* (1st ed. 1943, 5th ed. 1965; cf. sect. 2), which provides a broad but comprehensive overview of word formation in Swedish, was intended for researchers as well as for teaching at an academic level. A detailed investigation of a derivational adjective ending comprises Sven Benson's (b. 1919, Professor of Scandinavian languages at Gothenburg University from 1974–83) doctoral thesis, *Studier över adjektivsuffixet -ot i svenskan* (1951). In his discussion, the author often considers the suffixes competing with *-ot*, i. e. *-ug* and *-ig*, and the account has thus partly become a contribution to their history in Swedish. Åke Åkermalm's doctoral thesis, *Fornnordiska verb med substantivisk förled. Ett bidrag till nordisk ordbildningslära*, submitted at

what was then Stockholm University College in 1955, illustrates a feature of Scandinavian word formation where thorough investigation had previously been lacking. The thesis deals with words of the type OSw. *bonhōra*, *knæfalla*, *trolova*.

There are few works in the rich Swedish dialect literature which systematically investigate problems of word formation. An early example of such a work is Johan Götling's *Studier i västsvensk ordbildning* (1918), which examines the productive derivational suffixes and their functions in nouns in the language of Götene in the province of Västergötland. Inchoative verbs ending in *-na* and verbs formed with *k-*, *l-*, *r-*, *s-* and *t-* suffixes in the Finland-Swedish language of Närpes were studied by Eskil Hummelstedt in his doctoral thesis from 1939.

4. Loanwords

It is a well-known fact that Swedish, like the other Nordic languages, took a significant percent of its vocabulary from other languages. The study of loanwords has therefore occupied a central place in Swedish and Nordic language history. There still remains much to be done in this field, however. A thorough outline of Swedish loanwords from different parts of the world is to be found in Elof Hellquist's *Det svenska ordförrådets ålder och ursprung 2* (1930).

There is great variety in the age of loanwords in Swedish. The oldest, from the time preceding Old Swedish, originally derive from Latin (e. g. *kärva*, *köpa* and *vin*), and Celtic (e. g. *järn* and *rik*). Most of the medieval borrowings belong to the field of Christian terminology, many of them originally from Latin and Greek, e. g. *altare*, *biskop*, *kloster* and *kyrka*. This type of loanword has been treated in detail by Carl-Eric Thors (see sect. 2) in his work *Den kristna terminologin i fornsvenskan* (1957). A particularly profound influence was exerted by Middle Low German on Swedish during the Old Swedish period, mainly via the Hanseatic League. Although research into this influence has not been insignificant, several problems relating to the encounter between Low German and Swedish in medieval Sweden remain to be solved. For literature until around 1950, see Wessén (1970, with further references). During the 16th century, with the Reformation and Luther's translation of the Bible, a wave of loanwords from High Ger-

man arrived, which culminated during the 30 Years War (1618–48).

The late 17th century and 18th century loanwords came mainly from French, but during the 18th century English influence became more pronounced. Borrowings from French and English also dominate during the 19th century, primarily the English ones. During the 20th century, English influence continued at an increasing speed and introduced many words into the Swedish vocabulary. For an overview of loanwords from the 16th century onwards the reader is referred to the book by Lars-Erik Edlund/Birgitta Hene, *Lånord i svenskan. Om språkförändringar i tid och rum* (1996). French loanwords in Swedish during different periods have been systematically catalogued by Alfred Nordfelt in various articles appearing from 1901 to 1943, all of them under the title *Om franska lånord i svenskan*. Examples of French linguistic borrowings in Swedish dialects are given by Ingemar Ingers in his article *Franska lånord i folkmålen* (1958). Investigations of English loanwords in Swedish date largely from the latter part of the 20th century. A work from the beginning of the century may, however, be mentioned: Nils Bergsten's article *Om engelska lånord i svenskan* from 1915.

5. Dictionaries

Several dictionaries, many of them not yet completed, were compiled for historical linguistics during the period relevant to this article. Worth mentioning for the study of Old Swedish texts are C.J. Schlyter's *Ordbok till Samlingen af Sweriges Gamla Lagar* (1877), an exemplary dictionary of international repute, and K.F. Söderwall's *Ordbok öfver svenska medeltids-språket 1–2* (1884–1918; *Supplement* 1925–73). For Swedish from 1526 on, the dictionary of the Swedish Academy (*SAOB*), which began appearing in 1893 and has reached as far as the end of the letter S, is an indispensable tool. In principle a work of the same type as *SAOB*, but far less comprehensive and lacking authentic specimens of language, is A. F. Dalin's *Ordbok öfver svenska språket 1–2* (1850–55). Another very useful work is F.A. Dahlgren's *Glossarium öfver föräldrade eller ovanliga ord och talesätt i svenska språket från 1500-talets andra årtionde* (1914–16).

As far as dialect vocabulary is concerned, there is only one work which refers to the entire Swedish language area, J.E. Rietz' *Svenskt*

dialekt-lexicon. Ordbok öfver svenska allmogespråket 1–2 (1862–67). A successor to Rietz' dictionary, *Ordbok över Sveriges dialekter*, is under preparation in Uppsala, however; three fascicles have thus far been published (1991, 1994 and 2000). Three volumes of *Ordbok över Finlands svenska folkmål* have been published in Helsinki since 1976. As far as regional dialect dictionaries are concerned, however, the supply is admittedly good. An example of such a dictionary, published during the period in question, is *Gotländsk ordbok på grundval av C. och P.A. Säves samlingar* (1918–45).

During the years 1890–1905, eight parts (A–Karsk) of Fredrik Tamm's *Etymologisk svensk ordbok* appeared. It was a great loss for contemporary Swedish language research that this excellent work, which had no predecessor other than Johan Ihre's famous and for its time surprisingly modern *Glossarium Suio-gothicum* (1769), was not completed due to Tamm's death in 1905. On the other hand, Elof Hellquist's *Svensk etymologisk ordbok* (1st ed. 1922; 3rd ed. 1948) did reach completion and remains a work which bears comparison, even internationally. It is, not least, important for the wealth of cultural-historical information it provides and for its frequent explanations of set expressions and phrases. It could be maintained that Hellquist (see sect. 3) made his greatest contribution to Swedish language history with this dictionary.

6. Literature (a selection)

Ahlberg, Märta (1942), *Presensparticipet i fornsvenskan. En syntaktisk studie*. Stockholm.

Åkerlund, Walter (1929), *Studier över adjektiv- och adverb bildningen medelst suffixen -liker och -lika i fornsvenskan*. Lund.

10. Research in Norwegian language history 1850–1950. An overview

1. The dream of a Golden Age
2. Explaining Modern Norwegian
3. Innovations in the dialects
4. Methods
5. Society and language
6. Literature (a selection)

Norwegian linguistics has to a large extent been characterized by a historical approach. Many scholars have contributed by presenting results and ideas in a great many smaller but important publications, but extensive surveys are few.

The great interest in language history derives from the political struggle for independence and the general cultural conflicts of the country.

“This discipline, like all research, conveys a conviction of being connected with the life we experience today and with the future we create.” (Magnus Olsen, a speech 1908)

1. The dream of a Golden Age

1.1. P.A. Munch and a national reconstruction

The foundation of historical linguistics in Norway was laid by Peter Andreas Munch (1810–1863). The political programme he was committed to, National Romanticism, was the framework for his early scholarly work. Munch’s main goal was to demonstrate the national characteristics of Norwegian language, culture and history, and thereby legitimate the Norwegian claim for independence. His main field was the history of the Middle Ages. Whereas his older history colleague, R. Keyser, was interested in the Old Norse (Old West Nordic, OWN) language as an instrument for historical research, knowledge of the language was part of a cultural and political program for Munch.

The aim of Norwegian history and linguistics at that time was to link “our Norway and Norway of the past” as “two halves of a ring”. The Union period after 1319 had been a national disaster and was perceived as “the false soldered joint” which should be removed. The written language had disintegrated during the late Middle Ages, and Munch was convinced that it should be restored.

Studies of OWN were to prove that the rich medieval literature was Old Norwegian and not Old Common Nordic. For Munch it was

essential to prove that the Old Nordic language was divided into two branches: East Nordic and West Nordic. The West Nordic branch he called Old Norwegian or Old Norse (“norrønt”), and he emphasized the importance of respecting each nation’s right to its historic relics. The national demarcation in language and literature was obviously important, especially in relation to Denmark, and the Golden Age demonstrated that Norwegians had been superior to Danes and Swedes in producing medieval literature.

In 1845 OWN became an optional subject for the final university examination in Arts. In order to meet the demands of this new curriculum, Munch started giving lectures on Norwegian language history, and thus this subject was taught for the first time at the university. The lectures were based on his thesis about the form of the oldest Common Nordic language (1846). The following year attention was focussed on Old Norse as he and C.R. Unger published *Det oldnorske Sprogs eller Norronasprogets Grammatik* and *Oldnorsk Læsebog med tilhørende Glossarium*. These two books were standard textbooks for the next generation. The grammar, of which Munch was the main author, to a great extent followed the ideas and arrangement of Grimm’s *Deutsche Grammatik*, and thus Grimm’s linguistic insights were applied to OWN.

Munch accepted the Icelandic way of spelling OWN, and he considered it to be an adequate expression of what was typical Old Norwegian, or “the OWN language spirit”. Variation in the orthography was regarded as accidental. He assumed that OWN was pronounced more or less like modern Norwegian, because the language was one and the same in the past and in the present. According to the ideology of National Romanticism, languages had a static and national nature. This view is also reflected in the so-called “restoring orthography” which he developed for some mythical texts that he published and which M. B. Landstad used when writing down ballads. Munch considered the data Ivar Aasen (1813–96) collected from Norwegian dialects to be proof of “the almost unchanged existence of our old language”. For some time he argued that Unger and Aasen should edit a common dictionary of OWN and modern Norwegian dialects.

However, several other university men started their OWN studies in the middle of this century. During the period 1886–96, Johan Fritzner (1812–93) published his big *Ordbog over Det gamle norske Sprog*. Marius Nygaard (1838–1912) completed his OWN Syntax in 1906, and thereby finished a pioneering work that demonstrated a very systematic approach and used extensive excerpts from OWN texts. From the publication of Munch's 1847 grammar up to World War I, i.e. in about two generations, Norwegian linguistics had managed to obtain new and thorough insights into OWN.

1.2. Unity or dialects?

During the last half of the 18th century scholars had become aware that there were orthographic differences between Icelandic and Norwegian medieval manuscripts; a bit later it became known that there were variations even in the Norwegian ones. By about 1850 Munch was more willing to accept that there was some dialectal variation in OWN; this was a logical consequence of the unity he assumed between OWN and Modern Norwegian. He supposed that, for instance, OWN *ll* was pronounced *dl*, *dd* and *ll* in the same dialect areas that have these pronunciations today (e.g. *adle*, *adde*, *alle* < OWN *allir*); however, everybody “knew very well” that it should be written *ll*!

However, the idea of unity was predominant. Ivar Aasen tried to look for OWN dialect variation, but concluded (1885/1953) that “dialect forms have neither been many nor of any significance”. Moreover, the opinion that Modern Icelandic was almost identical to OWN was strong. Rasmus Rask had, however, pointed out in 1818 that Icelandic *u*, *y*, *ý*, *au* and *ey* were not “genuine”, as they had been changed from OWN. Aasen stressed in 1854 that *ö* in (the Icelandic spelling of) OWN should be pronounced approximately as *o*, and not as *ø* like in Modern Icelandic. This refers to the sound that is transcribed *ø* in modern OWN standard orthography (i.e. the *u*-umlaut of *a*), which has merged with *ø* to become *ö* in Icelandic (cf. OWN *børn* > Mod. Icel. *börn*).

Contemporary dialects were widely looked upon in the 19th century as a national treasure – and not as a language misfortune. As the interest in dialects increased, scholars became more occupied with looking for dialectal influence on the OWN spelling variants – which,

moreover, could be a means of deciding the provenance of the manuscripts. For instance, in 1878 Johan Storm (1836–1920) brought to light the fact that there was vowel weakening (*a* > *e*) in eastern dialects in the 13th and 14th centuries in unstressed positions (*senda* > *sendæ*). Aasen proved in 1885 that this vowel weakening followed OWN long syllables.

It was above all Marius Hægstad (1850–1927) who established the fact that Old Norwegian was represented by several dialects. In 1899 his monograph *Gamalt trøndermaal* appeared, and in the following years he described all West Norwegian dialects (including Faroese and Icelandic) in his series of books: *Vestnorske maalføre fyre 1350* (1907–1942). This monumental work of more than 1000 pages was based on thorough and extensive studies of medieval charters. It transformed our knowledge of the OWN language.

Hægstad's method was to try and trace modern dialect features in the OWN texts in order to attest geographic differences in the old language. As early as in his first publication (1899), he criticized Adolf Noreen for having distinguished between Old Norwegian and Old Icelandic. Hægstad found this distinction inadequate since Old Norwegian was not itself a homogeneous language. He demonstrated that the Trøndelag dialect had *æ* for *a* with *i*-umlaut (e.g. *hæfir* = standard OWN *hefir* ‘has’), which represents a more archaic language stage than existed in either Icelandic or other Norwegian dialects. He proved that the Trøndelag dialect had the privative prefix *ó-*, not *ú-*, and still kept the *a*-suffix in about 1270, whereas East Norwegian at that time had weakened this vowel to *-e*. Hægstad pointed out, too, that the late *u*-umlaut (i.e. where the *u* triggering umlaut is non-syncoated) did not exist in Trøndelag and the inner areas of eastern Norway during the 13th century. All in all – in his opinion – this tells us that there must have been dialect differences in Norwegian long before the oldest written sources came into being.

Hægstad described thoroughly in *Vestnorske maalføre fyre 1350* a pattern of vowel harmony which existed in OWN, with the exception of south-west Norwegian (including Faroese and Icelandic). In the southwest dialects the vowel suffixes were either *e-o* or *i-u*, whereas OWN elsewhere varied between *i* and *e* and between *u* and *o* depending on the preceding root vowel.

This theory of vowel harmony has created great scholarly interest. Both A. B. Larsen and

D.A. Seip had doubts concerning his conclusions on southwest dialects; however, Hægstad's assertion remained dominant. Magnus Rindal (1984) maintained that Hægstad's argument was circular since he classified his texts as southwestern using linguistic criteria. Egil Pettersen (1989) proved that vowel harmony did dominate in OWN letters from the inner dialects of southwestern Norway by studying all charters containing the svarabhakti vowel *u* or *o*, as these charters can only be from this area. Hægstad classified them as being from the northwest – even though they were issued in Voss and in Hardanger. It has also been proved that even in letters from Stavanger, i. e. outer dialects from southwest Norway, there was vowel harmony. The present view is that there seems to have been no dialectal difference in this respect in classical OWN.

The principles for vowel harmony seem to be complicated: Middle-high root vowels trigger *e* and *o*, high vowels trigger *i* and *u*. The theoretical problems are, however, caused by the low vowels, as *æ* triggers *i* and *o/u*, whereas *a* and *q* trigger *e* and *u*. Jan Ragnar Hagland (1978) has presented the most precise description so far in an analysis of documents from Trøndelag before 1350 where he found that connecting harmony to vowel weakening and describing the vowel variation in unstressed positions using four different phonological rules is most adequate. He, too, demonstrated that vowel weakening prevails in the final years of that period.

Vowel harmony disappeared from Norwegian before the end of the Middle Ages. Hægstad (1908), however, demonstrated that the principle of harmony continued to exist in the modern dialect of Stod in Trøndelag, and he considered the suffixes in some modern East Norwegian dialects (e. g. *biti* – *vik* – *hos* 'bitten-week-trousers') as vestiges of vowel harmony.

1.3. A written standard?

For a long time historians often idealized the OWN language situation by projecting modern conceptions of standardized national languages on to medieval times. The historian Ernst Sars (1835–1917) assumed that the aristocracy spoke a standard language and that the written language was a homogeneous standard; he believed both these factors restrained language changes. Seip (1934/1938) maintained that there was a standard for read-

ing according to which, for instance, consonants that had disappeared in spoken language should be pronounced.

The dialectologist Hægstad concluded that a national written standard developed during the period 1200–1350, during which the Royal Chancellery moved from Nidaros to Bergen. Thus the standard became a compromise between the dialect of Trøndelag and the dialect of western Norway. This claim was presented in 1902 in his thesis *Maalet i dei gamle norske kongebrev*. Hægstad's opinion totally prevailed up to 1986, when Jan Ragnar Hagland in his thesis rejected this view of a common national standard.

1.4. Language shift

After Munch's time there was an increasing interest in studying the period following the High Middle Ages, i. e. the period of union with Denmark. In the latter half of the 19th century it became more essential to look for continuous development than to restore the unity of the past and the present (cf. the contemporary philosophical ideas on evolution).

Many scholars have been preoccupied with what caused the Norwegian written language to become obsolete by the end of the Middle Ages. Aasen's opinion (1885) was that the Danish public servants in Norway were responsible, and that the Norwegian leaders wanted "to be in favour with the rulers and to demonstrate a certain superiority towards common people". Seip (1931) maintained that the Norwegian literary language did not have the strength to survive under this foreign pressure because the Norwegian scribes' centres were too dispersed. In his extensive language history (1951), Indrebø stressed the effect of the Black Death and the fact that foreigners married into the Norwegian nobility. In a way, he moralized about this issue and accused the medieval Council of the Realm of not having cared about the national language.

It has been argued that the language itself was disposed to this disintegration because people in the late Middle Ages felt it to be archaic. Indrebø refuted this by referring to Norwegian charters from about 1500 in which tendencies of language "modernization" can be witnessed, i. e. the fact that scribes used new forms from the spoken language.

There has been no fundamental discussion about how many of these problems concerning the disintegration of the written language

are anachronistic – whether, for instance, language users in medieval times and in the 16th century had a different conception of the notion of “language” under which the “Norwegian language” was not a relevant category (Sandøy 2000).

The language situation in the 16th century has been studied in depth. Indrebø, for instance, examined how long Norwegian names were kept on land registers (1927) and concluded that they dominated up to approximately 1530. He also documented (1951) the fact that Norwegian was used in charters issued by peasants until 1584, and this tradition remained for the longest time in inner Østfold, Telemark and Vest-Agder.

Trygve Knudsen (1962) demonstrated that Norwegian civil servants in the 16th century translated OWN legal texts into Danish mixed with features from Norwegian in order to make the texts comprehensible. In the latter half of the 16th century, the Humanists translated the kings’ sagas into Danish with the same purpose in mind.

1.5. The languages of the western islands

There have been tendencies to include the old languages of the colonized western islands under Old Norwegian. The dream of Norway as a great power in the past may have stimulated research interest in these languages. Hægstad included Faroese and Icelandic in his work on Old West Norwegian dialects, and he published *Hildinakvadet* from Shetland and an analysis of the linguistic features of the OWN dialect *Norn*.

Moreover, the interest in these emigrant languages may be founded on the ambition of throwing light on the Norwegian language situation; these island languages might have retained archaic features from OWN since emigration took place during the 9th and the 10th centuries, a period for which we have almost no written sources. Methodologically, using these sources is a very complex task, as the new language communities were made up of people with different dialects, which could certainly have resulted in a kind of language mixture with levelling tendencies. Phonologically this is illustrated by the fact that Norwegian had several archaic features which Icelandic had lost, cf. section 1.2. on *e* and *ę*.

A puzzle that has preoccupied some scholars is the fact that many innovations are alike or very similar in two or more of the West Nordic languages, e.g. diphthongization

(*bát* > *baot*), lowering of vowels (*vit* > [vɪt]), segmentation (*fjall* > *fjadl*) and differentiation (*karl* > *kadl*). Some scholars have doubted that the intercommunication between the countries could have been sufficiently intense to cause linguistic features to spread from one language to another. Therefore, e.g. Indrebø (1951, 267) claimed that similar changes may arise because the phonological starting point was the same for all these languages. Haugen (1970, 54) argued the same point more precisely by saying that there were “predispositions towards the innovations in the form of an allophonic split in Old Norse”. This has been supported by other researchers committed to the structuralist approach to language change. This discussion (cf. art. 209) has focussed on a challenging question in the context of a more theoretical discussion on possible internal and external factors in language change.

2. Explaining Modern Norwegian

After 1905 there was no further need for using historical and cultural uniqueness as arguments for political independence. After Norway’s independence the cultural conflict was to a greater extent a question about what was “genuine Norwegian”. The linguistic aspect of this conflict became apparent in the struggle between the language varieties Bokmål and Nynorsk. For the purpose of this struggle it was relevant to prove which forms existed in OWN, and as a result quite a few theses on language history in the 20th century have tried to legitimate modern language elements as coming from OWN.

2.1. The OWN heritage

Linguistic features from Southeast Norway, which often correspond with the Danish ones, were especially in need of legitimization. A central concern of Didrik Arup Seip (1884–1963) in his most important work, *Norsk språkhistorie til omkring 1370* (1931), was to demonstrate that such dialect features had their origin in the OWN period – and that they were not a result of Danish influence during the Union period. This concerns, e.g., the changes *kn* > *gn* (*reikna* > *reignæ*) and *tn* > *nn* (*vatt* > *vann*) along the coast of the Oslo fjord. He also found evidence dating from the time before 1300 for monophthongization and for the present form of irregular verbs without *i*-umlaut (*komr* for *kømr/kemr*). As Hægstad’s work on OWN did not include eastern Nor-

way, Seip's language history of 1931 completed the description of OWN dialects.

Among Seip's most controversial assertions was his 1947 claim that the *else*-suffix was mainly of Norwegian origin because many words could be traced to corresponding OWN words with the suffix *-sl*, and these words might have undergone metathesis. He supported this with instances from as far back as the 12th century.

A part of the process of national restoration was to give place-names a Norwegian form. This task led to both conflicts and research concerning which forms were correct from a historical viewpoint. This applies, e.g., to the name of the country, *Noreg* or *Norge*, a topic on which Seip published a thesis in 1923 in order to support the claim that *Norge* was a form developed in Norwegian, i.e. as a contracted form in the dative (and the genitive) of *Noregi(s)*. Indrebø (1925) tried to reveal weaknesses in Seip's linguistic arguments, and he stressed the probability of Danish influence. Naadland (1954) supported the same view by a thorough study of medieval charters.

The strongest opponent of Seip was Gustav Indrebø (1889–1942), who presumably was motivated to publish a Norwegian language history in order to counterbalance Seip's works. A short version was published as early as 1926, but his great *Norsk Målsoga* was published after his death in 1951. Indrebø characterized Norwegian language history as being "strongest at both ends", i.e. in the study of OWN and of Modern Norwegian. He himself improved this situation by presenting studies from the intervening periods. In his language history he provided data from the Middle Norwegian stage, and in articles published in 1954 and 1956 he described the situation in the dialects in the early 16th century (at the time of the Norwegian Reformation). It is generally accepted that the language at that time had reached the New Norwegian stage; however, Indrebø demonstrated that there still are many widespread archaic features in the dialects, in both morphological and lexical forms. He found that several dialect areas were different from today's, e.g. the areas with the infinitive in *-a*, and with *eg* and *me* as personal pronouns (1. pers. sg. and pl.). Unfortunately, his analysis is characterized by mechanical listing, a rather uncritical use of sources and a lack of perspective on language as a system, which may have resulted in an exaggeration of what had been living forms in the speech of that time.

2.2. Early linguistic changes

Nordic linguists joined the circle of neogrammarians at an early date. The Norwegian scholars Sophus Bugge (1833–1907), Alf Torp (1853–1916) and Hjalmar Falk (1859–1928) involved themselves in these new ideas. The latter two studied in Leipzig for a while, the neogrammarian "headquarters". Even before the Neogrammarians themselves, Bugge started using their approach when he published a thesis on consonant changes in Norwegian in 1852.

From the 1860s Bugge was mainly involved in runic studies; he reinterpreted several inscriptions and improved linguistic insights into Ancient Nordic. Munch considered the runic language to be Gothic with a centre in southern Scandinavia. His opinion was in full accordance with the prevailing view that the North Germanic tribes had migrated into Norway from the north. This view was not refuted until 1867 when Bugge and the Danish runologist Ludvig Wimmer proved that the runic language was an earlier stage of OWN.

In 1891 Bugge started publishing *Norges Indskrifter med de ældre Runer*, which made runic data easily available for researchers. Magnus Olsen (1878–1963) was a leading runologist, and he demonstrated in his studies of the Eggja-stone in Sogn that the period of syncope must have ended at about 700. This insight has made several historians of the language, e.g. Indrebø (1951), move the OWN period back one century.

Onomastics has often represented a challenge to historical linguistics. Oluf Rygh (1833–99) started publishing *Norske Gaardnavne* in 1897 and established through this an academic discipline which has supplied the national revision of place-names with essential knowledge. Rygh also elaborated a chronological typology of such names. After Rygh's death Bugge, among others, helped complete *Norske Gaardnavne*.

The Middle Norwegian period is essential for understanding the linguistic innovations leading from classical OWN to the modern dialects. The publication of *Diplomatarium Norvegicum* (1847–), a collection of medieval charters and letters, has provided favourable conditions for the study of written sources from this period. Per Nyquist Grøtvedt, as one of many, has recorded a large number of varying written forms and discussed how they may reflect dialect innovations in Southeast Norway in the period 1350–1450 (1969–74). He

concluded, for instance, that in the 15th century assimilations (*rl, rn, rs > ll, nm, ss*) were rather consistently used in the charters, and that vowel harmony disappeared in this area. Vowel lowering appears in this area after 1420: *fyrst, fylgja, þriðja, mik > først, følgia, trædia, mek*.

2.3. Influence from abroad

Gradually research interests have been extended to external conditions of language change. Seip, among others, published two special studies on loanwords, and he included this topic in his 1931 language history, where he demonstrated the influence from Middle Low German on Norwegian in the High and Late Middle Ages. He concluded that words are often borrowed directly into Norwegian and not via Danish.

In their dialect monograph Larsen/Stoltz (1912) discussed the heavy influence from English and especially Low German on the Bergen dialect, and they include a long list of loanwords which are the result of language contact. Of special interest is the impact of the Hanseatic merchants in Bergen on both grammar and vocabulary. As for the vocabulary, there is a pattern that words accepted in Bergen spread into the western and northern dialects. The same pattern of diffusion is observed for a syntactic structure, i.e. the genitive expressed by the pronoun *sin*.

Characteristic phonological and morphological features of the Bergen dialect are discussed both in Larsen/Stoltz (1912) and Sørli (1969), who preferred to interpret them as the result either of influence from other Norwegian dialects or of internal changes. As far as these grammatical features are concerned, there has been little interest in discussing the effect of a language melting pot.

2.4. Written language

An important change in perspective was introduced by Torp/Falk in *Dansk-norskens lydhistorie med særligt hensyn paa orddannelse og bøining* (1898) and Falk/Torp, *Dansk-norskens syntax i historisk fremstilling* (1900) in which they focussed on the language of the Union period. The latter work in particular has been frequently referred to in historical linguistics. The beginning point for the discussion is OWN, and the book goes on to document the historical lines of Danish literary language used by Norwegians.

Ragnvald Iversen (1882–1960) studied the Danish used by Norwegians after the Reformation and concluded that the Norwegians during this period did not follow the norms for the written language in Denmark. The Norwegians stuck to the Danish models from the Pre-Reformation period, and dialectal elements appeared more often in their texts than in the texts written by Danes (Iversen 1921–23).

3. Innovations in the dialects

Dialects have played an important cultural role in political life in Norway, and this has stimulated the production of extensive research on dialects. A bibliography of dialectology (Nes 1986) comprising approximately 3000 printed publications displays a solid geographic correspondence between the number of dialect descriptions and the support of Nynorsk. The great interest in dialects seems likewise to have been an incentive for trying to understand the innovations leading to dialectal characteristics. In the dialect studies there are, therefore, many attempts at historical reconstruction. Phonology has been the area for the most intensive scrutiny in historical linguistics. There are fewer studies of morphology, and syntactic changes have received the least attention.

A central topic in historical phonology has been the changes in the vowel system. In 1843 C.R. Unger revealed the quantity system of OWN, which consisted of 8 short and 8 long monophthongs. In most dialects today the quantity distinctions have changed into quality distinction. Aasen, in his earliest publications of *Landsmål*, used a spelling system with accents that enabled him to differentiate between vowels that reflected quantity distinctions in OWN (cf. *vik – vīk*). In this respect he had the advantage of speaking a dialect that retained 15 of the 16 old vowel distinctions – the maximum set of distinctions in Modern Norwegian as *o* and *o* merged in all dialects during the Middle Ages. In other dialects the vowel system has undergone more radical changes because of mergers.

In both Swedish and Norwegian a shift in vowel quality has taken place; it is most characteristic for *ó* and *ú*, which have been displaced one step upwards in *o > [u]* and one step to the front in *ú > [y]*. Amund B. Larsen (1885) was the first to propose an explanation for this change; he described the innovation

as a push-chain movement that began with *ú* changing into a rounded back vowel, which is near *ó* in quality and thus exerted pressure on *ó*, causing language users to raise the latter vowel in order to ensure an articulatory distance. This movement triggered a further change where *ú* was fronted, and Larsen assumed that this movement had exerted pressure on *y* so that it was delabialized to *i* in some dialects (Larsen 1885). Larsen's method of reasoning was structural – before structuralism had been introduced as a linguistic theory – as it implied that phonemes constitute a system of distinctive members.

This theory has been the prevailing one in Norwegian language history, though it has some weaknesses: As the rounding of *ú* led to its merger with *ó*, there was no new phoneme to create a stronger push than before. Moreover, it is dubious that *y* > *i* should be involved in this chain of changes as it represents a derounding and does not relate to place of articulation. The alternative theory is that the innovations form a drag-chain movement, as Arne Torp (1977, 25) proposed, where fronting of *ú* was the first change, and this created space for the raising of *ó* and *á*.

The neogrammarian tradition was strong in Norway, and most scholars in historical linguistics have worked within this framework. The dialectologist Olai Skulerud (1881–1963) in his early publications was a loyal neogrammarian who tested “sound laws” systematically against dialectal evidence. In 1934, for example, he published a study on diphthongization in the Sunnmøre dialect in which he investigated regular vowel changes caused or modified by the surrounding consonants. On the other hand, he did not discuss whether the structure of the vowel system had any impact, a factor which at that time had become known in general linguistics.

One of the few syntactic features that scholars have taken an interest in is the double definite, a feature which arose in Central Scandinavian after the Ancient Nordic period. Einar Lundeby (1965) studied this, and he concluded that the construction appeared as early as about 1200, and before 1400 the usage in speech must have been like that of modern Norwegian dialects, i. e. that the definite form of the noun is obligatory after the definite article (*den mannen*). Lundeby interpreted the innovation as both a syntactic and stylistic change, where “stylistic” refers to a popular tendency of enhancing the demonstrative content.

This feature does not characterize the written language of Norwegian authors in the Danish period. Especially in the last decades before 1814, Norwegian authors had a good command of the Danish standard norm. However, the author Henrik Wergeland started using the double definite, and so did the collector and publisher of folk-tales, P. Chr. Asbjørnsen, in the 1840s in order to mark an informal style. Lundeby demonstrated how this usage has increased in Bokmål. In Nynorsk it has become almost “mechanical”, as in the dialects.

4. Methods

Structuralism was accepted late into Norwegian linguistics, though some rudiments of this method of reasoning appear early on (cf. sect. 3.). Hallfrid Christiansen (1886–1964) used the structuralist approach in her *Norske dialekter* (1946–48), e. g. in her theory that palatalization and segmentation of alveolars (*kalla* > [kaʎe], *kadla*) are a result of the great quantity shift, in which old long and short consonants were kept apart by this change and thus made the quantity feature redundant.

The most consistent analysis using a structuralist approach is Trygve Skomedal's work on the Setesdal dialect (1972); he argued for a relative chronology of 5 stages for the changes in the vowel system from classical OWN to the modern dialect. Several consonant changes can be related to this scheme by structural logic, and as they are easier to give an absolute dating from the evidence of the old charters, the whole chronology of phonological changes can be tested.

Hagland (1978), cf. above, provides one of several examples of the framework of Generative Phonology being used in Norwegian historical linguistics. Recently, there has been an increasing interest in studying historical changes within the perspective of modern syntactic theory. Jan Terje Faarlund (1990) discussed the theoretical aspects of some changes by comparing classical OWN and Modern Norwegian, primarily the case system, passive voice and impersonal sentences. He underlined the fact that “modern Norwegian is configurational”, which for the case system means that “there is always total correspondence between structural position and morphological case: nominative for the subject and accusative in all other positions, regardless of semantic role”. As with other modern historical studies, this is a comparison of two language

stages with an interval of seven centuries. There is no attempt to trace and analyse data from the periods in between, whereas, for instance, Falk/Torp (1900) provided an ample database but displayed only modest ambition with regard to a theoretical approach.

Lexical studies have not played the same central role in Norwegian historical linguistics as in the neighbouring countries. The German research programme *Wörter und Sachen* was well-known, but it has resulted in few publications. The most extensive lexical study taking a historical approach has been carried out by the Swiss scholar Oskar Bandle (cf. art. 14).

5. Society and language

Sociolinguistics in Norway, as elsewhere, has primarily been a synchronic discipline. However, several studies on language change have used a diachronic approach in their discussion of how society influences language change. There has been major interest in the linguistic consequences of industrialization and urbanization. Steinholt (1964 and 1972) has carried out two studies using this approach, and his work is unique in having investigated the same area using the same method after an interval of about 30 years.

Historical sociolinguistics has a special problem in obtaining relevant evidence. However, many historical interpretations have applied a sociolinguistic perspective, as in the case of the shift in written language, cf. sect. 1.4., and not least in A. B. Larsen's accounts of urban dialects; i.e. the dialects of Oslo (Larsen 1907), Bergen (Larsen/Stoltz 1912) and Stavanger (Berntsen/Larsen 1925). Here the discussion of both social stratification and "neighbour opposition" has been of great importance.

The language struggle in Norway has been a subject of many theses, and monographs have presented analyses of political strategy, organizations and ideology. No less than five extensive biographies have been published on Ivar Aasen, three of them appearing in 1996, a century after his death. The most thorough documentation is in Kjell Venås' biography (1996), whereas Stephen Walton's (1996) is, with respect to genre, more creative in stressing more that a description is an interpretation. Walton emphasizes a social and psychological understanding of Aasen as a person who grew up in the local tradition of the Enlightenment and Rationalism and became de-

pendent on the cultural elite promoting National Romanticism.

As in other European countries, the study of nationalism has been central during the last two decades, and the ideological establishment of a cultural and political entity during the 19th century has been a central concern.

11. Research in Icelandic language history 1850–1950. An overview

1. Introduction
2. The 19th century: phonology and grammar
3. The 19th century: lexicon
4. The 20th century: phonology and grammar
5. The 20th century: lexicon
6. Literature (a selection)

1. Introduction

The study of Icelandic language history is more international in character than that of the other Nordic languages. Many scholars in many countries have been conducting research on Old Icelandic and its historical development for a long time, and the language has often been included in studies where the primary focus was on other Nordic languages (especially Old Swedish) and even other Germanic languages. This survey must therefore be very selective – see Jónsson (1918); Haugen/Markey (1972); Pétursson (1978); Hovdhaugen et al. (2000) and other works listed in the bibliography for further reading. Titles are often abbreviated in the text to save space. No general updated bibliography exists of Old Icelandic or Icelandic language history (cf. Ottosson 1996, 117f.), the most comprehensive one being Haugen (1974). With regard to fields of study which had to be neglected here, the following may be noted. For an overview of research on the standardisation of Icelandic, see Ottósson (1990). For umlaut and breaking, see Benediktsson (1982) and Schulte (1998), and for place-names, see Sigmundsson (1968). It must not be forgotten that a wealth of information on the language of individual manuscripts, especially on phonology, can be found in the introduction to basic text editions. Furthermore, stylistic studies, also those by literary scholars like P. Hallberg, have yielded many results of interest to linguistics proper.

2. The 19th century: phonology and grammar

Most of the research in Icelandic language history until the 1870s is now superseded and is mostly of interest to linguistic historiography. The following half-century or so, on the other hand, produced very much of lasting value, and most of the standard handbooks for present-day scholars stem from that period.

Rasmus Rask's *Vejledning til det islandske eller gamle nordiske Sprog* (1811) was the first grammatical description of Icelandic based entirely on the structure of the language, and not on the pattern of Latin grammar. Especially important was Rask's restructuring, compared to older descriptions, of the presentation of the verbal system, where he drew a basic distinction between verbs with ablaut and verbs without it. Rask believed that the modern language was in all essential respects identical to Old Norse, including the pronunciation. This view was especially detrimental in the case of the vowels, where Rask did not recognize the basic quantity distinction, and even saw *y* as a mere "etymological symbol". In a revised Swedish translation of the grammar from 1818, *Anvisning till Isländskan eller Nordiska Fornspråket*, Rask added a section on the old pronunciation, where he took account of Modern Faroese and continental pronunciation. In this revision, he assigns OIcel. *y* (long and short, likewise *ey*) a separate sound value, posits a sound value closer to Norwegian for *au* and more or less Latin pronunciation of *u*. He further posits a separate sound value for long *ø* (which later merged with long *æ* in Icelandic). Rask incorporated the new insights into his specifically Old Icelandic grammar *Kortfattet Vejledning til det oldnordiske eller gamle islandske Sprog* (1832), which won wide currency. The Icelandic scholar Konráð Gíslason in Copenhagen undertook the task of separating the old language from the modern one further in his 1846 study of Old Icelandic phonetics, *Um frumparta íslenzkrar tungu í fornöld*. This work was based on the scrutiny of a number of old manuscripts, and set new standards for precision. The extensive lists of spelling variants for individual sounds and other primary source material still have their value. The phonetic interpretation of the examples was rather weak, however, and Gíslason was no less reluctant than Rask to assume deviations from the modern pronunciation. Furthermore, although he was the first to recognise *u*-umlaut of *á*, he stubbornly maintained that the product was *ó* and not *ø*. The next important grammar of Old Norse was that of P. A. Munch/C. R. Unger, *Det oldnorske Sprogs Grammatik* (1847) (with a revised Swedish version by Munch in 1849, cf. art. 10). This grammar was based on independent study of the manu-

scripts, as well as comparative linguistic research, and in many respects followed Grimm more closely than Rask. With regard to pronunciation, however, Munch/Unger tended to follow Rask's later views, only vacillating for more vowels between the Modern Icelandic and Norwegian sound value.

Against this Scandinavian tradition in matters of pronunciation stood J. Grimm, who in the 2nd edition of his *Deutsche Grammatik* 1 (1822) had basically claimed that the only difference between unaccented (short) and accented (long) vowels was quantity itself, although he modified this view somewhat in the treatment of individual vowels. The decisive support for Grimm's basic view came from K. Lyngby in an article in *Tidskrift for Philologi og Pædagogik* (1861). Here, he gave a systematic and thorough evaluation of many different sources of evidence, including the *First Grammatical Treatise* (edited by Rask in 1818!) as well as the modern pronunciation of Norwegian and Faroese, even of Swedish and Danish, and the orthography of the manuscripts. His results have only required relatively minor modifications to date. In addition to the quantity distinction, Lyngby showed conclusively the distinction – not noticed by earlier scholars – between the two kinds of *ö*, namely *ø* as *i*-umlaut of *o*, and *q* as *u*-umlaut of *a*. The next important grammar after Munch/Unger was L. Wimmer's *Fornnordisk formlära* (1874), representing a thorough revision and expansion of his textbook *Oldnordisk formlære* (1870). Here, Wimmer incorporates Lyngby's results, although retaining the spelling *ö* for *q*. Nonetheless, he continued to give Modern Icelandic pronunciation pride of place in his widely used textbook through numerous editions. The rather brief phonological part of Wimmer's 1874 work was soon superseded by the first edition of Adolf Noreen's *Altisländische und altnorwegische Grammatik* (1884, with three new and revised editions until 1923). Noreen's main goal was to give the phonology a detailed treatment meeting the demands of contemporary linguistics. He thus incorporated the results of recent comparative studies, studies on umlaut and breaking, special studies of Old Norse phonology and remarks on the orthography of individual manuscripts, all with precise references, which were very sparse in Wimmer's book. Furthermore, he used an orthography consistently normalised in accordance with the most recent results, with *q* instead of *ö*. However, he may be criticised for a tendency to take all spelling

variants at face value. Also in this period, K. Gíslason utilized his intimate knowledge of poetry, scaldic poems as well as rimur, in a number of phonological studies. The Danish scholar J. Hoffory treated some important aspects of the phonetics of Old Icelandic consonants, especially in his *Oldnordiske Consonantstudier* (1883). A. Kock took Old Icelandic into consideration in his investigation of accent, umlaut and breaking in Old Swedish, and also published smaller contributions to Old Icelandic phonology in the last decades of the 19th c.

Turning now to inflectional morphology, K. Gíslason had started a detailed treatment in his *Oldnordisk formlære* (1858), but he only completed half of the strong noun inflection. Here, he does not distinguish *i*-stems or root stems as a separate class. Then K. Lyngby, in an article in *Tidskrift for Philologi og Pædagogik* (1865), drew conclusions which for the most part have remained unchallenged until today. His work was based on a thorough evaluation of evidence from manuscripts and comparison with Gothic and other old Indo-European languages. Here, he introduced stems as a classificatory principle, following Schleicher's *Compendium* (1861). Interestingly, K. Gíslason protested against certain points in Lyngby's reconstructive classification because he didn't see them reflected synchronically in Old Icelandic. The most detailed inflectional morphology of Old Icelandic is still Wimmer's above-mentioned *Fornnordisk formlära* (1874). The study is based on independent work with the primary sources, but unfortunately lacks all references to them. Wimmer's treatment formed the basis of the morphological part of Noreen's *Altisländische und altnorwegische Grammatik* (1884), which introduced the now customary numbering of the strong verb classes. Noreen's morphology was greatly expanded in subsequent editions as additional research accumulated. In this period, the Icelander Jón Porkelsson was the most prolific in this area. He published extensively on Icelandic language history, both Old Icelandic and later developments, especially morphology. His works are characterised by painstaking documentation rather than grand theories. In addition to a monograph on the svarabhakti vowel (1863), his monographs treat various aspects of the verbal inflection, the subjunctive (1877), strong verbs (1888–94) and the preterite-presents (1895).

Rask's treatment of syntax in his above-mentioned grammars was restricted to notes

on some prominent features, and the grammars of Munch/Unger also contained little on syntax. J. Grimm took Old Norse, especially the Eddic poems, into consideration to a certain degree in his *Deutsche Grammatik* 4 (1837). The first works on Old Icelandic syntax specifically appeared around 1850, i. a. an article by F. Dietrich in *ZfdA* (1851) on the exceptionally extensive use of the dative in Old Norse. In 1849, G. Lund published the monograph *Om det oldnordiske Sprogs Overensstemmelse med det græske og latinske i Ordføjnningen*, where he treated case, mood and the use of infinitive. Lund used the same model, based on Madvig's works on the classical languages, in the first comprehensive Old Norse syntax, *Oldnordisk Ordføjningslære* (1862). His examples, with exact reference to sources, are still useful. Much the same can be said of T. Wisén's monograph on the syntax of the Eddic poems, *Om ordføjnningen i den ældre Eddan* (1865). The scholar who was to maintain absolute pre-eminence in the field for decades, the Norwegian M. Nygaard, published a comprehensive treatise on the same subject in *Eddasprogets syntax* (1865–67) and later followed it up with a number of specialised articles: on the verb *munu* (1878), the present participle (1879), the subjunctive (1883–1886), omission of the subject (1894), the particle *er* (1896), the position of the verb (1900), and on the syntax of the learned style (1896). Nygaard's works are generally characterized by painstaking documentation and a clear and carefully thought-out presentation of the results. He does not try to offer many explanations, however, nor does he make comparisons with other Old Germanic languages. German scholars showed increased interest in Old Icelandic syntax in the last decades of the century, and there was some work done in Iceland and even the United States.

3. The 19th century: lexicon

The first comprehensive dictionary of Icelandic, mostly the modern language, was Björn Halldórsson's *Lexicon Islandico-Latino-Danicum*, edited by Rask in 1814. The first dictionary of the old language specifically was Sveinbjörn Egilsson's *Lexicon poëticum* (1854–60), which revolutionized the study of old poetry, especially the scaldic poems. The first dictionaries of Old Icelandic to include prose were those of E. Jonsson, *Oldnordisk Ordbog* (1863), and the first edition of J. Fritzner's *Ordbog over det gamle norske Sprog* (1862–67).

In 1874, there appeared an *Icelandic-English dictionary* under the names of R. Cleasby and Gudbrand Vigfusson. The real authors, however, were Konráð Gíslason, who completed a draft manuscript, and Vigfusson, who revised and expanded it. Although "Cleasby/Vigfusson" is still valuable for its definitions and morphological information, this dictionary was superseded by the greatly expanded second edition of Johan Fritzner's dictionary (1886–96) as the standard work of reference even today. Fritzner's work made obsolete much of J. Þorkelsson's *Supplement til islandske ordbøger* 1–2 (1876, 1879–85), whereas the 3rd part (1890–97) remains valuable for its precise documentation of 19th and late 18th c. vocabulary. Þorkelsson's 4th *Supplement* (1899) concentrated on morphology. In 1891, an invaluable concordance appeared, L. Larsson's *Ordförrådet i de älsta isländska handskrifterna*, covering ten of the oldest Icelandic manuscripts, including the *Stockholm Book of Homilies*.

Rask had included a relatively full treatment of word formation in his Icelandic grammar, in accordance with his high estimation of the inherent ability of that language to create new words. The basis for further work in that field, though, was for the most part laid by Grimm in *Deutsche Grammatik* 2–3 (1826–31), where he discussed Old Norse derivation as well as compounding. The Neogrammarian upsurge led to increased interest in word formation (as part of etymology) in the last several decades of the century. Comparativists wrote various studies of the Germanic languages where they gave full consideration to Old Norse, e. g. F. Kluge in his *Nominale Stammbildungslehre* (1886) (3rd edition 1926). In Scandinavia, a number of special investigations of the Nordic languages appeared. For instance, E. Hellquist wrote comprehensive articles on the formation of nouns and verbs with a suffixal *k*, *l*, *r*, *s*, and *t* in *ANF* (1891 and 1898), and H. Falk wrote on agentive nouns in *PBB* (1889).

4. The 20th century: phonology and grammar

Research in Icelandic language history increases so much in volume after 1900 that the present discussion must be even more selective than before; cf. Ottósson (1996) for recent work. Icelandic scholars are especially prominent in this field of study after 1960, while

research in Denmark is mostly concentrated in the first half of the century. Swedish contributions are especially important in syntax. Scholars from the German-speaking area were prominent throughout the period, but especially before the war.

The first professor of the Icelandic language at the University of Iceland (founded in 1911) was Alexander Jóhannesson. All his work was marked by his comparative neogrammarian training and limited interest in language development after the Old Icelandic period. Jóhannesson's grammar of Old Icelandic, *Íslensk tunga í fornöld* (1924) was not very carefully written and not always up-to-date, but it was based on considerable research using primary sources. The last edition of Noreen's aforementioned *Altisländische und altnorwegische Grammatik* (1923) remains the standard handbook for phonology and inflection. The work is invaluable because it utilizes and refers to practically all previous research. The clergyman J. L. L. Jóhannsson wrote a historical phonology, *Nokkrar sögulegar athuganir* (1924), covering the period ca. 1300–1600. Although his main source of data, *Diplomatarium Islandicum*, is not entirely reliable, and his explanations are sometimes quirky, his work contains original insights. Another valuable work is Hægstad's *Vestnorske maalføre fyre 1350 II. 2, 3* (1942), being a phonology of Icelandic until 1350.

Finnur Jónsson in Copenhagen continued the tradition from K. Gíslason with emphasis on the language of scaldic poems and *rímur*. He wrote a monograph on the language of the scaldic poems until 1300, *Det norsk-islandske Skjaldesprog* (1901), and treated the earliest poetry in *Norsk-islandske kultur- og sprogforhold i 9. og 10. årh.* (1921). Also in Copenhagen, B. K. Þórólfsson wrote the standard overview of Icelandic historical morphology, *Um íslenskar orðmyndir* (1925), and made valuable contributions to historical phonology (on *é* and *y*, and the quantity shift, both in 1929). J. Helgason in Copenhagen also contributed to Icelandic language history, especially in his description (*Málið á Nýja testamenti Odds Gottskálkssonar* 1929) of the language of Oddur Gottskálksson's New Testament translation of 1540 and his 1948 description of the language of an 18th-century translation of Holberg's *Niels Klim*. The most valuable work, however, was the massive description by the Swiss scholar Oskar Bandle of the language of the oldest Icelandic Bible of 1584, in *Die Sprache der Guðbrandsbiblíá* (1956). In

commenting the forms of this Bible translation, Bandle summarizes all previous research on the historical background of the forms. The Swedes also made some contributions, e. g. H. Celandier in *Om övergången av $\delta > d$* (1906) (e. g. *talði > taldi*), and G. Leijström in *ANF* (1934) on the unrounding of *ø* (e. g. *gøra > gera*).

The study of historical phonology was revolutionized by the work of Hreinn Benediktsson, professor of Icelandic in Reykjavík 1958–1998. He combined sophisticated structuralist theory with painstaking work with the primary sources, where his first-hand experience of editing and paleography is evident. He has mostly concentrated on the history of the Icelandic vowel system, including *u*-umlaut, unstressed vowels and vowels in positions neutralized for quantity; see his selected papers in *Linguistic studies – historical and comparative* (forthc.). K. Árnason studied the Icelandic quantity shift in *Quantity in historical phonology* (1980). Two lexicographers at the Modern Icelandic dictionary project in Reykjavík also made significant contributions, Á. B. Magnússon i. a. in his paper on *rd, gd, fd* for *rð, gð, fð* in *ÍT* (1959), where he traces this modern dialect feature back to 14th-century Western Iceland, and J. Benediktsson in his 1960 *ÍT* paper on two types of *ld* in Icelandic. In the Soviet Union, a number of linguists in Leningrad and elsewhere have contributed to Icelandic historical phonology and other aspects, from the mid-20th century onward. This work is most often characterized by original interpretations rather than presentation of new primary data. The most important contributions by M. I. Steblin-Kamenskij were collected in a revised form in *Očerki po diaxroničeskoj fonologii skandinavskix jazykov* (1966) – see also his paper on the Scandinavian consonant shift in *ANF* (1974). Recently, K. Küspert, in *Vokalsysteme im Westnordischen* (1986), published a careful study of vowel systems in Icelandic, Faroese and West Norwegian dialects. K. G. Chapman had earlier, in *Icelandic-Norwegian linguistic relationships* (1962), studied Icelandic sound changes with parallels in dialects in Western Norway but not elsewhere in that country. For phonological and morphological Norwegianisms in medieval Icelandic manuscripts, Stefán Karlsson's article in *MM* (1978) is the basic text.

There was rather little work done on historical morphology most of the 20th century. Two standard works in the area, Þórólfsson's 1925 monograph and Bandle's stout volume

of 1956, were mentioned above. The study of inflectional morphology was greatly revitalised from around 1970. In Iceland, H. Benediktsson wrote a number of papers, including one on the masculine *ija*-stems (1969), and later very detailed ones on individual words, thus following up his earlier work on the pronoun *nokkur* (1962). H. Guðmundsson wrote the dissertation *The pronominal dual* (1972), and J. H. Jónsson the monograph *Das Partizip Perfekt der schwachen ja-Verben* (1979). Apart from that, most of the work in this field was done outside Iceland. J. Orešnik in Ljubljana wrote mostly on verb forms, but also on morphophonemics. His most important papers are collected in *Studies in the phonology and morphology of Modern Icelandic* (1985). K. G. Ottosson's 1992 Lund dissertation, *The Icelandic Middle Voice*, seeks to explain the morphological and phonological development of this category on the basis of extensive data from primary sources. German scholars have also published in the field, using Natural Morphology and related approaches. Thus, Birkmann included Icelandic in his Freiburg dissertation on preterite-presents in the Germanic languages, *Präteritopräsentia* (1987).

Interest in the historical syntax of Icelandic increased greatly from the early 20th century onward, but there was almost no work in that field in Iceland until after 1980. The increased interest in the early century was probably stimulated by the appearance of good handbooks on Old Icelandic syntax as well as increased interest in syntax internationally from the turn of the century. M. Nygaard summed up and extended his earlier research in *Norron syntax* (1906), which is still the basic handbook, comprehensive and with precise references for the numerous examples. H. Falk/A. Torp's *Dansk-norskens syntax* (1900) is useful because of its systematic comparison with other Old Germanic languages. A. Heusler's *Altisländisches Elementarbuch* (1913) (with subsequent expanded editions until 1931) also contains original observations. B. Delbrück, the founder of comparative Indo-European syntax in the last decades of the 19th c., gave Old Icelandic syntax considerable attention in a Germanic context during the first decades of the new century. One may mention especially the monographs *Synkretismus* (1907), *Zu den negativen Sätzen* (1910), *Germanische Konjunktionssätze* (1919), and not least *Der altisländische Artikel* (1916). The master of "explanatory syntax", W. Havers, also in-

cluded Old Icelandic in his *Untersuchungen zur Kasussyntax der indogermanischen Sprachen* (1911). Considerable work was also done by some other German scholars, including O. Behaghel and G. Neckel, in the first decades of the century. The Norwegian V. Skard built on Havers' results in *Dativstudien* (1951) on the sympathetic dative and the comparative dative. The syntax of the composite verb forms received much attention from Swedish scholars. In *Studier över uppkomsten av supinum i de germanska språken* (1943), S. Ekbo studied constructions with *hafa* plus past participle, either uninflected (called supine) or agreeing with the object: *hefi mann felldan*. His results are supplemented by M. Barnes in *ANF* (1969). T. Johannisson wrote a comparative Nordic study, *Hava och vara som tempusbildande hjälperb* (1945). G. Holm included Icelandic in his *Syntaxgeografiska studier* (1958), where he mapped the Nordic distribution and development of ingressive *fara at* and *taka at*. Subordination has been much studied. Relative clauses were popular in the first half of the century, as seen i. a. in G. Lindblad's *Relativ satsfögning* (1943). B. Bjerre, in *Nordiska konjunktionsbildningar med temporal innebörd 1* (1935), traces the development of temporal subjunctions in Old Icelandic. Word order also received considerable attention from a fair number of scholars in this period. Since 1980 there has been considerable research in historical generative syntax, with a centre in Iceland, starting with H. Á. Sigurðsson, later E. Rögnvaldsson and others. Such studies have also been pursued i. a. in Norway, especially by J. T. Faarlund and K. E. Kristoffersen. Topics have included word order, not least so-called stylistic fronting, narrative inversion, and word order within the VP, further so-called oblique subjects and null arguments. In contrast to earlier scholars, the Icelandic syntacticians have taken care to include the development within Icelandic after the Old Norse period.

For the language history in that later period, Bandle's *Die Sprache der Guðbrandsbiblía* (1956) does good service with respect to the morphological and phonological development until the late 16th c., and Þórólfsson's *Um íslenskar orðmyndir* (1925) includes a very sketchy survey of morphology after 1600. No surveys exist on the development of word formation or syntax after the Old Icelandic period. For these fields, as well as phonology (and to a large extent morphology), all we have for the period after 1600 is a limited number of studies following the development of

specific phenomena from Old to Modern Icelandic. Given the primary sources, the centre of studies in the neglected field of language history after 1600 can hardly be anywhere but in Iceland.

5. The 20th century: lexicon

Finnur Jónsson published a completely revised edition of Egilsson's *Lexicon poëticum* in 1916, as well as *Ordbog til ... rímur* (1926–28), both works based on his own text editions. A supplementary volume to Fritzner's dictionary, by F. Hødnebo, appeared in 1972. W. Heizmann's *Wörterbuch der Pflanzennamen im Altwestnordischen* (1993) should also be mentioned. An important early concordance was H. Gering's *Vollständiges wörterbuch zu den liedern der Edda* (1903). Of recent concordances, H. Beck's *Wortschatz der altisländischen Grágás* (codex regius) (1993) may be mentioned, as well as A. v. A.-De Leeuw van Weenen's 1987 concordance of the entire *Möðruvallabók*, the largest collection of Icelandic sagas. Work on a dictionary of Old Norse prose (Icelandic until 1540, Norwegian until 1370) was started by the Arnamagnæan Commission in Copenhagen in 1939, and the first regular dictionary volume appeared in 1995. A historical lexicographic project from 1540 (when the first book in Icelandic was printed) to the present was started at the University of Iceland in 1948. The project is now in the editing stage, but no part of it has been published as yet. Many small contributions to the history and etymology of individual words, in Old Icelandic as well as the later language, have appeared, most of them by lexicographers at both of these projects. An extensive Icelandic etymological dictionary was compiled by A. Jóhannesson, *Isländisches etymologisches Wörterbuch* (1956), arranged by roots on the model of Walde/Pokorny's Indo-European dictionary. More useful are J. de Vries' *Altnordisches etymologisches Wörterbuch* (1956, 2nd ed. 1962), which contains argumentations for choice of etymologies and references to earlier literature, and Ásgeir B. Magnússon's *Íslensk orðsifjabók* (1989), which includes many words not attested in the old language.

With regard to loanwords in Icelandic, F. Fischer's *Die Lehnwörter des Altwestnordischen* (1909) is a pioneer work for the classical language, but very many of its results were made obsolete by research in the following decades. For the Reformation era, C. Wester-

gård-Nielsen's thorough investigation in *Låneordene i det 16. århundredes trykte islandske litteratur* (1946) is the basic text. In Germany, E. Walter, in *Lexikalisches Lehngut im Altwestnordischen* (1976) studied loanwords and other types of linguistic loans in depth in the semantic field of ethics, followed up by other studies in the field by him and his pupils. O. Bandle's (1967) *Studien zur westnordischen Sprachgeographie*, being a comparison of terminology for domestic animals in Icelandic, Norwegian and Faroese, throws new light upon the language mixture which occurred in the wake of the colonisation of Iceland by settlers from different parts of Norway. In Iceland, Halldór Halldórsson, professor at the university in Reykjavík until 1981, has been most productive in the field of lexicology. His areas of specialisation included idioms and loanwords, but also historical derivational morphology. Among his major works, one may mention *Örlög orðanna* (1958), and *Íslenzkt orðtakasafn* (1968–69). Going on to word formation now, A. Torp in his *Gamalnorsk ordavleiding* (1909) (re-published in 1974) summed up in a concentrated form the results of the intensive research in derivational morphology over the preceding decades, with remarkably complete lists of words. His work remains the standard reference for derivational morphology. A. Jóhannesson's *Die Suffixe im Isländischen* (1927) is an extensive list of Old Icelandic and more recent words, arranged according to the Modern Icelandic suffixes. Jóhannesson's *Die Komposita im Isländischen* (1929) concentrates on Old Icelandic and is most useful for its lists. In Sweden, research in comparative Nordic word formation continued. One may mention especially T. Johannisson's (1939) monograph on intensifying adjectival particles in the Germanic languages, *Verbal och postverbal partikelkomposition*, and also Å. Åkermalm's *Fornnordiska verb med substantivisk förled* (1955). In Norway, K. Venås, in his thorough monograph *Adjektivsuffixet germansk -ga- i norrønt* (1971), investigated the rise of the variant *-ug-* of this suffix to predominance in Old Norse. In Germany, Old Icelandic was included in works on comparative Germanic word formation, e.g. in W. Wissmann's *Nomina postverbalia in den altgermanischen Sprachen* (1932) (with additions in 1938 and 1975). Most of the existing work in derivational morphology actually has a comparative Germanic or Indo-European point of view rather than a synchronic Old Icelandic one.

A good illustration of the international character of Old Icelandic studies is seen in the investigation of the particle *of/um* (assumed to be the reflex of an unstressed prefix). Both I. Dal in Norway (*Ursprung und Verwendung der altnordischen "Expletivpartikel" of, um*), and H. Kuhn in Germany (*Das Füllwort of-um im Altwestnordischen*) published monographs dealing with the particle in 1929. Their investigations were criticised from a theoretical point of view by H. Christiansen in *NTS* (1960). P. Foote, in *Studia Islandica* 14 from 1955, investigated the later development of the variants of this particle in Old Icelandic.

12. Research in Faroese language history 1850–1950. An overview

1. Introduction. Historical and socio-cultural background
2. From Old Norse (ON) to modern Faroese
3. Principal sources of the history of the Faroese language
4. Recent contributions to Faroese language history
5. Literature (a selection)

1. Introduction. Historical and socio-cultural background

The origin of the Faroese language is to be found in the Nordic dialects of the Norwegian settlers who colonized the Faroe Isles, previously uninhabited, during the Viking Age, probably at the beginning of the 9th century. The Nordic culture of the Viking Age is generally considered to have been fairly uniform, and the linguistic differences relatively small. As time passed on, the language of the Nordic island realms split into different dialects, which later on developed into Icelandic, Faroese and Norn (in Shetland and the Orkneys). From about 900 A. D. a thing was held in Tórshavn, forming a kind of parliament for the Faroe Isles which at that time was a free state, founded on Norwegian legal tradition. In 1035 the Faroes lost their independence and became a tributary country under the Norwegian crown. As a result of the Nordic union at the end of the 14th century, the Faroes were incorporated in the great Dano-Norwegian kingdom, but this brought about no immediate change in the status of the islands. Norwegian law was still in force, with the addition of certain amendments, e.g. the famous *Seyðabrævið* 'The Sheep-letter'. As the capital of the Dano-Norwegian kingdom was Copenhagen, the language of administration became Danish both in Norway and in the Faroes. With the Reformation Danish was introduced as the language of the church, and from then on Danish was the only language used in writing in the Faroes. Faroese existed only as spoken dialects. In this period the basis of bilingualism was laid. A consequence of Danish being the language of the church, of the administration and of books was that Faroese vocabulary did not develop in the domains that lay outside the old agrarian society. All new ideas from the outer world were conveyed through Danish, and as time passed on, Danish influence grew so strong that it became a

threat to the Faroese language. Thus the Faroese folklore recorder Jens Christian Svabo (1746–1824) was so pessimistic about the future of his mother tongue that he doubted it would survive (Svabo 1970, XI). However, the Faroese language did survive, without a written norm, for nearly 400 years under Danish administration. The strongest support for Faroese was provided by its unique treasure house of oral tradition, above all the long mediæval *kvæði*. The development of Faroese during the last two centuries is all the more remarkable, since Danish influence was in fact intensified during the 19th century, due to increasing bureaucracy and the introduction of compulsory children's schools in the 1840s, where the language of instruction should be Danish. In order to challenge Danish as the only written language, V. U. Hammershaimb constructed a Faroese orthography in 1846, principally based on etymology, thus disguising significant sound changes. Thanks to its supralocal nature, Hammershaimb's orthography turned out to be a success, and to this day only minor revisions have been made. Besides editing some examples of Faroese folklore in his new orthography (1846), Hammershaimb also published a collection of Faroese ballads (1849–1851) and a normative Faroese grammar, including information on pronunciation and dialectal variation (1854), thus initiating the learned study of the Faroese language.

2. From Old Norse (ON) to modern Faroese

A comparison of ON with modern Faroese reveals a number of linguistic changes. The question of when and how these changes have come about has been the subject of a number of studies. Before giving an account of research done in this field, a short survey of the major linguistic changes will be given.

2.1. Vocabulary

Genuine Faroese vocabulary is firmly rooted in ON. A number of Celtic loanwords seem to be rather old. As a consequence of the status of Danish in the Faroes, and widespread – in recent times total – bilingualism, modern Faroese, especially the spoken language, abounds in Danicisms.

2.2. Syntax

Some syntactical innovations seem to be due to Danish influence, e.g. the placing of the negative adverb before rather than after the verb in dependent clauses. Spontaneous innovations are, inter alia, the partial loss of the genitive and constructions such as *Eina ferð hevði hann roynt at tikið*. ‘Once he had tried to take’, i.e. the use of the supine (*tikið*) as a second infinitive.

2.3. Morphology

Although most of the rich morphological system of ON is preserved, some simplifications have taken place, e.g. the generalization in the plural verb inflection of the 3rd person form, and the generalization of final *-r* in the nom. and acc.pl. of nouns. Together with lexical loans, a stock of affixes have been adopted, e.g. *be-*, *for-*; *-ari*, *-ilsi/-ulsi* from Danish *be-*, *for-*; *-eri*, *-else*. Ex.: *betala* ‘pay’, *forferdiligur* ‘terrible’, *bakari* ‘baker’s shop’, *bangilsli* ‘fears’.

2.4. Phonology

The most conspicuous changes have taken place in the phonological system. The difference in pronunciation between ON and Icelandic on the one hand and Faroese on the other is much greater than may be concluded from the written language, since there is a wide gap between the pronunciation and the etymologizing spelling of Faroese. Here only some of the most striking sound changes will be presented.

2.4.1. Vowels

Through the quantity shift in the Middle Ages, all stressed syllables have become long. In ON overlong syllables the vowel was shortened; in short syllables the vowel was lengthened. A consequence of these changes of quantity is that both long and short ON vowels have long as well as short equivalents in Faroese. A characteristic feature of the Faroese vowel system is the large number of diphthongs, as the original ON diphthongs are preserved as such and all ON long vowels have been diphthongized. The long vowels may be divided into four groups:

- (1) monophthongs: [i:], [e:], [o:], [ø:], [u:], corresponding to ON *i* (and *y*), *e*, *o*, *ø* (plus *q* and *æ*), *u*; and to *i* (and *y*), *e*, *o*, *ø*, *u* in written Faroese.

- (2) diphthongs with palatal termination: [ɛɪ], [aɪ], [øɪ], [ωɪ], corresponding to ON *au*, *ei*, *ey*, *i* (and *y*); and to *ey*, *ei*, *oy*, *i* (and *y*) in written Faroese.
- (3) diphthongs with velar termination: [əu], [əʉ], corresponding to *ó*, *ú* in ON and in written Faroese.
- (4) diphthongs with “open” termination: [ɛa], [ɔa], corresponding to ON *a* (plus *é* and *æ*), *á*; and to *a* (and *æ*), *á* in written Faroese.

When short, more vowels have merged. Thus only three diphthongs appear as short variants: *ei*, *oy* and *i* (and *y*); *ey* has coalesced with *e* [ɛ]; *á* with *o* [ɔ]; *ó* with *ø* [œ]. ON *y* and *ý* have coalesced with *i* and *i* respectively both as long and as short variants. In certain consonantal environments some vowels are pronounced otherwise than stated above. In derivational and inflectional (unstressed) morphemes, only the vowels *a*, *i* and *u* occur, with principally the same distribution as in ON. The svarabhakti vowel is written *u*. In the spoken language, however, the distribution of the suffix vowels *i* and *u* diverges in many ways from the written norm.

2.4.2. Consonants

The most obvious changes in the constant system are as follows.

- (a) Palatalization. The ON stops *g* and *k* have been palatalized into the affricates [dʒ] and [tʃ] before the front vowels *e*, *i* (and *y*) *ey* (ON *au*), e.g. *gera* [dʒ-] ‘do’, *kelda* [tʃ-] ‘spring’; also *sk* [ʃ]: *skinn* [ʃ-] ‘skin’.
- (b) The ON dental fricatives *ð* and *þ* have disappeared in pronunciation, although *ð* is inserted etymologically in written Faroese. ON *þ* has as rule become a stop, *t*.
- (c) Glide insertion between vowels, and Verschärfung. The loss of postvocalic *ð* – as well as of *g* – led to the development of a number of word forms with hiatus, which later on was filled by the insertion of glides. A few examples may demonstrate the complexity of this feature of Faroese phonology: *sigur* [‘si:jør] ‘victory’, *hogur* [‘hø:vør] ‘tall, high’, *veður* [‘ve:vør]. Verschärfung is realized as [dʒ] after *i* (and *y*) and *oy*, and as [gv] after *ó* and *ú* in hiatus and in word-final position, e.g. *oyggj* [ødʒ:] ‘island’ (ON *ey*), *siggja* ‘to see’ (< **sēa* > *sīa*; ON *sjá*), *rógva* [‘røgva] ‘to row’ (ON *róa*), *búgva* [‘bigva] ‘to live, stay’ (ON *búa*).

- (d) Merger of *kj-* and *hj-* into [tʃ]: *hjól* ‘wheel’, *kjallari* ‘cellar’; of *hv-* with *kv-*: *hvalur* [kv-] ‘whale’; of the clusters *sj*, *stj*, *skj* into [ʃ].
- (e) Segmentalization of *ll* to *dl*, and – after long vowels and diphthongs – of *nn* to *dn*; also *rn* has become *dn* (in the same morpheme after stressed vowel).
- (f) The loss of *h* before *r*, *l* and *n*: *nevi* ‘fist’ (ON *hnefi*), *reinur* ‘clean’ (ON *hreinn*), *leypa* ‘(to) run’ (ON *hlaupa*).

3. Principal sources of the history of the Faroese language

3.1. Mediaeval sources

The few manuscripts that may cast light on early Faroese are written in Old Norwegian. The only mediaeval document of Faroese provenience of some extent is a transcript of six letters concerning the legacy of one Guðrún Sigurðardóttir at Húsavík, AM fasc. 100 nr. 1a. The transcript, dated 1407, was published by Jakob Jakobsen in *Diplomatarium Færoense* (1907). – Two ON statute books exist, containing the so called *Seyðabrævið*, Duke Hákon Magnússon’s *réttarbót* for the Faroes. Both codices were conveyed from Bergen to Sweden during the Danish period. One is Isl. perg. 33 4to (“Sth 33”) in the Royal Library in Stockholm (now deposited in Tórshavn), with the original document, issued in Oslo in 1298. The other codex is Medeltidshandskrift nr. 1 in the University Library in Lund (“Lund 15”). *Seyðabrævið* is of special interest, as it is most probably founded on local Faroese traditions. Copies of this decree are also found in post-Reformation manuscripts, the most important one being AM 316 fol. *Seyðabrævið* has been edited several times, most recently by U. Zachariassen and J. H. W. Poulsen, Tórshavn (1971), where facsimiles and letter-true editions of all known manuscripts of the decree are printed. The principal contents of Sth 33 are the Norwegian Law. The codex was in the Faroes in the Middle Ages, probably in the care of the “løgmaður” (‘law-man’, i.e. the leader of the law-thing). While the codex was in Tórshavn, many short memoranda and decrees were written down in the margins and on blank pages. These texts were published by Jón Helgason (1951).

3.2. The Danish period

Danish texts that may give information on the Faroese language during the post-Reforma-

tion period are those containing place-names and records of official proceedings. Registers of landed property are kept from 1584, and later on account books and records of the proceedings of the law-thing are available.

3.3. The ballad collections

The oldest extensive texts in the Faroese language are found in Svabo’s collection of ballads from the 1770s and 1780s, edited by Chr. Matras (1939). Other ballad collections are inter alia *Sandoyarbók*, edited by R. Long (1968), and *J.H. Schrøter’s optegnelser af Sjørðar kvæði*, edited by Chr. Matras (1951–1953). The first book to be printed with Faroese texts of some extent was H. Chr. Lyngbye, *Færoiske Qvæder om Sigurd Fofnersbane og hans Æt* (1822). Later on Hammershaimb and others wrote down a great number of Faroese ballads, and in 1872–1876 Svend Grundtvig and Jørgen Bloch compiled and produced a huge collection of all *kvæði* known up to then: *Føroya Kvæði. Corpus Carminum Færoensium*, comprising more than 7000 handwritten pages.

3.4. After Hammershaimb

After Hammershaimb had constructed an orthography intended for the use of Faroese as a national language, an increasing number of printed texts have become available for the study of Faroese.

4. Recent contributions to Faroese language history

A pioneer in the investigation of Faroese was the Faroese philologist Jakob Jakobsen (1864–1918). In the introduction to his edition of Faroese folk tales (1901) he also comments on the language, inter alia drawing attention to a number of Danish loanwords, many of them no longer in use, thus contributing to the study of change in vocabulary. Words of Celtic origin in Faroese provided the subject of a newspaper article in 1902. In *Diplomatarium Færoense* Jakobsen investigated the language of diplomas. Although written in Old Norwegian, several peculiarities in word forms and spelling break the traditional orthographic pattern and are supposed to reflect the pronunciation of Faroese scribes. Forms that Jakobsen claims are specific for Faroese are inter alia pret.part. *skilgitin* (ON *skilgetin*) ‘of

legitimate birth', *fingid* (ON *fengit*) 'obtained', *deydh* (ON *daudh*) 'dead', *toa* (ON *tvá*) 'two', *þrier* (ON *þrír*) 'three'. Jakobsen suggests that the forms *toa* and *þrier* reflect a bisyllabic pronunciation, which later on developed into the forms *tógva* (in the ballad language) and *tríggir*. In *Seyðabrævið* Jakobsen has found a number of Faroese traces in the vocabulary. He also discusses Faroese word forms in Lund 15 and AM 316. – Marius Hægstad has given an overall description of Faroese in his history of the ON dialects, *Vestnorske maalføre fyre 1350* (1917). Hægstad emphasizes the close affinity of Faroese with the dialects of south-western Norway, both in vocabulary and phonological development, e. g. the sound changes *m, rn > dn* and *ll > dl*, and the use of *u* as the velar suffix vowel. He also discusses the *u*-umlaut, and proposes that the large number of unmodified forms in Faroese are due to Danish influence. Thus he believes that *u*-umlaut once existed in Faroese also in trisyllabic verb forms such as *kallaðu* (ON *kolluðu*). – Jón Helgason has investigated (1924) a copy of a few stanzas from a ballad collection, which was sent to Copenhagen in 1639, but which later was lost. Helgason has shown that the spelling, although irregular, reveals some sound changes, well-known in modern Faroese, such as the merger of *a* and *æ*, and the pronunciation of *ei* as /ai/. He also presumes that post-vocalic *ð* in a form like *eyð* (ON *auð*) was still preserved at the beginning of the 17th century. Helgason has also analyzed the notes and shorter decrees in the margins and on the blank pages of *Sth 33* (1951). Most of these texts have been dated to ca. 1400. Attention is drawn to several specific spellings and forms, e. g. *æk hafi* 'I have', the oldest known example of this 1.pers.sg. verb inflection (ON *ek hef*, Far. *eg havi*). – The manuscript *Lund 15* has been investigated by Mikjel Sørlië (1936; 1965), who has come to the conclusion that the codex was probably written in Bergen ca. 1310 by a Faroese scribe, thus explaining the considerable number of nontraditional forms which anticipate later developments in Faroese. Sørlië even tries to determine the scribe's dialect background. In the introduction of R. Long's edition of *Sandoyarbók* (1968) Sørlië has analyzed the language of the ballads in this collection. Comparing the sound system of these with today's Faroese, he gives a survey of Faroese sound history. – Christian Matras (1900–1988) was the leading Faroese philologist for half a century. In his dissertation (1932) valuable information is

given about the stock of words used in naming rivers, sounds, mountains, villages etc., i. e. the vocabulary that was part of the living language at the time of settlement. In 1939 Matras published a lettertrue edition of Svabo's collection of ballads. The introduction comprises an investigation of Svabo's spelling, which may be characterized as phonetic-phonemic. Svabo's spelling system gives a clear view of the pronunciation (in his Western Faroese dialect) and morphology around 1800. In the introduction in his edition of Schrøter's record of *Sjúrðar-kvæði* (1951–1953) Matras gives a complete account of every word every time it appears, thus presenting an exhaustive description of Schrøter's language. Dialectal features are discussed. In *Fróðskaparrit* (1952–), the annual of the Faroese Academy, Matras has published numerous articles covering a broad range of issues in Faroese philology. Thus, in a 1952 study, he has convincingly demonstrated that Verschärfung was first developed in hiatus, and later on in wordfinal position. Matras' work within the field of Faroese philology also comprises a number of overview articles, e. g. *Færosk sprog* (1960), where he gives a condensed survey of the earlier history of the Faroese language. – The official documents from the period 1584–1750 were scrupulously examined by Hamre (1944). His principal aim was to investigate the spelling of the place-names and other Faroese words, as a rule Danicized, in Danish texts in order to reconstruct the pronunciation of the time. In a summarizing chapter Hamre enumerates the sound changes that he considers must have taken place before or during the period in question. Hamre has also investigated the *u*-umlaut in Faroese (1961) and has come to the conclusion that unmodified forms existed along with umlauted forms before the end of the 16th century, probably already in the Middle Ages. He assumes that the large number of unmodified forms in the period after the Reformation are reflexes of a certain Danish-influenced style of spoken Faroese among officials. – The problem of the irregular occurrence of *u*-umlaut is discussed thoroughly by Widmark (1959). She rejects Hægstad's and Hamre's supposition that unmodified forms to a certain extent are due to Danish influence. She argues that those words, especially where umlaut is missing in unstressed syllables (e. g. *kallaðu*, *bannan*), should be looked upon as the result of the close relation between the Faroes and the Norwegian main-

land in the Middle Ages, rather than spontaneous innovations. – A detailed report of the history of written Faroese, from the very beginning and through the different stages of its development, is given by Djupedal (1964). – Chapman (1962) has made an attempt to explain parallel linguistic changes in a large West-Scandinavian area, including Iceland, the Faroes and Western Norway, changes that have taken place a long time after the emigration to the Atlantic islands. He holds the view that “all linguistic change is a borrowing process” (Chapman 1962, 148), and strongly rejects the theory of “drift”, i. e. an inherent tendency leading to the same linguistic changes in areas without social contact. – Essential contributions to the study of Faroese, especially in the domains of phonology and syntax of modern Faroese, were made by Otmar Werner. In *Orbis* (1964, 1965) he has delivered an exhaustive report of investigations within all fields of Faroese studies. An overview of similar content is given in a condensed form in *Die Erforschung des Inselnordischen* (1968). – Björn Hagström has read the Husavik letters from the manuscript (1964) and found some forms deviating from the printed version of *Diplomatarium Færoense*, thus reducing the number of instances without *u*-umlaut in the document. Hagström’s dissertation (1967) is a detailed study of the dialect geography of the suffix vowels in order to determine the extent to which /i/ and /u/ have merged. In an article 1977 Hagström has demonstrated how the spelling and inflection of Danish loanwords during the period 1890–1970 gradually changed to conform with Faroese pronunciation and morphologic structure. He has shown that there is no influence from Danish on Faroese on the phonetic level, in spite of total bilingualism. – Oskar Bandle has studied the terminology used in connection with domestic animals in the West-Nordic dialects (1967). His material comprises ca. 450 Norwegian, ca. 210 Icelandic, and ca. 135 Faroese words. The investigation shows the close affinity of Faroese to the dialects of Southwestern Norway, thus supporting Hægstad’s results of 1917. Bandle also touches on similarities in the phonetic development. Also in his work 1973 on the dialect geography of the Nordic countries, Bandle emphasizes the close relation between Faroese and the dialects of Western Norway, giving examples from the lexicon as well as from phonology. Bandle has also examined the *u*-umlaut, summarizing the result of discussions through the years (Bandle

1967, 29ff.). The irregular distribution of umlauted and unmodified forms is explained partly as a result of analogical levelling within the paradigms, partly due to influences from Norwegian and Danish. – In a recent publication (1992) Jørgen Rischel gives a survey of the major phonological changes that have set Faroese apart from ON. Having the results of earlier studies at his disposal and a first-hand knowledge of Faroese, he has succeeded in giving a full account of the relative chronology of the most spectacular changes of the phonological system of Faroese. The systematic character of the changes is emphasized. Although explicitly abstaining from a discussion of the absolute chronology of sound changes, he states that “the great changes happened from 800 to 1600” (Rischel 1992, 116).

III. Perspectives in research history II: The contribution of Nordic research to historical linguistics (until 1950)

13. Nordic contributions to historical linguistics before 1800

1. The general scenario
2. Traditional linguistic thinking
3. Linguistic change and genetic relatedness
4. Descriptive or applied work providing evidence for language dynamics
5. Exemplars of descriptive work on past stages of Nordic languages
6. Concluding remarks
7. Literature (a selection)

1. The general scenario

Historical linguistics as a serious scholarly enterprise is (by the year 2000) only two hundred years old. There was no real research paradigm in this field until comparative linguistics abruptly came into existence around the turn of the 19th century and soon developed in the direction of historical linguistics. Before that time, historical and etymological language study was a speculative occupation in which seemingly everybody could engage. Much better work was carried out in fields which one might today call Applied Linguistics. Thus the Reformation motivated an upsurge of interest in the sound structure of language because of the need for metrical schemes to be used in new hymns in the mother tongue.

The most important undertaking was the endeavour, in the era of Humanism and the Reformation, to establish consistent orthographies, e.g. for Bible editions. Sweden got its first complete Bible in the national language in 1526/41, Denmark in 1550 (the New Testament two decades earlier), Iceland in 1584. These orthographical attempts were often anchored in tradition so as to give the orthography a more conservative and less dialect-specific appearance. This converged with an increasing interest in national history and thus in the understanding of early texts (manuscripts and inscriptions on monuments) in the mother tongue.

The establishment in each of these three areas of an orthographical norm meant that

speakers of a wide array of dialects acquired a language loyalty toward a common written language. This created a polarization between three main languages: Swedish, Danish and Icelandic (disregarding Gutnish, Faroese and Shetland and Orkney Norn), although Norwegian was also referred to as a language of its own, without clear recognition of its complex status (this complex issue cannot be discussed in detail here, cf. Hovdhangen 1982). The achievements of the 16th century thus laid the groundwork for later nationalistic controversies over the Nordic linguistic scenario.

2. Traditional linguistic thinking

The linguistic thinking up to the late 18th century can be envisaged as including three perspectives on vernaculars which are relevant to historical-comparative language study.

2.1. Vernaculars as imperfect reflections of logic

The medieval and humanist approach to language study was based on the classic contention that there is such a thing as an ideal language which is in accordance with the logical structure of the world. As a consequence, the actual languages as we know them are more or less perfect reflections of this proper, logical language. As to the “vulgar” European languages in particular, these were viewed as the result of corruption which had been going on since antiquity, and thus Greek and Latin were more relevant to a logic-based approach to language. Among the representatives of the leading linguistic theory of medieval Europe, Modistic Grammar, there were in 13th-century Paris four scholars with the epithet de Dacia, viz. Bo (Boethius), Johannes, Martin and Simon. In the following centuries, however, Nordic linguistics shows a conspicuous lack of inspiration from these Danes. In any

case, their theoretical work is of little relevance to diachronic studies.

2.2. Vernaculars as continuations of the language of Eden

As for the historical perspective, linguistics took its point of departure from the biblical heritage with its two linguistic milestones: (1) Adam and Eve used words to name things, i.e. there was an original language spoken in Paradise; (2) after a period of monolingualism, the human tongue split into several mutually unintelligible languages as a result of building the Tower of Babel. These dogmas set the agenda and got in the way of potentially more interesting research. For a long time it was taken for granted that Hebrew was the original language; this was assumed by many writers, as pointed out repeatedly by Hovdhaugen et al. (2000), for example the Dane Peder J. Wandal, who published a comparative word list of Danish and Hebrew (1651). Hovdhaugen et al. (2000, 38) mention another more prominent (and indeed more interesting) representative of this view in Finland: Åbo University professor Simon Paulinus (1652–1691), who in a very extensive Hebrew grammar (1692) attempted to align Hebrew with Latin grammar.

It became increasingly desirable to bolster the status of one's own country. One way was to make claims about the great age of the national language by tracing it back to Hebrew or explicitly to the language of Adam. The latter claim could be supported by the assumption that Noah's son Japheth had escaped the confusion of Babel so that his descendants had simply inherited the original language.

The Dane Peder Pedersen Syv (1631–1702) wrote a monograph on the Danish language with the somewhat surprising title *Nogle Betenkninger om det Cimbriske Sprog* (1663). By "Cimbrisk" he meant most of what is now called Germanic, explicitly including Danish, Swedish, Norwegian and German. In the first chapters there are some partly adequate etymological comparisons reaching as far as Persian, but at the same time he employs surprisingly naïve argumentation in favour of the historical primacy of Cimbric. Syv claims that in its oldest form, Cimbric has more in common with Hebrew than with Greek or Latin and thus antedates the latter two languages, although it became more different from Hebrew after the arrival of Odin, which caused it to be mixed up with the language of

the Ases. The linguistic loyalty in this line of reasoning seems to be toward Nordic in general, but the reference data are all from Danish. The most prominent Nordic representative of historical-linguistic patriotism is the Swede Olaus Rudbeck (1630–1702), whose large-scale work *Atland eller Manheim* (1679–1702) identified Sweden as the cradle of civilization (i.e. Atlantis), where the language of Adam was spoken. Rudbeck's work was strongly ridiculed by the Danish professor Ludvig Holberg, and the article *Étymologie* in Diderot's *Encyclopedia* half a century after the appearance of Rudbeck's work explicitly took issue with his linking of etymology with mythical history.

2.3. Etymology as explanatory semantics

The third component, the etymological study of words, is more difficult to come to grips with. Through an analysis of the etymological practice inherited from antiquity, one may tentatively construe the following operational definition: "etymology" (true meaning) traces the origin of a word through a comparative analysis of the meanings of words whose spellings are suggestive of some logical relatedness. Again, one may point to the medieval Danish modists' studies of meaning, but their emphasis was on universal properties of language, not on language history.

3. Linguistic change and genetic relatedness

Linguistic change was for a long time not a salient notion except in the sense of corruption of language, and comparative studies were distorted by religious fundamentalism and naïve beliefs in migration myths. In medieval Europe there was one outstanding exception, Dante Alighieri (1265–1321), who unfortunately did not come to play any lasting role. Five hundred years before Rasmus Rask's work, Dante's book about Italian vernaculars (1303–04) demonstrates a basic understanding of the relationships among genetically related languages or dialects, and more interestingly, a clear notion of linguistic change. Starting out as a scholastically trained scholar, Dante thereby laid the foundation for a comparative-diachronic linguistic paradigm, but this was forgotten in the following centuries.

Scholars of the 17th century, also in Scandinavia, were, however, interested in the diver-

sification of human language, the origin of language and the occurrence of language death. There was also a sporadic interest in dialect differences and even in the relationship of dialects to a standard language; Hovdhaugen et al. (2000) point out that in the 1620s Jørgen Thomassøn, serving as a vicar in Norway, worked out a comparative study of sound correspondences between various Norwegian dialects in relationship to Danish, though his seminal work was published only in the 20th c. (by Hannaas 1911).

The Swede Georg Stiernhielm (1598–1672) has a respectable position in the history of comparative linguistics, although he was involved with the speculative search for the primordial language. In his preface *De linguarum origine* to a 1671 edition of the *Codex Argenteus* of Wulfila's Gothic Bible translation, Stiernhielm outlines a basically good genetic division of languages of Europe and the near Orient into families with reference to the generally assumed linguistic split between Noah's sons Sem, Cham and Japheth. He also gives many etymological comparisons between related languages. Hovdhaugen et al. (2000, 115) credit him for having provided "one of the first, primitive tabular representations of the relationship between the Germanic languages"; I read Stiernhielm's diagram and accompanying text instead as defining the emergence of a standard language from multiple origins, in this case New German seen as a conflation of three German dialects (he similarly, but of course with less justification, claims that Latin is a conflation, a coalescence of "Hetrusca, Osca & Sabina"). For the history of genetic-linguistic pedigrees, it is more relevant that Stiernhielm posits seven Romance languages (including Rumanian: "Walachia") as stemming from one and the same language: Latin. As for the search for the language spoken by Adam, a caveat was voiced by Stiernhielm's compatriot *Samuel Columbus* (1642–1679); in his *Swensk Ordeskötsel* (which was influenced by Peder Syv), Columbus observed that although European languages seem to come from one common source, one cannot select *the* original language among these; it would be possible to take any of them and derive the others from it. But in fact, his argument goes further, languages such as Swedish and German are sister languages whose parents died long ago.

One of the first Nordic scholars working on metrics after the Renaissance, Hans Mikkel-sen Ravn (1610–1663), was an early Danish

proponent of a well-known view on language change: the mother tongue (Danish in his case) has undergone a decline over time, being corrupted by foreign influences. A later compatriot, Ole or Oluf Borch (Olaus Borrichius 1626–90), in his *Dissertatio de causis diversitatis linguarum* (1675), focussed on the reasons why languages have become so different after they split up due to the confusion at Babel. Not all the contributing factors he suggests are very convincing, but his mentioning of carelessness as a factor in linguistic change anticipates later insights. We find a more static conception of language relatedness half a century later in the manuscript of an anonymous Dane (1727). He assumed that the languages of the world are different because God arranged them differently out of the sounds of the original language; thus no known language is the common ancestor. This did not prevent the anonymous author from setting up interesting criteria for dealing with degrees of language relatedness.

A crucial criterion in the comparative and historical study of languages is the systematic comparison of "look-alikes" from different languages or from different epochs of the history of a language. It took a long time, however, to understand the necessity of making this criterion operational on a rigid methodological basis, as there was no explicit theory to associate it with. As long as the learned world was seriously concerned only with the codified orthographical norms of the languages of antiquity plus (eventually) a few contemporary languages, there was no inherent reason why scholars would assume that languages generally tend to change in smaller or greater steps over time, or that such changes tend to be very systematic rather than erratic. As for the traditional notion of etymology, it involved no stringent requirements on graphic/phonetic similarities in order for such similarities to count when words were claimed to be etymologically related.

Although the 18th century is known in linguistics as the period of transition toward the historical-comparative paradigm of the 19th century, there was no real methodological progress from the etymological attempts of 17th century Scandinavia all the way up to Rask's epoch-making comparative work. Already the 17th century, however, shows interesting premonitions of comparative linguistics. One virtually unknown precursor is the above-mentioned Jørgen Thomassøn (1625), another the Swede Ericus Schroderus (Eric

Schröder), whose small *Lexicon Latino-Scondicum* of 1637 (two years before his early death) has a comparative-linguistic introduction. Because of the relevance of such seminal work for an appraisal of the linguistic revolution in the early 19th century, Schroderus' (and his compatriot Ihre's) work will be characterized here in some detail:

Schroderus is very explicit about regular correspondences between closely related languages and successfully compares "Gothic" = Swedish with (High) German, deriving the latter from the former. If we look at labial consonants, for example, he posits German *p* for Swedish *b*, citing examples such as *Basun/posaune*, *Embete/ampt*, *Beck/pech*, and German *b* for *f* (which here stands for [v]) as well as for *g*, e.g. *Elff/elb*, *Graff/grab* and *Färgha/farb*, *Korgh/korb*, respectively. His comparisons of dental stops/affricates most clearly illustrate what is now known as the High German or Second Consonant Mutation. Schroderus knew that German mostly ("sæpissime") has *t* for *d*: *Dufwa/taube*, *Dygd/tugend*, *Dagh/tag*, etc., and that German has a variety of correspondences to *t*. We here enter the realm of conditioned change, since he observes that the German reflexes are dependent on initial versus medial/final position:

"Gothicum T ab initio vocis fermè mutatur in Z" (his examples include *Twijfwel/zweiffel*, *Twång/zwang*, *Tegel/ziegel*, *Twå/zwey*, *Tahm/zahm*, *Tijdh/zeit*) but "in media voce, vel in calce fermè transit in D" (e.g. *Pant/pffand*) "vel in Geminum S" (e.g. *Lott/loß*, *Slott/Schloß*, *Faat/faß*).

The idea of consonant mutations was salient, e.g. in Eric Pontoppidan's Danish grammar on which he worked only a few years after Schroderus (it appeared in 1663). He states, for example, that *c* "mutatur" into *h* in words such as *Cornu – Horn*, *Calamus, culmus – halm*, *Cutis – huid*, *cannabis – hamp*, *collum – hals*, *caput – hove*t, and he is aware of the systematic relationship between German *b* and Danish *v*, the former mutating into the latter: *haben*, *loben*, *leben*, *geben*... – *haver*, *lover*, *lever*, *giver*... Interestingly, Pontoppidan is explicit about the role of articulatory phonetics in mutations: homorganic elements can easily mutate into each other.

After the just-mentioned scholars there was a theoretical stand-still of more than a century. In the middle of the 18th century the influential Swedish scholar Johan Ihre (1707–1780) appeared on the stage. His booklet with the ambitious title *De origine linguarum* from

1759 seems strangely traditional in its etymological approach, even compared to 17th century work. There is more of a follow-up on Schroderus in Ihre's *Glossarium Suiogothicum* which appeared a decade later. It is an impressive Swedish dictionary with Latin translations and explanations and with Danish, Icelandic or more remote etymological parallels. In his introduction he has eight pages of letter correspondences exemplified by lists of lexical cognates taken from languages as far removed from Swedish as Celtic and Iranian. Not surprisingly, Ihre posits several wrong etymologies; at other times his intuition about cognates is correct, though he oversimplifies the relationship, as when he posits "T pro L" in *Tunga – Lingua*. Many etymologies are perfectly good and straightforward, however. Some of Ihre's letter correspondences between Swedish and Latin can be combined so as to give seminal evidence of the Germanic consonant mutations, e.g. "T pro D" (*Tand – Dentes*, *Tio – Decem*, etc.), "H pro K" (*Hafer – Caper*, *Horn – Cornu*, *Hud – Cutis*, etc.), "G pro H" (*Gäst – Hostis*, *Gård – Hortus*, [i] *Gär – Heri*), but Ihre does not make any such connections. Ihre also observes the Indo-European *s mobile* ("S præfigitur") but gives a random mixture of more or less spurious examples.

Considering Ihre's relative success in etymologizing, it is noteworthy that it is hard to see much theoretical and methodological progress from Schroderus' 17th-century work. Ihre's etymologies often suffer from the traditional flaw of concentrating on some detail of resemblance and ignoring accompanying dissimilarities, as when he posits "K pro D", exemplified by *Leka – Ludere*. It should be noted that his comparisons are strictly graphical and thus not supported by any phonetic systematization or by any phonetic plausibility measure. This is in a way strange since the relevance of phonetics for etymology was understood much earlier (cf. Pontoppidan 1663) and was emphasized in the article *Étymologie* in Diderot's Encyclopedia, some years before Ihre. Moreover, Ihre's observations look rather random, without special focus on the most regular and most well-corroborated correspondences (on this point, too, his work lacks the scientific rigor required for etymological work by the French Encyclopedia). Through the quantity of his useful work and his level of learning, however, Ihre stood out internationally as an etymologist. Although Rask took his work with much reserve, Ihre's

achievements were in fact of direct importance for early 19th century scholarship, including Rask himself.

The 18th century is characterized by a growing interest in dialects and in their assumed great age. A prominent example mentioned by Hovdhaugen et al. (2000) is Marcus Schnabel's *Prove paa hvorvidt det gamle Norske Sprog endnu er til udi det Hardangerske Bonde-Maal*. It is a comparative inquiry into the greater or lesser preservation of "the Old Norwegian language" in "the peasant idiom of Hardanger", published in 1784 by the Royal Norwegian Society of Sciences and Letters (Ihre's dialect dictionary will be mentioned in a different context in sect. 5). On the whole, however, precious little progress had been made in the understanding of how the Nordic languages and their dialects were mutually related, and how they were related to the language attested in early manuscripts or runic inscriptions.

4. Descriptive or applied work providing evidence for language dynamics

It seems appropriate to introduce this section with a few words on the older data used in historical research. Needless to state, all linguistic records from the past form raw data for language history. Although this volume of material is enormous, especially for recent centuries, there is both a strong bias with respect to topics covered in the early literature and sheer arbitrariness in the selection of material which has been handed down to posterity. Much of the most valuable medieval material was irretrievably lost due to wars and fires and also, unfortunately, by recycling. We do not know, for example, whether there formerly existed a much greater number of manuscripts containing treatises on descriptive or historical linguistic matters; if so, they could have been lost both by misfortune and because such matters were thought obsolete by later generations.

There is remarkably little evidence of reflections on Nordic languages in the Middle Ages, with some prominent Icelandic exceptions: an anonymous Icelandic treatise on phonology and orthography and Snorri Sturluson's 13th century handbook of Scaldic Metre (*Skáldskaparmál*). The latter gives a wealth of information on the traditional metric patterns and

poetic usage and hence indirectly on the general sound pattern of the language, with the particular qualification that metric tradition often reflects conservative and perhaps even obsolete pronunciation. Thus we get a certain diachronic time depth by studying Snorri's information plus those specimens of surviving scaldic verse from the preceding three centuries which can be dated with some certainty. Snorri's work is essentially of a didactic nature.

The so-called *First Grammatical Treatise* from the late 12th century is important in that it applies the minimal pair test (the commutation test) to the phonology of a Nordic language, some 800 years before the test was introduced by structuralism. For example, words with final long and short consonants are contrasted in sound and meaning in order to show that consonant length is distinctive. This is in itself a milestone in the history of linguistics, although the idea was based on well-established classical and medieval ideas; for Nordic language history it is particularly important because it gives us the most direct and reliable record, for any Nordic language, of a sound pattern of the past.

There is also a *Second Grammatical Treatise* from medieval Iceland, which deals with the combinatorics of the letters in the established orthography and which is perhaps more independent in its approach than the first. Finally, we may mention a *Third Grammatical Treatise* written by Snorri Sturluson's nephew, Ólafr Þórðarson; that work is interesting in that it also takes runic writing into account. As in the case of the Danish modists, however, this strange concentration of interesting linguistic scholarship had no obvious impact on the later development of linguistics in Scandinavia.

The incentive behind the *First Grammatical Treatise* was the need for improvements in orthographical practice; as a spin-off, the treatise supplies Nordic philologists with such wonderful information as the existence of a contrast between plain and nasalized vowels, a contrast which might be predicted for an early state of Nordic on comparative evidence but which was not borne out in Old Icelandic orthography (early East Nordic runic inscriptions provide evidence of the retention of this contrast at least for the vowel /a/ in the early Viking Age). The relatively great regularity in spelling in runic inscriptions and early medieval manuscripts, compared to late medieval and Renaissance texts, suggests that there may

indeed have been a series of early orthographical normalizations, though we have no records of these.

The most intriguing event in early Nordic writing is the fairly rapid transition from a longer runic alphabet (“futhark”) with 24 characters to a shorter one with 16 characters shortly after the sound pattern of Proto-Nordic (urnordisk) had undergone radical changes, including the addition of umlaut vowels. It is understandable why there was a need for a radical reform at that time. In spite of its larger number of characters, the old futhark was quite inadequate vis-à-vis the new sound pattern. What is intriguing is that those in charge chose an orthography which is in one sense more “primitive” since it under-specifies but in another sense is highly sophisticated: whenever a runic character covers two or more phonemes, these are morphophonemically rather than just phonetically related. The only comparable event in the history of a Nordic orthography was the orthographical turmoil in late medieval Danish and the subsequent attempt to re-establish a more regular spelling system in the 16th century. Again, the major underlying problem was a set of sound changes which seriously upset the sound-letter correspondences so that Danish orthography was in flux in the 15th and early 16th centuries. Throughout the era of the Reformation there was a conspicuous lack of spelling regularity. Writing habits were highly individual, often also characterized by imperfect command of Danish and/or by personal mannerisms. The enormous influence of Low German, later also of High German, contributed to this instability.

The task of establishing an acceptable form of written Danish was assigned to one learned scholar of the Humanist tradition. The immediate objective was to rectify the very unsatisfactory first Danish edition of the New Testament which had appeared in 1524, a translation marred by all kinds of Germanisms, a clumsy orthography and other shortcomings. The scholar Christiern Pedersen managed to produce a much better translation already by 1529. The titles of the 1524 and 1529 editions themselves give a startling (albeit rather exaggerated) impression of the nature of the changes: in 1524 it is *Thet noye Testamenth*, in 1529 *Det ny Testamente*. In the 1529 edition and subsequent editions of various works in Danish (the entire Bible in 1550), Pedersen laid the foundation for Modern Danish orthography. In the context of this article the relevant

question is: what kinds of linguistic deliberations did he use in his orthographical reform? Since there was no well-defined and widely used standard spoken Danish, one way to arrive at an acceptable common denominator was to look at an earlier state of the language as it was reflected in the law texts and other medieval texts with which Pedersen was thoroughly familiar. In medieval times Danish underwent both a weakening of postvocalic stop consonants and (particularly in East Denmark) a weakening or loss of voiced fricatives; as a result there are enormous discrepancies in the orthography during this period. Pedersen’s solution of the orthographical problem was characterized i.a. by innovative use of older scribal conventions. In several instances etymologically false spellings were introduced, and because of the relative stability of Danish orthography since the Reformation, one still encounters spellings such as *sælge* ‘to sell’ in modern Danish as against (-lj-) in Proto-Nordic. Spurious consonants such as fricative -g- in *sælge* even made it into the educated pronunciation of Standard Danish.

When we enter the 17th century, we see in Sweden an upsurge of scholarly activity, represented by Johannes Bureus (1568–1652) and his pupil Georg Stiernhielm (cf. 3.), with the aim of elevating the mother tongue to a higher status as a written language. Ihre, in *De Mutata Lingva Sveca* from 1742, deals with innovations in Swedish; i.a. he points out how the Swedish Bible editions from 1526 and 1541 differed dramatically in spelling and linguistic usage. The orthographical representation of Swedish, a controversial issue, was treated in detail in works from the late 17th century (including Samuel Columbus’ above-mentioned *En Swensk Ordeskötsel*) and afterwards.

In Denmark, there were several attempts of this kind in the 17th and 18th centuries, in the beginning particularly with reference to orthography. Dictionaries of Danish usage appeared throughout the 17th century. Of particular value as a source of information is the anonymous work from 1727 mentioned in section 3, which makes much of distinguishing a contemporary Danish norm from dialectal or obsolete or otherwise irrelevant material. These scholarly activities often influenced the course of development of the mother tongue, and from that perspective they are relevant to historical linguistics.

5. Exemplars of descriptive work on past stages of Nordic languages

This section is meant to underline and emphasize by way of selected illustrations that the data for modern diachronic studies of Nordic languages are not confined to raw texts (be they runic monuments, coins, manuscripts or printed books) but also include outstanding descriptive work from the past which in some cases is of extremely high reliability and applicability. Since the bulk of diachronic work of the 19th and 20th centuries is on sound change, the focus here is on phonetics/phonology.

The so-called *First Grammatical Treatise*, which was referred to in sect. 4, belongs in the category of particularly significant descriptive sources by virtue of its outstanding and reliable analysis of the sound patterns of 12th-century Icelandic. There is no comparable source of knowledge about other Nordic languages from medieval times.

In the era of Humanism, phonetics entered the Nordic scene with the Danish scholar Jacob Madsen (1538–1586) with the surname Aarhus (i.e. his home town in Jutland), who cites a number of Danish words in quasi-phonetic notation in his linguistic dissertation *De Literis Libri Duo*, which appeared in the year of his death. We can see that although Madsen does not distinguish between letter and sound in his terminology, he manages to give genuine spoken word-forms since the spellings reflect his North Jutlandish background, with dialectal features such as diphthongizations as against the monophthongal spellings of Christiern Pedersen's standard Danish orthography.

From the 17th century onwards we have several works on metrics and on grammar, particularly in Denmark. If used with caution, these provide important information, e.g. on rhythm. One name occupies a much higher rank than those of all others: Jens Pedersen Høysgaard. Høysgaard (1698–1773) had a humble position at the University of Copenhagen but provided outstanding and highly original descriptions of Danish grammar and prosody, i.a. his *Accentuered og Raisonnered Grammatica* (1747), which includes systematic indications of word prosody and thus is an invaluable source for diachronic studies of Danish stress and *stød*. Høysgaard was also an outstanding syntactician whose insights were far ahead of his time.

Toward the end of the period treated here, Johan Ihre's *Swenskt Dialect Lexicon* (1766) stands out as a primary source of 18th century

Swedish and as a seminal work in dialectology. Being overtly inspired by the existence of an array of works on dialects or regional languages in other European countries, it contains a wealth of non-standard words and expressions with indications of their dialect provenance. Unlike much of Ihre's other work, it is strictly descriptive, not historically oriented.

The Faroese scholar Jens Christian Svabo (1746–1824) carried out trailblazing work on Faroese language and culture, although he never finished his university studies. His most important linguistic achievement is *Dictionarium Færoense* from the late 18th century (published only in 1966 by Christian Matras). Svabo considered Faroese to be moribund, and sharing the practical orientation of his time, he saw a better future for the islanders if they switched to Danish. His own task was to take down whatever was left of the language so as to preserve it as an antiquarian object for posterity. Before Svabo, almost the only mention of the language situation in the Faroe Islands is by Lucas Debes (1623–75), who in his *Færoæ et Færoa reserata, Færoernis Beskrivelse* (1673, re-edited by J. Rischel 1964) makes the significant but somewhat enigmatic statement that "Their language is Norwegian, although nowadays mostly Danish; they have, however, still preserved several old Norwegian words [...]". Svabo considered designing a Faroese orthography based on a comparison with Old Norse. Instead, however, he made the happy decision to use a quasi-phonemic notation. Partly because of this, his extensive documentation of 18th century Faroese provides a solid foundation for diachronic studies, and it has been instrumental in calling later scholars' attention to Faroese as a separate Nordic language.

6. Concluding remarks

The general impression of linguistic endeavours up till the 18th century, both in Scandinavia and elsewhere in Europe, is that there was not much progress in the field of historical linguistics. This is in contrast to both theoretical and descriptive linguistics. Language philosophy reached an impressive level in ancient Greece, and the work of the scholastic "modists" around the 13th century brought interesting new facets to this field. Descriptive grammar flourished in ancient Rome and merged with language philosophy in the analytical approach of the Port Royal grammarians in 17th century France. Scandinavia con-

tributed little to the progress of linguistics over this long period, apart from the Danish provenance of some of the most outstanding modists in Paris. The following several centuries saw only a couple of Nordic linguists of recognized international standing: one is Jacob Madsen Aarhus, another Johan Ihre. There are others, including the medieval author of the *First Grammatical Treatise* and Høysgaard in the 18th century, who were in fact eminent scholars, but being outside the European mainstream (for one thing because they wrote in their mother tongue), they had no chance of influencing international developments.

14. Contributions to Nordic language history by non-Nordic linguists (until ca. 1980)

1. Introduction
2. Contributions
3. Conclusion
4. Literature (a selection)

1. Introduction

- 1.1. The terms “language history” and “historical grammar”

Oskar Bandle (1984 a, 71) defines *historical grammar* as

a presentation of the pure linguistic data (in some cases including an internal linguistic interpretation and with a traditional split into historical phonology, historical morphology, etc., without taking as a primary issue the totality of the course of evolution), while *language history* on the contrary concentrates on giving the outlines of evolution: perhaps not comprising all details, but seeking the totality behind the evolution in the separate linguistic categories and trying to combine it with non-linguistic factors of primarily sociocultural character.

This article presents general contributions to Nordic language history comprising two or more languages, omitting contributions to the individual languages or periods, e.g. Krause (1971), Antonsen (1975) (both Proto-Nordic grammars), or special fields, e.g. Sturtevant (1930, phonology), Penzl (1952; 1984, phonology), Liberman (1982, phonology), Boor (1922, syntax), Lehmann (1976, syntax), Fischer (1909, lexicon), von See (1964, lexicon). The controversial issue regarding the earliest split (and grouping) of the Germanic languages is omitted (see articles 64–65).

1.2. General

The contributions to be treated are one article by Hans Kuhn, and books by Kenneth G. Chapman, Oskar Bandle and Einar Haugen. The purpose and contents of these contributions are discussed, as well as their importance according to (chiefly) reviews by Nordic linguists. M.I. Steblin-Kamenskij's *History of the Scandinavian Languages* (1953) will not be treated here, being a historical grammar rather than a language history.

2. Contributions

2.1. “The linguistic geographers”

2.1.1. Introduction

Common to the authors is their dealing with West Nordic relations, i.e. the relationship between Icelandic and Norwegian. Kuhn, Chapman and Bandle (1967) cover only these languages, while Bandle's later contribution (1973) also surveys Danish and Swedish.

2.1.2. Hans Kuhn (1955)

Kuhn's contribution was inspired by reviews of his works by F. Maurer, E. Schwarz and D. A. Seip (1951; cf. Kuhn 1952). In 1955 he published an article, “On the grouping of the Germanic languages”. Of primary interest here is Kuhn's “outstanding example”, “Oceanic Nordic”, i.e. a dialect group (“Mundartgruppe”) which presumably evolved during the Middle Ages through the intercommunication of the West Norwegian language (dialects) with those of the various western settlements (1955, 17). Norwegian and Icelandic linguists have not considered the linguistic evolution of (South)West Norwegian and the language of the western settlements from Kuhn's perspective. They (Hægstad, Indrebø, Seip, Ulvestad, Skomedal, Torp, Finnbogason, Benediktsson) have assumed linguistic “predisposition” (or “drift”) to be the fundamental cause. (Kolsrud, however, states that extensive communication between Iceland, the Faroe Islands and Norway, mainly in late Old Norwegian and Middle Norwegian times, is of linguistic importance [1950, 298]; cf. Bandle [1967, 507, note 9]).

Kuhn says that he knows about 50 innovations which are younger than the western colonies, adding that only a few innovations are found everywhere in the area. In western Norway (presumably the source area of the new developments) many innovations receded and some are now extinct, and others were pushed back from the coast (e.g. to Setesdalen!). Of the 50 innovations, Kuhn mentions 31. At first he attaches importance to three developments in the Nordic countries which demonstrate the untenability of a common predisposition as a basis of “Oceanic Nordic”: (1) *hl-, hn-, hr- >*

l-, n-, r- (not in Icelandic), (2) monophthongization of PGmc *ai, au*, and (3) lengthening of short vowels in stressed open syllables. Then Kuhn proceeds mentioning 12 (chiefly) West Nordic features, ending by enumerating 16 special developments in “Oceanic Nordic”, all of them previously known phonological traits, discussed by Hægstad (1915; 1916; 1917; 1942); cf. Benediktsson (1961–62; 1962).

Kuhn lists many innovations to endorse his hypothesis. But the material is somewhat uncritically collected: It is somewhat banal to include features like *rs > ss, -eng- > -eing-, gn- > n-, and hj- > [j]*. Most of the common traits of “Oceanic Nordic” are certainly or probably independent developments which occurred at different times; cf. *p, t, k > b, d, g; á > au, æ > a; ll, rl > dl* and *nn, rn > dn* seem to have developed earlier in Icelandic than in Norwegian (cf. Benediktsson 1963, 160).

Innovations may have arisen through contact across the ocean but objections may be raised. Why is the *morphology* of Modern Icelandic nearly unchanged compared to Old West Nordic? How can we explain developments like Icel. *a > [ai]* and the Far. “sharpening” (*flýja > flýggja*)? Why are traces of the old Trøndelag dialects absent in Icelandic? Finally, to make Kuhn’s hypothesis suitable, one has to collect words for comparison from different Norwegian dialects. Many innovations can be explained structurally and Hreinn Benediktsson has done most of this work (cf. also Benediktsson 1963, 161). Good structural explanations are given by Sommerfelt (1952, *ll > dl*); Skomedal (1970, diphthongization; *p, t, k > b, d, g*) and Haugen (1970, 133, delabialization). Skautrup (1958, 57) and Ulvestad (1964, 604) stick to the traditional opinion of a preconditioned articulatory basis. I conclude this review of Kuhn’s contribution with the following quote: “Presumably both communication and originally common articulatory predisposition have led to the discussed innovations, at least in the first half of the millennium. Later on, however, the changes concerning the (evolving) separate languages are mainly due to internal, independent factors” (Nes 1973, 185).

No other Nordic reviews of Kuhn’s hypotheses are known to me.

2.1.3. Kenneth G. Chapman (1962)

Kenneth G. Chapman’s dissertation, *Icelandic-Norwegian linguistic relationships* (1962, 199 pp. including 37 maps), has a preface

dated March–August 1956 (!). In the Introduction “sound change” is discussed in general, and the author formulates a “socio-psychological hypothesis of sound change”:

1. the nature of allophonic change is dependent upon phonological and psychological factors.
2. the spreading of allophonic change and the transformation of it into phonemic change through the processes of borrowing and analogical development are dependent upon sociological factors (1962, 22).

Cf.: “The possibility of independent parallel development cannot be excluded, but should be regarded as less likely and used only as a last resort in explaining such similarities” (Chapman 1962, 24). The citations show the work to be not “a study of Icelandic-Norwegian linguistic relationships per se, [...], but rather a study of the mechanism of linguistic change” (Hamre 1967, 667). Then follow expositions of the Icelandic-West Norwegian linguistic and historical background, ending with these words: “Referring especially to commercial contacts, it is of special importance that in the 12th, 13th and 14th centuries Bergen was the most important point of contact” (41). (This assertion, however, is inconsistent with the view of the historians, viz. the pre-eminence of Nidaros (Trondheim) as trade centre in the 12th, 13th and early 14th centuries [cf. Ulvestad 1964, 602]). Chapter 2 is devoted to “Dialects and dialect boundaries in Norway”, ch. 3 gives an “Outline of historical changes in Icelandic”, while ch. 4, “Geographical distribution of the WN-Icelandic common features” is much longer, being divided into “Consonantal developments” and “Vowel developments”. Chapman mentions 17 developments, 16 of which are also discussed by Kuhn (whose 1955 article is referred to nowhere by Chapman).

In the fifth chapter, “Historical interpretation”, regarding “Dissimilation phenomena” (85–103), the author encounters severe problems concerning the connection between the various developments in Norwegian and Icelandic. He offers the rather dubious explanation that “it is quite reasonable that through trade connections with Bergen they [i.e. the Icelanders] came in contact with inhabitants of the closely surrounding area, and of central WN in general, from whom they could have borrowed these linguistic features” (102–03). Some of the dissimilations also seem to be ear-

lier in Icelandic than in Norwegian (see 2.1.2.). The sixth chapter, “The language in the other Norwegian colonies”, is a very short presentation, while ch. 7, “Vocalic structure” describes the vowel systems of Norwegian in general, Icelandic, inner West Norwegian, Faroese, and the Setesdal and Sunnmøre dialects of Norwegian. Chapter 8, “Conclusions”, terminates in this way: “In short, we can say that the Icelandic-WN linguistic situation in no way contradicts the socio-psychological hypothesis of linguistic change and in many ways supports it” (148).

The following Nordic linguists have expressed their (published) opinions of Chapman’s thesis. Sven Benson (1963) reports Chapman’s investigation and his conclusions, only pointing out that Chapman has been unable to utilize the newest explorations bearing on Icelandic and West Norwegian dialect relations. Hreinn Benediktsson (1963) subjects Chapman’s views and arguments to a scrupulous and sober examination, concluding that “Icel. and Norw. language history imply a parallel, independent linguistic development of the phonological system to be more common than [Chapman] will admit according to his fundamental theory”. (Benediktsson has published many articles in which he cultivates structural explanations of historical linguistic issues.) Bjarne Ulvestad (1964) submits Chapman’s book to critical scrutiny, dismissing Chapman’s opinion and chief tenets as follows:

the old hypothesis, the one building on latent tendencies in closely related, originally identical languages, is for the time being the best one available. This of course does not mean that borrowing has not taken place, but a validation of the borrowing hypothesis in the generalized form suggested by Chapman will have to be far more stringent [...] (604).

Haakon Hamre (1967, 668) stresses that a major difficulty is Chapman’s “failure to establish convincing historical evidence of contact between Icelanders and Norwegians sufficiently close to warrant the assumption of linguistic influence”. Hamre points out misinterpretations, especially in the treatment of phonological phenomena in the crucial dialect of Nordhordland. The reviewer

cannot agree that a sociopsychological linguistic theory should necessarily (1) exclude the possibility of independent linguistic de-

velopment occasioned by a major structural change such as the “quantity change”, and (2) reject some parallel developments resulting from such independent local development in two or more dialects, that is, in Icelandic and Southwest Norwegian (671).

However, despite “certain shortcomings, Chapman’s book must be recognized as a very valuable contribution to the study of Icelandic-Norwegian relationship” (ibid.). Ingeborg Hoff in her survey of Norwegian dialectology (1968, 457) mentions Chapman’s book, stating it to contain many faults and misinterpretations. “But his conclusion, however, that the mediaeval relations between Bergen (with western Norway) and Iceland have to be the cause of the [linguistic] similarities, seems to be well-founded”. Helge Sandøy (1994) referring to Chapman, Benediktsson (1963), and Ulvestad, “will not deny structural conditions” for the changes in Icelandic, pointing out, however, that before 1200 Norwegian-Icelandic commerce seems to have been run mainly by big farmers outside Bergen (e.g. Sogn). “The outer and inner causes [of the changes] have to, and can, supply each other, because many questions still remain if we try to rely on external explanations” (Sandøy 1994, 50). Arne Torp in his language history (1998, 50–52) discusses the phonological systems of Norwegian, Faroese, and Icelandic. Commenting on the partly parallel phonological developments, he considers “language contact” (referring to Chapman) to be less probable than linguistic “predisposition”.

2.1.4. Oskar Bandle

2.1.4.1. Oskar Bandle (1967)

Oskar Bandle’s *Habilitationsschrift, Studien zur westnordischen Sprachgeographie. Haustierterminologie im Norwegischen, Isländischen und Färöischen*, A. Textband and B. Kartenband (1967, 575 pp. + 76 maps), is a most impressive achievement. The primary goal is not the investigation of the terminology of domestic animals, but “to contribute to the solution of classificatory problems” (Bandle 1967 A, 5). The main part of the book (32–445) is devoted to the thorough study of ca. 430 Norwegian, 210 Icelandic, and 135 Faroese words, distributed over 85 different semantic categories. It is very interesting per se, but the main point in our connection is Bandle’s summation as to the classification of West Nordic (446 ff.).

The title of this part – amounting to 90 pp. – is “Summary”. “The grouping of the Norwegian [dialects]” (452–504) is discussed especially in relation to word geography. He finds that in Norway, more than elsewhere, one has to reckon with communication in a most general way to be the triggering factor regarding the development of dialect areas. Of special interest are the Icelandic and Faroese relations with the Norwegian dialects (505 ff.). Bandle surveys earlier research, i. a. the contributions by Hægstad, Kuhn (“sketchy”), and Chapman (“in no way exhaustive”). Then follows Bandle’s contribution based upon his *Haustierterminologie* (510 ff.), entailing the question of Icelandic and Faroese being mixed languages (“Mischsprachen”). He states the fundamental facts to be: “Relations between Iceland and all parts of Norway regarding the vocabulary, absolute predominance of the Icelandic – West Norwegian communities as to the phonology” (527). It is “most likely that many common phonetic developments belonging to the postcolonial period were also transferred from Norway to the Atlantic islands, although in many cases they may have been supported and advanced through a common articulatory and accentual initial position” (530).

Four (printed) assessments of Bandle’s huge work by Nordic linguists are known to me. Sven Benson (1968) calls attention to Bandle’s primary goal (to contribute to the solution of linguistic geography problems). The classifications by Bandle agree in many points with earlier classifications, but he has “laid a more stable foundation for the appraisal of the West Nordic linguistic geography, and in many ways improved the understanding” (269). The map volume (B) is according to Benson (a linguistic geographer himself), “in every way a work of extremely high quality. It combines scholarly accuracy with pedagogical clarity and gives an aesthetically very pleasing impression” (269). Ingeborg Hoff (1968) comments very briefly on Bandle’s work, hoping that “this solid and comprehensive study will stimulate others to start on further contributions of linguistic geography” (458). However, a linguistic classification (grouping) ought to be based upon “formal linguistic criteria, i. e. phonological and morphological criteria” (ibid.). Jóhan Hendrik Poulsen (1969) gives a comprehensive introduction to Bandle (1967), mentioning i. a. that “[o]riginally Bandle had planned to treat phonology and morphology as well as vocabulary, but soon abandoned

this plan when it turned out to be insuperable” (124). Poulsen states that “Bandle inclines to the opinion shared by Kuhn, Chapman, and others that throughout the Middle Ages Norway exerted linguistic influence on the colonized islands of the North Atlantic” (126). The reviewer accepts Bandle’s opinion that “Icelandic has from the start been a hybrid and corresponds to the testimony of the historical sources regarding the origin of the Icelandic colonists, something that is not reflected by Icelandic phonology and morphology, which seem closely to agree with west Norwegian dialects” (ibid.). Sveinn Bergsveinsson states (1969) that Bandle’s book “is an important contribution to the word geography in Norway, the Faroe Islands, and Iceland, as well in a synchronic as in a diachronic perspective” (227). “On the basis of his studies of the terminology of the domestic animals it must be regarded as sure that Icelandic, although a Nordic language, in a sense, nevertheless, is a mixed language” (ibid.). The reviewer does not share Bandle’s negative attitude towards “predisposition” (227). Lennart Elmevik’s review (1974), starts out deploring the lack of attention paid to Bandle’s work in Nordic scientific literature. The reviewer describes Bandle’s project, commending the maps and scrutinizing a number of Bandle’s words. Elmevik believes Bandle’s hypothesis (“relations between Iceland and all parts of Norway in regard to vocabulary”) to be correct in principle, and it is to be hoped that future investigations of the same kind will corroborate it.

2.1.4.2. Oskar Bandle (1973)

The purpose of *Die Gliederung des Nordgermanischen* (1973, 117 pp. + 23 maps) is “to examine the often neglected problem of the grouping of the North Germanic (Nordic) speech area from the widest point of view and by means of the methods of recent linguistic geography as unprejudiced as possible, thus leading to a more precise and valid solution in opposition to the descriptions so far, being mostly unsatisfactory” (11). In the introduction the author lists isoglosses shared by Nordic, East Germanic, West Germanic, North Sea Germanic and Upper German, and mentions some developments peculiar to Nordic, ending with a discussion of previous classifications of Nordic dialects, based on diachronic and synchronic criteria. Then follow four chapters concerning: (1) “Western innovations”, (2) “Eastern innovations”, (3)

“Southern innovations”, and (4) “Northern innovations” (24–95). The different phenomena are mostly well-known; those regarding lexicon are often supplied by Bandle (1967). Chapter 5, “The marginal dialects”, deals with the West Nordic Icelandic and Faroese “daughter languages”, which “at least to the end of the Middle Ages generally developed in the same direction as in the mother country” (100), the dialects in Finland and Estonia, and lastly the Gutnish of Gotland, which is “demonstrably not so isolated as frequently claimed” (109). In the concluding chapter 6, “Results”, Bandle asserts a tripartite division of North Germanic: (1) West Nordic, (2) South Nordic, and (3) North Nordic. The last one is subdivided into “North Nordic in a narrower sense”, “East Swedish”, and “Götisch”, covering the western part of central Sweden.

Three reviews by Nordic linguists are known to me: Sven Benson (1974) considers Bandle’s book to be “an extraordinarily valuable work” based on an extensive scientific literature within language history and dialectology. Its novelty is Bandle’s overall view as regards the Nordic language areas. The borders between Bandle’s three large speech areas are very fluid, and the maps depict a great simplification of the reality. Lennart Elmevik (1975) describes Bandle’s book, commends his vast knowledge of relevant literature, concluding that Bandle’s work is a “welcome contribution to the literature within this field”. In Elmevik’s opinion Bandle has presented a weighty contribution to the discussion of the (sub)division of the Nordic speech area. The Norwegian Germanist Laurits Saltveit (1978) states that the book is not a language history, but a grouping of the so-called North Germanic languages based on linguistic geography. The emphasis is on phonology; linguistic geography as well as geographical difference as to the morphology and syntax are covered in less depth. The reviewer advances some critical comments, concluding that Bandle “beyond doubt” has succeeded in his tripartite division of the Nordic speech area.

2.2. “The sociolinguist”

2.2.1. Introduction

The heading alludes to a passage in the preface of Einar Haugen’s *The Scandinavian languages*, stating it to be “a sociolinguistic

sketch of the historical development of the Nordic languages” (1976, 18). Haugen’s project began in the early 1960s. In the preface he acknowledges “the special contributions of a number of persons who have either read preliminary versions of the book or offered valuable suggestions while it was in gestation” (18), the number of “distinguished names” amounting to 70! As “by-products of the same project” (18) are mentioned the valuable research report by Haugen and Markey (1972) and the bibliography by Haugen (1974). Einar Haugen also took the opportunity to introduce his project in Haugen (1970), thus raising great expectations among the Nordists. Haugen’s later contribution, *Scandinavian language structures. A comparative historical survey* (1982) will not be dealt with here, while undoubtedly belonging more to historical grammar than to language history in the common sense. A rather negative appraisal was expressed by Damsgaard Olsen (1983).

2.2.2. Einar Haugen (1976)

The Scandinavian languages: An introduction to their history (1976), with a preface dated May 1972, is an important work, being

not a comparative grammar in the strict sense of that word; it is a sociolinguistic sketch of the historical development of the Nordic languages [...]. The linguistics of the book is fundamentally that of traditional school grammar [...]. The book is thus neither a study of *langue* by itself nor *parole* by itself, but of *langage*, the indivisible tissue of human communication (18).

The book is divided into “Section A. *Introduction: The Scandinavian languages today*”, covering chapters 1–7, and “Section B. *The growth of Scandinavian: A historical survey*”, with chapters 8–12. Only the titles of the chapters are mentioned here, indicating the contents of the book. Chapter 1 is named “Location and identity”, ch. 2 deals with “The literary languages”, ch. 3 goes on with “The cultivation of language”, followed by ch. 4, “The spoken languages”, and 5, “Resource languages”. Chapter 6, “Linguistic forms: A contrastive sketch”, “will provide a quick survey of the chief linguistic traits that unite and separate the modern Sc[andinavian] languages” (72). Section A ends with a tabularly formed ch. 7, “The historical background”.

These chapters, concerning the present situation, are aimed at “the intelligent general reader”. Section B follows, for graduate students, covering five chapters, namely ch. 8, “The prehistoric era (up to A. D. 550): Proto-Scandinavian”, ch. 9, “Ancient Scandinavia (550–1050): Common Scandinavian”, ch. 10, “The Middle Ages (1050–1350): Old Scandinavian”, ch. 11, “From Medieval to Modern (1350–1550): Middle Scandinavian”, and chapter, 12, “Modern Times (1550 on): Modern Scandinavian”.

Contrary to the previously mentioned works, Haugen’s book attracted the attention of many Nordists:

Reading Bengt Pamp’s judgement (1977) was a hard blow to Haugen. Pamp points out mistakes

partly depending upon careless formulations or omitted reservations, partly caused by pure ignorance or lack of precision, which a reader having poor knowledge of Nordic languages and Nordic language history may encounter already by a cursory reading of [Haugen’s] description of the Scandinavian languages and their history (252).

Pedagogically the book is fine (*ibid.*).

It is uttermost deplorable that [Haugen] did not submit his finished work to the scrutiny of ‘leading experts’ [...]. The mistakes could then have been corrected and the grandiose efforts by the author [...] would not [...] have failed to achieve their purpose (252).

Pamp’s scathing critique caused Haugen to reply in “Remarks to a review” (1978), “for the first time in my life” (225). He explains some of the flaws, stating that he had to omit “over a hundred pages of more detailed rules” (226). Haugen agrees on oversights to be avoided, thanking Pamp for his advice.

Lennart Elmevik (1977) describes Haugen’s book, doubting that it is suitable for “the beginning student and the intelligent general reader” (Haugen 17). He goes on to discuss Haugen’s scanty treatment of umlaut and breaking, his doubtful classification of Old Nordic weak verbs into three conjugations, mistakes concerning the grouping of Nordic dialects (72), Proto-Nordic forms of Old Nordic words (*ibid.*), and the information about Nordic place-names (73). The dialect maps in the book are not impeccable. The conclusion is that Elmevik

has by no means only negative criticism for Professor Haugen’s work. [...] The reviewer emphasizes that the book – though it may be less well-suited to the categories of readers for whom it was primarily intended – is indeed of great value (75).

Stig Örjan Ohlsson (1978) discusses the utility of Haugen’s book concerning the intended readership, and proceeds to study the maps, which he states refer to “the last decades of the 19th century” (148). He goes on to discuss Haugen’s (misleading) description of language change. Ohlsson is critical at Haugen, pointing out problems concerning the Proto-Nordic period and later eras, which “rather give evidence of political and linguistic opposition and struggle than of longlasting peace and harmony” (152). The reviewer concludes, having criticized the treatment of Swedish conjugations, that Haugen in certain aspects is “too loyal” to the “present state of science” (155).

Kjell Venås (1979) comments on and criticizes many details, but also more far-reaching aspects, e.g. from a Nynorsk point of view. For him the greatest weakness is Haugen’s “not distinguishing sharply enough between speech and writing, between genuine dialect and artificially fixed or chosen norms” (107). Examples demonstrating faults, contradictions and unfortunate expressions are given, and he continues to discuss technical aspects, e.g. the use/non-use of phonetic transcription, and, lastly, states that Haugen’s meticulousness is “unsatisfactory” (111 f.). However, the book “is an impressive work in its conception and scope [...]. The presentation is carried through by an overall view and an authoritative stand of the author making the book to be something else, and more, than a compilatory work” (112).

Jón Gunnarsson (1979) in his review goes systematically through the book. Especially chapter 6 is criticized for being difficult to read and containing “very many mistakes and all kinds of inaccuracies” (224). In table 9 (Haugen 1976, 74–75), “all is mixed up [...]. It is in need of much correction” (*ibid.*). At the end the reviewer asks the question whether the 60 pp. of photographs and texts in the book could have been reduced, and instead be treated in a more organized form concerning various points of linguistic development than has actually been done (234). Gunnarsson contends that much remains until Haugen is in accordance with himself as regards the

phonetic symbols; reconstructed forms are not kept apart from documented forms, except occasionally; and the methodology of the author is very mixed some places (ibid.). Finally comes a long list of mistakes and debatable points.

Guðrún Kvaran (1979) is impressed by Haugen's work, only remarking that it contains too little about Germanic and criticizing his treatment of the *i*-umlaut as being out of date.

2.2.3. Einar Haugen (1984)

The Scandinavian languages did not have a revised English edition. In 1984, however, a translation into German by Magnús Pétursson was published, based upon Haugen's revision of his 1976 book, resulting in a complete revision of the notorious chapter 6 and correction of "obvious mistakes" (19), besides updating (till 1980) of the bibliography. This edition, by far superior to the previous English edition, has not attracted the appropriate attention of the linguistic community and is subsequently unfortunately missing from the majority of the Scandinavian libraries. The sole Nordic linguist to appreciate the German edition was Venås (1986), stating that ch. 6 has been totally rewritten and, by random sampling, that Haugen has corrected obvious mistakes pointed out by his reviewers or found by himself. "Haugen deserves praise for showing once more his diligent and meticulous performance in the art of linguistics" (96).

3. Conclusion

The organization of this article is unusual. However, to discover how the above-mentioned works were received by Nordic scholars is futile when searching in book-length Nordic language histories. The last noteworthy Swedish language history is Bergman (1968, reprinted four times by 1993). In Denmark the short Danish language history by Karker (1996, aimed at the general reader) mentions Haugen (1976; 1984) in the bibliography, while the sole Norwegian book in this field to be noted, Torp (1998, a university textbook), draws attention only to Chapman (1962). Therefore I have found it worthwhile rendering the reviews and views given by competent scholars. It must be added that Bandle has had the opportunity to present his views (1984b; 1997).

The five (or six) works discussed here are quite disparate. Actually, only Haugen (1976; 1984) has produced a comprehensive language history (although limiting the subject to be the question of the classification of the Nordic languages). Kuhn and Chapman are chiefly concerned with phonological matters and Bandle derives his argumentation chiefly from his investigations of word distribution.

The last two decades, not discussed here, have been a period of revival as regards studies of Nordic and Middle Low German relationships. Many valuable – especially German – contributions have appeared since Edith Marold heralded a new approach (1980), based upon sociolinguistic views. Theories of language contact – or rather dialect contact – are of fundamental importance in this case. Many Nordic scholars are taking part in this research.

15. The contribution of the Nordic countries to historical-comparative linguistics: Rasmus Rask and his followers

1. Rasmus Rask
2. Diachrony in Denmark: Rask, Petersen and Bredsdorff
3. Swedish and Norwegian scholars up to ca. 1870
4. The seminal period: an overview
5. Scholars of the late 19th and early 20th centuries
6. Concluding remarks
7. Literature (a selection)

1. Rasmus Rask

The first half of the 19th century represents the real dawn of Nordic philology and historical linguistics in the Nordic countries. This breakthrough is associated with a small cluster of Danish intellectuals, first and foremost Rasmus Rask (1787–1832).

Rask was born in the late 18th century, and he was in strange ways a child of that rationalist century as well as the next, romantic one. During the 170 years since Rask's death, a variety of biographers and linguists have approached his strange personality from different perspectives. No coherent nor completely true picture emerges from this accumulation of biographical literature, however.

As we see both from Rask's letters and from his later publications, Rask was by inclination a language taxonomist whose research paradigm might be compared to that of contemporary botany and zoology. Rask departed from the concept of General Grammar as a

logically founded universal but believed in the inherent organization of language structure in terms of certain basic features. His approach to a language was a complex venture which can be factored out into two (interrelated) goals: (1) to present its grammar and phonology in *the* proper way, and (2) to place the language in its proper relationship to other languages. In this pursuit he virtually established some of our present-day fields of systematic and comparative linguistic study. The scientific approach to Old Norse was initiated by Rask, and so was the scientific study of Sami (Lapp) grammar, and more generally of Fenno-Ugric languages. At the same time, Rask played an important role by foregrounding the study of contemporary languages in their spoken form. As a corollary of this, he engaged himself in the reform of Danish spelling.

The topic of Rask's famous prize essay of 1818: *Undersøgelse om det gamle Nordiske eller Islandske Sprogs Oprindelse* (actually written 1811–14) was in a quite traditional vein, the prescribed task being to identify the origin of a specific language (in this case Old Norse) by comparing it with other languages (be they extinct but documented or possibly still extant ones). Traditionally, this concept of origin had nothing to do with reconstruction but implied that one might point to a known language as being the source of other known languages, although that assumption

had not always proven very productive in the preceding centuries. As we see e. g. from a letter of Rask's of March 1812 (Hjelmslev 1941, I, 117) Rask was by that time convinced that most of the structure of Icelandic could be traced back to Greek. In retrospect, the expectation might perhaps be that Rask would point to Sanskrit as being closest to the source language. Sanskrit, however, was rather outside his scope when he wrote the essay, whereas Franz Bopp's work *Über das Conjugationssystem der Sanskritsprache* from the same decade (1816) took Sanskrit as the very point of departure in his study of diachronic grammar.

Rask's focus on languages geographically closer than Sanskrit limited the relevance of his work for the later reconstruction of Proto-IE, but the defined task of the prize essay compelled him to make more careful comparisons between European languages than he might perhaps have done in the presence of Sanskrit, with respect to both grammar and lexical cognates. While doing this he repeatedly pointed to regular correspondences between the elements of one language and those of another as evidence of relatedness, the most illustrious example being the substitutions within the stop consonant system which set Germanic off from all other IE languages; this pattern of correspondences was later presented more systematically by Jacob Grimm and is therefore generally referred to as "Grimm's Law". In later linguistic jargons, such correspondences as these consonant mutations are generally called "sound shifts", though the elements involved in first-order genetic comparison are typically not sounds (and not even phonemes) but the alphabetic symbols of extinct written languages whose phonetic values are in principle hypothetical and can often be inferred only by comparative and internal reconstruction. Rask aptly called such correspondences "letter transitions" (*Bogstavovergange*).

In his introduction to the prize essay, Rask made some famous statements about the methodology to be used and the traps to be avoided when determining family relatedness between languages. His thoughts are for the most part of lasting validity, though not all were as trailblazing as has sometimes been assumed. As pointed out by Paul Diderichsen (1959), Rask formed his basic ideas about systematic and comparative linguistics and about etymological research from the teaching and writings of his outstanding mentors in grammar school. The extensive article on etymology in Diderot's *Encyclopédie* (more than

twenty pages of theoretical argumentation), which Rask himself refers to, was also most significant as a forerunner with respect to methodology and certain basic assumptions. It appeared anonymously in the 1756 volume of the *Encyclopédie*, but it was later acknowledged that its author was the economist Anne-Robert-Jacques Turgot (1721–81).

Turgot views an etymology as a hypothesis whose probability increases with the number of correspondences, and he views a complex linguistic change as a chain of changes, each of which must meet a criterion of plausibility. Turgot also emphasizes that a linguist doing etymological research must have a profound knowledge of the language under study and thus be able to retrieve the root of each word by peeling off "the terminations and inflections which disguise it". It is characteristic of all these warnings that they were widely violated in contemporary etymological research, and Turgot's impressive article shows how theory had advanced far ahead of practice half a century before Rask. 19th-century comparative linguistics was not created in a theoretical vacuum.

By comparison, what is most remarkable in the introductory chapter of Rask's essay is (1) his emphasis on language contact as a factor in linguistic change and thus also as a source of confusion in genetic comparison, and (2) his emphasis on grammar as being particularly important for comparative linguistic study. It is a key point in his argumentation that lexically based etymology is tricky since words, especially those reflecting culture-bound phenomena, are so easily borrowed. When comparing words across languages, one must rely on core vocabulary: "the most essential, most concrete, most indispensable and first words: the foundation of language."

In his prize essay, Rask was requested to deal with language genealogy, and this fell in well with his life-long interest in language classification in a more general sense. In a letter from St. Petersburg of January 1819 (Hjelmslev 1941, I, 382–86) Rask presents a new elaborate classificatory system of pedigree type which is much superior to earlier language taxonomies. In his system the languages of the world fall into eight different "races" (this is to be understood as a strictly linguistic term comparable to phylum or macro-phylum, although Rask's classification is in part typologically based). One of these, Sarmatic, is defined by having (with some exceptions) three genders and declension with paired "subjective"

and “objective” endings; from a modern perspective Sarmatic comprises the then known languages of the IE language family (though it includes also Dravidian). In Rask’s taxonomy of 1819 each language race is subdivided into classes, stems, branches, languages and dialects (“Sprogarter”). Sarmatic is first subdivided into eight classes; one of these follows the scholarly tradition by associating Latin with Greek, but by and large, his classification is in agreement with later views. There is one (unnamed) class which comprises the Germanic languages; in Rask’s system and terminology it has three stems: Gothic, Germanic, and Scandinavian.

Rask was a century ahead of his time with his research program, which involved the production of concise descriptive grammars of a great number of different languages. This was the logical consequence of his conviction that systematic description of each language in strict accordance with a common set of analytical principles is a prerequisite to adequate cross-language comparison. At the same time, his belief in structural features of grammar and phonology as evidence of relatedness makes his approach somewhat obsolete from the perspective of later *genetic* comparisons, since it has become gradually acknowledged that languages may be typologically similar, even on very basic points, for reasons other than genetic affiliation. Rask’s weighting of criteria even made it possible for structural dissimilarity to override lexical evidence of relatedness; this happened in his essay when he considered Celtic languages to be too grammatically aberrant and thus had to discard the obvious lexical cognates as loanwords. Interestingly, Rask soon changed his mind with respect to the affiliation of Celtic (Celtic belongs to Sarmatic according to the letter referred to above).

We see from Rask’s manuscripts that over the years he made numerous notes about lexical or other affinities between languages, particularly languages of the Near Orient and of South Asia. One of his most interesting observations was about affinities between Greenlandic Eskimo and Aleut. These languages are indeed related and, in spite of the vast geographical distance, even fairly closely related. Because of dramatic sound changes particularly in Aleut, however, it is a priori difficult to spot cognate words, and the genetic relationship was not definitively proven until the second half of the 20th century. This is a beautiful example of how Rask’s intuition and his

comparative approach, with its emphasis on grammar, could lead to the right initial assumption. Rask’s knowledge of languages was legendary, but his singular ability to spot genetic relatedness was an even more important asset.

Since Rask’s early comparative work involved strongly inflectional old IE languages as well as less inflectional young offsprings, one may wonder why he put so much emphasis on abstract features of grammatical systems. From the classic genetic-comparative perspective, it is not the grammars as such but paired etymological correspondences between affixes that provide a strong grammatical criterion of relatedness between languages. But this was not so obvious in Rask’s framework.

Rask did, however, carry out substantial work on etymology, not only within the lexicon but also most significantly in the realm of grammar. In a manuscript from the 1820s, for example, there are comparative notes about IE inflections. He contributed to the etymological study of grammar much earlier, however. Even before the publication of his prize essay, Rask had developed an etymological grammar for Danish as derived (according to his conception) from Icelandic, in which he meticulously worked out and explained the transformations from one grammatical stage to the other. This outstanding piece of work, *Den danske Grammatiks Endelser og Former af det islandske Sprog forklarede*, was published only in 1820 (cf. *Udvalgte Afhandlinger* II, 1932), and thus Rask was overtaken as the top scholar in the field of etymological grammar by Franz Bopp and Jacob Grimm. As for word etymology, Rask left various, in part extensive, notes for an etymological dictionary behind, although the majority of his unpublished manuscripts are more descriptive, with their focus on vocabularies and grammars of a wide variety of languages.

2. Diachrony in Denmark: Rask, Petersen and Bredsdorff

Rask did not seem to view linguistic change as a continuous, gradual (diachronic) process but rather as a kind of restructuring. In his view the languages of antiquity, including Old Norse, eventually produced offspring, such as Danish, through a process of temporary turbulence (he used the word *gæring* ‘fermentation’) which led to the emergence of a new

stage of language (in his wording: *afklaring* ‘clarification’, continuing the beer-brewing metaphor). A model for this theory was the development of Danish under heavy influence from Low German.

The prevailing assumption has been that Jacob Grimm (*Deutsche Grammatik*, 1819, 1822–37) must be credited with introducing the historical dimension in the study of languages. But in fact, the historical study of Nordic languages came to thrive in the milieu around Rask even in his own lifetime. The presence of a scholar of Rask’s stature was instrumental in arousing this interest in Scandinavia, and if the development of Nordic comparative and historical linguistics is seen in conjunction with Continental scholarship, it should be realized that Rask’s own work significantly influenced German scholars including Jacob Grimm, who was perfectly able to read Danish.

The belief in Icelandic as the language from which the other Nordic languages should be derived, set the agenda for comparative and historical studies. Icelandic was remarkable both because of its archaic appearance and because of the near-identity between Old and Modern Icelandic grammar. It was natural to assume a similar closeness between Old and Modern Icelandic in terms of phonetics, so that Rask could describe Old Icelandic pronunciation by taking the modern pronunciation, which he mastered himself, as his point of departure. We can see, however, that he was ready to take issue with this fondly held view of Icelandic as being unified across time if hard evidence forced him to do so. This internal conflict is less obvious in his early work, more so in a late version of his Old Norse grammar (*Kortfattet Vejledning til det oldnordiske eller gamle islandske Sprog*, 1832). In the introductory section “Udtalen” Rask quite explicitly uses comparative Nordic evidence plus the metrical convention of half-rhyme to posit rounded front vowels in Old Norse. The closely related Faroese language is crucial in this argumentation: it shows that Icelandic *æ* is the reflex of two different old vowels: an unrounded and a rounded one, although these are often mixed up even in old manuscripts. Similarly, Faroese shows that *ey* and *ei* were pronounced differently in the old language. It is interesting that in spite of the prestige of Icelandic, Rask no longer gives its modern pronunciation any absolute historical priority over the pronunciation of Faroese or of Continental Nordic (“Fastlandssprogene”).

Some diachronic issues, which we now consider crucial in Nordic language history, were not on Rask’s agenda in his reconstruction of the old pronunciation, exactly because it projects features of the modern Nordic languages back in time. It is conspicuous that he describes the pronunciation of vowels without making any assumptions about a quantity shift separating ON from modern Nordic. Vowels such as *o* and *ó*, or *u* and *ú*, were qualitatively different, according to Rask, and an ON vowel was rather long (“temmelig lang”) before single consonants (as in *vil*) but short before double consonants and clusters (as in *vilja*, *vildi*). This contention is the more interesting because Rask had a profound knowledge of Old Norse metrics with its crucial distinction between long and short syllables.

In other cases, where the difference between an earlier stage and a later stage is beyond dispute, Rask’s excellence in comparative-diachronic studies is apparent. In a Nordic context it deserves mention in particular that he was far ahead of Jacob Grimm in his understanding of the role of post-tonic vowels in umlaut, namely that it is the vowel of the ending that conditions the vowel quality of the stem, contrary to progressive vowel harmony (cf. a letter of 22 September 1812 to the brothers Jacob and Wilhelm Grimm, Hjelmslev 1941, I, 144), though Grimm was later credited with the correct understanding of the nature of umlaut. Still, the mechanisms and causes of linguistic change are not particularly salient in Rask’s work. When he was still fairly young, however, this issue was addressed by his friend Jakob Hornemann Bredsdorff (1790–1841). In the history of linguistics, Bredsdorff deserves an honourable position for his seminal paper *Om Aarsagerne til Sprogenes Forandringer*, 1821 [On the reasons for changes in languages], which takes up issues that were otherwise seriously addressed only a century later. By way of introduction he sides with Rask in considering influence between languages as a factor in linguistic change, but his interesting contribution is a taxonomy of internal causes of linguistic change. He elaborated on a variety of such causes and made suggestions which are in line with much later thinking in this field. In spite of its advanced ideas, Bredsdorff’s work did not exert any direct influence on the development of historical linguistics; it was published most unassumingly (in Danish) and was neglected in his own rather brief lifetime. Bredsdorff

dorff also made a breakthrough in the study of Runic Nordic: he made a distinction between older and later runes and provided the first essentially correct reading of the early inscription on the Gallehus horn. That accomplishment can be seen as the first landmark in a long struggle to determine the chronological depth of Nordic.

An even closer friend of Rask's, Niels Matthias Petersen (1791–1862), whom he had known since his school years, was to lay the foundation for the historical study of Danish. Taking direct inspiration from Rask, he wrote a prize-winning history of the Danish, Norwegian and Swedish languages (1829) and was awarded a chair in Nordic languages at the University of Copenhagen in 1845. He reached a wide audience by translating the sagas, and he wrote the first scientific literary history within Nordic philology. Petersen was a very clear-minded and broadly oriented philologist. In his essay-like lectures on Nordic languages, he outlines a research program by posing a series of rhetorical but still challenging questions about the historical relationship between spoken and written language: Where is the root of the vernacular? Where is the root of the written language? Do these two have a common source language from which they have not deviated? Can they be traced back to a language of antiquity? Petersen goes on to refer to evidence for the overall history of Danish: place-names, old texts, fossilized forms in the extant language, the phonetics of vernaculars. His coupling of this approach to language history with literary studies almost defines the field of Nordic philology. Although Petersen clearly distinguished between Old Norse = Old Icelandic/Norwegian and Old Danish, he agreed with Rask in taking the former as a key to insights into the past history of all the Nordic languages. It also became the primary subject of research for Petersen's successor, Konráð Gíslason (1808–91), who was the first to seriously study linguistic variation in the Old Norse data.

The remainder of this article will follow the growth of Nordic philology in the Nordic countries, as inspired by Rask and Petersen. (In many instances the fairly concise biographical and bibliographical information in the remaining sections draws heavily on *The history of linguistics in the Nordic countries* by Even Hovdhaugen, Fred Carlsson, Carol Henriksen and Bengt Sigurd (2000).)

3. Swedish and Norwegian scholars up to ca. 1870

In the decades after 1800, Sweden – which had had a scholar of Johan Ihre's standing – lagged strangely behind Denmark in historical-comparative research on Nordic languages, although one may mention Petersen's favourite pupil Carl Fredrik Säve (1812–1876), whose main expertise was Swedish dialectology. There were no university chairs for Nordic studies in Sweden until Säve received a professorship in Uppsala in 1859. There was more activity in Norway, although the contribution to comparative and historical linguistics in the first half of the century was modest there. The best and most influential work was by the historian Peter Andreas Munch (1810–1863).

The strangest character in Norwegian linguistics around the middle of the 19th century was indisputably Ivar Aasen (1813–1896), who lived on scholarships during his active life. He was self-taught as a language researcher, but learning from Rask's achievements he rose to a high level of excellence. Aasen was, like Henrik Wergeland and other culturally prominent Norwegians of the early 19th century, deeply concerned about the fate of the Norwegian language (the continuation of Old Norse) which had succumbed to Danish as a written norm. His great discovery was that the language was still very much alive in rural dialects of Norway, and he made it his special field to investigate these dialects with the ultimate goal of creating a written norm based on them (a parallel program was carried out for Faroese almost at the same time by V.U. Hammershaimb). As is well known, he established his Nynorsk or Landsmaal chiefly on the basis of West Norwegian dialects, which seemed both least influenced by Danish and genetically closest to Old Norse. Aasen's name is, therefore, generally associated with his endeavours in language policy. In Nordic linguistics, however, his Norwegian dialect grammar (1848) and dictionary (1850; 1873) still stand as very important reference works, both as primary sources for the recent history of written Norwegian and as sources of information on spoken West Norwegian, although one must consult later reference works in order to get a more detailed picture of Norwegian dialect geography.

The most neglected Nordic language, Faroese, enters the scene occasionally in this same period. In the 1840s a vicar, V.U. Hammershaimb (1819–1909), who had native

command of the language, published text specimens and a tentative grammar in a strongly etymologizing orthography which he himself had created with many a sidelong glance at Icelandic orthography.

4. The seminal period: an overview

What makes the first half of the 19th century such a great period is that so much started exactly then. This is true from both a scholarly and an institutional perspective. The scientific approach to genetic and historical linguistics came into existence during this period, and there were also developments in the philological approach to text editing and criticism. The study of Nordic languages became institutionalized during that same period, along with the decline of the earlier dominance of classical studies. Nordic philology, as it was up through the Second World War, was largely the creation of the early 19th century.

Rask and two of his Danish friends are, if viewed jointly, representative of this seminal period. Across the field, Rask himself stands out because of his genius, intuition and vast knowledge; in spite of his personal difficulties, he was a source of inspiration for others. Hornemann Bredsdorff was, however, at least as original a thinker. N. M. Petersen's work was more in the vein of German linguistics (Grimm) and from that perspective more mainstream. Petersen, however, may be called the first exemplar of a now vanishing species: the traditional Nordic philologist with a broad knowledge of languages, literature and culture and a conspicuous predilection for early historical periods.

5. Scholars of the late 19th and early 20th centuries

For this period, only a small selection of scholars will be mentioned, the main purpose being to show the multifariousness of comparative-historical work on Nordic languages in the Nordic philological milieu after the middle of the 19th century, i. e. the time when the classic comparative and diachronic method was developed fully. This section is meant to provide a reference background for art. 16 on the Neogrammarians, which is less oriented to individual scholars. For the same reason the survey is strictly chronological within each of the Scandinavian countries, and it is biased in favour of the period up to ca. 1920. Philologists

and dialectologists are, on the whole, only included if they have played a key role in diachronic language study.

5.1. Danish and Faroese scholars

Many of the most influential language comparativists were associated with the University of Copenhagen; for this reason, Nordic philology had an early boost in Denmark.

Kristen Jensen Lyngby (1829–1871) was a university teacher from 1862. Only two years before his death he was appointed to a professorship which comprised comparative linguistics and Nordic philology. Lyngby, who is known to posterity because of his great contributions to Danish dialectology, was influential as teacher of the generation of comparativists and language historians who made Danish linguistics famous.

Ludvig F. A. Wimmer (1839–1920), who became Professor after Konráð Gíslason in 1886, was an all-round language historian but soon chose to concentrate on runology. In this field he became the authority (beside Bugge, see 5.2.) both by his ground-breaking study of the history of runic writing (Wimmer 1887) and as author of the then standard work on Danish runic inscriptions (1893–1908).

Vilhelm Thomsen (1842–1927) was Professor of Comparative Linguistics from 1887. In the present context it must be mentioned in particular that he exerted a profound influence on Nordic linguistics by presenting the evidence for early Germanic loanwords in Fenno-Ugric (Thomsen 1869).

Otto Jespersen (1860–1943), Professor of English Language and Literature from 1893 to 1925, was the most versatile Danish (and Scandinavian) linguist of all times. Within Nordic Philology he was influential as a leading authority on phonetic transcription.

Marius Kristensen (1869–1941) wrote a dissertation on loanwords in early Danish and became very influential in Nordic studies but never took up a university career. Being a dialectologist as well as a Neogrammarian philologist, he advocated an explanatory coupling of historical linguistics with dialectology (Kristensen 1933).

Johannes Brøndum-Nielsen (1881–1977) was Professor of Nordic Languages from 1926. He had a wide range of scholarly interests, from dialects and Old Danish to literature. In the context of comparative and historical language study, his most important and lasting contribution is his diachronic manual

of medieval Danish with the slightly misleading title *Gammeldansk Grammatik i sproghistorisk Fremstilling* (1928 ff.). The first two (and most important) volumes are on sound history and are very much in Axel Kock's spirit. The masses of detail compressed into these volumes make them heavier reading than Kock's *Svensk Ljudhistoria*, however.

Through her sociologically based historical work, Lis Jacobsen (1882–1961) stands out from the mainstream of Copenhagen professors to whom she was often in opposition. She was an outstanding runologist (Lis Jacobsen/Erik Moltke 1941–42) and was editor of *Ordbog over det danske Sprog*.

Peter Skautrup (1896–1982) does not really belong to the period but is mentioned because of his monumental manual *Det danske Sprogs Historie* (1944–68). Skautrup became Professor of Nordic Languages in 1934 at the newly established university in Århus. In his language history he chose a modern approach to diachronic linguistics in which language-external (socio-cultural) factors loom large, along with alleged internal forces.

The Faroese scholar Jakob Jakobsen (1864–1918), whose research was funded through scholarships, carried out authoritative work on Faroese, but above all he performed a monumental service to Nordic studies by documenting the then remaining relics of the West Nordic dialects on the Shetland and Orkney Islands. His Shetland Norn dictionary (1908–1921) was posthumously re-edited in English (Jakobsen 1928–32).

5.2. Norwegian scholars

In Norway the scholars of the early period were mostly associated with the university in Christiania (= Oslo). Those concerned with Nordic studies tended to be ideologically anchored either in an Aasen camp (Landsmaal > Nynorsk) which tended to favour West Norwegian as genuine Norwegian, or in a Dano-Norwegian camp (Riksmål > Bokmål).

Sophus Bugge (1833–1907) was Professor of Comparative Philology and of Old Norse from 1866. Within comparative and historical linguistics his lasting contribution is to have established that the language of the oldest runic inscriptions in Scandinavia is early Proto-Nordic ("urnordisk" rather than Gothic). Bugge also brought forward the understanding of the elder runes and thus of the early inscriptions. He was co-editor of the standard

edition of Norwegian runic inscriptions (with Magnus Olsen 1891 ff.).

Kristofer Marius Hægstad (1850–1927) was Professor of Norwegian Landsmaal and its dialects from 1899. Hægstad was a whole-hearted proponent of Landsmaal. As a consequence of his position, he undertook substantial research on medieval West Nordic as the ancestor of present-day Landsmål/Nynorsk. His manual (Hægstad 1906–1942), which makes meticulous use of old diplomas and similar sources, is a valuable counterpart to Kock's and Brøndum-Nielsen's East Nordic manuals, though it is not easy to use in contemporary research.

Hjalmar Falk (1859–1928) became Professor of Germanic Philology in 1897. He was a prominent proponent of the Riksmål variant of Norwegian and a language historian in the Neogrammarian vein. From 1898 to 1906, Falk and the Indo-Europeanist Alf Torp (1853–1916) created a set of reference works treating phonological, grammatical and lexical aspects of the history of Dano-Norwegian (1898; 1900; 1903–6).

Didrik Arup Seip (1884–1963) was Professor of Riksmål, later Scandinavian Languages, from 1916. Seip strongly and constantly advocated the view that Bokmål is as genuine Norwegian as Nynorsk. His main scholarly contribution was the textbook *Norsk språkhistorie til omkring 1370* (1931).

Carl Marstrand (1887–1965), a highly competent IE comparativist, was first a professor in Dublin, but a few years later (1913) he received a chair in Celtic languages in Oslo. In the context of Nordic philology, Marstrand is known particularly as a runologist with independent views, but he was most influential through his comparative Celtic studies which inspired eminent followers in Oslo such as Alf Sommerfelt and Carl Hj. Borgstrøm.

5.3. Swedish scholars

In Sweden the professorships of Nordic languages or of the Swedish language were created rather late but became prestigious. Membership of the Swedish Academy crowned the university career of several of these scholars (e.g. Noreen 1919, Kock 1924, Hesselman 1935, Wessén 1947).

Axel Kock (1851–1935) was Professor of Nordic Languages first in Göteborg, later in Lund. He was an extremely active and influential Nordic philologist, whose research focussed mostly on early Nordic, especially

Swedish, sound history (1878–1885; 1906–1929). Kock did not accept the neogrammarian doctrine fully, as seen from his essay *Om språkets förändring* (1896). In the conceptual universe of Nordic philology, Kock's fame and continuing influence is first and foremost due to his bold theory about Nordic umlaut.

Adolf Noreen (1854–1925) was Professor of Nordic Languages in Uppsala from 1887. He was very influential both as a scholar and as a teacher and became a leading figure in Swedish linguistics. Noreen worked on Nordic on a broad scale (also including reference to early Germanic: *Abriss* 1894) though with special emphasis on Swedish and its dialects. His main achievement is the monumental *Vårt språk* (1903–1924), in which he demonstrates a systematic-descriptive approach to the presentation of an enormous amount of information. Like the Latinist Madvig in Denmark somewhat earlier, Noreen anticipated the strong emphasis on synchronic language study of the structuralist era (and thus perhaps to some extent obviated the desire for a structuralist revolution in Sweden?). In the context of this article it must be mentioned in particular that the third and fourth volumes of *Vårt språk* deal with Swedish historical phonology.

Elof Hellquist (1864–1933), Professor of Nordic Languages in Lund from 1914, must be mentioned as the author of a widely used reference work on Nordic word etymology (Hellquist 1922). Much thanks to Hellquist, the etymologies of most Swedish words (and in fact Nordic words in general) were solved by the middle of the 20th century.

Otto von Friesen (1870–1942) was Professor of Swedish language in Uppsala from 1906. As a researcher on the early history of the Nordic languages, he was above all a recognized expert on Runic, but he also published a major monograph on Nordic language history (1901–06).

Bengt Hesselman (1875–1952), Professor of Nordic Languages first in Göteborg and later in Uppsala, carried out substantial work on the development of Swedish as a written language. Towards the end of the period under consideration here, i. e. in the last years of his life, he made a monumental though unfinished contribution to the history of Nordic vocalism in two monographs of 1945 and 1948–52.

Elias Wessén (1889–1981) was Professor of Nordic Languages at the University of Stockholm from 1928. Unlike most other Nordic philologists who were preoccupied with sound history, he emphasized the historical study of

syntax, though without introducing much theoretical innovation in this field (1941–56). His textbooks were much used.

5.4. Finnish scholars

In linguistic research in Finland since the middle of the 19th century, the main emphasis has been on the Finnish language and on Fenno-Ugric. One of the prominent scholars, Emil Nestor Setälä (1864–1935), deserves mention also in the context of this article: he adhered firmly to the neogrammarian doctrine and was responsible for it becoming particularly dominant in Finland as compared to all the other Scandinavian countries.

As for Nordic philology in Finland, Hugo Pipping (1864–1944), Professor of Nordic Philology from 1907 and editor of *SNF*, was a well-versed experimental phonetician who applied his phonetic expertise to historical phonology. He worked on Old Swedish and published i. a. on the Gotland language/dialect but is perhaps most well-known for his textbook *Inledning till studiet av de nordiska språkens ljudlära* (1922).

Torsten Evert Karsten (1870–1942), Professor of Scandinavian Languages from 1911, took up Vilhelm Thomsen's project of identifying and dating Germanic loanwords in Finnish, though he disagreed with Thomsen and others about the age of the loans.

Rolf Pipping (1889–1963) stands out particularly for his monumental editorial and analytical work on the Swedish *Erikskrönikan* (cf. Pipping 1926).

5.5. Icelandic scholars

In Iceland, the University of Reykjavík was established only in 1911, and its founder Alexander Jóhannesson (1888–1965), Professor of Icelandic, was for many years the all-dominant figure. He was an etymologist (Jóhannesson 1956) and also wrote on word formation in Old Icelandic but became a controversial figure with his stubbornly held views about a “gestural origin of language”.

6. Concluding remarks

Looking back at linguistic activities up through the first half of the 20th century, we can observe that the choice of topics within comparative linguistics was often dependent on the emergence of individual scholars each

developing a unique type of competence. Research on Nordic language history was, on the contrary, to a large extent a joint venture across Scandinavia, although there were differences of emphasis depending on national obligations and local ideologies.

7. Literature (a selection)

Aasen, Ivar (1848), *Det norske Folkesprogs Grammatik*. Christiania.

Aasen, Ivar (1850), *Ordbog over det norske Folkesprog*. Christiania.

Aasen, Ivar (1873), *Norsk Ordbog*. Christiania.

16. The contribution of Scandinavian neogrammarians

1. Introduction
2. The neogrammarian concept
3. Nordic linguistic topics in the neogrammarian period
4. Text studies relevant to historical linguistics
5. The neogrammarian legacy
6. Can the neogrammarian achievements experience a renaissance?
7. Literature (a selection)

1. Introduction

The time period which is the subject matter of this article marks the real breakthrough of Nordic historical linguistics. It differs profoundly from the entire body of scholarship up to the middle of the 19th century, which is rarely consulted today except as material for the history of ideas. The period under consideration provided our basic knowledge about Nordic language history, and at the same time it formed our present-day conception of the discipline known as Nordic philology. For both reasons, the legacy of this unique period in the history of linguistics is of key importance.

Nordic philologists in the last decades of the 19th century and the first decades of the 20th century had as a major task the interpretation of old Nordic texts. This involved a scrutiny of the textual evidence, its provenance and dating. It was above all the Old Norse texts that commanded a wide interest. By the mid-19th century the phonological structure of Old Norse (i. e. mainly Old Icelandic) was understood to the extent that texts could be edited very successfully in normalized orthography, and occupation with the lan-

guage itself was becoming a didactic rather than an analytical issue. The philological focus thus was on the literary, historical and cultural aspects of the old texts, more specifically on the texts which were of most interest from these perspectives.

The East Nordic texts, in comparison, were randomly preserved, and they were on the whole rather less exciting from a literary point of view. Furthermore, there was no easy way to establish a clearly defined language norm (in terms of phonology and orthography) for either Old Swedish or Old Danish. Old West Nordic, in the form of normalized Old Icelandic, thus furnished the most convenient reference for East Nordic studies as well. The East Nordic texts (and not least their chronological documentation of place-names) did, however, present more interesting linguistic challenges than the Icelandic ones, since they gave intriguing evidence of the dramatic changes which these languages had undergone in the Middle Ages. This diachronic scenario thus constituted an interesting field of study in itself, in addition to its relevance for the philological work on texts. As a particular challenge one must mention the runic inscriptions from the Viking Age, which – if interpreted properly – yielded an important East Nordic contribution to the study of Old Nordic.

Another frame of reference was furnished by the wide range of extant Nordic dialects, which commanded interest in their own right because of the assumption that the rural dialects were more genuine offsprings of early medieval Nordic than the standard languages. The dialects acquired additional philological

interest because it was assumed (as a corollary of their assumed great age) that they could be consulted when discussing the provenance of medieval manuscripts (cf. below). Eventually, in the era of structuralism, Danish dialectologists revolted against the traditional neogrammarian approaches, promoting autonomous descriptive linguistics to such an extent that the useful historical-comparative connection was severed in the resulting dialect monographs from around the middle of the 20th century.

In spite of its heterogeneity, Nordic philology maintained a fairly unitary character up into the early 20th century, with scholars typically having a very broad expertise in the field. Eventually, however, the field split up because of the way East Nordic philologists were trained, giving way to several disparate and almost complementary subjects of study such as: (1) (practical command of) Old Icelandic; (2) Early Danish or Swedish language history on a text-philological and runological basis; (3) literary study of texts from more recent centuries; (4) conservative rural dialects viewed as offsprings of the proto-language; (5) the phonetics and grammar of the modern standard language. Scholars became increasingly specialised in their interests, and students were introduced to the field in all its enigmatic heterogeneity, with little or no explication of the reasons behind the chronological split between the philological and literary disciplines, or of the lack of interesting interaction between the study of the modern standard language on the one hand and dialectology and text philology on the other.

The key discipline in this multifariousness was language history. The general approach to be used when documenting (or perhaps more precisely construing) the history of a language, had been handed down from the preceding generation of philologists, but its methodology developed enormously, i. a. due to the so-called neogrammarian doctrine. Thus it is not far-fetched to refer to this whole period as the neogrammarian period, although this refers to just one aspect of the whole approach.

The scholarly profile of earlier Nordic language historians was characteristically different from that of modern comparativists and language historians, who are typically general linguists by education. The neogrammarian had to be a competent text philologist and a dialectologist as well, and there was often a corresponding lack of emphasis on general

language theory. Throughout the neogrammarian period, diachronic studies were undertaken in close conjunction with meticulous text philology because they rested heavily on the phonetic interpretation of old written texts, so that the correct reading and adequate linguistic understanding of these texts was a prerequisite to serious historical phonology. Contemporary linguistic data, in contrast, were often oral and derived from equally meticulous dialectological field work.

2. The neogrammarian concept

After this sweeping overview of the major topics of interest in the period under consideration we may now take a closer look at the theoretical basis from which its scholars operated.

The neogrammarian period followed the initial establishment of the historical-comparative paradigm by Franz Bopp, Rasmus Rask, Jacob Grimm and their immediate followers. It was introduced by the German so-called *junggrammarians* who worked within comparative Indo-European studies after the middle of the 19th century. This orientation in linguistic research started with the German August Schleicher (1821–1868), who set the agenda by stressing that language is an object of nature which can be approached scientifically (in the sense of the natural sciences) and that sound changes can be described as laws. The focus on detail rather than on whole systems in much of the subsequent diachronic work goes back to Schleicher. In Denmark the influential mentor K.J. Lyngby, and hence Lyngby's many outstanding pupils (see art. 15), were directly influenced by Schleicher. One aspect of Schleicher's view of language stirred up controversy, viz. the idea that language (pre)history comprises first an era of development and then a subsequent era of decay. Otto Jespersen was throughout his career a proponent of the diametrically opposite view.

The scholars who formed the neogrammarian group belonged to the following generation. The pioneers were four Indo-Europeanists: August Leskien (1840–1916), Berthold Delbrück (1842–1922), Hermann Osthoff (1847–1909) and above all Karl Brugmann (1849–1919). Among the contemporary adherents to these ideas were some of the most eminent Germanists of the time, such as Hermann Paul (1846–1921) and Eduard Sievers (1850–1932). Paul became particularly influential in shaping the doctrine as it was applied also in Nordic philology. He took issue with

the romantic and vague notion of “Volksgeist” as a factor underlying the development of a language and conceived of sound change as an innovative, idiolectal event conditioned by physiological factors. Because of the emphasis on idiolects, it was considered fruitful to focus on oral dialects rather than national languages.

Thanks to their sometimes rather aggressive advertising of their ideas, this approach soon became so dominant that it makes sense to speak of “Neogrammarians” or “Post-Neogrammarians” in a wider sense, referring to a research tradition rather than the specific scholarly community from which it sprang. It is interesting to note that in terms of the number of faculty members worldwide, comparative philology of this school remained the most widely represented paradigm in linguistics for almost a century, its dominance tapering off only very gradually at a time when structuralism had also been in vogue for decades.

There is one idea which more than anything else characterizes the neogrammarian approach, namely the assumption that sound laws are without exceptions, or paraphrased in more modern jargon, that any sound change can be stated as a rule which applies automatically across all word-forms which meet the structural description of the rule. This claim, which is ascribed to Leskien, gave an enormous boost to comparative studies. On the one hand, the neogrammarian demand for scrutiny and explicitness contributed much to the quality which characterizes the best work within this field of study. On the other hand, the apparent (though in fact spurious) affinity of the concept of “sound law” to the concept of laws within natural sciences made the field exciting (just like transformational grammar a century later had a strong initial appeal), and the flirtation of late 19th century linguistics with instrumental phonetics worked in the same direction.

It is thought-provoking that Otto Jespersen, an international authority on phonetic theory, took issue with the one-sidedly physiological orientation of neogrammarian explanations of sound change. Jespersen stressed the social aspect of language, and he adduced functional explanations of diachronic events, as when he explained why some Old English endings were lost, others not, as a function of their different status in the declensional systems. Another related type of explanation adduced by Jespersen was psychological, as when he explained stress on the root syllable in Germanic as being

due to the psychological salience of this syllable (“the most significant element receives the strongest phonetic expression”; Jespersen 1938, 25). Unfortunately, Jespersen took an extremist position with his functional view of language development as a steady, incremental gain in “efficiency”, and it was the neogrammarian position that became entirely dominant for several decades.

The phonetic orientation of Nordic studies in the neogrammarian era is such a conspicuous characteristic that it deserves more comment. There are a few instrumental studies from the late 19th and early 20th centuries of phenomena in Nordic languages and dialects, including work by Hugo Pipping and by Karl Verner on accentual phenomena, in particular the Danish *stod*. There was a much stronger impact of the bias toward natural sciences, however, in the archiving of sound. The invention of the phonograph made it possible to record voices for posterity in what was then ideally to be a perfect replica (anybody studying these old phonograph records must realize that they were far off this mark, although restoration by modern computer methods may enhance the usefulness of the very oldest records).

Most importantly, however, the whole concept of phonetic representation was influenced by the natural-scientific orientation. If the vocal manifestation of language was to be approached and described in the framework of the natural sciences, the use of a graphic representation of sound should of course come as close as possible to the standards of scientific observation. This did not invite any approach to speech sounds in the framework of language as a social norm (an aspect later stressed by Saussure); instead, speech sounds were identified as (physiological and) acoustic phenomena which one might ideally represent with scientific accuracy, given adequate auditory training and an adequate notational system. The way was open for phonetic transcription to develop into such an allegedly scientific notation. The Swedish *Landsmålsalfabet* designed by J. A. Lundell (1879) comes close to this idea of a scientific notation system with its ability to indicate fine shades of sound.

To return to sound change viewed as a natural phenomenon, it could not be denied that sound laws do have exceptions in some cases. What is required within the neogrammarian format of analysis is that such exceptions can be given explicit explanations, e.g. in terms of additional sound laws or in terms of well-

motivated morpholexical analogy. Random exceptions without any language-internal cause have no place in the model; sporadic and apparently unmotivated exceptions in the vocabulary of a language may not be real exceptions but reflexes of external contact phenomena (borrowing, dialect mixture) and thus irrelevant to the issue.

Within IE there was a glaring and fatal stumbling-block, namely a seemingly arbitrary class of word-forms which in Proto-Germanic behaved irregularly in relation to Grimm's Law by having unexpected voicing of medial obstruents (e.g. voicing of the medial dental fricative in *father* but not in that of *brother*). It was, therefore, a triumph for the neogrammarian doctrine when the Danish Slavic philologist Karl Verner discovered an additional and perfectly regular sound law (Verner's Law) which accounts beautifully for this phenomenon. Verner found it to be conditioned by the position of the Indo-European accent in the word-forms in question. He called the regularity he had discovered "an exception from the first sound-shift" (Verner 1876); there is a subtle irony in the impact of this work on the theory of sound change, since it was hailed as the main proof that sound change is exceptionless.

3. Nordic linguistic topics in the neogrammarian period

In Nordic studies, the neogrammarian approach became immensely influential, and the bulk of knowledge about the history of the Nordic languages has been accumulated in a neogrammarian format. Much of this is available to us in the form of monographs or papers on specific topics within the history of the Nordic languages. The neogrammarian view of linguistic change was introduced e.g. in standard handbooks by Adolf Noreen and Axel Kock in Sweden and by Alf Torp and Hjalmar Falk in Norway around the turn of the 20th century. Whereas the work of the latter two was by and large superseded by later work, Noreen's and Kock's wealth of important handbooks must still be consulted by scholars doing serious work on Nordic diachrony. Danish philologists eventually got their inspiration from Kock and Noreen (Brøndum-Nielsen looked upon himself as a pupil of Kock's), and thus the culmination of Nordic studies in Denmark within the neogrammarian framework happened later than

in Sweden. The authoritative handbooks on the history of the Danish language appeared only toward the middle of the 20th century.

Altogether, the majority of reference works of this sort are of Swedish origin; within Nordic philology the neogrammarian tradition was especially fertile in Sweden in the first decades of the 20th century. It is no coincidence that Noreen wrote the section *Geschichte der nordischen Sprachen* in Hermann Paul's *Grundriss* (3rd ed., 1913). Altogether, the volume of literature within this field in the period under consideration is so abundant that it is impossible to go into any specifics here. Only a few important works can be singled out for mention below. Much of the innovative research of the period, however, appeared as papers in the broadly Nordic-oriented journal *Arkiv för nordisk filologi* and from 1926 in the more Danish-oriented journal *Acta philologica Scandinavica*. The latter, which eventually ceased to appear, used to provide extensive bibliographical information.

Today it is not an altogether easy task to search for exhaustive bibliographical information if the topic is strictly linguistic. Especially if one is looking for discussions of a fairly specific problem, relevant information may be hidden in digressions and footnotes in philological papers whose titles specify the texts they are concerned with rather than the derived linguistic problems and their possible solution. It is much easier to spot such work if it is presented in major text editions or in historical grammars and language history volumes or at least referred to in such manuals. Searching in that way yields a selection which is adequate in one important sense: it tells the modern linguist which of the many papers on diachronic issues became truly influential in the mainstream development of Nordic historical linguistics.

3.1. Nordic sound history

By far the most important, lasting contributions of the neogrammarian era are within diachronic phonology and etymology. For considerations of space, only a few topics can be mentioned below, and these for the most part will be selected from the gamut of issues in Nordic sound history. It is not incidental that the name Axel Kock is dominant in the sections below; Kock is the most interesting and the most influential figure within this approach in Scandinavia.

3.1.1. Historical prosody

This topic remains a major challenge because of the very different prosodic histories of the various Nordic languages, with Norwegian and Swedish (and some southern Danish dialects) being for the most part tonal, with central and northern Danish having the distinctive *stod*-accent, and with the remaining languages and dialects having neither tone nor *stod* but only stress and quantity (length), the two prosodic categories which are shared by all Nordic languages. A large amount of work was carried out in the neogrammarian period, particularly by Kock, who was inspired by Verner's discovery (1876) of the influence of Indo-European accentuation on segmental sound change. Kock wrote about comparative Nordic accentology with special reference to Swedish (cf. art. 15) and also (in two important papers in *ANF* 5, 1885 and 7, 1888) specifically about Old Danish accentology viewed in connection with developments such as vowel apocope. The diachronic reconstructions and descriptive statements by Kock and Noreen remain relevant, and basic issues that were addressed in the neogrammarian period are still major challenges in Nordic historical linguistics: What was the accentual pattern of the Nordic proto-language? In what sense did the tones and the *stod* have a common origin?

3.1.2. Vowel developments

A major topic, which is in part related to accentology, is the history of Nordic vocalism. It was a main objective of the Nordic neogrammarians to find out what the Proto-Nordic vowel system was like, and how it evolved up to late medieval times in the various Nordic languages. The predilection for vowel studies in diachronic Nordic philology is apparent if we consider that Kock from the start had planned his *Svensk Ljudhistoria* as comprising five volumes, which actually appeared over twenty-four years and which the reader might expect to cover all aspects of Swedish historical phonology, whereas in fact the emphasis throughout most of the thousands of pages is on vowels. Among these, more than seven hundred pages are devoted to the developments of more or less unstressed vowels. This emphasis on vocalism was repeated forty years later in the monographs of Bengt Hesselman.

One major challenge for the neogrammarians was to explain the rather dramatic series of changes in the systems of stressed and unstressed vowels which mark the transition

from Proto-Nordic ("urnordisk") to Common Nordic in its varieties (Old Norse, Old Danish, Old Swedish), in particular the reductions by which short unstressed vowels were lost and long unstressed vowels were shortened. The theoretical framework for approaching the latter issue was provided first and foremost by Eduard Sievers' work on Germanic. Nordic contributions to this topic within the neogrammarian period are legion. There has been quite some dispute, e.g. about the relative chronology of the reduction and/or loss of unstressed vowels of different qualities (*i* and *u* versus *a*) in Common Nordic as well as in specific dialect areas, but on the whole a widely accepted scenario has emerged as the result of the neogrammarian enterprise.

Umlaut and breaking comprised perhaps the most disputed topic throughout the neogrammarian era in Scandinavia. The classic analysis had been developed by Kock and presented in *ANF* 4 (1884, 141 ff.), above all in the large monograph *Umlaut und Brechung* 1911–16 (and in the 3rd volume of *Svensk Ljudhistoria*). *Umlaut und Brechung* presents early Swedish evidence consistent with its subtitle ... *im Altschwedischen*, but the argumentation involves both an extensive treatment of Early Runic (urnordisk) and frequent reference to Old Icelandic. For more than a century Kock's ground-breaking umlaut theory has remained the standard theory in spite of its controversial assumptions.

Rask had already seen that umlaut is the reflex of influence from a following unstressed vowel on the preceding stressed vowel, and this is still accepted, although one might argue for or against somewhat different understandings of the nature of this process (did vowels influence each other directly, by distant assimilation, or did the articulatory influence operate through the intervening consonant(s)?). The real crux, however, was that not all words with a potential for umlaut underwent this process: old bisyllabic words with a short stressed syllable which became monosyllabic by syncope of the unstressed vowel formed a more or less regular class of exceptions. In order to account for this, Kock was forced to see umlaut of stressed vowels + syncope of unstressed vowels (especially umlaut due to a following *i*) as a complex phenomenon which unfolded as a strangely discontinuous sequence of events. The basic assumption was that syncope occurred first after a long syllable (for which there is some, though not abundant, textual evidence); later it occurred after a short

syllable without leaving any trace in the form of umlaut in words of this type (exceptions: words which do exhibit umlaut must then be accounted for by assuming special developments in palatal environments or through analogy); finally, umlaut was invoked once more (in certain word types) by the quality of the final vowel, but this time without the unstressed vowel undergoing syncope.

Kock's scenario was ingeniously conceived, and although its claim about umlaut as chronologically discontinuous has been vigorously attacked, it did not seem possible to posit a more elegant solution which accounted for the data satisfactorily within a neogrammarian format. The great theoretical weakness, of course, is that umlaut appears as two events separated not only in time but also in the very nature of the sound change since the first instance of umlaut is coupled to syncope, whereas the second is dependent on the absence of syncope.

Part of the problem is that it is open to debate whether umlaut happened as a corollary of syncope (a kind of qualitative compensation) or whether stressed vowels had non-distinctive umlaut variants long before the time of syncope so that umlaut was a matter of "phonologization" of existing phonetic differences. This is an area in which the advent of structuralism could contribute to a clearer formulation and discussion of the issues. Still, it remains enigmatic what exactly happened; it seems likely that a more sophisticated theory of sound change (which takes both sociolinguistic and cognitive factors into account) is a necessary prerequisite to a better understanding of the phenomenon of Nordic umlaut. In recent research it has also been emphasized that Nordic umlaut should be seen in a wider Germanic perspective. As it is, Kock's theory remains an inescapable point of departure.

As for breaking, this was supposed to start as a kind of distant assimilation by which an unstressed vowel was copied in the form of a diphthongal offglide from the preceding, stressed vowel, which subsequently changed into a sequence of glide plus vowel (**e* > **ea* > **ja* before final **a*, etc.). Again, this was an ingenious explanation, but later research found it hard to account for the variation over forms, e. g. the Danish occurrence of *ja* rather than *ja* in words with **e* (a much debated example being the word "six").

The real challenge came only very late, with Svensson (1944). In this work, Svensson exhi-

bited an independence of mind which was somewhat unusual in the Kock-dominated universe; he saw breaking as the product of two quite separate processes: a spontaneous diphthongization of the stressed vowel into glide plus vowel and a subsequent modification of its second component by umlaut. Bengt Hesselman then published another book whose title points to the key importance of this issue in Nordic historical linguistics: *Omljud och brytning i de nordiska språken* (1945). Hesselman tried to save breaking as a unitary process, a kind of umlaut, but had rather controversial ideas about the phonetic nature of umlaut and of syncope. For Hesselman this issue had an even wider scope because he also maintained a connection between umlaut (and breaking) and the so-called "tilljämning" (adjustment), a specific kind of vowel harmony occurring in some central Scandinavian dialects. The whole issue was so prominent that a whole day was devoted to "the new umlaut and breaking theories" at the meeting of Nordists in Copenhagen in 1946.

3.1.3. Quantity shift

A further major topic was the change of the quantity system in stressed syllables in medieval Nordic, by which the old distinction between long and short vowels was partly substituted by qualitative vowel distinctions, and new long:short distinctions eventually emerged as well. The interesting thing about this whole development is that it took place in more or less similar ways across the Nordic languages, and that it conflated three different syllable types into one type, i. e. long syllables, in most of the Nordic languages and dialects. Unless one resorts to the vague notion of "drift", quantity shift would seem to reflect medieval language contact. Intriguingly, however, only certain aspects of quantity shift are shared by the various Nordic dialects. Quantity change was an interesting challenge for the neogrammarian approach, which was primarily geared to working within the *Stammbaum* concept of language development. The basic understanding of phenomena such as syllable balance ("jamvekt") in Norwegian dialects was codified in the classic neogrammarian handbooks. Because of ambiguity in the spelling conventions of medieval and later Danish, however, it was never really settled how to envisage the scenario underlying the occurrence of short stressed syllables in mo-

der Danish, unlike the other Nordic languages. This remains a major challenge, and it is particularly interesting because of the interconnection between *stod* and syllable quantity, which is another feature of diachronic typology which sets Danish off from the other Nordic languages. The leading handbook by Johannes Brøndum-Nielsen (1928–73) has conspicuously little to offer on this point.

3.1.4. Consonant developments

Within the history of Nordic consonantism there is less of a common ground, since many of the major developments are limited to specific geographical areas within Scandinavia plus the North Atlantic. Many of these developments have to do with assimilations and other simplifications of consonant clusters. Some of these developments are in fact more or less common to all Nordic languages. By way of illustration we may take the early developments of the *r*-sounds by which (1) the Proto-Nordic palatal *r* (<R>) coalesced with dental *r*, and (2) this *r* assimilated to a preceding dental consonant (this may be depicted in the following hypothetical steps: *stainaR > *stainR > *stainn 'stone', nom. sg.). From a contemporary linguistic perspective it is interesting that all of Nordic shared these developments, which took place in the Viking Age; this attests to the high degree of linguistic unity within the whole Nordic area at that time. In the neogrammarian era, however, the study of the mother tongue *per se* became a professional pursuit in Scandinavia. As a consequence, the tendency was to look at each language or dialect separately, as an autonomous branch of Common Nordic, and to do so in a rather atomistic way. From the early 20th century there was the possibility of choosing a complementary approach and looking at such phenomena from a dialect geography perspective. Dialect geography was atomistic in its own way, which made it less inviting to attempt to unite the sound law oriented historical approach with dialect geography.

By and large, much less was written by the neogrammarians about the developments of consonants in Nordic languages than about accents and vowels. An exception is a salient topic in Danish language history: *klusilsvækkelsen*, the weakening of postvocalic stops to fricatives in medieval times; this Danish-specific phenomenon looms large both in the work of Brøndum-Nielsen and of Skaut-

rup. Otherwise, much of the work on Nordic consonantism involved necessary groundbreaking and documentation without either posing or answering challenging questions of a more principled or far-reaching nature. Many of the findings stand essentially unchallenged, not necessarily because the problems were solved satisfactorily but sometimes because no better solutions have yet been found, partly due to lack of decisive textual evidence. Thus the classic handbooks retain their value, with rather less tendency to (theoretical) obsolescence when it comes to consonant developments than in the case of diachronic vowel studies.

3.1.5. Concluding remarks on sound change studies

A characteristic of Nordic diachronic work in the neogrammarian period is the emphasis on the early history of the languages, i.e. from early Runic up through the 16th century. Kock's preamble to his *Svensk Ljudhistoria* is characteristic:

[...] The main emphasis is on medieval language but New Swedish is also dealt with; details from the phonetics of the modern language are, however, only touched upon when they are particularly illuminating for the historical presentation. (my translation).

3.2. The development of standard languages

One of the major challenges in the study of Nordic language histories is the emergence of standard national languages in Sweden and Denmark. These came into existence fairly early, which is remarkable on the background of the wide spectra of dialects and regional scribal practices in both countries, and the imminent danger of Low German taking over as the standard written language in late medieval times. One of the pioneers in the study of the development of written/standard language was Lis Jacobsen (1910; 1915). A central topic is the standardization which occurred in Denmark and Sweden in the 16th century out of the chaotic orthography of the earliest printed texts, where there was an added complication because printers did not necessarily follow the spellings of the authors.

Since early texts were typically viewed from a dialectological perspective, early neogrammarian studies of the development of the

standard languages are surprisingly scarce outside the context of the Norwegian language controversy.

On the whole, the neogrammarians tended to focus on linguistic details from one particular perspective at a time and thus did not really cope with the complex language situation in the (formerly widely bilingual) Nordic countries. Although they were aware of the relevance of such dichotomies as formal vs. colloquial language use, written vs. spoken language/s, regional vs. common norms, mother tongue vs. Low German, the interplay between these was rather too complex to be addressed adequately within the approach. In addition, it must be conceded that there are serious lacunae in our knowledge about language use in medieval times which make the study of this particular topic less inviting than the coupling of dialectology and philology which was in vogue in the neogrammarian period. Later handbooks have included this topic in overall treatments of language history, of course, a good and late example being Peter Skautrup (1944ff.).

3.3. Historical morphology and syntax

The neogrammarian period did not foster many original contributions about historical morphology in the Nordic languages. Although declensional systems and their histories were accounted for carefully in the handbooks, the emphasis especially in the early work was on the way sound changes affected the forms in question. Word formation was studied, e.g. by the Swede Fredrik Tamm (1847–1905); it may suffice here to mention his work on derivational phenomena in adjectives (1899). Historical syntax came to loom larger, with valuable contributions especially by Swedish and Norwegian scholars, e.g. Noreen (1903ff.), Falk/Torp (1900), which still inspire scholars.

4. Text studies relevant to historical linguistics

It is indisputable that the considerable accumulated knowledge of older stages of the Nordic languages, although now often taken for granted, grew out of the philological concern with old texts during the neogrammarian period. This was a give-and-take process. Although the study of texts from an earlier

period ideally required perfect command of the old language, the struggle with each particular text contributed to the accumulation of knowledge about the language in which the text was transmitted.

4.1. Old texts and modern dialects

A particular issue in the neogrammarian era was the mutually beneficial relationship between the study of early texts and the study of modern dialects. Johannes Brøndum-Nielsen was one of those who most extensively and daringly used modern dialects and contemporary dialect boundaries as evidence in assessing the geographical provenance of old manuscripts, even in the case of texts dating from the 13th–15th centuries, such as copies of the old provincial laws. He did this seemingly very successfully, and undoubtedly many of his conclusions stand, but claiming that spelling idiosyncracies in old manuscripts reflect features of regional speech which can be identified in modern dialects of the same regions is obviously a somewhat risky venture. His impressive handbook *Gammeldansk Grammatik* must be appraised in this light.

There are a variety of reasons for having reservations about Brøndum-Nielsen's dialect-based provenance studies, some will be mentioned here. Firstly, it is known today that dialect boundaries cannot have been so constant over many centuries as the provenance test seems to presuppose. Secondly, as Brøndum-Nielsen knew perfectly well and pointed out himself, the scribes might have moved around e.g. from one monastery to another, so the method could at best identify the dialectal background of the scribe rather than the geographical location of the place where the manuscript was written. Thirdly, there is reason to believe that orthographical norms developed in early medieval times without necessarily reflecting geographically bound spoken norms; spellings in a given manuscript might thus represent a conglomerate of some orthographical usage plus features of the scribe's own dialect plus possibly features of the local dialect where the manuscript was copied. And finally, one may call the very age of the dialect splits into question. Strictly speaking, we do not know for sure how old the dialect differences in Denmark are. The orthographical usage in runic inscriptions is not very informative on this point; even medieval inscriptions are conspicuous in not showing much in the way of dialect differences (ex-

cept in cases where a non-native person, e. g. a Norwegian, is supposed to have been at work). If the assumption of a great age for Danish dialect boundaries is based on old spellings, there is clearly a circularity in the whole approach.

4.2. Editions of early literature

One of the spectacular achievements of the neogrammarian era within the realm of Nordic language history is the great number of editions of older texts. This whole venture of making early Nordic texts available in reliable editions began in the decades preceding the neogrammarian breakthrough and is not in itself directly related to the neogrammarian approach as such. It grew out of the romantic interest in the past (cf. art. 15 on Rasmus Rask and his followers), and it developed into a refined scholarly pursuit due to three convergent trends: (1) the development of paleography, (2) the unification of historical linguistics, literary studies and elements of general history into what came to be understood by the term Nordic philology, and finally (3) the introduction of the text-critical method (cf. below).

The golden age of philological text editing was largely contemporary with the neogrammarian age, and the resulting volumes are not just philologically responsible renderings of texts. Quite frequently, these editions contain rich orthographical and cultural-historical commentaries, sometimes even a lexicon providing quick access to the spellings and meanings of lexical items which occur in the edited texts. In the best instances, these are of lasting relevance to the general study of language history, quite apart from their importance for the understanding of the specific texts in question.

In the neogrammarian period the text-critical method created a dilemma for conscientious philological editing of early texts. One approach to text editing was to establish the allegedly best readings throughout the text by making textual conjectures based on careful comparison of the extant sources as well as the editor's own hypothesis about the original composition and well-formedness of the text (be it originally an oral or a literary product). This approach, in itself legitimate, runs a risk if applied to texts which used to be transmitted orally, thus leaving little chance of arriving at an "Urtext". The other approach, which became dominant in Nordic philology, was to choose one of the extant manuscripts and to

edit that manuscript with or without text-critical conjectures. This often forced a decision as to what was the "best" manuscript (the ideal solution was, of course, to faithfully edit all manuscript versions of the text). In the case of texts from mainland Scandinavia and Denmark, manuscript editions were typically "diplomatariske", i. e. typographically faithful letter-per-letter copies, with full preservation of spelling idiosyncracies. The ultimate step was a facsimile edition made on a photographic basis, an approach which is equally applicable to manuscripts and to rare old printed texts. In the case of inscriptions, illustrations based on drawings were eventually superseded by photographs, with cardboard imprints as a useful supplement. Unfortunately, editors did not always refrain from making corrections to an otherwise faithfully reproduced text; occasionally, this has happened even to a text reproduced in facsimile (a notorious example is P.G. Thorsen's otherwise praiseworthy and beautiful lithographic edition of the runic manuscript of the Scanian provincial law: Thorsen 1877).

A standardized, so-called normalized orthography was often used in the edition of texts if two conditions were (supposed to be) fulfilled: (1) the sound pattern of the language period in question could be established with confidence on orthographical and comparative evidence, (2) some of the "good" texts exhibited a fairly stable norm. This is true of Old Icelandic in particular, and thus a mass of the classic text editions of that literature occurred in normalized form. Such a normalized orthography is convenient for historians and others who are interested in the contents rather than the exact linguistic rendering of the texts. It may be convenient also for the language historian working on the lexicon or syntax and using automated search procedures but generally speaking, normalization seriously detracts from the applicability of the editions in the study of language history unless one can have recourse to the raw text as well. Occasionally, the normalization of an ambiguous or seemingly erroneous form may rest on a dubious reading of the text meaning; normalization then makes it less likely that other researchers will look at the data with fresh eyes, especially if the editor was a scholar of high prestige and self-confidence such as Finnur Jónsson. The best use of normalization in the neogrammarian period was as an interpretive notation occurring alongside the transliterated original text; this is what we mostly

find in the editions of runic inscriptions by Wimmer and others.

Ballads occupy a special position because they were generally believed to stem from medieval times although the text evidence was of a later date. Svend Grundtvig (1824–1883), Professor of Nordic Philology from 1869 and well versed in the study of folklore, became a pioneer in the scientific editing of ballads. In *Danmarks gamle Folkeviser*, Grundtvig reprinted the various 16th and 17th century texts with their idiosyncracies alongside more recent text material rather than fusing all versions into one text restitution. This seemingly low level of scientific ambition was not altogether well received, though it is a commonplace today. In the last decade of his life, when Grundtvig worked with his brother-in-law Jørgen Bloch in order to compile a collection of Faroese ballads, *Føroya Kvæði = Corpus Carminum Færoensium*, he stuck to the multiple presentation of variant texts but normalized them all. Irrespective of the idiosyncratic and dialect-specific spellings of the various manuscripts of Faroese provenance, the texts were converted into Hammershaimb's strongly etymologizing orthography. This heavy-handed normalization is controversial in retrospect, although it has served to make the rich oral tradition of Faroese poetry more accessible to folklorists and philologists.

Over time, editions of early texts were increasingly orthographically faithful rather than normative and conjectural, with or without a text-critical apparatus; some were facsimile editions. An early example of the classic type of text edition is Axel Kock and Carl af Petersens' edition of medieval East Nordic proverbs (1889–94) with commentaries by Kock; a much later example is the facsimile edition (1915) of Herman Weigere's Danish version of Reinke de Vos, *En Ræffue Bog*, with a subsequent volume of commentaries by Niels Møller and an extensive vocabulary by no less a figure than Kristian Sandfeld. A particularly important landmark is Rolf Pipping's text-editorial work on *Erikskrönikan* (see mention in art. 15, 5.4).

As for Old Norse, there was a strong tendency to stick to orthographical normalization and to improve the text readings in accordance with the urtext assumption. Verse was often adjusted to fit Eduard Sievers' metrical theories. A late example of this trend is Finnur Jónsson's text-critical edition of the Elder Edda, *De gamle Eddadigte*. Interestingly, Finnur Jónsson edited Snorre's Edda at the

same time in a quite different format. His *Edda Snorra Sturlusonar* includes an extensive treatment of textual variation over the extant manuscripts but renders the text itself on the basis of one manuscript (Codex Regius) whose spelling is preserved, in explicit contradistinction to previous normalizing editions. It was a matter of debate how such texts should be presented in order to meet scientific standards, though the approach obviously depended on the purpose of the edition and the nature of the text.

For most linguistic uses it is essential to have access to faithful, non-conjectural and non-normalizing text editions, ideally facsimile editions with transliterations. This is true particularly if the issue deals with historical (diachronic) phonology, where normalization leads to pernicious circularity. Many of the old texts have been made available several times in editions which each claim to correct earlier mistakes, but scholars working on challenging textual data have felt a continual need to turn to the sources themselves (at least in facsimile) rather than relying entirely on the judgments underlying any particular edition. The possibility of arriving at new and hopefully more correct readings and interpretations is never exhausted.

The conclusion to be drawn from an overview of classic text editions is that the accumulated mass of editions does not obviate the need for direct access to source material in crucial instances. Still, for purposes of syntactic or lexical study, for example, even normalized editions may provide useful input. To promote historical language study in Scandinavia, it is desirable for large numbers of text editions to be made available in machine-readable form, and this applies also to publications from the classic neogrammarian era, many of which still stand out as high-quality achievements.

5. The neogrammarian legacy

As stated in the introduction, the bulk of accepted knowledge about Nordic language history has been accumulated in a neogrammarian framework. It is not possible to give a concise appraisal of the extent to which the achievements of the neogrammarians are still relevant today. Basically, they *are* relevant, although many claims and assumptions of the 19th century have of course been abandoned or at least superseded by more recent work. One cannot seriously discuss such issues as

umlaut and syncope or Nordic accentology without referring back to work done in the late 19th and early 20th centuries by more or less devout adherents to this doctrine.

5.1. The merits and drawbacks of neogrammarian work

The best work of the neogrammarian period does not become obsolete with respect to the information that is positively stated there. It may have essential shortcomings, however, because of the rigidity of the whole framework, its strong limitations of scope and its narrow range of explanatory approaches. As an approach to linguistic analysis, the neogrammarian type of Nordic philology tended to form a rather self-contained universe. In this sense it was a school in a much more absolute sense than structuralism, for example. The neogrammarian universe defined not only the range of interesting issues but also the conceptual framework within which these issues were to be addressed, as well as the relevant tools and prerequisites. The best scholars were highly successful in building large edifices representing the complex and inter-locking steps in major diachronic events such as the umlaut period(s). Thus it would be unfair to the entire enterprise to write its approach off as being just atomistic, although some of the work (such as Brøndum-Nielsen's *Gammeldansk Grammatik*) is indeed difficult to use because of its focus on detail at the expense of overall clarity.

Unfortunately, its methodology tended to become fossilized. In later years the neogrammarian framework seems to have a conspicuous lack of sophistication in the discussion of phonetic and grammatical issues; it is as if general linguistics and phonetics had not advanced much since the 1890s. The whole doctrine gave this school of scholarship an inner strength, but the argumentation in the monumental works of the period is often vulnerable to criticism for exactly that reason. This reticence toward the neogrammarian period would certainly be unfair if applied to Noreen, whose manual *Vårt språk* (1903–24) is not only a treasure chamber of solid information but is also arranged in a manner which makes it much less prone to obsolescence.

The real strength of the competent neogrammarian philologists was their impressive command of the textual evidence for earlier language stages, and their incredible diligence in working through masses of data in search

of relevant evidence. Without the aid of the processing tools available today, they excerpted and arranged pieces of information down to the smallest detail of scribal variation. Needless to say, their picture of the relevant data can and must be revised and supplemented; for one thing, new runic evidence in terms of early as well as late inscriptions has turned up in considerable quantity since the Second World War and has also widened our understanding of the range of genres for which runes were used in medieval time. The perspective is widening all the time, and in several respects. Still, the hard, ground-breaking work carried out by these earlier generations of philologists largely stands as far as factual evidence is concerned, whereas the theoretical and methodological framework acquired an increasingly traditional flavour when the approach was continued well into the 20th century.

It is now possible to address issues which were less in vogue or in some instances not even clearly defined in the neogrammarian era, in particular in the realm of diachronic syntax and semantics. And most interestingly, it is possible to change the perspective e.g. on sound change and to look at such phenomena from the perspective of variational linguistics, language acquisition theory, sociolinguistics, or natural phonology, just to mention a few *not* mutually exclusive formats of analysis. It is easy enough to point to problem areas in language history which invite a new approach (although statements to this effect are often just programmatic).

The development of theoretical and descriptive linguistics has not just meant an advantage over the neogrammarians; there is now less excuse for outdated and inadequate scholarship than ever. New insights and techniques do not automatically ensure progress in the historical study of languages; what was needed all along in the decades following the decline of the neogrammarian campaign was serious work by scholars who were at the same time (1) well versed in contemporary theoretical and empirical approaches, (2) interested in historical issues *per se*, (3) competent in the old and more recent languages and dialects of the field, and (4) thoroughly familiar with the neogrammarian legacy, including the philological tradition and the associated broad scholarly knowledge of adjacent fields.

There are not very many scholars who combine these qualities. One might point to the late Paul Diderichsen as an outstanding representative of this type of scholar, although he

did not manage to publish much in the field of language diachrony, being more occupied with synchronic studies.

5.2. Did modern approaches render the neogrammarian approach outdated?

Diderichsen and other pioneers of early structuralism in Scandinavia felt, and did not hesitate to claim, that language history had long held a too dominant position and that the continued emphasis on language history did not give a sufficient return in the form of interesting new insights, so much more since this occurred at the expense of synchronic studies of (modern or ancient) languages and at the expense of the application of ideas and techniques within contemporary linguistic theory. Copenhagen at the middle of the 20th century became a center of such tension because of the early propagation of structuralism there, first in the form of structural phonology (inspired by the Prague school) and later in the form of glossematics. This structuralist orientation had an enormous impact on Danish dialectology but also caused a conflict within Nordic historical linguistics in general. Diderichsen's most important move was his paper about goals and means in Nordic philology with which he addressed the meeting of Nordic philologists in Copenhagen in 1946.

Seen in retrospect, the polarity between the neogrammarian and the structuralist position is somewhat exaggerated. The latter grew out of the former, and the various versions of structuralism (and later offsprings such as Noam Chomsky's transformational grammar) owe much to the rigid scientific requirements introduced into language study by the neogrammarians. The problem with Nordic historical and diachronic language studies under late neogrammarianism had to do with attitude as well as education: its most stubborn adherents failed to see the fruitfulness of integrating new viewpoints, and toward the end of the period the increasing specialization had the unfortunate effect that philologists increasingly lacked the comparative and general linguistic background which had characterized earlier generations.

How, then, can the classic reference works be exploited fruitfully today, some seventy years after the neogrammarian approach was first challenged by phonologists? Although much of the information contained in the volumes from the neogrammarian period is impressively reliable, it is necessary to express a

caveat: the adequacy of information stemming from an earlier era of scientific research, and more specifically its applicability in a new context, must be appraised in relation to the general approach or research paradigm within which the information was generated. It should never be forgotten that every study of linguistic phenomena has been made from a certain perspective, and that this delimited the choice of criteria and the kinds of information which it was considered essential to take into consideration. Having such an inevitable bias, the data and findings available in traditional handbooks, however detailed and overwhelmingly abundant they are, may be insufficient and even misleading if taken out of context and restated in a new theoretical framework, or if used uncritically by scholars who address diachronic issues from a quite different perspective without providing their own substantive input. This problem should not be projected as a fault of the neogrammarian work; if anything it is a fault of the modern scholar who exploits traditional results without taking their point of departure seriously.

The neogrammarian approach to spoken language may with considerable justification be called phonetic rather than phonological. That might be construed to mean that the data presented in the reference works represent at least an objective phonetic reality. In most cases, however, the approach was impressionistic (and in fact semi-phonemic) rather than physical or physiological. When it comes to past stages of languages, the concept of "sound" was of course much further removed from "reality". Our shared catalogue of attested sound changes, as handed down to us by the neogrammarians, makes no sense without well-founded hypotheses about the phonetics of past stages of the languages involved. These reference points, however, are constructs based on comparative and orthographical evidence (and on more or less well-founded typological expectations), and one should be constantly aware of the inherent danger of circularity in diachronic studies involving phonetic reconstruction. Altogether, it must be emphasized that diachronic phonetics is just as dependent as phonemics on the existence of a theoretical framework.

There was no real theory of accent and stress in the neogrammarian scheme (nor is there a fully satisfactory theory today, for that matter). Thus it must be taken with many spoonfuls of salt if scholars of that period operated with subtle degrees of stress in their

data. It is completely naïve for a student today to take this kind of information at face value and to construe formal explanations for it. One must use historical explanations with even more caution if they refer to vaguely defined though intuitively plausible categories, such as Kock's (and his follower Brøndum-Nielsen's) term "relatively unstressed" used in the explanation for why certain words preserve unbroken *e* (e.g. *medan/medens*) or why certain other words exhibit non-trivial reductions, e.g. vowel loss.

To sum up, it is important not to overlook the fact that the neogrammarians were firmly rooted in the classic framework of phonetic description which was developed in the last decades of the 19th century. Having a frame of reference, with its strong points and its shortcomings, gives an inevitable bias, no matter which approach one follows, though the impact of such a bias on linguistic observation is seldom fully appreciated. What is important here is that the conceptual and descriptive filter through which the neogrammarians perceived linguistic reality was considerably different from the one which is part and parcel of the approach of the well-trained modern linguist. This is true also of the last generation of neogrammarians who undertook much of their work after the rapid development of modern phonetics and phonology which started some fifty years ago. Some of these scholars seemed positively disinterested in integrating post-classic phonetic-phonological insights into their approach, probably because they felt that it was redundant or even distracting to do so. From their perspective, the classic frame of reference, i.e. the phonetic knowledge of the early 20th century, plus their often outstanding intuition seemed to work perfectly well.

The advent of structuralism, which was introduced into Nordic language research in Denmark and (sporadically) in Norway in the late 1930s, made it mandatory to view sound changes in terms of their consequences for the whole system. Diachronic handbooks in the neogrammarian framework, even late ones such as Brøndum-Nielsen's *Gammeldansk Grammatik*, came to look atomistic, disorganized, sometimes even inadequate from the structuralist point of view, since phenomena which belong together from a system-oriented perspective were treated separately there, the authors being more concerned about evidence for each sound change *per se*. From the structuralist perspective it was more interesting to

look for properties of the data which would contribute to generalized statements about changes within the system as such. Quite often the patient and benevolent structuralist could indeed trace the various reorganizations of the sound pattern over time by working through traditional handbooks, but the path might be felt to be thorny, leading through masses of awkward detail.

It is difficult to assess the lasting contribution of structuralism to diachronic theory. Dynamic concepts dealing with contrastiveness (mergers, splits, rephonologization) were developed or at least formalized within structuralism, and in this vein there was an upsurge in language-internal explanations for linguistic change with reference to system-related notions such as optimization and "functional load" (as an explanatory device, the latter notion did not really live up to the expectations, however). More specifically, and more interestingly, some structuralists developed the idea that languages tend to reshape or even repair themselves if inner imbalances or "tensions" arise in the system. Eventually, the system-change paradox was resolved by linking structural change to creative language acquisition by children. In the transformational era it became fashionable (for a while) to discard the notion of analogy in favour of the notions of rule addition and restructuring. All of this was a radical departure from neogrammarian thinking. It is remarkable that we are now at some points back where linguistics was before the Second World War. The belief in structural machinery has waned in favour of notions more akin to the neogrammarian concept of analogy. On the other hand, the view of sound change as something happening within an autonomous phonetic stratum is now open to challenge.

In language study, the most tangible feature of structuralism is its descriptive practice. The introduction of the notion of the phoneme came to stand for genuine progress in synchronic work, in particular in the documentation of oral dialects by linguists who were not themselves speakers of the dialects in question. This would seem to make descriptive statements more applicable to diachronic study if such study was undertaken. Since competent and unbiased linguists have always had an intuitive notion of structure, however, even traditional analyses tended to be quasi-phonemic, provided that the field worker had a native or near-native practical command of the dialect.

The most important and novel change within historical linguistics around the mid-20th century was a shift or rather division of emphasis. The neogrammarian period left us with an emphasis on sound history (diachronic phonology) which was in part methodologically motivated and in part motivated by a philological interest in aligning early written records with alleged sound changes so as to establish an absolute chronology for both. This exaggerated emphasis on sound was gradually weakened in favour of interest in diachronic grammar as well, and particularly in favour of more interest in recent historical periods.

First and foremost, however, the whole area of explanation in linguistic studies has recently been revitalized by the development of more precise notions about the internal and external forces which exert their influence on language, and by the development of more sophisticated notions of “pattern” and “variation”. It is now being recognized in synchronic linguistic analysis and gradually even in diachronic analysis that phonologies do not operate on just one level but involve degrees of distinctness and often also a range of speaking styles. In addition, there may be an interplay between local norms and prestige norms. The existence of a fairly stable orthography for a past stage of a language always makes the phonology of the period in question look deceptively orderly, however. Moreover, the very codification of languages in writing, a codification which tends to be very conservative, may influence speakers’ phonetic prejudices in highly literate societies and may obviate any desire to bring the orthography up to date in relation to phonology. It is a further complication that some languages or dialects have large and influential groups of speakers who are functionally bilingual.

If a chronology of sound changes is inferred from written records of the language in question, all of the factors just mentioned deserve to be taken into account. It is thus a complex issue whether and how we can determine what was *the* sound pattern at a certain point in time, the pattern which eventually underwent change. Strictly speaking, the very idea that a sound pattern undergoes change should be interpreted in terms of its speakers’ usage: it is the complex of linguistic habits of the society that changes, not the sounds, although a change of phonological habits often appears as a visible phenomenon in written specimens of the language.

Although it has long since been well-known that medieval society was linguistically complex (with bilingualism in towns, for example), the neogrammarian approach to sound change seems to have tended to underplay the above-mentioned aspects. Though many neogrammarians were outstanding and broad-minded philologists, some with expert knowledge about the culture and structure of earlier societies, there was something sacrosanct about the concept of sound change itself. Sound change was approached programmatically as something which had a natural phonetic explanation, which had happened spontaneously, and which was carried through quite consistently (in a well-defined phonetic environment), its course being betrayed in writing. Complicating factors such as those mentioned above were to a greater or lesser extent taken into consideration, but typically only when the simplistic notion of sound change did not suffice to clear matters up.

Incidentally, this perspective was narrowed further in structuralism with its emphasis on the principles of “autonomy” (with respect to description or explanation) and “invariance” (with respect to the system itself). This brought with it a certain tendency to downgrade the importance of phonetic phenomena which had no immediate role in the phoneme system as conceived by the structuralist, though in fact phonetic detail of an allegedly non-distinctive kind may be crucial for the reconstruction of past sound patterns and for the tracing of diachronic events.

In recent decades there has been a very conspicuous decline in the formerly broad interest in language history, partly for ideological reasons, partly because of a widespread feeling that there are not many more exciting discoveries to be made in the field of the history of Nordic languages, for example. The neogrammarians, in spite of their now widely criticized doctrine, performed the groundbreaking work, and it is not nearly as stimulating to make formal restatements and revisions of their work as to make the discoveries and acquire the basic insights in the first place.

As a result, we are faced with a situation where there has not been an effective handing over from the neogrammarians in terms of continued focus on language history. This has had the inevitable consequence that the textbooks of the lengthy neogrammarian period continue to stand as the standard reference works for those wishing to acquire information about details in Nordic language history;

we are constantly consulting works the latest of which stem from the mid-20th century, and some are half a century older. Reference works of more recent date are not only more scarce; in their handling of diachronic information they must sometimes be deemed more controversial than traditional handbooks if their main *raison d'être* was to make a theoretical point by taking issue with the allegedly outdated approach of traditional scholarship while exploiting their data uncritically.

6. Can the neogrammarian achievements experience a renaissance?

The real revitalization of the legacy of the neogrammarian historical approach is coming from post-structuralist and even post-TG trends in theoretical linguistics. The so-called “natural”, “functional” and “cognitive” approaches have added new dimensions to concepts such as “structure” or “system”, and have in part done so also from a diachronic perspective. Most important, however, is sociolinguistics, with its emphasis on external factors influencing linguistic usage and with its variational aspect, both of which are crucial to an understanding of the mechanisms of linguistic change. Again, the insights are not altogether new. The neogrammarian period relied on both norm-oriented diachrony and variation-oriented dialect geography, but strangely enough these were never quite felicitously integrated in spite of the dual interests of some philologists.

At the dawn of the 21st century, the neogrammarian reference works remain the backbone of historical linguistics, and certainly so with respect to the Nordic languages. The philological work on primary data and many of the generalizations about data remain valuable achievements, even if the presentations may be theoretically outdated. Paradoxically, theoretical innovations after the middle of the 20th century have not so far led to any advance in our concrete knowledge about language history which is comparable to the achievements of classic Nordic philology.

Still, by integrating more recent insights when approaching the mass of solid work left to us by the neogrammarians, we are better equipped to gain new insights by addressing general questions of paramount importance in diachronic studies, such as: What internal and external factors cause changes in languages?

How and under what conditions do such factors operate? Thus we are now finally in a better position to take up the challenge left by work such as Jacob Hornemann Bredsdorff's pamphlet from 1821 about the causes of sound change. For a healthy future for Nordic historical linguistics, a synthesis of this kind is a major prerequisite.

8. Literature (a selection)

1. Structuralism

Structuralism is the comprehensive term for some important movements in the humanities and the social sciences during the 20th century. Their common feature involves viewing the objects under study – languages, texts, works of art or other cultural phenomena – as structures constituted by interacting elements. The word *system* has often been used

as an alternative to structure. Structuralism in the humanities is akin to ideas from the same period in other sciences, such as Gestalt theory in psychology and holism in philosophy and biology.

Two pioneers of a structuralist approach in linguistics were Jan Baudouin de Courtenay (1845–1929), a Polish linguist who worked for a long time in Russia, and the Swiss linguist Ferdinand de Saussure (1857–1913). They took their original inspiration for their structuralist views from historical linguistics. The insight that language change was regular had led them to the conclusion that a language represented a closed system for those who spoke a language at a particular time. Saussure's thoughts on language as structure were first expressed in his university lectures. They gained widespread influence posthumously when they were published in *Cours de linguistique*

générale (1916). Saussure's and Baudouin de Courtenay's ideas were taken up constructively by a group of Russian and Czech linguists who were active in Prague in the 1920s and 1930s, among them Nikolay S. Trubetskoj (1890–1938) and Roman Jakobson (1896–1982). The works of Saussure and Jakobson were to exert a seminal influence in other fields, especially in the social sciences and literary criticism. The structural movement in American linguistics had very little impact in Scandinavia before 1950.

2. Precursors in Scandinavia

Structuralism in linguistics was foreshadowed in the works of some Scandinavians in the decades around the year 1900. The most important among them were Adolf Noreen (1854–1925), who was Professor of Scandinavian Languages in Uppsala from 1887 to 1919, and Otto Jespersen (1860–1943), Professor of English in Copenhagen from 1893 to 1925. Their writings included many of the features that later were to play a prominent role in structural linguistics. Their choice of the contemporary spoken language as an object of study led them to take a synchronic perspective on language. They were eager to abandon the concepts and terms of traditional grammar for those based on their own view on language, which was supposedly more coherent and scientific.

Noreen's monumental but uncompleted description of contemporary Swedish, *Vårt språk*, published in 1903–24, is notable for its reclassification using newly invented terminology. The most original part of this work is dedicated to the study of meaning. An example of a semantic category that was established by Noreen is *status*, the semantic relationship between two words or phrases in a text. This is an extension of the traditional category of case. Noreen anticipated to some extent modern case grammar (Linell 1978; Brodda 1999). The American linguist Sydney M. Lamb mentions Noreen as a pioneer in the stratificational view of language (Lamb 1966, 2). Nevertheless, Noreen's influence outside Sweden has been limited; the long time span involved in the publication of *Vårt språk* and the delay of translating it into a major European language contributed to this.

The concept of structure is also present in Jespersen's work. He was also a forerunner in his use of abbreviated formulae in grammatical writing as well, notably in *Analytical syn-*

tax (1925). The rise of structural linguistics in Denmark, however, was accompanied by a disagreement between Jespersen and Hjelmslev, the foremost representative of the new directions in linguistics.

Another linguist who inspired future structuralists in his Danish homeland was the grammarian Hylling Georg Wiwel (1851–1910). Wiwel criticised the teaching of grammar in Danish schools. He turned against the Latin grammar tradition as well as the un-called-for application of logical or historical considerations. In *Synspunkter for dansk sproglære*, published in 1901, Wiwel provided a positivistic description of Danish in which words were categorized according to properties that were found in the language itself, rather than “metaphysical” concepts. Later linguists have testified to the importance of Wiwel's grammatical work (Hjelmslev 1928, fn. 6 and 12; Diderichsen 1965, 143–151).

3. Structural linguistics in Denmark

3.1. Louis Hjelmslev

3.1.1. Prolegomena to a theory of language

Louis Hjelmslev (1899–1965) undisputedly took the central and dominant place in structural linguistics in Scandinavia in the first half of the 20th century. An overview of his theory in its most elaborated form, however, is best given with reference to his principal work, *Omkring sprogteoriens grundlæggelse* (1943), although many of Hjelmslev's ideas had been expounded and used in his earlier works (e. g. 1928; 1935–37). The book gradually won international attention, and an English translation appeared in 1953 under the title *Prolegomena to a theory of language* (see Rasmussen 1992, 34–42; 49–57). Hjelmslev's theory of language has been called *glossematics*, and he and his followers in Denmark are often referred to as the Copenhagen School.

Hjelmslev was inspired by Saussure and the Prague School. Hjelmslev draws fully from Saussure's definition of the linguistic sign and his emphasis on structural relations as the main object of the description of a language. Contemporary philosophers, notably Rudolf Carnap and Bertrand Russell, also influenced Hjelmslev (Hjelmslev 1948). He departs from what he (in an idiosyncratic use of the term) calls the *empirical principle*. This states that linguistic description shall be free of contradiction, exhaustive and as simple as possible.

Hjelmslev rejects “conventional linguistics” which often studies “the *disiecta membra* of language” ... “the physical and physiological, psychological and logical, sociological and historical precipitations of language, not language itself” (1943, 7). “The aim of linguistic theory is to provide a procedural method by means of which a given text can be comprehended through a self-consistent and exhaustive description” (1943, 16). A key word is *immanence*, Hjelmslev’s term for the understanding of language as a “self-subsistent, specific structure”. Immanence is the opposite of transcendence in the original meaning of that word, “going outside the object”. Hjelmslev rejects the inductive procedure in linguistics, which leads to fluctuating, language-specific definitions of grammatical concepts. Instead, the linguist should start with the text and proceed from there by dividing it repeatedly into classes and segments. Hjelmslev names this procedure *deduction* and characterizes it as “analytic and specifying”, in contrast to *induction*, the “synthetic and generalising” procedure which has been used hitherto in linguistics (1943, 12f.).

Hjelmslev provides a set of concepts and terms as tools for language description. Ana-

lysis proceeds by distinguishing a variety of dependences, i.e. possible relations between linguistic units. There are also different terms for such relationships when they are part of a process (text), i.e. viewed syntagmatically, and when they are part of the grammar, i.e. viewed paradigmatically. (Table 17.1 gives an overview of the relational terms together with some of the small number of concrete examples Hjelmslev provides).

Hjelmslev distinguishes two *planes* (levels) in the language, those of content and expression. Both planes have *form* (relational structure) and *substance* (which refers to the physical reality, e.g. sounds and linguistically relevant meanings). Hjelmslev later elaborated on the concepts of content and expression, each of them having form and substance, as part of a stratificational system in the glossematic theory (Hjelmslev 1954). The word *stratum* replaced *plane* or *level*, used in earlier writings. Content substance, content form, expression substance and expression form constitute four strata in this version. The attribute *plerematic* refers to aspects of content, and *cenematic* to those of expression. The substance of the expression stratum can be described in phonetic

Tab. 17.1: Glossematic terms for relations (references to Hjelmslev 1943)

	Mutual relation	One-sided relation	No relation
General terms	Interdependence	Determination	Constellation
Syntagmatic relations (within a process [text])	Solidarity	Selection	Combination
Examples	between expression and content, the sign function (45); between [t] and [a] in the syllable [ta] (74); between case and number in suffixes, as in Latin <i>-ibus</i> (40)	between Latin <i>sine</i> and the ablative (24)	between Latin <i>ab</i> and the ablative, “which have possible but not necessary coexistence” (24)
Paradigmatic relations (within a system)	Complementarity	Specification	Autonomy
Examples	between vowel and consonant (24); between substantive and adjective (24)		

(articulatory and acoustic) terms, while that of substance of the content is manifested by the reality to which the linguistic units refer. The distinction between a content and an expression stratum provides the basis for establishing the invariant elements within a category. Hjelmslev's analytical instrument is the *commutation test*, an exchange experiment through which one can determine the invariants, the relevant elements in the structure of a language (1943, 67). Commutation resembles the observation of phonological oppositions and the search for minimal pairs in other areas of structural linguistics.

The concept of neutralisation in linguistics is introduced in the glossematic theory under the term *syncretism* (1943, 78f.). Hjelmslev also introduces the procedure of *catalysis*, which in some cases is a prerequisite for the analysis, for instance the restitution of interrupted or incomplete constructions, such as abbreviated expressions like *How nice!*, *Because!* etc. (1943, 83f.).

Once his immanent linguistic theory has been established, there is room for other aspects of language in it. Like Saussure, Hjelmslev ends up with an all-embracing view on the study of language, expressed in elevated words: "A temporary restriction of the field of vision was the price that had to be paid to elicit from language itself its secret" (1943, 112). And his book ends with the proclamation of the goal of linguistic theory: "*humanitas et universitas*".

3.1.2. The category of case

Omkring sprogteoriens grundlæggelse was the peak of his long process of creating a linguistic theory. Hjelmslev's requirement of "an immanent understanding of language as a self-subsistent, specific structure" is foreshadowed in one of his examination papers as early as around 1920. He expressed an opinion on historical linguistics that shocked his teachers: "We can totally leave out the idea about pre-historic language periods. It is not correct to define language parentage as common origin. 'Language parentage' is nothing more than systematic coincidence" (Gregersen 1991, 173). His *Principes de grammaire générale*, which was intended to be his doctoral dissertation, was published only in an abridged version (1928). Instead, he was awarded his doctorate for his study of the Baltic languages, *Études baltiques* (1932).

In *La catégorie des cas* (1935–37), Hjelmslev treated problems in general linguistics with reference to a specific grammatical category. The first part consists of a critical survey of earlier attempts to deal with the category of case. According to the localist theory, case expresses something subjective: a spatial concept. The speaker applies it also to various other objective phenomena: time, logical causality or syntagmatic rection (government) (p. 37). Each case has a basic meaning. The contrasting antilocalist theory is based, according to Hjelmslev, on the misconception that the localist theory is exclusively spatial. Hjelmslev defines the category of case as an expression of a relationship between two objects, taken in an abstract sense (p. 96). The relations between cases can be expressed in a mathematical or logical way (p. 98). The system, however, is not a logico-mathematical system with oppositions between positive and negative; there is never an opposition between *A* and *non-A*. Instead, the oppositions are between *A* on the one hand and *A + non-A* on the other. With a reference to the French philosopher Lucien Lévy-Bruhl, Hjelmslev declares this to be a reminiscence of prelogical thinking (p. 102).

Hjelmslev deals with the principles that bring about change in case systems. He is convinced that such systems change not only due to external causes. The conserving tendency in language prevents the system after a change from regaining its optimum size (p. 109f.).

A case is seen as intensive when there is a tendency to concentrate the meaning, while extensive cases exhibit a tendency to spread their meaning over the entire semantic domain (p. 112f.).

Hjelmslev chooses this as the basis for his treatment of the structure of the case system. The terms "intensive" and "extensive" correspond here to the concepts better known as "marked" and "unmarked".

We find in *La catégorie des cas* many of the ingredients that are used in glossematics: levels (strata), mathematical tools such as graphs and letter symbols, and repeated statements that a proposed theory is provisional. There are also restrictions in the scope of the grammar. Hjelmslev declares that "the great danger for grammar is the need to explain everything. Grammar has the well-defined task of explaining that which is essential when seen from the point of view of the system" (p. 89). This attitude allows the linguist to dispatch irregularities to stylistics.

Finally, Hjelmslev tests his case theory on a small number of languages, most of them spoken in Caucasia.

3.1.3. The Danish expression system

The presentation of the expression system of Modern Danish by Hjelmslev in a lecture in 1948 is of special interest because it is among the few works where he himself demonstrates the glossematic method applied to a concrete, familiar matter (Hjelmslev 1951). This had been preceded by several versions made in collaboration with H. J. Uldall and reported on at conferences. Hjelmslev's analysis centred on "latent" consonants and the *stød*. He distinguishes two denotative modulations (non-falling and falling) and two accents (heavy and weak stress). It is, however, possible to eliminate accents altogether in the analysis by marking part of the vocabulary (loanwords) as "cenematically distinctive". Units corresponding to phonemes are distributed over four categories according to their relation to the 'selection' function. Vowels are selected units, and consonants are selecting units, but some units are both selected and selecting, e. g. [Φ], [ɦ] in interjections. The inventory of consonants is reduced to /b, d, f, g, h, l, m, n, r, s/. (Hjelmslev, however, does not use slashes to indicate phonemic units). Consonants such as [p], [t], and [k] are interpreted as /hb/, /hd/ and /hg/. [ʃ] is represented as /si/, and [ŋ] as /ng/. The inventory of vowels contains /a, ε, e, α, o, ø, y, i/. The vowel [œ] is derived from /ø/ in various ways, e. g. *dør* [dœr] 'door' from /døør/ in contrast to *dør* [dœr] 'dies', which is interpreted as /dø.ɛr/. *Høne* [hœ:ne] 'hen' is derived from /'høn ◦ ε/, while *kønne* 'beautiful' is derived from /'ghøn ◦ dε/. (◦ indicates a syllabic boundary. The syllable and its structure are relevant elements in the analysis). Long vowels are interpreted as "identity diphthongs" ([a:] as /aa/ etc.). The category of neither selected nor selecting units contains only one member, /u/, which is manifested as [v] or [u], depending on the environment. Inventory reduction is often reached by ingenious reinterpretations. The *stød* is a signal of certain types of syllabic structure. It can also be seen as a signal of "cenematic compounds", i. e. words like *arbejde* ['aɾbaiʔðə] 'work'. Some problematic cases, such as *aftale* 'to agree upon' (verb, with *stød*), and *aftale* 'contract' (noun, without *stød*) can be explained by reference to plerematic ("heteroplane")

rules, i. e. to semantic categories (Hjelmslev 1951, 21).

3.2. Other Danish structural linguists

3.2.1. Viggo Brøndal

One of the most active members of the Linguistic Circle of Copenhagen was Viggo Brøndal (1887–1942). He was a professor at the University of Copenhagen from 1928. Besides studies in Romance languages, his own field, he published a number of original works in general linguistics, e. g. *Ordklasserne* (1928), *Præpositionernes teori* (1940), and *Essais de linguistique générale* (1943). Brøndal's brand of structuralism was not in line with that of others at the time. For instance, he defines word classes through a system of logical relations rather than criteria based on their function. Fischer-Jørgensen, summarising Brøndal's theory of grammar, characterizes his theoretical system as being "so original that it can hardly be taken over by others". However, through his ideas and his personality, Brøndal exerted a great influence on other Danish linguists, not least on Hjelmslev and Diderichsen.

3.2.2. Paul Diderichsen

Another Danish linguist active in the Linguistic Circle in Copenhagen was Paul Diderichsen (1905–64). His influence has been more long-lasting than that of Brøndal. He was an editor of the *Ordbog over det danske sprog* (the comprehensive Danish dictionary) before he became Professor of Danish in Copenhagen in 1949. Hjelmslev and Brøndal provided Diderichsen inspiration, but his ideas took shape independently, at first within his initial field of study, Danish medieval texts (Diderichsen 1938). He initiated several studies of graphemic systems by Danish scholars. Structural thinking is also found in Diderichsen's dissertation (1941), a syntactic analysis of a law text from the Middle Ages (Table 17.2). His main achievement, however, concerns contemporary language. He created a general model for syntactic analysis (often referred to as Diderichsen's sentence scheme), which he used in a comprehensive grammar of Danish, *Elementær dansk Grammatik* (1946). The model emanates from the observation that in most Danish sentences there are three positions ("fields") in which the components of

Tab. 17.2: Diderichsen's sentence scheme

Fundamental field	Nexus field			Content field		
S A	v	s	a	V	S	A
Saa So	har has	han he	vist probably	glemt forgotten	galocherne the galoshes	her here
Galocherne The galoshes	har has	Onkel Peter Uncle Peter	vist probably	glemt forgotten	–	forleden recently

V, v = verb (al); S, s = substantial (nominal); A, a = adverbial. The order of the fields is in subordinate clauses s a v.

a sentence can be inserted according to their function. A field can also stay vacant. One of the fields contains the finite verb. Diderichsen names it “the nexus field” (using Jespersen’s term, where *nexus* means the interdependence between the subject and the finite verb). Next comes “the content field”, dominated by the infinite verb form. It contains, as a rule, the semantically most important part of the sentence. The first position, “the fundamental field”, can be filled with a number of different words or phrases. This makes Diderichsen’s model a useful instrument for analysis of the Scandinavian languages where, beside the subject, any focussed component, e.g. the object or an adverbial, can be placed optionally in the initial position in a sentence (see Table 17.2). The model has served widely as a theoretical foundation for grammars and textbooks, as well as for some large research projects in Scandinavia (Næs 1965; Loman/Jørgensen 1971; Teleman 1972).

3.2.3. Eli Fischer-Jørgensen

Eli Fischer-Jørgensen (born in 1911), Professor of Phonetics at the University of Copenhagen in 1966–81, became a member of the Linguistic Circle of Copenhagen in 1933. As a phonetician, she has carried out important experimental studies, especially on the *stød* and vowel length in Danish. As a phonologist, she has investigated the interplay between expression and content in European and American schools of structural linguistics

(1949; 1956; 1975; see also her contribution to Siertsema 1955). Fischer-Jørgensen has acted as an independent critic and interpreter of glossematic theory. She gave a first report on glossematics in a survey of Danish linguistic activity between 1940 and 1945, published in *Lingua* in 1949. Later, she published critical summaries of the ideas of the great theoreticians in Danish linguistics, often together with biographical notes (1965a; 1965b). Roman Jakobson describes her role in the following words: “Her thorough examination laid bare the cardinal contradictions and fluctuations in the gradual elaboration of this theory, or rather theories” (*Form and Substance* 1971, 9).

3.2.4. Hans Jørgen Uldall

Hans Jørgen Uldall (1907–57) became Hjelmslev’s principal collaborator. His life was filled with variation. He studied English and phonetics in Copenhagen and London. After a stay in South Africa and studies at Columbia University in New York, Uldall undertook a thorough study of an American Indian language in 1931–32. Returning to Denmark in 1933, he started his collaboration with Hjelmslev. Eli Fischer-Jørgensen has described their work as “something unique in the history of linguistics. They worked together so intimately and harmoniously that afterwards neither of them could tell who had contributed what”. Their hope for the prompt publication of the results of their work was foiled by the outbreak of the war. Uldall, who

was active in the British Council, spent the years 1939–45 in Greece, Egypt and the Near East. Hjelmslev, in the meantime, had published his *Omkring sprogteoriens grundlæggelse* (in 1943). Hjelmslev and Uldall continued their collaboration after the war with the aim of publishing a definitive work on their theory of language. Uldall's part of the work appeared in *Outline of Glossematics I*, published in the year of his death, 1957. Uldall sets forth in this work an algebra based on functions, i.e. dependences in the analysis between objects, called functives. Functives in a given function establish a functional field (Uldall 1957, 36 ff.). This is illustrated with examples from semantics, e.g. *boy* is analysed as *young, male, human* (p. 46), or from phonology, as the relations of the English syllables *see, saw, we* (p. 40). The set of functions and other concepts (represented in formulaic form) are built up gradually. Uldall's text continues with tables of considerable size listing the possible results of calculations. The linguistic examples are, as a whole, very simple and presented with a caveat: "It must be clear, once for all, that the authors refuse to be held responsible for the ultimate validity of their examples" (p. 39, fn. 1).

Hjelmslev's share of *Outline of Glossematics* was never completed.

3.2.5. The influence of glossematics in Denmark (works until 1950)

The activities at the Linguistic Circle of Copenhagen and, in particular, Hjelmslev's work influenced Danish and some other Scandinavian linguists to attempt a glossematic approach to various problems. General problems were taken up by Jens Holt, who published a work on semantics (Holt 1946), and by Nils Ege on the nature of the linguistic sign (*Recherches structurales* 1949, 11–29). Anders Bjerrum's *Fjoldemålets Lydsystem* (1944) was the first of a sequence of descriptive works on Danish dialects in glossematic terms, most of which were published in the 1950s (see the overview by Poul Andersen 1965, 90 ff.). There are also some historical studies. Ella Jensen analysed the language of a medieval law text in Danish (*Recherches structurales* 1949, 244–255). Marie Bjerrum presented a glossematic analysis of the rich system of vowels and diphthongs in Faroese (*Recherches structurales* 1949, 235–243). It is interesting to find in this paper an early example of analysis in acoustic

terms of phonological distinctive features, based on the frequency of the first and second vowel formants. This is given in graph form with a notational system using upper- and lower-case Greek letters, similar to that introduced by Hjelmslev (1935–37) in his study of the category of case.

4. Structural linguistics in Norway

The position of structural linguistics in Norway in the first half of the 20th century differed very much from that in Denmark. There were no dominant theoreticians. Instead, some Norwegian linguists with varying specialties applied ideas from European and American schools of structuralism, mainly to the Norwegian language.

An early introducer of new trends in linguistics was Alf Sommerfelt (1892–1965). His chief interest was originally the Celtic languages, which he studied in Paris, where he first became acquainted with structuralism. After his return to Norway he became occupied with university teaching and lexicographical tasks. He dedicated some years in the 1930s to the study of languages spoken in the Caucasus and Australia. Sommerfelt stayed in England during the Second World War, working with the Norwegian exile government. His main contribution to linguistics lies within the field of sociological linguistics.

Carl Hjalmar Borgstrøm (1909–86), Professor of Comparative Indo-European Linguistics in Oslo, published an early survey of the phonology of Norwegian (including the prosodic structure) in the Prague School tradition in 1938. He proposed a polyphonemic interpretation of diphthongs and retroflex consonants, represented in writing as *rt, rd* etc.

Hans Vogt (1903–86) studied in Oslo and Paris, specialising in Armenian. He then conducted field studies of other languages in the Caucasus, such as Georgian. He also spent the year 1937–38 in the United States and carried out linguistic fieldwork among American Indians. Vogt became Professor of Romance languages in Oslo in 1946. He had become acquainted early on with contemporary structural trends, including glossematics. He investigated a corpus consisting of ca. 5000 Norwegian monosyllabic words listed in large dictionaries (Vogt 1942), finding interdependence between the initial and final clusters, and between vowels and following consonants. Vogt discussed the constraints that exclude

the majority of possible non-realized monosyllables, whose number is about ten times higher than those which exist. He took up the problem of the interpretation of the retroflex consonants that had been brought to the fore by Borgström in his 1938 paper. Vogt (1939) pleaded for their inclusion in the inventory as separate consonant phonemes, i. e. /t/, /d/ etc., not as realisations of clusters.

Hallfrid Christiansen (1886–1964) provided an important instance of the application of structural thinking in Norway before 1950. Einar Haugen characterized her 1932 description of the dialect of Gimsøy in northern Norway, as “often entirely eclectic in methodology”, but a “pioneering” work with an “epoch-making” explanation of the apocope found there (Haugen/Markey 1972, 86).

5. Structural linguistics in Sweden and Finland

The scientific study of languages in Sweden and Finland faithfully followed the historical lines founded in the neogrammarian tradition. Most scholars worked in such areas as place-name studies, dialectology and philology. An exception was Bertil Malmberg (1913–94), Professor of Phonetics and, later, of General Linguistics at the University of Lund. Malmberg (1939) presented the phonological ideas of the Prague School early on to a Swedish audience. He continued, through his huge output of handbooks, surveys of research in phonetics and general linguistics and reviews, to act as the indefatigable introducer of new trends in Europe and America. However, he was never an active structuralist in his own research, although the influence from Continental ideas can be felt in many of his works (e. g. 1944). He was also a co-editor of *Studia Linguistica*, where articles with a structural approach were published, for instance one on the Saussurean sign by Pierre Naert (1947), a Frenchman working in Sweden and Finland.

Roman Jakobson stayed in Scandinavia during the first years of the Second World War. One of his seminal works, *Kindersprache, Aphasie und allgemeine Lautgesetze*, was published originally at the University of Uppsala in 1942. John (János) Lotz (1913–73) worked at the University of Stockholm in 1937–45, where he published some structural studies together with Jakobson. He also wrote sketches of a structural grammar of Swedish (Lotz 1942).

Structuralism did not have a great impact on linguistics in Finland. A few scholars, however, were aware of the new movements; Erkki Itkonen, Valentin Kiparsky and Paavo Siro deserve special mention.

6. Glossematics in the world

Glossematics was the most consistent and far-reaching development of Saussure’s thoughts, and Hjelmslev’s theories have had a lasting influence in some sectors. Algiras J. Greimas founded a school of semiotics in France that has integrated many of Hjelmslev’s ideas. The American Sydney M. Lamb also characterizes his own theory of stratificational grammar as being “no more than the result of adding a few extensions and refinements to a synthesis of Hjelmslev’s glossematics (1943) and one of the standard versions of American structural linguistics” (Lamb 1966, 2).

7. Structuralism in Scandinavia after 1950

Glossematics had a firm footing in Denmark in the decades after 1950. It especially influenced Danish dialectology in the following years, noticeable e. g. in the studies of the Samsø dialect by Poul Andersen and Inger Ejskjær (1985–87) and of the Rønne dialect by Børge Andersen (1959); see also the overview given by Poul Andersen (1965). A unique Swedish example of a dialect study in a glossematic framework is Ulrik Eriksson’s monograph (1971–1973).

The influence of American structuralism is noticeable in Sweden but only after 1950. Much of the work in this line was reported on in the yearly conferences on the description of Swedish (*Svenskans beskrivning*; see Loman 1985). Beginning in the late sixties, the structural paradigm in linguistic theory was replaced with that of transformational generative grammar.

IV. Perspectives in research history III: Theoretical and methodological perspectives in current historical linguistic description (after 1950)

18. Nordic language history and structural linguistics

1. Delimitation
2. The structuralist ambition
3. Manuscript orthography
4. Morphological systems and morphological change
5. Syntax
6. Literature (a selection)

1. Delimitation

In the Nordic countries, structuralism was influential and developed in original ways, especially in Denmark.

The focus is here on the influence of structuralism on studies of the older stages of Scandinavian, especially in the way it influenced the approaches to ODan. and ODan. manuscripts in the works of Paul Diderichsen and Anders Bjerrum, both members of the Copenhagen Linguistic Circle.

2. The structuralist ambition

Structuralist views clashed with philological tradition and the neogrammarian approach of Brøndum-Nielsen at Det nordiske Filologmøde [Nordic philologists' meeting] in Copenhagen in 1946. In his contribution (1947, repr. 1966), Diderichsen castigated traditionalists for not orienting themselves towards the demands of the modern world. On Diderichsen's agenda was the need for explicit synchronic descriptions as a precondition for genetic linguistics to turn into a methodically satisfactory explanatory discipline and provide a rational theory of language change. Single synchronic descriptions were steps towards a line of such structural, synchronic descriptions, all pointing towards a general typology, a truly empirical "grammaire générale" that would bridge the gap between synchrony and genetic linguistics.

Diderichsen's programme was received with mixed feelings. The debate was summarized and continued in the overviews by Bjerrum (1965) and Nielsen (1965). However, actual empirical research reflects less of the controversy that one might have expected.

Hjelmslev's view of language change and his call for a typological reorientation of genetic linguistics was obviously behind Diderichsen's statement. Hjelmslev's spirit was also behind Aage Hansen's no less programmatic final flourish (1956). According to his view, reanalysis begins at the level of content; only later do we find changes in expression as a reaction to rebalance the system.

3. Manuscript orthography

Diderichsen's studies of ODan. orthography (1931–37) were his first contribution to the overall plan:

Die Grundlage einer adän. Sprachgeschichte muss von einer Reihe von Einzelbeschreibungen möglichst verschiedener Handschriften gebildet werden; in jedem einzelnen Fall müssen auf Grund einer mit Umsicht interpretierten einfachen Statistik die orthographische Norm des Schreibers und die innerhalb derselben gestatteten Variationen festgestellt werden, wonach die normfremden Elemente teils als der Vorlage entstammende Archaismen, teils als „phonetische“ Zeugen der Umgangssprache des Schreibers [...] zu bestimmen sind. (1938, 162)

Diderichsen's strategy was to separate orthographically regulated variation from unsystematic variation. Only in the latter case are conclusions about dialect influence warranted (be it from the scribe's own language or from the copied manuscript). ODan. orthography is more systematic than assumed by philologists. It does not betray the dialect background of the scribes in a straightforward way.

Diderichsen acknowledged the need for relating the orthographic system to hypotheses about the sound system. He differed in this respect from Anders Bjerrum who, in his grammar of the *Scanian Law* (1954), made it a matter of principle to describe only the graphematic system of the manuscript B 74.

Anders Bjerrum's approach is exemplified in his analysis of the relationship between the graphemes <e>, <æ> and <ǣ>. The graphs <æ> and <ǣ> (æ caudata "tailed æ") are variants of the grapheme <æ>. The vowel <e> can be used for <æ> (it is said to deputize, Dan. *vikariere*), as in *melt* 'said' for the normal *mælt*, but never vice versa. This partial overlap is systematic: *sæ* is the dat. sg. of the reflexive pronoun, *se* 'to see', an infinitive. We never find **sæ* 'to see'.

That the latter position was controversial is hardly surprising, see the fine overviews by Karl Martin Nielsen (1965) and Bjerrum himself (1965). In her structural description of the vowel system of the Flensburg Bye-Law (1949), Ella Jensen explicitly reconstructed the sound system.

An obvious counter-strategy from the sound-historian's perspective is to find examples where simpler or more adequate rules can be formulated on the basis of sound hypotheses inaccessible via the graphematic system. Bjerrum seems to be consistent given his premises, yet Nielsen (1965, 45) wanted information on the length of <e> deputizing for <æ>, since from the view of the sound historian, this would be expected to be long. Furthermore, Nielsen has a point with regard to the analysis of Scanian rules for vowel harmony, which are better understood against the background of assumed vowel lengthening.

In some respects, we find convergence of these views. Findings that manuscripts may reflect steady orthographical norms, even when they show local dialect influence, are not unobtainable via dialect geography methods and genetic descriptions. Thus, in an investigation of three Jutlandic oraries (1956), Nielsen stated that these texts represent a homogeneous orthographic system, generalizing some typically Northern Jutlandic features, while in other respects conforming to Zealand orthography.

The inspiration to view manuscript orthographies as consistent systems and not as individual dialect reservoirs or symptoms of sound change may well be ascribed to the systematic perspectives of the structuralists. But in their conclusions, Diderichsen's and Niel-

sen's orthographical works are not in obvious conflict.

It follows from the structuralist position (Diderichsen 1938, 162) that one will tend to see archaisms and innovations in deviant forms, rather than influence from other dialects. Bjerrum underscored that language systems, spoken or written, may well allow the coexistence of older and younger competing forms. One such example is the pres.sg. *star/stær* 'stands' in manuscripts of the *Zealand Laws*. The latter form (the metaphonic variant) is the archaic one, preserved in some modern Jutlandic dialects. This is not an instance of the scribe Johannes Jutæ's dialect background showing through, Jutlandic or not. Quite to the contrary, the scribe consistently followed the linguistic and orthographic norm prevalent in Zealandic around 1300; see Bjerrum's article *Johannes Jutæ og Valdemars Jordebog* (1960). This basic view was also applied in practice by his student Gerd Wellejus: *Jysk, sjællandsk eller skånsk?* (1972).

Bjerrum's central claim remains sound – that languages undergoing rapid change are nevertheless describable as synchronic systems. His practice has led to a renewed understanding of the dangers behind hasty mappings of modern isoglosses (dialect boundaries) onto the language of medieval manuscripts.

4. Morphological systems and morphological change

In this area, Hjeltslev's influence on the analysis of morphological systems is pervasive. A basic concept is participation, made operative especially in Bjerrum's grammatical descriptions. Hjeltslev himself defined participative relations in the following way:

Le système n'est pas construit comme un système logico-mathématique d'oppositions entre termes positifs et négatifs. Le système linguistique est libre par rapport au système logique qui lui correspond. Il peut être orienté différemment sur l'axe du système logique, et les oppositions qu'il contracte sont soumises à la loi de participation: il n'y a pas d'opposition entre A et non-A, il n'y a que des oppositions entre A d'un côté et A + non-A à l'autre [...] (Hjeltslev 1935, 102).

Hjeltslev spoke of the semantic construction principles underlying morphological systems. Somewhat simplified, linguistic oppositions (A vs. B) consist of an intensive element that must contain meaning element A, as opposed to an extensive element articulating the same

semantic dimension. The extensive element will normally, but not necessarily, manifest the meaning element B. In Hjelmslev's works on morphology, participation is used for the content relations structuring the system in question.

4.1. Anders Bjerrum's descriptions

Hjelmslev's morphological principles were applied by Bjerrum in his morphological descriptions of the Scanic Law, the Zealandic Laws and the Jutlandic Law. One illustration is from *Verbal number in the Jutlandic Law* (1949, repr. 1973). Where verbal number is concerned, Bjerrum's structuralist point is to establish that the linguistic situation in the Middle Ages was not one of confusions, but fully normal from a linguistic point of view. The singular and the plural were used according to systematic principles. The singular of the verb is found in contexts where the subject is a semantic or morphological plural, as in:

<i>hoor born</i>		<i>takær</i>
child-PL	from adultery	take-SG
<i>æftær</i>	<i>fathær</i>	<i>ækki</i>
after	father	nothing (1949, 163)
<i>sym</i>	<i>limæ</i>	<i>lytæ</i>
(as far) as	branch-PL	extend-PL
<i>oc</i>	<i>rotær</i>	<i>rinnær</i>
and	root-PL	run-SG (1949, 163)

Bjerrum concluded that a semantically singular subject denoting "unity" will never combine with a plural form in the verb, since this form denotes "plurality". All other combinations are found. Again, this situation is not one of confusion of forms, but a strictly rule-governed one. The singular deputises for the plural, but not vice versa. Bjerrum presented the following methodological considerations in his grammar of the *Scanian Law* (summarized from Bjerrum 1973). In the paradigm for *thiufuær* 'thief', the historical nominative in *-ær* is found three times, the normal subject being in the form *thiuf*, the historical accusative. Bjerrum insisted on a participative relationship, referring to Hjelmslev's principle of simplicity (1943, 18):

In a synchronic description it seems to me to be most correct to postulate the simplest possible correspondence between [...] significans and significatum. That is why I assert that we have the unit of content nominative when, and only when, the ending is *-(æ)r*, and that we have accusative when, and only when, the ending is zero. Sen-

tences of the type *æn þo ær han ok þiuf* 'but he is a thief all the same', must in accordance with this theory be explained as being due to the fact that the unit of content accusative can deputize [...] for the unit of content nominative (but not vice versa). (1973, 164–65)

(This is explicitly claimed to be parallel to the analysis of the relationship between the graphemes <e>, <æ> and <ǣ>, see 3.)

Participation must not be confused with inflectional mergers. A nominative/accusative merger is common throughout the noun system of the *Scanian Law*. Since few strong nouns preserve instances of the original nominative, nom./acc. sg. and nom./acc. pl. mergers such as *dag* (nom./acc. sg.) and *daga* (nom./acc. pl.) are common.

Participation in Bjerrum's sense does not fully coincide with Hjelmslev's usage. Hjelmslev's concept is firmly at the level of content – the relationship between modern French positives (as *bon*, *mauvais*) and comparative-superlatives (*le meilleur*, *pire*) (1972, ms. 1934) is a participative one, since the positive is compatible with the comparative-superlative.

However, in Bjerrum's grammars (1966; 1967) participation is normally employed in the sense of distributional overlap. No content analysis is offered of e. g. case. Thus, we learn nothing about the semantic difference between the earlier stable relationship (*thiufuær* as opposed to *thiuf*) and that found in the *Scanian Law* between the nominative and the accusative. In spite of this possibly unorthodox application of Hjelmslev's concept, it is fair to claim that Bjerrum's perspective and interest was to interpret Hjelmslev with respect to the debates about Scand. philology, and that Bjerrum's contributions derive their lasting value from the insight that language systems may very well tolerate the coexistence of older and newer forms, even as integrated members of paradigms. Bjerrum's grammars are certainly not without semantic insights either. He points out the semantic difference between the paradigms for mood and tense in the *Scanian Law* and the *Zealand Laws*, respectively. Scanian maintains a two-dimensional paradigm (*fara* 'to go'):

	ind.	subj.
pres.	<i>far</i>	<i>fare, fari</i>
pret.	<i>for</i>	<i>fore</i>

Of particular importance are the "hypothetic possibility" readings of the subjunctive, both present and preterite. In the Zealand laws, however, the present subjunctive is an opta-

tive/hortative, with no instances of the hypothetical reading. Hypothetical and counterfactual readings are only found with the preterite subjunctive. Thus, the two-dimensional paradigm has disintegrated, since it has lost its content organization. Bjerrum has no explicit diachronic perspective, but what we see here is a very early stage of the process resulting in the Mod.Dan. reorganization of tense and mood into one semantic domain.

4.2. Aage Hansen

Aage Hansen's article on the development of the Dan. case system *Kasusudviklingen i dansk* (1956) was directly influenced by Hjelmslev. Hansen insisted that paradigms should be analysed at the content level. Where case is concerned, he points to the heterogeneous character of the genitive, setting up two paradigms.

Paradigm 1. (1st rank cases)

nom.	<i>thiufær</i>
acc.	<i>thiuf</i>
dat.	<i>thiuf(u)i</i>
gen.	<i>thiufs</i>

Paradigm 2. (1st rank cases vs. 2nd rank case)

non-gen.	<i>(thiufuær thiuf thiuf(u)i thiufs)</i>
gen.	<i>thiufs</i>

The traditional genitive is both a first rank sentence member, governed by a specific verb class, and an indicator of second rank status, as in the modern language. Paradigm 2, the one that survives to the present day in the form of zero vs. *-s*, does not really deserve the label "case", Hansen said. The fate of the case system with nouns, then, is to be completely abolished in the modern language, giving way to the modern systems, namely paradigm 2 plus a specific number system. We see in this the application of content analysis of paradigms as a tool to identify the character of morphological systems at different stages of development, cf. Bjerrum's analysis of mood. However, splitting up the case paradigm for Scanian ODan. the way Hansen suggests is hardly in keeping with Hjelmslevian principles, since the two functions of the genitive are firmly merged in a syncretism that cannot be dissolved. Nowhere in the case system are these two functions reflected by contrasts at the level of expression.

In modern terms (Timberlake 1977; Harris/Campbell 1995), Hansen has identified a basis

for later reanalysis, namely a structural ambiguity in the case paradigm. This version of the analysis is in fact sufficient for his (correct) identification of the modern situation.

Hansen's general claim is that content changes are primary (see 1.), but actual content analysis seems to be lacking in his texts. Instead, traditional labels such as "subject" vs. "non-subject" slip in.

Thus, it would seem that when it comes to practice, the Hjelmslevian influence in Hansen's article boils down to the latter's insisting that paradigms must be identified also for content. His claim that content restructuring is the decisive triggering factor of morphological change does not materialise in his analysis, nor do we find any counterpart to Hjelmslev's attempts to identify systems prone to change by distinguishing between stable and unstable ones.

4.3. Conclusion

Where empirical morphological analysis and description is concerned, it would seem fair to conclude that in spite of the rhetoric of the period, the efforts during the 1950s and the 1960s to utilise in practice the potential claimed for the structuralist paradigm led to fewer successes than expected, especially because of the problems inherent in content analysis.

4.4. Later developments

The somewhat resigned conclusion above does not imply that the European structuralist position should necessarily be viewed as inherently unfruitful. In an irony of fate, a partial proof to the contrary has been given by the Norwegian Helge Dyvik (1980) in one of the most extensive critical examinations of the insufficiency of traditional syntactic categories formulated on the basis of a Scand. language. Dyvik applies principles of classical structuralism to settle the question whether ONorw. had a passive category. The principle of maximal polysemy – boiling in fact down to the same as the commutation test as formulated by Hjelmslev (1943, 66–68) – is according to Dyvik the only possible way to put claims about language-specific structure on an empirical footing. Only such content distinctions are relevant that find distinctions also at the level of expression.

The candidates for the status of "passive" in ONorw./OIce. are the so-called mediopassives and the periphrastic construction tradi-

tionally named “passive”. The mediopassive, ending in *-mk/-sk* (later in *-st*) derives from enclitic reflexive pronouns still morphologically recognisable in OIcel. It had four semantic subcategories:

- (a) reflexives: *geymask* ‘to guard oneself’
- (b) reciprocal forms: *berjask* ‘to fight one another’
- (c) intransitives: *andask* ‘to die’
- (d) passives: *búask* ‘to be equipped’

Applying the principle of maximal polysemy leads to the conclusion that these four semantic subtypes are all variants of the mediopassive (“middle”) form. None of them is a structural passive. Thus, “middle” is one category with four contextually determined senses.

Similarly, the periphrastic “passive” may not be a structurally independent construction but rather a variant of the predicative (or complement) construction, formed by the verbs *verða* ‘to become, turn’ and *vera* ‘to be’, observing concord along the same lines as other predicatives. Whatever the details of the debate, Dyvik’s line of reasoning illustrates well the potential inherent in the structuralist paradigm.

Working within the paradigm of the Copenhagen functional school, Lars Heltoft (1996) advocates the necessity of content analysis of paradigms, applying concepts of reanalysis and generalisation to a content-based view of paradigm structure. Reanalysis applies at the level of content (not some abstract deep structure). There are striking differences of content between Sw. and Dan. passives. In Sw., the *s*-passive can function as a simple declarative:

beloppet togs ut i går
[the amount was take-past.pass.
out yesterday]

Dan. *s*-passives would be modal in this context, and Dan. demands the periphrastic passive here:

beløbet blev hævet i går
[the amount was taken out yesterday]

This, according to Heltoft, is the result of a content reanalysis of the passive system to serve also as a mood system (see Heltoft/Falster Jakobsen (1996) for details). Heltoft gives concepts such as reanalysis and generalization a Hjelmslevian tenor by insisting that reanalysis must pertain to content and that content must be understood as language-specific structure – in the sense of Hjelmslev’s content form (1943).

5. Syntax

In the discipline of Scand. syntax, the outstanding figure of the period was Paul Diderichsen (1905–1964). What is relevant here is the importance of his work for language history.

Diderichsen’s occupation with syntax dates back to the 1930s. His famous positional model, the sentence frame, was presented in a lecture in the mid ‘30s (1966, NyS 16–17 (1986)). His major syntactic contribution to the description of an OScand. language is, however, his 1941 treatise *Sætningsbygningen i Skaanske Lov* ‘The Syntax of the Scanian Law’.

5.1. The sentence frame

Diderichsen’s sentence frame rests on the assumption that word order (in word order languages) must be described at a distinct level, the topical level (Dan. *topisk*, G *topisch* ‘positional’). The intermarriage of constituency and linear ordering as found in American linguistics – a firm part of Chomsky’s frameworks – is not an integrated part of Diderichsen’s thinking. On the contrary, by distinguishing between the logical and the topical articulation of a clause (1941; 1943), Diderichsen makes distributional analysis a tool of topology. Substitutional tests led to topological classes, not to syntactic classes. These, on the other hand, are defined by the combinatorial slots for verbs. It is irrelevant at this level whether we take complex (multi-place) verb constructions or simple one-place verbs as a starting point. The result will all the same be a sort of valence description or valence theory, to use modern terms. By contrast, constituents derive part of their value from their position. For instance, fronted objects derive part of their function from their position in the initial position (the fundamental field). Topology is the positional component of a grammar. In topological descriptions, we must take as our starting point comparisons of maximally long clauses. According to this principle of maximal positionality, full clauses form the background against which to describe short sentences. These have empty positions that indicate the virtual topology of the sentence (see fig. 18.1). Thus, the relationship between combinatorial syntax and topology is made a matter of empirical investigation. Fields and positions are not in themselves constituents but topological concepts, discernible from the syntactic constituents that they host. For in-

Heute Der Vater	hat erzählt	der Vater jedoch nicht 0 0 nicht	den Kindern Geschichten erzählt den Kindern Geschichten 0
I dag Faderen	har fortæller	faderen alligevel ikke 0 0 ikke	fortalt børnene historier 0 børnene historier
så	havde	jeg skam ikke	givet Peter nøglen tilbage
så	gav	jeg skam ikke	0 Peter nøglen tilbage
så	gav	jeg 0 0	0 Peter nøglen tilbage
Jeg	gav	0 0 0	0 Peter nøglen tilbage
Jeg	gav	0 0 0	0 Peter nøglen 0

Fig. 18.1: After Diderichsen 1966, 55 (1943); 1946, 151

stance, the so-called *fundamentfelt* ‘fundamental field’ is open to sentence members of almost any type, but it is not in itself a syntactic constituent. One further instance is the position of *hv-* ‘wh-’ constituents in dependent interrogative clauses. Whatever their syntactic category – adverbial or nominal, subjects or objects, – they will always turn up in the position of subordinators, like the subordinator *om* ‘if’. *Hv*-elements contain a semantic conjunction element, and this – not their syntactic category – is the decisive factor.

For discussions and applications of this framework, including critical ones, see Diderichsen (1964); Hansen (1970); Teleman (1970); NyS 16–17 (1986); Platzack (1985; 1986); Faarlund (1990).

5.2. Diderichsen’s doctoral dissertation: *Sætningsbygningen i Skaanske Lov*

In this work, the topology for the language of Old Scanian is described in comparison with Mod.Dan. topology. The sentence frame for Mod.Dan. functions as the basic frame of reference, and against this background the Scanian situation is characterized.

Diderichsen did not explicitly design a layout for a sentence frame for the Old Scanian Law, but it is easily reconstructable from the analysis. It consists of an initial position, a position for the finite verb, a subject position and the content field. The content field differs greatly from the modern situation since sentence members may both precede and follow the non-finite verb. Following Behaghel, Diderichsen claimed that the order of the content field constituents mirrors semantic or syntactic affinity. Verbal particles or nouns that would in the modern language form synthetic units with the verb are closest to the non-finite verb; objects are next, and adverbial phrases

form the outer constituent (Diderichsen 1941, 43–45). Since these constituents may either precede or follow the verb, we have the formulas:

$$\begin{array}{c} V \text{ Part } O \text{ A} \\ A \text{ O Part } V \end{array}$$

(V = non-finite verb; O = object; A = adverbial phrase; Part = particle).

These formulas show the alternation between VO and OV order, or more generally, between VX and XV order. The subject position constitutes a separate problem, and Diderichsen would have to say that in Old Scanian, this position is not obligatorily filled, since at this stage, the subject may very well be preceded by content field constituents – particles, objects, and adverbials – it may even occur in the content field. Thus, his formula is the following:

$$F \text{ V (S) | A O Part V Part O A V} \dots$$

In the content field, there is a strong tendency for the constituents to follow either VX or XV order. Including the position for negation and back-grounded constituents, esp. weak pronouns, we have:

$$F \text{ V (S) L NEG | A O Part V Part O A}$$

(F = fundamental field; S = subject; L = weak pronoun). The rules are illustrated through the following examples:

Uil han æi at þem lahstæfnu dahi
[will he not at that meeting day]
sit stiborþ up taka (1941, 50)
his drawdoor up take

Æn wil hun ofthleka swa sælia bort.
[But will she often so sell away,
tha ma hun oc mykin scatha gora.
then may she also great harm do]
(ch. 152, ex. by author)

F	V	(S)	NEG	A		O	Part	V	Part
	Uil	han	æi	at þem lahtæfnu dahi		sit stiborþ	up	taka	
Kuna	ma	–	æy	mæth logum mer				sælia	
	wil	hun		ofthleka swa				sælia	bort
tha	ma	hun		oc		mykin scatha		gøra	
	Scal	man				iarn		bæra.	

F	V	(S)	NEG	A	O	Part	V	Part	O	A
thingmæn	mugu	–	æy	–	–	–	døma	af	thiufuj øra	
tha	scal	han					thwa		hand sina	

Fig. 18.2: Sentence frame for Old Scanian

thingmæn mugu æy doma
[thingmen may not sentence off
af thiufuj øra.
from a thief an ear]
(ch. 153, ex. by author)

Scal man iarn bæra. tha scal han
[must a man carry iron, then must he
thwa hand sina.
wash his hand] (ch. 154)

For the frame, see fig. 18.2.

It may not be clear in which sense the procedures behind such frames are structuralist ones. Diderichsen, however, is explicit about his predecessors. From John Ries (1927) he inherited the view that the basic unit is the sentence (G *Satz*, Dan. *sætning*), the organizing principle that structures the sentence members into a larger whole. In Aage Hansen (1933) he found the idea of the binary articulation of the sentences as a message, hence the concept of the fundamental field (the field for the topic), and more generally, from Viggo Brøndal (1932) the basic principle that combinatorial syntax and topology are discernible levels of analysis (see Diderichsen 1941, 2 for these acknowledgements).

Hjelmslev's influence is not manifest in this work, except for the fact that Diderichsen did not consider word order phenomena to be part of the language system – on the contrary, for him they are conventional language use phenomena (in Hjelmslev: *usus*, not *norm*). Referring to Mod.Dan., he refrains from calling verb first sentences *modus conditionalis* or *interrogativus*, verb-second sentences are not *modus affirmativus* etc. Neither did he consider word order systems to be case systems.

Word order patterns derive their signification value from convention, from genres and styles; the content value of genuine morphemes is, so to speak, an innate character of the system.

As a consequence of this view, he renounced the use of commutation tests in determining the content of word order differences. Thus, he does not pursue parallels that would seem obvious from the viewpoint of the present day. Other contemporary trends both in tradition and in structuralist modes (Meillet 1921 [1912]), would have permitted Diderichsen to emphasise instead the parallels between case and subject-object rules, and between mood and verb first/second.

Be this direct influence or not, surely his choice was in accordance with Hjelmslev's views. For an exposition of Diderichsen's later orientation towards Hjelmslev's position, see Gregersen (1990).

5.3. The sentence frame as a sign systematic model

The sentence frame was for a long time – and possibly still is – *the* descriptive model for the modern Mainl.Scand. languages, Danish, Norwegian and Swedish. One could claim that in some respects the frame is still unsurpassed, namely in explicitly relating positions and fields to content functions. The basic idea behind the initial position is not its function as a free landing place for almost any syntactic constituent, but its double coding as the position that determines sentential mood and the position for topics. Similarly, the actualisation field (“nexus field”) contains the constituents (finite verb, subject and sentence adverbials) that turn the sentence into something that can be predicated with a claim of validity. The content field is the field for descriptive sentence members, the referential and predicative elements of the predication. The sentence frame may thus be summarized as follows, relating positions to field, and these again to content functions:

Mood Topic	Predicational anchoring	Descriptive content
Initial field	Actualization field	Content field
F	v s a	V S A

(F = fundamental field, v = finite verb position, s = subject position, a = positions for sentence adverbials, incl. negation; V = non-finite verb position, S = positions for objects, A = positions for all other types of adverbials, e.g. of manner, time and place).

The fields and positions of the sentence frame reflect content distinctions, and the model is obviously a structuralist invention in this sense: it is a sign model. For an excellent modern interpretation where these codings are analysed for Norwegian, along with a discussion of the typological potential of the model, see Askedal (1986). Thus, Diderichsen's model is not structuralist in the sense of a glossematically inspired model. On the contrary, it reveals influence from Brøndal and Behaghel in its emphasis on cognitively and communicatively functional principles.

These explanatory principles are still on the agenda in functionally oriented paradigms, namely *fasthedsprincippet* 'the principle of firmness', exemplified above as the principle regulating positions for particles, objects and adverbial phrases, and *vægtprincippet* 'the weight principle', the 'Gesetz der wachsenden Glieder' (not exemplified, but see Diderichsen 1941, 36; 1946, 193).

5.4. Followers

Little was published in Denmark to follow up on Diderichsen's groundbreaking work, and in spite of the confrontations in the late forties, the impression remains that where language history is concerned, even Diderichsen's structuralism did little but scratch the surface. Valuable and necessary philological work in textual editing and textual history still dominates the picture. As a synchronic model of Dan. and, slightly adapted, also of Norw. and Sw., the model has been widely discussed and revised.

Anders Bjerrum was not a syntactician, and his Hjelmlevian orientation means that in his grammars (1954; 1967), he restricted himself to meanings of morphemes and dependency relations contracted by these categories. Allan Karker, who has never claimed to be a structuralist, has nevertheless been influenced by Diderichsen's and Bjerrum's terminology

("infinitival nexus", "vikariering", see e.g. Karker 1991). In a similar way, the Swede Nils Jörgensen (1987) uses parts of Diderichsen's framework for statistical studies, but his widespread use of concepts from other paradigms as well means that we do not characterise his work as structuralist.

Outside Denmark, Faarlund (1990) refers to Diderichsen's model when formulating the rules for the positions of prepositions and nonfinite verbs – although this is embedded in Faarlund's task of working out a wider frame for historical syntax.

In an excellent discussion of the character and spread of the rules for weak pronouns in Dan. dialects, the Dan. dialectologist Karen Margrethe Pedersen (1993) adds the observation that there is really no position for weak pronouns in Old Scanian, since full, but back-grounded noun phrases may go there as well:

at han giorthē bondanum æy
[that he did the owner-dat. not
mera schatha j thy af hoggi
more harm in this cut]
(*Scanian Law* B74, ch. 122)

her point being that *bondanum* precedes negation. Disregarding the rules for particle position, now a specification of the second predicate position, we have:

F V (S) X Y NEG | A O V O A

(The notation XY means that these positions are open to all NPs and adverbials. We would probably expect AO order, but examples are scarce for Scanian).

Following Pedersen and Faarlund, Heltoft (1995) has made explicit a version of a sentence frame for the language of the Old *Scanian Law*, with a view to formulating a set of hypotheses about later reanalysis and generalization in the history of Dan. syntax. The methodology and framework is explicitly Diderichsen's, embedded in a larger framework influenced by the Danish Functional Grammar group (Engberg-Pedersen et al. 1996; Harder 1996; Heltoft 1996).

3. Early generative approaches to Nordic language history
4. Contributions to the study of Nordic syntax history
5. Language change
6. Literature (a selection)

1. Introduction

This article surveys the contributions to Nordic language history by scholars working within the generative paradigm, concentrating on approaches to the history of syntax, including syntactically relevant morphology, since it is within this realm that the generative framework has led to original and fruitful results. The focus will be restricted to studies inspired by the Principles and Parameters theory of Chomsky (1981), and its modern version, the Minimalist program (Chomsky 1995).

2. Theoretical background

It is an underlying assumption of the Principles and Parameters approach that there is a component of the human mind/brain dedicated to language which is uniform to all human beings. Under the influence of the environment, the mind undergoes changes during the first 30–40 months of life, resulting in an attained state called the “internal language (I-language)” of a natural human language. I-language is considered a way of computing the connection between form and meaning. This connection is dependent on principles common to all human languages. Structural variation between languages is seen as depending on certain principles with multiple values, called parameters. For instance, it is a principle that the verb takes its object as comple-

ment (structural sister), but the relative order of the verb and its complement (VO: *verb-object* or OV: *object-verb*) is decided by a parameter.

There is a growing insight today that the concept “parameter” is pre-theoretical and is to be replaced by language-specific lexical properties in interaction with universal principles. The division of labor between universal principles and language-specific properties is similar to that in the natural sciences, where an interplay between general laws and local properties is used to account for observed events. Consider e. g. the parabolic trajectory of an object which is the result of two general laws (gravitation and the principle of inertia) in combination with situation-specific factors like mass, force and angle to the horizon. Even though the notion parameter may be outdated, I use the term here, since many studies of the history of Scandinavian syntax make use of this concept.

From an I-language perspective, grammars are never transmitted between generations; they are always created anew by the child from innate mental resources and the language surrounding the child (“Primary Linguistic Data”, PLD). Since PLD is both limited and heterogeneous, the attained internal language is inevitably underdetermined by the input data.

The learner’s normal task is to set parameters using whatever PLD is available. In a series of works, Lightfoot (1979; 1991; 1999) has considered this process, trying to come to grips with how principles on language acquisition restrict the ways in which children create an I-language. A change with respect to the I-language of the older generation has occurred when the child incorporates an I-language that at some point differs from the I-language of the older generation. In such a situation the I-languages of parent and child can be describ-

ed in the same way as two contemporaneous languages are described; hence the perspective is synchronic and comparative. Thus, in principle, arguments for a particular principle or parameter may be drawn both from a comparison between different historical stages of a language and from a comparison of different dialects or languages, the only difference being that the database is limited to surviving written records in the former case.

3. Early generative approaches to Nordic language history

As mentioned in the introduction, this article excludes contributions to Nordic language history by generative phonologists and morphophonologists; interested readers are referred to Ottósson's (1996) review (with references), and to the dissertations by Ralph (1975), Ottósson (1992) and Riad (1992). Also ignored are contributions to Nordic syntax history by scholars working outside the Chomskian mainstream of the generative paradigm (see Platzack 1998, ch. 1), which means e.g. that important works like Faarlund (1990) and Kristoffersen (1997) will not be presented.

4. Contributions to the study of Nordic syntax history

4.1. Oblique subjects

The first attempt to apply ideas from the Principles and Parameters framework to a problem in the history of Scandinavian syntax was Jan Terje Faarlund's article *Subject and nominative in Old Norse* (Faarlund 1980). In this article Faarlund sets the scene for a discussion that still prevails: did Old Norse (or Old Nordic) have oblique subjects or not, i.e. are the properties we associate with the concept of "subject" necessarily linked to a nominative NP? Within the generative tradition, Andrews (1976), Thráinsson (1979), Sigurðsson (1989) and several others have convincingly shown that Mod.Icel. has a wide variety of verbs and other predicates that take oblique arguments which, intuitively, correspond to subjects, and that they pass most subject tests. The only test they do not pass, besides not being nominative, is that they do not agree with the finite verb. Consider the examples in (1), where the oblique argument, like a nominative subject, inverts with the finite verb (1 a), and binds the reflexive (1 b):

- (1) (a) *Hafði mér því leiðst Haraldur.*
[had me.dat. thus bored Harold.
nom.]
(b) *Honum leiðist konan sín*
[him.dat. bores wife his.refl.acc.]

As Faarlund concludes, the ON situation is very much the same as in Mod.Icel.: it "may be fruitful to use the term 'subject' for a NP that has a particular grammatical relationship to the verb and the rest of the sentence, and that has a certain role in the information structure of the sentence. This grammatical category can then be expressed by different surface cases".

In later work, Faarlund (1987; 1990; 1999) argues explicitly that there are no oblique subjects in ON. The same conclusion is reached by Kristoffersen (1991; 1994; 1997) and Mørck (1992). On the other hand, Rögnvaldsson (1991; 1996b) argues in favor of the existence of oblique subjects in ON, and so do Barðdal (1997) and Haugan (1998 a). The debate has unearthed many interesting facts about the properties of oblique and nominative arguments in ON, but it illustrates at the same time one of the problems with historical syntax: since the description must be based on a finite amount of data, ultimately determined by the texts which happen to have survived, it is often hard or even impossible to find evidence for a particular position that all scholars accept as conclusive. This is amply illustrated in Falk (1995; 1997) with regard to OSw., who states that it is not possible to claim without reasonable doubt that oblique subjects existed.

The debate regarding the existence of oblique subjects in OScand. cannot be said to be representative of historical syntax performed within the Principles and Parameters framework: in fact, few specific assumptions of this framework are put to use in the debate. What is needed is a theory where the concept of 'subject' is not necessarily connected with nominative case, and such a division can be established in all approaches where case is not used in the definition of the subject. Indirectly, though, the connection to the Principles and Parameters framework is evident, since the possibility of having oblique subjects has been shown to be related to other differences between the modern Mainl.Scand. languages on one hand, and Mod.Icel. and Old Nordic on the other hand; see e.g. Platzack/Holmberg (1989) and Holmberg/Platzack (1990; 1995), where the relevant parametric difference is said to be the existence of overt subject-verb

agreement. I will return to a review of the syntactic effects of this type of agreement in section 4.3. below.

4.2. OV and VO

4.2.1. Swedish

An early generative contribution to the history of Nordic syntax within the Principles and Parameters framework is Platzack (1983), entitled *Three syntactic changes in the grammar of written Swedish around 1700*. In this paper, Platzack attempts to show that the simultaneity of three changes in written Sw. around 1700 is not a coincidence but can be given a grammar-internal explanation. The changes studied include the emergence of the option to delete auxiliary *ha* 'have' in subordinate clauses (see (2) below), the loss of the possibility of having final finite verb in subordinate clauses (3), and the loss of the possibility of having the non-finite main verb after its complements (4):

- (2) *hwilka the hade upskurit med Kniffwar, och sedan inslagit och lätit ingrodt sådan Färga* (Kiöping)
[which they had cut up with knives, and then rubbed in and let grow in such color]
- (3) *huad han der hafuer* (Stiernhielm)
[what he there has]
- (4) *Wi hade wekon förr en Stor-Bönedag haft* (Swedberg)
[we had the week before a Great Prayer-day had]

As Platzack demonstrates, the properties illustrated in (3) and (4) are both instances of one and the same parameter: the order of verb and complement. A person learning to write Sw. during the second half of the 17th century had to assume that this parameter is unset: written Sw. had both VO and OV at this time, whereas spoken Sw. only had VO. A person learning to write half a century later needed to assume VO for both written and spoken Sw. The possibility of deleting finite *ha* 'have' in subordinate clauses, a construction presumably borrowed from German during the second half of the 17th century, and maybe, as Platzack (1989a) suggests, supported by the emergence of a specific "supine" form of the past participle used only after auxiliary *ha*, might explain the rapid disappearance of OV from written Sw. during the first half of the 18th century. When *ha*-dropping became an option, sequences like (5) were syntactically ambiguous, since we cannot know if the auxiliary

is deleted from a position in front of the supine (VO) or after the supine (OV):

- (5) *att vi sjungit*
[that we sung.sup.]

A much more thorough and detailed study of the change from OV to VO in Sw. is found in Delsing (1999). This paper is based on an analysis of 16 texts from the period 1280–1600, containing roughly 780,000 words. The investigation clearly shows that the texts from the 13th century represent an I-language where OV was the only option; all cases of VO can be understood as extrapositions of the object and related constructions. Around 1300, there was a change in the underlying I-language such that noun phrases functioning as subject and object had to be accompanied by articles, overtly or covertly. This change had the effect that the underlying I-language for a period accepted both VO and OV word orders. Comparing the contexts where VO is preferred with those where OV is preferred, Delsing (1999) discerns two licensing principles for direct objects in OSw.:

- (6) Internal licensing: visible article, giving VO
- (7) External licensing: invisible article, forces raising of the object, giving OV.

The effect of these principles can be seen in the texts from 1300 and later: D(eterminer) P(hrase) objects, i. e. objects with a visible article, including proper names, are found after the verb, whereas objects without a visible article, including pronouns, are moved to a position in front of the verb. As Delsing mentions, the seemingly arbitrary variation with respect to OV/VO is only apparent: the position of the object is determined by the licensing principles. Delsing's study is a good example of the generative approach to the history of syntax, where theoretical insights are combined with rigorous empirical studies to reveal underlying principles that are important for understanding a situation where syntax apparently varies considerably.

4.2.2. Icelandic

Word order variation in the order of verb and object is found not only in OSw., but also in the other Nordic languages. OIcel. has been accounted for in three important works, Sigurðsson (1988), Rögnvaldsson (1996a), and Hróarsdóttir (1998); the authors agree with respect to the empirical characterization

of the situation, but not with respect to the theoretical interpretation.

Sigurðsson (1988) clearly shows that Old Icelandic had both VO and OV orders. Theoretically, Old Icelandic may have been a VO language, an OV language, or a language with a mixed base order. Sigurðsson's conclusion is that Old Icelandic represents a stage just after the change from OV to VO, probably under pressure from other parts of sentence structure that are head-initial.

When Rognvaldsson (1996a) reopened the discussion of OV/VO in Old Icelandic, his conclusion differed from Sigurðsson's: according to Rognvaldsson the most natural way of accounting for the variation is to assume that the VP in Old Icelandic was unspecified with respect to VO/OV. Rognvaldsson's approach is very close to the one found in Delsing (1999), noticing e.g. that pronominal objects tend to precede the verb and DP objects follow the verb, but he does not attempt to relate the different positions of pronouns and DPs to principles like (6) and (7). Rognvaldsson does not take a stand with respect to the status of the VP as head-initial (VO) or head-final (OV), and like Delsing for Old Swedish after 1300, he assumes a grammar without a fixed base order.

The third study in this group, Hróarsdóttir (1998), broadens the empirical base considerably by including other types of verb complements besides objects; theoretically, it is an interesting attempt to test the antisymmetrical hypothesis of Kayne (1994), according to which VO is the universal base order.

The loss of OV in Icelandic is the subject of a paper by Hróarsdóttir (1996); the main results are that in the course of approximately 60 years around the year 1800, the frequency of OV order dropped rapidly.

4.3. Subject-verb agreement

A typical contribution to historical syntax from the Principles and Parameters point of view is the series of investigations concerning the decline of subject-verb agreement in Mainland Scandinavian, i.e. Danish, Norwegian and Swedish, during the 15th, 16th and 17th centuries, and the effects of this loss on syntactic phenomena. The basis for these investigations is a hypothesis originally due to Kratzer (1984) and developed by Kosmeijer (1987, 99ff.), namely that the different positions of the finite verb in embedded clauses in modern Icelandic and modern Mainland Scandinavian, illustrated in (8) and (9), are an effect of the presence of subject-verb agreement in Icelandic, and its absence in Mainland Scandinavian.

- (8) (a) *að hann las aldrei bókina*
[that he read-3sg.never book-the]
(b) *að þeir lásu aldrei bókina*
[that they read-3pl.never book-the]
(9) *att han/de aldrig läste boken*
[that he/they never read book-the]

Many scholars have developed and refined the hypothesis that there is a relationship between subject-verb agreement and verb-raising to a position in front of sentence adverbials, most recently Rohrbacher (1999) and Vikner (1997–98). Of interest is also the possibility that many other syntactic differences between Icelandic and Mainland Scandinavian can be derived from morphological differences, like the ones presented in (10), based on Holmberg/Platzack (1990, 95). See also Vikner (1995):

- (10) (a) null expletives
(b) oblique subjects
(c) verb-raising in embedded clauses
(d) stylistic fronting ("kil")
(e) absence of pseudo-passives

That the cluster of properties in (10) was lost in Swedish more or less at the same time as subject-verb agreement disappeared is shown in Platzack (1985) in excerpts from 33 Swedish writers from 1550 to 1770, mainly taken from diary texts and informal letters. In a subsequent paper (Platzack 1988, of which Platzack 1989b is a Swedish version), it is demonstrated that Swedish lost verb-raising in embedded clauses (see (8) and (9) above) at this time as well.

The most detailed study so far of the Mainland Scandinavian syntactic changes that resulted from the loss of subject-verb agreement during the 16th and 17th centuries is found in Falk (1993a, b). Falk carefully investigates the different constructions, confirming beyond doubt the correctness of the preliminary results reached in Platzack's earlier studies. In addition, Falk shows how the loss of inflection is reflected in a gradual increase in the insertion of a non-referential expletive subject *det* 'it, there' in various constructions, and she also uncovers strategies used to compensate for the loss of agreement. Falk (1993a) also includes a discussion of the synchronic and diachronic approaches to language history, and various ways to explain a particular language change; cf. also Faarlund (1995) and Falk (1999).

4.4. The loss of case-marking in Mainland Scandinavian

Whereas the loss of subject-verb agreement has had radical consequences for Mainland

Scand. syntax, and the development of the determiner system of the noun seems to have consequences for the OV/VO variation mentioned in 4.3., the consequences of the loss of morphological case during the Middle Ages appear to be less dramatic. For Sw., the case system was first weakened in the period 1250–1350, as demonstrated in Delsing (1991); one important result was that the genitive was lost after verbs, adjectives and prepositions, but was retained in possessives. This genitive was, however, no longer a lexical genitive but a structural one. According to Delsing, this assumption enables us to explain both the emergence of the obligatory placement of the possessive genitive in front of the head noun (*konungens hus* ‘king (det.gen.) house’ < *hus konungens* ‘house king (gen.det.gen.)’ as well as the loss of all internal genitive markers (*konungens* ‘king (gen.det.gen.)’ > *konungens* ‘king (det.gen.)’) and the emergence of group genitives during the 15th century (*ens gammals mansz hæstr* ‘a(gen.) old(gen.) man(gen.) horse’ > *en gammal mans häst* ‘an old man(gen.) horse’).

When most of the case system broke down during the 15th century, one consequence was an increase in the availability of preposition stranding. Observing this change, Delsing (1995) suggests that preposition stranding is not compatible with morphological case, showing in detail that this holds true mainly for DPs in OSw., which begin to strand prepositions in the first half of the 15th century. Since DPs may strand prepositions in modern Icel., which has retained morphological case, Delsing’s hypothesis may seem hard to maintain, unless there is something special with the modern Icel. case system. Delsing provides cross-linguistic empirical support for the hypothesis that preposition stranding usually is unavailable in languages with morphological case.

Another consequence of the loss of morphological case is the loss of certain construction possibilities with psychological verbs, described from a generative perspective in Falk (1995; 1997), and in earlier frameworks by Lindqvist (1912) and Sundman (1985). It is evident from Falk’s description, however, that lexical case was not lost in Sw. with morphological case: on the contrary, verbs with lexically case-marked arguments and verbs that rely on structural case-marking of their arguments show a different historical development long after morphological case was lost. In Falk’s conception, lexical case is an idiosyn-

cratic specification of the verb, and its loss can thus be accounted for as individual changes for particular verbs.

4.5. Miscellaneous studies

In this subsection I briefly mention a number of studies of the history of Nordic syntax carried out within the Principles and Parameters framework, without going into details. In older variants of the Nordic languages, as well as in some modern dialects, it is possible to leave out an object when this is mentioned in the context. This is briefly discussed in Áfarli/Creider (1987), and given a more detailed treatment in Þóra Björk Hjartardóttir (1987) and Halldór Sigurðsson (1993).

Another set of facts that has been discussed in a generative framework is the passive in ON, see e.g. Haugan (1998a) and references cited there; partly, this discussion is related to the discussion of oblique subjects, see 4.1. Also worth mentioning is Eythórsson’s (1995) study of verb movement in both the syntax of runic inscriptions and in ON, and Haugan’s (1998b) account of right dislocated subjects in ON. The noun phrase in ON is described in Sund (1998). There are still large fields within Nordic historic syntax that have not been investigated with generative methods.

5. Language change

Generative grammar is an effective tool for comparing different I-languages, contemporaneous or not. It is also a powerful tool for accounting for grammar-internal consequences of various external changes, as has been shown earlier in this article. On the other hand, it cannot predict when a child, exposed to a particular set of primary linguistic data (PLD), will select a parameter value that differs from the value of the I-language of his/her parents, and it does not explain the spread of a new parameter value through a linguistic community. There are several reasons for this. First of all, generative theory is not a learning theory, thus it is not designed to account for the effects of exposure to a particular set of PLD. Secondly, it is not obvious that such a theory is available, since the number of theoretically possible sets of PLD, given a particular I-language, is almost infinite. To account for such a situation, we need models such as those in chaos theory, as suggested by Lundin (1999); generative grammar is certainly not a theory of this type.

20. Nordic language history and language typology

1. Introduction
2. The development of synthetic into analytic structures
3. Analyticity in an areal context
4. Concluding remarks
5. Literature (a selection)

1. Introduction

The aim of the present article is to describe the relationship between Nordic historical linguistics and language typology, except for word order and certain universals, which will

be discussed in more detail in a later article (205). While this other contribution deals with concrete developments in language history, here the emphasis is on certain basic theoretical points of view and in particular on relevant aspects of the research history pertaining to the typological study of Nord. languages.

This general approach is fraught with a number of problems, partly of a theoretical, partly of a practical nature. First, from a theoretical point of view, the reason for excluding

word order from a general typological overview is not self-evident. This implies concentrating on morphology, possibly including word formation, but excluding ordering phenomena which, in a universal perspective, to a certain extent stand in a complementary relationship to morphological means of expression. (Cf. the classical assumptions concerning case marking being replaced by fixed element order due to phonologically conditioned erosion of morphology.) Given a componential or modular conception of grammar, it might in principle seem natural to include studies that deal with intercomponential connections, which are no less interesting than intracomponential relations, in particular when it comes to formulating implicational rules and universals. One prominent example is Greenberg's (1966, 96) Universal 41: "If in a language the verb follows both the nominal subject and nominal object as the dominant order, the language almost always has a case system". In principle, general statements of this kind can be seen as the point of departure for a "holistic" quest for interrelations between syntactic, morphological and even phonological patterning phenomena. (Cf. Skalička 1979; Roelcke 1997, ch. 3; Plank 1998.)

In addition, different kinds of ordering phenomena have different systemic affiliations. The distribution of subjects, objects and adverbials is clearly a matter of clause-level syntax, while element order within composite nouns is clearly not. However, word order within NPs at least displays affiliations with clause-level linearization (Hawkins 1983) and is of interest in connection with the question of "consistent", i.e. uniformly right- or left-branching, vs. "inconsistent", i.e. mixed right- and left-branching, linearization of constituents across different syntagmatic constellations of elements (cf. the "Principle of cross-category harmony" in Hawkins 1983, 142–145, and the critical appraisal of such proposals in Oesterreicher 1989).

Second, there is the practical problem of what kind of work should be presented as relevant research on Nord. language history and language typology. In general, modern mainstream typologists show no great interest in the Nord. languages, and they are on the whole more concerned with synchronic than with diachronic description. Perhaps more significantly, scholars specializing in the history of the Nord. languages have not, with a few notable exceptions, dealt with typological per-

spectives in a very explicit fashion. However, it has to be admitted that before the upsurge in typological studies in the 1960s, the field of typological theory in fact did not have much more than the traditional synthetic/analytic distinction and similar morphology-related concepts to rely on.

Against this general background it seems natural, in the present contribution, to lay the main emphasis on the traditional synthetic/analytic distinction and related phenomena (section 2.) which is a kind of common, although most often implicit, background to part of the work that has been carried out. Syntheticity is commonly defined as categorical marking by inflectional means, analyticity as marking by means of auxiliary words with ordering restrictions as an ancillary resource (cf. Hulthén 1948, 212; Abraham 1988, 38, 787f., 865f.). In this context, the large-scale morphological restructuring that has occurred in Mainl.Scand. since the Middle Ages calls for some comment, as the common assumption of MLG influence would seem to amount to a hypothesis of transference of incipient constructional analyticity from one language system to another (section 3.). Finally, a concluding remark is in order concerning certain syntactic phenomena with which the syntheticity/analyticity distinction may be interconnected (section 4.).

In general, it is difficult to do full justice to the wish for a comprehensive state of the art report on Nord. diachronic typology for the simple reason that there are few explicitly typological works to refer to. On the other hand, the Nord. languages have been the object of intensive linguistic study for more than a century. The available body of research offers a great deal of material that is relevant in the context of typological studies despite the lack of an explicit typological orientation. In the conclusion, I shall try to indicate a few further perspectives for typological research.

2. The development of synthetic into analytic structures

2.1. Preliminaries

The original diachronic content of the analytic/synthetic distinction as presented by August Wilhelm von Schlegel is highly relevant to a characterization of the general direction of the typological development of the Nord.

languages. According to Schlegel, three basic (synchronic) types of morphological structure have to be assumed, i.e. “languages without a grammatical structure [isolating languages without manifest morphological marking], [agglutinative] languages using affixed, and languages having [fusional] inflection” (Schlegel 1818/²1971, 14; my translation with additions in square brackets). The inflectional type appears in two subtypes – synthetic and analytic – between which a historical relationship obtains (cf. Askedal 1998, 241 f.). In a synchronic sense, analytic languages are specifically described as languages making use of articles with nouns, personal pronouns with (“in front of”) verbs, auxiliaries for purposes of conjugation, and prepositions to compensate for the lack of morphological case marking, while still retaining a certain amount of inflection. Synthetic languages make do without these various periphrastic means of expression. Whereas “the origins of synthetic languages are lost in the mist of time” (Schlegel 1818; ²1971, 16; my translation), analytic languages are generally assumed to derive from the “decomposition” of synthetic languages. (See also art. 205).

In general terms, ON was a highly synthetic, inflecting language with regard to verb conjugation and noun, pronoun and adjective de-

clension, having the full set of Gmc tenses and moods (indicative, imperative, subjunctive with different forms for the present and past tense) and the common Ancient Gmc four-case system (nominative, accusative, dative, genitive). But ON also displayed characteristics which are typical of analyticity according to Schlegel’s list of criteria referred to above. The Mod.Nord. languages show interesting and typical differences with regard to the criteria for analyticity originally proposed by Schlegel (1818).

2.2. Auxiliaries and periphrastic constructions

Despite its rich finite verb morphology, ON did not lack auxiliaries. *Hafa* ‘have’ and *vera* ‘be’ were well established as perfect auxiliaries (Nygaard 1905, 184–191); *vera* ‘be’ and – less common in classical prose – *verða* ‘become’ were used as passive auxiliaries (Nygaard 1905, 174 f.). *Hafa* can occur with a participle which agrees for person, number and case, but in classical OIcel. prose sources it is more commonly found with a non-agreeing neuter participle (i.e. supine) form, testifying to its grammaticalization as an auxiliary verb. *Vera* and *verða*, on the other hand, only take a participle which agrees (Nygaard 1905, 190, 248):

- (1) *hefir þú Hlorriða hamar um*
 have you Thor’s hammer (masc.sg.acc.) (particle)
folginn?
 hidden (participle, masc.sg.acc.)
 ‘Have you hidden Thor’s hammer?’
- (2) *vér hófum fengit*
 we have received (participle, neut.sg.nom./acc. = supine)
mikinn skaða á mönnum várum
 great damage (masc.sg.acc.) to our men
 ‘Our men have been severely harmed.’
- (3) *er nu liðin*
 is now passed (participle, fem.sg.nom.)
sú stund ...
 this time (fem.sg.nom.)
 ‘The time has now passed ...’
- (4) *er þessi hringr keyptr eða*
 is this ring bought (participle, masc.sg.nom.) or
gefinn?
 given (participle, masc.sg.nom.)
 ‘Has this ring been bought by you or given to you?’

Munu ‘may’ with the infinitive appears to be so common as a designator of future events as to merit categorization as a tense auxiliary (Nygaard 1905, 191f.):

- (5) *bræðr munu berjask*
‘Brothers shall fight each other.’

In the modern languages, participles which agree have been retained with ‘be’ and ‘become’ in a Northern belt comprising Icel., Far., Norw. Nyno. and – in passive constructions only – Sw. Elsewhere the non-agreeing supine construction has been generalized. (See art. 205 for further details.)

2.3. Articles

ON has a postposed definite article which is not, however, often found in the older Eddaic poems. It is commonly used in later classical prose, but less than in Mod.Nord. There is also a preposed article requiring, basically as in Mod.Nord., a following adjective, but no grammaticalized indefinite article. (Cf. Nygaard 1905, 26–50.) Among the modern languages, only Mod.Icel. still lacks the indefinite article. In Mod.Ins.Scand. and Mod.Sw., the preposed adjective article is used in a somewhat more restricted way than in Mod.Norw. and Mod.Dan. (cf. Kress 1982, 170f., 174; Hulthén 1948, 45–66). This general state of affairs points to the following acquisition and grammaticalization hierarchy:

- (6) a. suffixal postposed definite article >
b. lexematic preposed definite adjective article >
c. lexematic preposed indefinite article

2.4. Subject pronouns and expletives

AN appears to have been more similar to modern “pro-drop” languages like Spanish or Italian with regard to subject pronouns with (Schlegel: “in front of”) verbs. First, omissibility of 3rd person subject pronouns is not restricted to cases of conjunction reduction but is found more generally as null anaphora (Nygaard 1905, 10–14; Faarlund 1990, 118–122):

- (7) *Ekki sá skipit fyrir lafinu.*
‘He couldn’t see the ship for the leaves.’
(8) *Óðinn vissi um alt jarðfé, hvar folgit vas.*
‘Odin knew where all the treasures hidden in the earth were.’

The omission of subjects appears not to have been radically different from omission of ob-

jects, and the omission of subjects with the imperative does not appear to have been radically different from omission in other syntactic environments (cf. Faarlund 1990, 118; 120). In this regard, all the modern languages including Mod.Icel. have undergone a major change to basic non-omissibility with conjunction reduction as a special environment licensing subject omission.

Second, there is the question of expletives, of which the following three main lexical and distributional types may be assumed for Gmc (cf. also Faarlund 1990, 63–73): (i) lexically conditioned semantically empty subjects with specific lexemes (e.g. Norw. *Det regner* ‘It’s raining.’); (ii) structurally conditioned semantically empty clause-initial elements (e.g. Mod.G *Es waren viele Leute anwesend.* ‘There were many people present.’); (iii) cataphoric pronominals correlated with a postposed sentential complement (subject or object) (e.g. Norw. *Han fant det hyggelig at alle var der.* ‘He found it nice that everyone was there’).

Types (i) and (ii) are apparently not present in ON, but Type (iii) exists with neut.sg. *þat* in initial position (Faarlund 1990, 72). In Mod.Icel. (and Far.), Types (i) and (ii) occur with clause-initial (but not clause-internal) neut.sg. *það*, and Type (iii) may even occur as stressed clause-internal *það* (Rögnvaldsson 1995, 6–8). In Mod.Mainl.Scand., there is a lexical difference between Norw. and Sw. on the one hand, which have one uniform expletive *det* in all three original types, and Dan., on the other hand, which has *det* in the modern Types (i) and (iii) and *der* in the Type (ii). There has thus been a general syntactic shift towards an obligatory expletive subject in all three original types. An obligatory expletive subject is required with all lexical impersonals in the original Type (i), and this requirement is extended to the two other types too. In Mod.Scand., Type (ii) comprises locative-existential clauses (9) and impersonal passives with (10) or without (11) a retained (indefinite) object. The development towards a generally obligatory expletive is most complete in Mod.Norw. In particular, Sw. allows to a certain extent for optionality of the expletive in Types (ii) and (iii) (cf. Falk 1993, 269–274):

- (9a) *Etter ham skulle det komme andre generasjoner.* (Norw.)
(9b) *Efter honom skulle Ø komma andra generationer.* (Sw.)
‘After him new generations were to come.’

- (10a) *I Latvia var det blitt opprettet et formelt "selvstyre" under ledelse av latviske kolaboratorer.* (Norw.)
- (10b) *I Lettland hade Ø upprättats ett formellt "självstyre" under ledning av lettiska samarbetsmän.* (Sw.)
 'In Latvia a formally independent government had been established under the leadership of Latvian collaborators.'
- (11a) *I flere vitneutsagn klages det over den store tilstrømmingen av veggelus.* (Norw.)
- (11b) *I flera vittnesmål klagas Ø över den rikliga tillgången på vägglöss.* (Sw.)
 'In several testimonies complaints were made about the number of bedbugs.'

The Sw. sentences in (9)–(11) may be considered relics of the original Type (ii) before syntactic reinterpretation as an impersonal construction with an expletive subject took place.

2.5. Prepositions and PPs

Prepositions have since the inception of morphological typology been considered a key indicator of change from syntheticity to analyticity. Traditionally, the emphasis has been particularly on the increase of PPs at the cost of (earlier case-marked) NPs.

A case in point is ON genitive or dative objects in various valency patterns. With a number of verbs, the genitive or dative object is in principle still optionally possible in Mod.Icel., but more often a PP is used instead (Kress 1982, 211f.; 225). A PP is the only alternative in the corresponding cases in Mod.Mainl. Scand. where the morphological distinctions between formerly case-marked objects are lost. Compare for instance the genitive objects in (12a–c) and the instrumental dative in (12d):

- (12a) Mod.Icel.Gen./PP vs. Mod.Mainl. Scand. (Norw.) PP: *leita einhvers/leita eftir* vs. *lete etter* 'look for'.
- (12b) Mod.Icel. Acc. + Gen./Acc. + PP vs. Mod.Mainl.Scand. (Norw.) DO + PP: *spyrja einhvern einhvers/... um eitthvað* vs. *spørre noen om noe* 'ask somebody about something'.
- (12c) Mod.Icel. Acc. + Gen./Gen. + PP (with linear shifting of the thematic roles) vs. Mod.Mainl.Scand. (Norw.) DO + PP: *beiða einhvern einhvers/beiðast einhvers af einhverjum* vs. *be noen om nol* 'ask someone for something'.

- (12d) Mod.Icel. (instrumental) Dat./PP vs. Mod.Scand. (Norw.) PP: *þekja hús (með) halmi* 'thatch' vs. ... *med halm*.

The dative in (12d) is a special case on account of its putative adjunct status.

Diachronically, the Mod.Icel. alternations and corresponding Mod.Mainl.Scand. replacements in (12) should be seen in the context of a more general system of oblique case/PP alternations in ON which comprised a fairly large number of verbs (Nygaard 1905, 101–154).

On the other hand, replacement of a case-marked IO by an inverted PP with three-place verbs (so-called "dative shift") – e.g. Mod. Norw. *gi noen noe/gi noe til noen* 'give someone something/give something to someone' – is rare in Mod.Icel. although widespread and productive in Mod.Mainl.Scand. (Holmberg/Platzack 1995, 188; 204f.). Thus, in the Indirect Object – Direct Object argument domain Icel. shows less of a transition from syntheticity to analyticity than with the lexically assigned cases in (12). The transition to analyticity is here more general in Mainl.Scand. than in Icel. (On the role of PPs as genitive replacements see 2.6.)

2.6. The genitive and genitive replacements

The ON genitive had the following broad range of uses (Nygaard 1905, 128–154): (i) Adnominal subordination (*þræll konungs* 'the king's slave'); (ii) verb-governed genitive object (cf. section 2.5.); (iii) object complement with certain adjectives (*Ólafur var þess ekki fljótr* 'Olaf was not fast at this'); (iv) predicative (*var sú litillar ættar* 'she was of modest descent'); (v) adverbial adjunct (*gærdags* 'yesterday'); (vi) object of a preposition (*til eyjarinnar* 'to the island').

In Mod.Icel., the ON genitive is in principle intact in all its traditional uses. In the other languages, the genitive has undergone a radical process of functional and morphological unification: (i) Its sole productive function is to mark subordination within NPs. Its use as the object of a preposition is only found vestigially in set phrases like Norw. *til sengs* 'to/in bed'. (ii) The modern genitive is uniformly realized as an *s*-suffix. (iii) It has been integrated into the prenominal determiner position (cf. Braunmüller 1982, 169–190). (iv) The domain of possible heads has been extended from nouns to complex NPs (*dronningen av Danmarks slott* 'the Queen of Denmark's

castles'). The genitive has thus changed from a fusional morpheme with a number of allomorphic realizations into an agglutinative suffix with one dominant syntactic function. Its modern manifestation represents a type of inflection that provides for more constructional transparency and is thus closer to analyticity.

In the modern languages, genitive forms of the personal pronoun are retained as paradigmatic equivalents of inflecting possessive adjectives (e. g. Norw. *hans bil/hus* 'his car/house' vs. *min bil/mitt hus* 'my car/house'). In Far., non-pronominal genitives are more or less absent from the spoken language but they are used occasionally in the written language as a stylistic relic (possibly under Dan. influence; cf. Hamre 1961). The situation is similar in Norw. Nyno. On the whole, the genitive has a stronger position in Dan., Sw. and Norw. Riksmål but in all these languages, the new agglutinative genitive has a number of functional competitors of a more straightforward analytic nature (cf. Norde 1997, ch. 3), in particular in the spoken colloquial varieties.

The non-pronominal genitive is often replaced by a postnominal attributive PP. It should be noted that no single preposition has been grammaticalized as an analytic genitive replacement (comparable to E *of*, Fr. *de*). A number of different prepositions are used. Compare e. g. Norw.:

- (13) *inngangen til huset* (cp. the genitive:
husets inngang)
entrance-the to house-the
'the entrance of the house'
- (14) *taket på huset* (cp. the genitive:
husets tak)
roof-the on house-the
'the roof of the house'

Since the late Middle Ages the genitive periphrasis in (15) which derives from a reanalyzed MLG possessive dative has been adopted by various West Dan. and West and North Norw. dialects and written Nyno.:

- (15) *mannen sin bil*
man-the his car
'the man's car'

The construction in (15) is currently gaining ground in spoken standard Norw. (cf. Torp 1973). In addition, certain Norw. dialects have the possessive construction in (16):

- (16) *bilen hans Ola*
car-the his Ola

Both constructions are clearly analytic in the sense that the possessor and the possessive relation are given separate lexical expression. The two constructions are similar in placing the relation-indicating pronoun or pronominal possessive adjective adjacent to the head noun, but they are mirror images of each other with regard to linearization:

- (17) [[possessor lexeme_x relational possessive adjective_y] [lexical head_z]]
[[lexical head_z] [relational pronoun_y possessor lexeme_x]]

Like the *s*-genitive, the complex possessive attribute in (15) is integrated in the pronominal determiner position of the NP and it is in principle not subject to lexical restrictions. The right-branching distribution of the complex possessive phrase in (16) is akin to that of postnominal possessive adjectives (cf. *bilen min* 'my car'), but it is lexically restricted to proper nouns (**bilen hans mannen*). Both constructions testify to the general drift toward constructional analyticity.

2.7. Varieties of analyticity

The general structural drift toward analyticity has affected the modern Nord. languages to a different extent. Intuitively, they constitute a syntheticity/analyticity hierarchy where Icel. is more synthetic than Far. and Far. is more synthetic than Mod.Mainl.Scand. (cf. Berkov 1989, 3; but see also Kubrjakova 1970 for a different view concerning Sw.). Within Mod.Mainl.Scand. certain analyticity differences exist concerning the use of auxiliary words of various kinds. Sw. stands apart in requiring auxiliary words to a lesser extent than Norw. and Dan. (Askedal 1997; Götzsche 1995). This divergence is due to a variety of convergent diachronic developments in Sw.

The absence of the preposed definite article in front of certain adjectives in Sw. reflects ON and OSw. usage (cf. 2.3. and Wessén 1965, 43–45; Lundeby 1994, 209f.):

- (18) *Ø lettiska ambassaden* (Sw.)
den latviske ambassade (Norw.)
'the Latvian embassy'

As noted in 2.4., expletives are more generally required in Norw. and Dan. than in Sw. The latter language vestigially reflects an older system still present in Mod.Icel. (cf. also Falk/Torp 1900, 6–11).

With regard to prepositions (cf. 2.5.), Sw. does without the infinitive marker, historically derived from a preposition, with a considerable number of infinitive-governing verbs whose Mod.Norw. and Dan. lexical equivalents require the use of the marker. Compare for instance:

- (19) *De hade slutat Ø diskutera marschen.*
De hadde sluttet å diskutere marsjen.
 'They had stopped discussing the march.'

Since OSw. times, there has been a general increase in the use of the *att*-infinitive (Wessén 1965, 149), but in Mod.Sw., omission is often the preferred option when the infinitive particle is optional (Hulthén 1944, 248).

Similarly, Sw. often does without an additional linking preposition in front of a governed infinitive (with the infinitive marker *att*) in cases where a linking preposition is required in Norw. and Dan.:

- (20) *Jag tvekar inte Ø att använda ordet.*
Jeg noler ikke med å anvende ordet.
 'I don't hesitate to use the word.'
- (21) *Hon var rädd Ø att möta honom.*
Hun var redd for å møte ham.
 'She was afraid of meeting him.'
- (22) *Han hade ingen befogenhet Ø att säga detta.*
Han hadde ingen myndighet til å si dette.
 'He had no authority to say this.'

The absence of a linking preposition in front of infinitival clauses in Sw. represents the older state of affairs (cf. Falk/Torp 1900, 204).

With regard to formal subjects, the preposed definite article, the infinitive particle and linking prepositions, Mod.Norw. and Mod.Dan. have innovated somewhat more consistently than Mod.Sw. The absence of auxiliary words in the examples adduced so far is due to morphosyntactic conservatism in Sw., but certain Sw. innovations contribute to the same overall effect.

Concerning auxiliaries, the suffixal *s*-passive developed as an alternative to the auxiliary passive from AN onwards. It has reached its maximal extension in Sw., whereas the other languages show morphological restrictions (cp. art. 205 for details). A corresponding difference is found when the Sw. synthetic *s*-suffix is used as a marker of reflexive or reciprocal reference:

- (23) *De politiska förutsättningarna hade inte ändrats.*
De politiske forutsetningene hadde ikke forandret seg.

'The political conditions had not changed.'

Since the 18th century, Sw. has allowed optional deletion of the perfect auxiliary 'have' in subordinate clauses (Platzack 1983):

- (24) *Jag tackar alla dem som Ø hjälpt mig i mitt arbete.*
Jeg takker alle dem som har hjulpet meg i mitt arbeide.
 'I thank all those who have assisted me in my work.'

Sw. also has a raising construction in a number of cases where Mod.Norw. and Mod.Dan. have a finite clause:

- (25) *De förklarade sig vara störda av musiken.*
De erklærte at de ble forstyrret av musiken.
 'They declared that they were disturbed by the music.'

Raising constructions became increasingly frequent in late Medieval Sw. (Wessén 1965, 340, 345). Norw. and Dan. did not follow suit.

The Sw. convergence phenomena noted here span the whole recorded history of the language. In these respects, Norw. and Dan. have developed in a systematically different fashion. The outcome is an interesting subtypological split in connection with the same general drift towards analyticity in the Mainl.Scand. area.

2.8. General perspectives

In connection with conjugation and declension, four general options may be assumed concerning the development from synthetic to analyticity: (i) a language may retain synthetic conjugation and declension (cf. putative Proto-Baltic and Mod.Lith.); (ii) it may retain rich synthetic conjugation but develop (more) analytic declension (cf. Lat. and Mod. Spanish; among Slavic languages OChSl. on the one hand and Bulg. and Macedonian on the other; cf. Berkov 1989, 5f.); (iii) logically possible, but empirically rare is the opposite development with retention of synthetic declension but formal reduction to (more) analytic conjugation (Berkov 1989, 5f.); and (iv) a language may develop (more) analytic conjugation and declension (cf. OE and Mod.E). Option (ii) (and (iii), to the extent that it can be documented) is of special methodological importance as it provides evidence of the non-interdependence of typological developments

within the two main word classes verb and noun.

Three of the four types are represented in Mod.Scand. Mod.Icel., being the morphological continuation of ON, represents option (i) above, but with the addition after the ON era of a number of periphrastic aspectual constructions. Cases in point are the following (Kress 1982, 154–162):

- (26) *Ég er að spyrja.*
'I'm asking.'
(27) *Ég er búinn að gleyma.*
'I have (already) forgot.'
(28) *Ég fer að hlæja*
'I am about to laugh.'
(29) *Hann er sofandi/vakandi.*
'He is asleep/awake.'

Mod.Icel. in fact represents a more general trend among modern inflecting IE languages to enrich a synthetic verb system by adding analytic constructions whose individual components (like Icel. finite verbs) are still often highly inflecting (compare Lith. and ModG).

Far. represents a change in the direction of option (iii). Mod.Far. has retained large parts of the Gmc and ON case system but has lost the subjunctive (with the marginal exception of the so-called present subjunctive as a formal relic; Barnes/Weyhe 1995, 205). Far. has also neutralized more person and number oppositions with finite verbs than Mod.Icel. (Cf. art. 205 for details.)

Option (iv) is represented by Mod.Mainl.Scand. Case has been lost with the exception of the subject/oblique distinction found in a limited number of personal pronouns. The formerly highly synthetic verb morphology has been reduced to a binary tense opposition between present and preterite without person and number oppositions in the modern languages (cf. art. 205). The Mod.Mainl.Scand. languages have also developed a broad variety of periphrastic verb constructions which add to their general analytic character (cf. e.g. Faarlund et al. 1997, 515–537, 591–627, 647–660 on Norw.).

3. Analyticity in an areal context

It is often assumed that the diachronic development from syntheticity to analyticity in Mainl.Scand. was supported or even caused by external influence from in particular MLG (cf. e.g. Haugen 1976, 253, 285). Considering the typological characteristics of ON, OLG

and MLG, the assumption of a MLG connection is debatable.

First, Ringgaard (1986) asserts that the beginnings of the neutralization of case oppositions in Dan. may be traced as far back as the 12th century. Second, Mainl.Scand. and MLG were both case marking languages with the four traditional Gmc cases (cf. Björnheden 1997). Third, and perhaps most importantly, neutralization of case oppositions would seem typologically more natural in Mainl.Scand. than in LG in view of the regularities expressed in Greenberg's Universal 41 (cf. sect. 1). In Nord., the shift from what appears to have been a mixed XV/VX situation in AN to uniform VX in ON was more or less complete by the time of the appearance of the first written sources (cf. Braunmüller 1982, ch. 3), whereas LG has to this day retained a basic XV structure despite the neutralization of case oppositions since MLG times (cf. Lindow et al. 1998, 144; 296f., and the contributions on Mod.LG dialects in Russ 1990):

	case marking	verb position
(I) O/MLG:	N, A, D, G	XV
(II) ON (and Mod.Icel./Far.)	N, A, D, (G)	VX
(III) Mod.LG:	N, Obl (pron)	XV
(IV) Mod.Mainl.Scand.:	N, Obl (pron)	VX

Thus, the LG development has been the rather unexpected one from system (I) to system (III) in (27), whereas Mainl.Scand. has undergone the development from system (II) to (IV) that one would rather expect within a Greenbergian framework.

If there was a MLG impact on Mainl.Scand. analyticity drift and case loss in the Middle Ages, it cannot have been direct or formative; it must rather have been indirect and supportive. One possible hypothesis is that Scandinavians engaging in semicom-munication (cf. Braunmüller 1996) with LG speakers allowed their command of their own case system to be weakened, another that they may even have been actively imitating the morphological simplification errors made by Low Germans trying to speak Scandinavian.

4. Concluding remarks

From a purely morphological point of view, the former morphological unity of AN and ON has given way to a split among the Mod.Scand. languages between a still highly synthetic insular branch consisting of Mod.Icel. and Far. on the one hand and

Mod.Mainl.Scand. on the other (with Far. leaning toward Mainl.Scand.). This picture is, however, somewhat one-sided. When syntactic phenomena are also taken into account, an underlying unity appears to the extent that all the languages display the basic configurational features commonly found with VX ("SVO") languages. In particular, the oblique subjects of Mod.Icel. and Far. provide interesting evidence that syntactic restructuring may precede a change of morphological type rather than be caused by it. (Cf. art. 205 for a more detailed discussion of the systematic connections between the syntactic and morphological phenomena in question.)

Some of the available research indicates perspectives and possibilities for further typological study. For instance, Braunmüller's (1999) synchronic descriptions of the phoneme inventories of the modern Nord. languages and Garlén's (1984, 182–221) synchronic survey of the phoneme systems of 30 different languages in connection with his description of the Mod.Sw. phoneme system would appear to invite further typological and diachronic comparison in the field of phonology. The special Peninsular Scand. tone opposition has already been the object of intensive study (cf. e.g. Liberman 1982), but recent work indicates the possibility and relevance of further typological perspectives (Hognestad 1997).

Concerning morphology, the Nord. languages seem to offer opportunities for more detailed and diversified study of morphological restructuring processes than is commonly provided by the traditionally rather superficial application of the synthetic/analytic distinction (cf. 2.1.). For instance, there is a difference between Mod.Norw. *sanger* – *sang-ene* '(the) songs' vs. Sw. *sånger* – *sång-er-na* insofar as the plural morpheme and the definiteness morpheme are merged in Mod.Norw. but constitute an agglutinative chain in Mod.Sw. On the other hand, the genitive morpheme *-s* is agglutinating in all of Mainl.Scand., cf. Norw. *sang-ene-s* and Sw. *sång-er-na-s* 'of the songs'. The history and extent of the transition from highly fusional ON to simplified fusion in Mod.Norw. and more transparent agglutination in Mod.Sw. awaits closer scrutiny from a typological point of view, particularly with regard to the systematically less well understood MSw., MDan. and MNorw. periods.

In a broader perspective, Braunmüller's (1995) contention that small speech communities are more apt to tolerate morphological

opaqueness provides an interesting socio-ecological background for the typological study of morphological variation among dialects in the Nord. area as a result of morpho-phonological change.

21. Nordic language history and research on word order

1. The status of word order studies
2. Word order studies of Ancient Nordic
3. Word order studies of Old Nordic runic inscriptions
4. The word order of Old Nordic
5. Foreign impact on word order
6. Literature (a selection)

1. The status of word order studies

One of the main points of interest of modern linguistics is syntax and word order, although introductory ON coursebooks only mirror this to a certain degree: Wessén (1961) and Iversen (1973) limit themselves to a couple of syntactical phenomena, while Heusler (1962), Hanssen/Mundal/Skadberg (1975) and Haugen (1995) aim at a better balance between morphology and syntax, word order included. In works on Nordic language history, the situation is the same; if mentioned, word order plays only a minor part. Seip (1955) scarcely refers to syntactic phenomena at all, Skautrup (1944–68) devotes a few pages to the matter of syntax and word order, while Wessén (1965) dedicates a whole volume to historical syntax. Nygaard (1905) is still the most comprehensive work on ON syntax.

Being well aware that the last fifty years have witnessed many new approaches to general linguistics, syntax and word order, I shall confine myself here to present research on surface constituent order, verb position in sentences and clauses as well as phrase structure. Word order beyond basic word order typology in a certain language may be governed by syntactic functions, semantic roles, pragmatic functions, prosody, or, eventually, a combination of these factors (Wessén 1965, 205). To some extent all these factors, alone or combined, will be commented upon as relevant to different aspects of Nordic word order studies treated here.

2. Word order studies of AN

The majority of the nearly 200 known inscriptions in the older runic alphabet, the older futhark, dated from about 150 to 750 A.D., are found in Scandinavia and are usually considered to be written in the AN language. In spite of their wide geographical spread, these inscriptions are linguistically quite consistent. Scholars do not fully agree upon whether the

inscriptions originally represented a spoken or a written language, nor whether the language in question was homogeneous or had dialectal variation. See Grønvik (1981, 36ff.) for further references.

One central problem concerning the runic inscriptions of this period as well as of the younger one is that they are relatively short, syntactically quite stereotypic and seldom extend beyond the bounds of a sentence, only rarely containing a subordinate clause. There are therefore very limited possibilities for studying sentences and constituent order in context, a fact that severely restricts our means of deciding the degrees of markedness for e.g. metrical, stylistic or pragmatic purposes.

2.1. Main clauses

Krause (1971, 133f.) devotes only two pages to word order in his detailed presentation of a total of 127 AN inscriptions, focusing on finite verb position, V1, V2, V3 (and V4). He gives no statistics but states that V2 occurs frequently. According to Ureland (1978, 120), there are 35 inscriptions in Krause's material which can be considered relevant for word order studies. All three verb positions are to be found in the main clause; V1 is attested in 8 cases, (22.9%), V2 in 15 cases, (42.8%), whereas the 12 V3 cases cover the remaining 34.3%. Antonsen (1975, 24ff.) deals with nearly the same corpus as Krause but divides it into dialect groups, listing in all 121 inscriptions. Antonsen clearly advocates the SOV pattern as the unmarked one for the inscriptions representing NwGmc in the material (100–550 A.D.): “Syntactically, NWGmc seems to have diverged only slightly from PG, with S + V + O beginning to incur upon the dominant S + O + V order ...” (p. 26). Among the 93 examples of NWGmc, the position of the verb versus other constituents may be determined in 34 sentences, according to Antonsen. He categorizes 22 sentences as verb final, 3 as verb first and 8 as having a medial verb. Antonsen's verb-final group may be strongly misleading, because several of the listed examples evidently do not contain any other constituents than S + V at all. These inscriptions should of course not be taken as evidence for verb finalness in support of an SOV hypothesis because there is no relevant object present.

In addition to the 34 NWGmc inscriptions, Antonsen accounts for 12 of the somewhat younger NGmc examples of main clauses, of which 10 have the finite verb in medial position. Based on these examples, Antonsen claims that a dramatic syntactic change has taken place in NGmc (including EN); the unmarked word order has become S + V + O, clearly implying that frequency of occurrence corresponds to unmarkedness.

Faarlund (1990a, 51) states: "In Nordic, the complete change from OV to VO can be followed closely in the extant material." He regards the variation as a result of "focusing", and not of the commonly accepted "afterthought", which in his view normally results in a right-dislocated construction: "The focus of the sentence is that part of the sentence which carries new information, or which is least predictable from the context" (1990a, 55).

Faarlund (1990b) challenges the orthodox question of free or fixed word order for AN, to which he gives quite an untraditional answer: The constituent order is free concerning morphological case and semantic role, but fixed from a more functional point of view. Studying the relative order of the nominal constituents (NPs) in each inscription, he concludes that a "reference-and-empathy" hierarchy seems to govern the internal relative order of such constituents. Anaphoric reference is on the top of this hierarchy, followed by "nominal elements of higher empathy deictic reference", "low empathy deictic reference" and finally all other elements.

Since there is about the same percentage of verb-second structures as verb-final ones in the AN runic main clauses as a whole, misinterpretations and miscalculations taken into consideration, the question of which word order should be considered unmarked or neutral cannot be answered categorically on the basis of constituent order alone. If markedness correlates strictly with frequency, there might be equally good reasons to prefer V2 as the unmarked word order rather than V3 or verb-final. Braunmüller (1982, 139) tends to characterize AN as already being an SVO language, while Braunmüller (1994, 29ff.) characterizes the older stages of the Gmc family as typologically ambivalent, maybe even typologically undetermined. Ureland (1989, 253) states: "There is no question about the double SVO and SOV character of the Proto-Scandinavian runic material."

Antonsen's suggestions of dialectal variance seem to be founded on too little evidence

to be conclusive, and his suggestions of topicalization (Antonsen 1975, 24), although interesting, are very difficult to verify due to the nature of the runic material. For further critics, see Braunmüller (1982, 142ff.). Likewise Faarlund's theory of pragmatic hierarchies (1990b), or of focusing as the reason for the shift from OV to VO (1990a, 55) may not be totally convincing. But incontestably, Faarlund's approach represents a challenge to more traditionally and less pragmatically oriented syntactic approaches.

2.2. Subordinate clauses

Only a couple of subordinate clauses are attested in the AN runic material: two fairly synonymous relative clauses, both exhibiting (S)OV word order and having a pronominal object preceding the finite verb form are cited by Antonsen (1975, 25) and mentioned by Faarlund (1987, 53).

2.3. Phrase structure

Krause (1971) does not comment at all upon the order of the elements of phrases. With some exceptions, the evidence from NWGmc, according to Antonsen (1975, 24f.) points at an SOV language, but in the somewhat younger inscriptions from NGmc, a breakdown in the old ordering seems to take place. But as Braunmüller (1994, 29ff.) indicates, the typological evidence from AN noun phrase structures as a whole is in fact quite ambivalent and confusing, some constructions pointing in the direction of SVO as being the unmarked or basic constituent order, others more in the direction of SOV. He further emphasizes the fact that the shortness of an element may be crucial for its placement, thus stressing prosodic factors as part of the explanation for a certain order, as well as typological and grammatical ones (Braunmüller 1994, 31). Antonsen's claim (1975, 24) "that animate heads require a following genitive, inanimate ones a preceding genitive", cannot be confirmed. Braunmüller further points out, in adherence to Faarlund (1990a, 94f.), how the apparent ambiguity of word order in phrases may be explained as a result of the PGmc noun phrase being "non-configurational", that is: "... adjectives (A') and prepositional phrases (P'') are not members of the syntactic categories DET(erminer) or Spec(ifier), but form two constituents of their own. They may thus oc-

copy different syntactic as well as topological positions within an N''-constituent'' (Braunmüller 1994, 36f.).

3. Word order studies of ON runic inscriptions

There are more than 3500 runic inscriptions from the Viking period (800–1100). Perridon (1996, 248) stresses that there should be “no good reason for supposing that the syntax of the inscriptions was radically different from that of everyday speech in that time”. In addition there are about 2500 inscriptions from the Middle Ages, the older part of these still representing the ON language.

3.1. Main clauses

There has been no comprehensive work done on word order in sentences and clauses in the younger runic material since Larsson (1931), who confirms the V2 order of the main clause. Larsson documents no convincing examples of verb-final structures in the 2000 mostly Sw. inscriptions he investigates. There is no reason to believe that the evidence from Denmark and Norway should deviate to a great extent from the Sw. material, although more extensive research needs to be done before final conclusions can be drawn. Thus, based on the findings in Larsson (1931), in the absence of more recent empirical research, Runic Nord. as a totality is clearly a V2 language. The very few deviances (Larsson 1931, 32ff.) may be due to metrical or magical formulations, to mistakes, misinterpretations, or possibly to foreign influence (see sect. 5).

3.2. Subordinate clauses

There are relatively few subordinate clauses in the actual material, most of them relative clauses. Temporal and comparative clauses are also attested in a few cases, according to Larsson (1931, 39f.).

V2 is incontestably the dominant verb position in the subordinate as well as in the main clause. Ureland (1978, 120) mentions four exceptions from V2 or V1 structures, cf. Larsson (1931, 40). A striking trait, though, found mostly in relative clauses, is that a constituent traditionally regarded as belonging to the verb phrase and normally occurring after the finite verb may occupy the position just after the relative particle in front of the finite verb. This

word order, which notably normally conserves the V2 structure of the clause but yields an OV order, is called “stylistic fronting” or “stylistic inversion” by some scholars; by others it is looked upon as a straightforward case of topicalization, although occurring in a dependent clause. Some examples violate the V2 constraint. See sect. 4.2. and 5.

3.3. Phrase structure

3.3.1. Noun phrases

Noun phrases in the OSw. runic material from the Viking Age have been closely examined by Perridon (1996), in ODan. by Nielsen (1943) and Marez (1981). Braunmüller (1994) also draws on evidence from this period. No word order study as such has been done recently on the Norw. runic material exclusively, but Nielsen (1943) comments upon some examples. Different kinds of modifiers in the modern sense – adjectives, numerals, genitives, demonstratives etc. – may occur on both sides of the nominal head and even be dislocated from the head, as was also the case during the preceding period. Perridon’s thorough analysis concentrates on the quantitative aspects of the placement of these modifiers. Based mainly on frequency of occurrence, he draws rather careful conclusions about the reasons for the variation found. Without taking any typological aspects into consideration, he claims that the order of the adjective versus the nominal head indicates a free word order. Thus, Perridon asserts (1996, 250) that the Sw. material does not confirm the hypothesis advocated by Marez (1981, 398), following Nielsen (1943, 216f.) and other earlier scholars, who hold that the position of the adjective may have had different semantic values depending on whether it was pre- or postposed in Runic Dan. That is, the adjective is supposed to be “characterizing” when preposed and “qualifying” when postposed. “Characterizing” in this sense implies a close relation between the nominal head and the modifier, the modifier plus head thus being a predecessor of a nominal compound of the modern Nord. type. Perridon concludes that word order in the nominal phrase varies, and that there might be some slight geographical differences between Runic Sw. on the one hand and Runic Dan. on the other, for several of the noun phrase types in question. He concludes as follows: “The noun phrase in Viking Age Scandinavian differs considerably from

the one found in modern Swedish and Danish” (1996, 259). Nielsen (1943) and Marez (1981) both tend to give somewhat more complex explanations for the variation found in word order – the pre- and postpositions, the dislocation of elements – than does Perridon (1996). In addition, Braunmüller (1994, 39 ff.) suggests that the relative length of the elements of the NP, stress and referentiality are factors not to be totally overlooked. Marez (1981, 408 ff.) draws attention explicitly to the dislocation of modifiers and to the position of appositions, an intriguing phenomenon well worth further study.

3.3.2. Verb phrases

Faarlund (1990b, 169) emphasizes that there is no basis either in the AN runic material or in later stages of the language for saying that the VP constituent consists of the main verb and its closest object. Ureland (1978, 121), taking a more typological perspective, indicates that the enclitic verb forms (e.g. the mediopassives) represent a syntactic innovation which can only occur in a language which typologically is VO, with the object normally occurring after the finite verb form, and thus advocates SVO as the unmarked pattern for ON, an opinion also held by Larsson (1931, 35). However, Kossuth (1978, 43) as well as Lehmann (1978, 111) explicitly draw the opposite conclusion. They believe these word formations are remnants of an older SOV pattern, and probably consider the *-sk* ending to be a proper suffix – suffixation and not affixation being the normal process in an SOV language – a view perhaps due to a somewhat rigid but traditional interpretation of Greenberg’s Universal 27.

4. The word order of ON

There is no reason to believe that constituent order or verb position varied radically within the ON realm, as there are no fundamental differences attested concerning the main patterns of word order in East and West ON and no crucial differences between the Mainl. Scand. languages of today. This fact does not exclude minor word order divergences, a preponderance of particular stylistic devices or means of expression due to genre and the nature of texts, their orality versus literacy, or varying degrees of foreign impact (see 5.).

4.1. Main clauses

Old and Mod. Nord. are both primarily V2: only one constituent may occupy the position in front of the finite verb form in the main clause, that is, the “front field” in the so-called “field analysis”, a highly influential topological model developed by Diderichsen (1941, 1946) for Old and Mod. Dan.

A striking phenomenon in ON texts, though, is that the matrix relatively often is V1. Prompted by a fatal but authoritative quotation from Heusler’s §508 (1962, 173) which states that the V1 order is so frequent, “daß man darin die aisl. Normalstellung sehen konnte”, scholars have been led to believe that the V1 order is a candidate for the unmarked or neutral pattern of word order in ON. Whereas this pattern is restricted to questions in Mod. Scand., it uncontestedly had a far more general use in ON, being a device for context marking in the matrix, yielding main clauses with no topicalized element in front of the finite verb, an “empty front field” in Diderichsen’s terminology. This use of V1 order is traditionally called “narrative inversion” and has been studied in the Icel. family sagas in particular; cf. Rieger (1968); Kossuth (1978, 38 ff.) and Platzack (1985) for further references. Christoffersen (1993, 53 ff.) shows that this word order is quite common in the matrix in the WN legal language as well and should be considered a general context marker. The label “discourse cohesion” applied by Sigurðsson (1990, 45) therefore seems a more appropriate term than does the relatively well-established “narrative inversion”. As there are differences in frequency of the V1 order within the saga genre itself, as attested by Hallberg (1965), there might also be geographical differences between EN and WN. Platzack (1985, 135) shows that SV word order after *ok* is extremely rare in the sagas he has examined, as does Christoffersen (1993, 102) for ONorw. legal language. Sigurðsson attests a somewhat higher number of SV orders after the coordinator for OIcel. (1990, 51), while Wessén (1965, 208) rather surprisingly, but probably inaccurately, claims that the normal word order is SV after *ok* in OIcel. as well as in OSw. Here we agree with Platzack (1985, 142) who states that “[...] the frequent use of declarative VS-sentences in Old Icelandic Sagas has nothing to do with a typological difference between Old Icelandic and other Germanic languages [...]”. Faarlund (1985, 376) stands alone in claiming that V1 in the main clause is a mere case of topical-

ization: “Since any category can be topicalized, the finite verb can also be topicalized in its own right [...]”.

An ON main clause may commence with the subject, the finite verb or a topicalized element, exemplifying the word order patterns SVX, VSX or TVX (cf. Christoffersen 1980), and an initial element may be dislocated, as in the Mod. Scand. languages (cf. Christoffersen 1993, 261 ff.). The position of nominal constituents, subjects included, is somewhat freer than in Mod.Scand. A non-thematic subject may even occupy the last position in the sentence (cf. Faarlund 1985, 374f.). Such deviations from the far more frequent patterns where the subject either is in first or third position may be due to the nature of the ON subject as such, see Mørck (1994), or to thematic as well as rhythmical reasons. Still, as in Mod.Nord., topicalization of the subject is less marked and less context-sensitive than topicalization of any other nominal constituent. Christoffersen (1993, 338ff.), based on empirical studies, tends to explain internal word order variation in a discourse-functional perspective and postulates four possible positions for NPs in the matrix, with the second position just after the finite verb, being the theme-position *per se*. Lehmann (1978, 111) categorically states: “The Old Icelandic, Old Norwegian, Old Danish and Old Swedish texts which have come down to us are without question VO in structure.” This claim may be too strong if V also represents the nonfinite verb form, because recent empirical studies, e.g. Christoffersen (1993, 332ff.); Rögnvaldsson (1996, 82f.); Hróarsdóttir (1999, 278ff.), clearly show that other constituents quite frequently occupy the position between the verb forms in ON, yielding surface OV structures. Faarlund (1990a, 100ff.), on the other hand, maintains that “The position of the nonfinite verb is typically first in the final part of the sentence”, admitting, however, that this principle may be overridden by discourse-functional or stylistic principles.

To conclude, the ON main clause is clearly V2, but there is incontestably a “synchronic variation in phrase structure”, cf. Rögnvaldsson (1996, 76), which, within different linguistic paradigms, will call for diverging explanations of the OV-VO variation. See sect. 5.

4.2. Subordinate clauses

In ON, word order in main and subordinate clauses is identical when it comes to the po-

sition of the finite verb, while Mod.Scand. has developed a distinct subordinate surface order in which the sentence adverbial precedes the finite verb form, a V3 order (see sect. 5). V2 is clearly the dominant verb position in the ON subordinate clause (notably when the subordinator is not regarded as a proper constituent). Quite often, though, constituents other than the subject precede the finite verb form. This happens in particular when the clause for some reason lacks a grammatical subject, although this fronting by no means is restricted to such sentences. Some scholars look upon this phenomenon as a straightforward case of topicalization, a trait shared by the ON subordinate and matrix clauses (Rögnvaldsson/Thráinsson 1990, 24). The fronting of constituents other than the subject in the subordinate clause has been called “stylistic inversion” or “stylistic fronting”, terms attributed to Maling (1980).

It can also happen, particularly in OSw., more seldom in ODan., and very rarely in ONorw., that a subordinate clause exhibits a proper SOV order which cannot be explained as a case of “stylistic inversion”. See Ureland (1989, 258ff.) and sect. 5.

4.3. Phrase structure

There have been no comprehensive empirical studies carried out on nominal phrase structure, verb phrase structure or prepositional phrase structure in ON except for the studies of the runic material presented under sect. 2.3. and 3.3. Faarlund (1990a, 17, 94ff.) as a whole mainly draws on evidence from Nygaard (1905) and the Icel. family sagas.

The order of elements in noun phrases seems to vary, cf. Braunmüller (1994); Kossuth (1978, 48f). Nominal modifiers may occupy the position in front of or after the head, or be discontinuous, cf. Lødrup (1983).

Faarlund (1990a, 86ff.) holds that there is no verb phrase in ON. His main argument for this is that when topicalized, the nonfinite verb form never triggers topicalization of nominal modifiers, as in Mod.Scand., and that there is no VP pronominalization. Other scholars advocate the existence of a VP with varying internal word order (Rögnvaldsson 1996, 69ff.), due to pragmatic and prosodic factors and to individual variation.

Faarlund (1990a, 97f.) also argues that the status of the prepositional phrase (PP) differs from that of Mod.Scand. Although he asserts that it is “normal for prepositions to precede

their objects”, he emphasizes that there are numerous exceptions to this rule. Faarlund’s examples of discontinuous PPs in ON may be relevant for the discussion of configurationality, but the number of discontinuous phrases compared to the normal ones, is probably relatively small, and his theory needs to be proved by further empirical studies.

4.4. Topic prominency

Li/Thompson (1976) made a distinction between so-called “subject-predicate languages” and “topic prominent languages”. “Subject-predicate languages” manifest the normal sentence structure and concord between the nominal subject and the finite verb form, while the sentence pattern in a “topic prominent language” usually has a left-dislocated nominal phrase with a more or less loose connection to the rest of the sentence without apparently violating the acceptable sentence structure. It has been argued that ON seems to be more “topic prominent” than the modern stages of the Nord. languages, because such constructions are found in ON. See Christoffersen (1981); Dyvik (1980, 74f.).

4.5. Conclusion

The attested surface constituent order vacillates between (S)V(O) and (S)OV in the AN runic material but is most often SVO with a very few deviances in ON runic main clauses. Subordinate order is barely attested in AN, yielding some evidence of so-called “stylistic inversion” for Runic Nord., examples which notably must not be taken as evidence for verb-final structures because V2 normally is well preserved in these sentences. Phrase structure is highly variable in the runic material as a whole and does not attest a fixed order of elements, maybe signalling “nonconfigurationality”, to apply Faarlund’s term, or typological undeterminedness (Braunmüller 1994, 29ff.).

The ON main clause is V2 and has V1 as a marked alternative order, and all constituents may precede the finite verb form, as topicalized elements. Subordinate clauses are V2, but exceptions are found, especially in EN. The verb phrase as well as the nominal phrase demonstrates variable word orders.

5. Foreign impact on word order

It is still a matter of discussion whether syntactic borrowing or major syntactic change through linguistic contact is possible at all. A

frequently emphasized requirement for borrowing is the “structural compatibility” requirement (Harris/Campbell 1995, 120ff.), implying that genetic closeness and typological similarity are prerequisites for such borrowing. In the model of Thomason/Kaufman (1988, 50/74ff.) substantial lexical and morphemic impact clearly precede major syntactic change. Cf. also Zeevaert (2000). Harris/Campbell (1995, 149), however, conclude as follows: “[...] as far as the strictly linguistic possibilities go, any linguistic feature can be transferred from any language to any other language”.

Looking at the Nord. languages, lexical as well as morphological influence from Lat. and from different stages of G is quite easy to demonstrate, while syntactic borrowing and even minor influence on word order may be very difficult to attest. Although the general lexical impact especially from MLG must have been massive, such influence probably represents only the first stages of language change induced by foreign contact (Zeevaert 2000, 175ff.). Thus, impact from Lat., MLG and later Early HG, which incontestably was substantial on the lexical and morphological domains in the Nord. languages, does not necessarily imply major syntactic change.

The Nord. languages at different stages, as well as the most influential foreign ones – Lat., MLG and Early HG – all manifest a great deal of internal word order variation. When word order varies in the influenced as well as in the influencing language, it is plausible that foreign impact may lead to an increase in the occurrence of marginal patterns in the affected language, with rare constructions finding their direct correspondences in a more frequent pattern in the other language: “[...] im verstärkten Gebrauch von bereits vorhandenen syntaktischen Strukturen [...]” (Zeevaert 2000). This is facilitated when the languages were used by bi- or multilingual members of the society. In most typological and generative studies, the primary cause of word order change is seen as being language internal, and similarities between languages tend to be explained as “parallel inner developments”, or as a change in parameters. Ureland (1989, 249ff.) criticizes this one-dimensional “biological-genealogical view” and argues for a model in which language contact and bilingualism are also taken into consideration. Cf. Braunmüller (1995, 31; 1998, 328ff.).

Actual candidates for an explanation based on foreign syntactic impact on the Nord. lan-

guages are the variation and deviance in word order presented in sect. 2.–4.

5.1. Main clauses

The incontestable variation between SVO and SOV order in AN main clauses as demonstrated in sect. 2.1. should probably first and foremost be attributed to internal developments: Larsson (1931, 37) tends to regard the older runic inscriptions with SOV order as proper remnants of the older stage. For this period, statements about foreign impact must remain mere conjectures.

ON runic inscriptions represent, with very few exceptions, a V2 language; see 3.1. and 3.2. Larsson (1931, 26f.) suggests that the deviant SOV order in main clauses in the younger runic inscriptions may be due either to Lat. influence or to mistakes, pointing to corresponding Latin prototypes. Ureland (1989, 256) stresses, following Larsson (1931, 27), that these examples are usually calqued on the Lat. SOV prototype *X me fecit*. They are found on baptismal fonts or on rune stones close to churches, while the majority of the inscriptions representing the vernacular are clearly SVO. Except for the very few examples of SOV order in main clauses, which might be due to imitations of a frequent Lat. pattern, there is no evidence of direct Lat. influence upon word order in ON main clauses. But, incontestably, during this period Lat. impact should not be underestimated, although it must primarily have taken place in written sources and have been limited to certain genres.

5.2. Subordinate clauses

By the end of the classical ON period in the middle of the 14th century, the Hanseatic League had achieved a dominant position. The lexical impact from the Hansa was great, but probably somewhat varying in intensity in the different regions of Mainland Scandinavia. It is plausible that MLG influence may contribute to explaining the variations in word order in ON subordinate clauses treated under sect. 4.2. When e. g. the direct object precedes the finite verb in subordinate clauses, this phenomenon may be given at least three different explanations: it may (1) be taken as evidence of remnants of PGmc (S)OV order, (2) be interpreted as “stylistic inversion”, or (3) be regarded as an innovation, caused by language internal or external factors, e. g., foreign in-

fluence, cf. Nyström (1985, 145). The first explanation should probably be rejected, cf. Kossuth (1978, 42), and Ureland (1978, 121f.), while (2) and (3) together may have contributed to an increase in the old but probably obsolete OV pattern found particularly in different stages of Sw., cf. Ureland (1989, 258). The native “stylistic inversion”, which might have merely been a case of topicalization although occurring in subordinate clauses, apparently sometimes violating the V2 order (see sect. 3.2. and 4.2.), was open to foreign influence from different stages of G, which besides having other syntactic patterns, incontestably exhibits OV order to a far greater degree than the ON languages. In addition to clear cases of “stylistic inversion”, however, other violations of the V2 order are also found in ON, first and foremost in Sw. law texts, particularly in The Law of Uppland and in the Law of Södermanland. Ureland (1978, 121f.) discusses the findings of Larsson (1931, 152ff.) who documents verb-third and verb-final structures in these law texts to a far greater degree than in the laws from the western part of Sweden, probably due to the fact that the western texts were less influenced by MLG, having been written in a region where the cultural, political and economical influence from the Hanseatic League was of minor importance.

Thus, verb-third and verb-final structures in subordinate clauses, which increased in number in particular in Sw. after 1400, thereafter to decline, may be regarded as innovations based on native albeit not very frequent constructions (“stylistic inversion”), a tendency which was strengthened by foreign influence from MLG, a language which had the OV clause pattern among others (Braunmüller 1998, 321ff.). This happened although the Nord. languages already as a whole were mainly V2 in the subordinate clause and clearly V2 in the main clause. Ureland (1989, 258) supposes that the impact from MLG first and foremost affected written language, whereas spoken language must have exhibited an SVO pattern.

Mod.Mainl.Scand. has developed a V3 order in the subordinate clause, in which the sentence adverbial normally precedes the finite verb form. The origin of this development is highly disputable; see Barnes (1987); Pettersson (1988); Platzack (1988) and Christoffersen (2000). The new word order starts to show up in OSw. after 1300, cf. Nyström (1985, 192), and in ONorw. probably somewhat later, cf.

Christoffersen (1997, 46). According to Platzack (1988, 243), the new word order was not finally established until about 1700. Platzack conceives the new order as being the result of a shift in parameters, taking place in Mainl.Scand. involving several syntactic features.

It is possible that foreign impact may have contributed to establishing this new word order, although this view is rejected by Barnes (1987, 19f.), who claims the “narrative inversion” to be the actual candidate. Zeevaert (2000, 192f.) summarizes the competing patterns for the subordinate clause in Sw.: “Normal” word order (that is, the new word order) in the subordinate clause competes with a word order that is similar to the word order of the main clause (the subordinate order for ON); it further competes with a word order that corresponds to the G word for finite verb forms (in absolute or relative final position); and, finally, it competes with the pattern of the G main clause with its “sentence bracing construction”. He stresses that the word order of the subordinate clause must have been far more influenced by Luthers’s Early HG language than by MHG, which in the middle of the 16th century was in decline. The new word order in the subordinate clause is rarely attested in written sources before 1500. Influence from Early HG may have strengthened a syntactic pattern that already existed, finally leading to the fixed formal difference now obligatory in the word order of the main and subordinate clause in Mainl.Scand. written languages.

Not only word order, but also ways of expression may be attributed to foreign influence. Christianity and the Lat. alphabet is usually supposed to have reached the WN region from the British Isles, while the somewhat later influence on EN was of a more Continental nature. This may have led to linguistic differences, to stylistic variance and the dominance of certain patterns or syntactic constructions. Subordination in ON in general may be expressed by means of an initial subordinator or through word order, the latter restricted to conditional clauses, as in Mod. Nord.: *Kommer du, går jeg!* The origin of this clause type without a subordinator is highly disputable, the candidates being a matrix with “discourse cohesion” (see sect. 4.1.), an interrogative-type matrix or a particular kind of subordination marking. This clause type is often explicitly labelled “interrogative-type conditional clause”. It dominates the Sw. legal

texts, and to some extent Dan. texts to a far higher degree than the WN legal texts, although it does exist as clause type in WN as well (Stähle 1958, 77ff.; Naumann 1979, 8ff.). The normal conditional clause marker in WN is the subordinator *ef*. The frequently occurring subordinator-initiated conditional clause in WN as opposed to the interrogative-type conditional clause in EN may possibly be due to influence from the British Isles. Stähle (1958, 162ff.) holds that the Sw. legal texts, with their majority of interrogative-type conditional clauses, although younger than the WN ones, mirror the oral stage, while the WN type is of a foreign and more recent nature, reflecting the conditional clause pattern dominant in British sources.

5.3. Cursus

Berg (1999), in an empirical study, summarizes previous research and discusses whether Lat. *cursus*, which is a rule-governed sentence-final rhythmical pattern, may have had any impact on ON prose, a view first advocated by Benediktsson (1965; 1974). Berg comes to the conclusion that *cursus* incontestably must have played a role as an influential rhythmical pattern in certain paragraphs of the ON texts (translations) that she has investigated, but these texts are not totally dominated by *cursus*. It remains to be demonstrated whether this rhythmical pattern may have contributed to the deviant word orders commented upon in sect. 5.2. and 5.3.

5.4. Conclusion

There is no reason to believe that foreign influence led to major word order change in Mainl.Scand., in spite of massive influence, especially from MLG, over several centuries. Probably already existing deviating word orders were strengthened in active use, especially in writing, and first and foremost during the process of translation, where the translators were confronted with influential languages demonstrating a great deal of syntactic variance at different stages. Simultaneously, bi- and multilingualism, which may have been more widely spread than is normally acknowledged, may have nourished, confirmed and revitalized word order variations and made them acceptable.

22. Nordic language history and research on universals and theories of linguistic change

1. Universals and principles
2. Theories of change
3. Historical implications of synchronic universals
4. Dynamization of synchronic universals
5. Diachronic universals and principles
6. Literature (a selection)

1. Universals and principles

Research into language universals has been conducted in two different research paradigms, which I will call typological and generative, respectively. The goal of the typological approaches is to find cross-linguistic generalizations – universals – and then derive these from more general principles. In general, the same type of explanations are offered as in different functional approaches to grammar, such as discourse-pragmatic factors, production, processing, cognition, etc. See the different contributions in Hawkins (1988a; including his introductory paper). For the generative approaches, on the other hand, what primarily needs to be explained instead is how children can acquire a grammar so rapidly, with so meager evidence and without access to what is ungrammatical. The answer to this problem is that part of the linguistic competence is innate. Therefore, the goal for generative research is to construct a theory of an innate universal grammar (UG) with properties specified enough to account for this acquisition problem, but also flexible enough to account for language variation.

The typological universals pertain to languages. In Greenberg's (1963/66) seminal investigation on word order, 30 languages are included. Most of the universals in his paper take three different forms: unrestricted, implicational, or equivalent. Unrestricted universals hold for all languages. Implicational universals have the form $P \supset Q$, such that if a language has property P, it also has property Q, but not vice versa. An implicational universal thus captures a cross-linguistic pattern where three out of four logically possible combinations of two properties are attested. Equivalent universals are statements of uniquely co-occurrent properties of languages, such that property P is always found together with property Q, and vice versa. Some of Greenberg's universals are absolute, i. e. without any known

counter-examples. Others are statistical, i. e. with a few attested exceptions. Some scholars have seen the difference between unattested and extremely rare as less important: since the empirical, inductive method used by typologists can never logically prove a universal to be absolute, possible and impossible language types are in reality probable and improbable language types. Others want to uphold the distinction. Hawkins has advocated this latter view in a number of papers, summarized and extended in his 1983 book. In order to make implicational universals absolute, he has made them more complex, taking the general form $P \supset (Q \supset R)$, which reads "if a language has property P, then if it also has property Q, it has property R." Statistical patterns should instead be stated as distributional universals, to account for the relative frequency of different language types.

In the generative approaches, universals instead pertain to grammars. Chomsky (1965) distinguished between substantive universals, i. e. statements about the substance of rules, for instance the universality or universal availability of features, categories, etc., and formal universals, i. e. statements about the form and interaction of rules. Later, when the essentially rule-based Standard Theory (1965) was replaced by a Principles-and-Parameters model of grammar (Chomsky 1981), the noun "universal" was no longer used.

In this article, I will use the term "universals" in the typological sense, i. e. for generalizations about languages. Generalizations about grammars, whether we take these to be properties of an innate universal grammar or tendencies motivated by different sorts of functional demands on grammar, will be called "principles". On different ways to systematize different types of statements about universality, see e. g. Coseriu (1974), Seiler (1976) and Braunmüller (1982, 20–27). On the differences between the generative and typological approaches to universals, see further Hawkins (1988 b) and Hoekstra/Kooij (1988).

2. Theories of change

The typological paradigm and the generative paradigm have both been applied to historical linguistics, and different theories of linguistic

change have been formulated. The general principles that have been proposed to account for universals which have been found also restrict possible language change: synchrony restricts diachrony, and no change can occur that would lead to an impossible language type. In the typological approaches, this impoverished theory of language change has been enriched in several ways (cf. Greenberg 1978). The principles behind synchronic universals have been given a more dynamic interpretation: they serve not only as synchronically working principles but also as motivations for language change. The principles (in interaction) evaluate states as preferred and dispreferred, where a language in a dispreferred state is more likely to change. This may also account for the relative distribution of language types: preferred language types are common language types. In other words, diachrony explains synchronic patterns. Still however, the principles are essentially synchronic in nature in that they describe states, not changes. An even more powerful theory of change tries to identify diachronic universals and principles. The perhaps most active area today as regards diachronic principles is research in grammaticalization, and a number of universally valid characterizations of this process have been suggested. For instance, Bybee/Perkins/Pagliuca (1994, 9–22) set up eight hypotheses about grammaticalization, including both more generally accepted generalizations and more controversial ones.

In the generative approaches, a restricted theory of grammar sets the limits on possible change; synchrony restricts diachrony rather than the other way round. In early generative work on historical linguistics, this is combined with attempts to formulate a restricted theory of change. The differences between adjacent grammars are characterized as rule addition, rule loss, rule reordering, etc. (King 1969). This forms a set of possible changes that constitutes a theory of change, in that it constrains how adjacent grammars can differ. In his important and influential work on diachronic syntax, Lightfoot (1979, 141–147) questions this type of theory of change. Given that each generation builds up their grammars afresh, without access to the grammars of the older generation, there is no direct link between adjacent grammars, and hence, no constraints between them can be formulated. The link relevant for diachrony is instead the link between the grammar that the child is about to construct and the language around him or her.

Within the typological approaches, the Scandinavian languages have only to a limited degree contributed to the formulations of specific universals or more general theories on change. The Scandinavian languages (or one of them) have sometimes been included in larger language samples; Norwegian was, e.g., part of the original 30-language sample in Greenberg (1963/66), and Danish is one of the languages in the language sample in Bybee/Perkins/Pagliuca (1994). Sometimes, the Scandinavian languages have been taken as counterexamples of proposed universals. In some cases, more specific theories of change have implications for how to analyse or interpret the history of the Scandinavian languages. In this article, I will present some different theories of change that have been proposed on the basis of typological universals and connect them with the history of the Scandinavian languages. Within the generative approaches, there has been considerably more research on the history of Scandinavian languages (cf. art. 19).

3. Historical implications of synchronic universals

Synchronic universals have historical implications. Since they establish possible and impossible languages or language types, they also establish possible and impossible language changes. An implicational universal $P \supset Q$ establishes three possible combinations and one that is impossible. An impossible or at least extremely rare change would be a change leading to the excluded combination.

Series of synchronic implications, forming hierarchies, have historical implications about the relative order of change. Consider e.g. the Preposition Noun Modifier Hierarchy proposed by Hawkins (1983, 75): $\text{Prep} \supset (\text{NDem} \vee \text{NNum} \supset \text{NAdj}) \& (\text{NAdj} \supset \text{NGen}) \& (\text{NGen} \supset \text{NRel})$. This hierarchy reads: “If a language has prepositions and either *NDem* or *NNum*, then adjectives follow the noun; if adjectives follow the noun, then genitives follow the noun; if genitive follows the noun, then relatives follow the noun.” The implication states a hierarchy of postnominal modifiers in prepositional languages: if only one modifier is postnominal, it is always the relative. If two modifiers are postnominal, it will be the relative and the genitive, etc. The modern Scandinavian languages adhere to this hierarchy: the Mainland Scandinavian lan-

languages represent the type with only one postnominal modifier, relatives, and Icelandic represents the type with two postnominal modifiers, relatives and genitives. The Mainland Scandinavian languages formerly had freer NP word order. The hierarchy now predicts the order with which the position of the different modifiers would be fixed, namely from the top and downwards. According to Hawkins this is also what we see in the development of the Germanic languages. He has followed the development of the West and East Germanic branches and concludes that the NP word order shows the predicted patterns of change.

To the best of my knowledge, the development of the North Germanic branch has not been investigated in this light. A brief look at the development of Swedish gives the following picture (data from Wessén 1965, 103ff.): In Swedish runic inscriptions, numerals and demonstratives can precede or follow the noun; adjectives can precede or follow the noun, but postnominal position seems to be more common; stressed genitives normally follow the noun; the few attested examples of relatives are postnominal. If we take relative frequency into consideration (as does Hawkins), we can interpret these data as follows: numerals and demonstratives are halfway through their switch to prenominal position; adjectives have begun to change their position, whereas genitives still show the old pattern. Interpreted like this, the data show the predicted pattern. In medieval laws, numerals and demonstratives normally precede the noun; prenominal adjectives are more common than postnominal ones; genitives precede or follow the noun. Again, this is the expected picture. In other Old Swedish texts, prenominal modifiers are the rule, except for relatives. Modern Icelandic, on the other hand, represents an older stage where the genitive has not become prenominal.

There is, however, one complication to this scenario, namely the genitive. Hawkins takes Late Common Germanic to be a language with prepositions and postnominal modifiers, but the runic inscriptions from 200–600 A. D., representing the earliest records of Germanic, show a mixture of NGen and GenN orders. According to Hawkins, none of these orders was basic; according to other scholars, the basic word order was actually GenN (see Braunmüller 1982, 172–175, and the references cited there). In any case, the position of the genitive in early Germanic constitutes

potential counterevidence to Hawkins' hierarchy.

4. Dynamization of synchronic universals

According to a more elaborated theory of language change, general principles that are formulated to account for language universals put a diachronic pressure on language: language changes to conform to (interacting) synchronic principles.

4.1. Harmony and drift

Greenberg (1963/66) introduced two general concepts to characterize the patterns he discovered and formalized in his universals, dominance and harmony. Dominance will be discussed in section 4.2.; here I present harmony, the concept that first caught the attention of researchers of diachrony.

Harmony captures co-occurring word order combinations. Harmonic word orders are those co-occurring in an equivalent universal. Harmony can also be read off from an implicational formula: given the implication $OV \supset \text{postpositions}$ (= prepositions $\supset VO$), the two harmonic word orders are OV & postpositions , and VO & prepositions . Greenberg distinguished two major harmonic word order patterns: prepositions & $NGen$ & VS & VO & $NAdj$, and postpositions & $GenN$ & SV & OV & $AdjN$. Harmony is, according to Greenberg, "very obviously connected with the psychological concept of generalization" (Greenberg 1963/66, 76). The patterns have been extended to also include the ordering of auxiliary/modal – main verb; noun head – all kinds of nominal modifiers; adjective – adverbial; and adjective – standard marker (all examples given here with the head-first alternative).

The idea that languages more or less inevitably move in a certain direction is old. Sapir (1921, ch. 7) coined the term "drift", which became something of a key-word in much historical work during the 1970s (cf. Kossuth 1978 on Old Icelandic). Drift has been motivated differently by different scholars. Of interest in this context are the attempts to interpret drift as movement towards maximal harmony or typological consistency. This research program is often associated with the works of Lehmann and Vennemann. A principle ("the principle of modifier placement", Lehmann (1973, 48); "the principle of natural

serialization”, Vennemann (1974, 347)) states that all modifiers in a language will appear on the same side of the head. The determining word order is the order of V and O, i.e. languages will serialize other instances of head-modifier in harmony with VO/OV. According to Vennemann, OV is in turn dependent on case morphology; in a verb-last system, the function of the nominals must be disambiguated by case. Languages that do not adhere to the principle of natural serialization, so-called “inconsistent languages”, are in a transitory state, striving towards consistency. According to Vennemann, the word order changes that have taken place in the Romance and Germanic languages with common Proto-Indo-European origin with (consistent) OV pattern are examples of a drift towards a consistent VO pattern, triggered by loss of a “reliable” and “uniform” case system (Vennemann 1974, 356f.; the case system of e.g. Modern German is not uniform and reliable enough). A language changing from SOV to SVO passes through a verb-second stage (TVX in Vennemann’s terminology, where T stands for “topic”), with the finite verb in second position in main clauses. TVX languages show a mixture of developing head-modifier structures and remaining modifier-head structures. Modern German is in this transitory stage, whereas English and French have become more pure SVO languages.

Vennemann does not discuss the development of the Scandinavian languages in his paper. Like Modern German, they are verb-second languages, and some attested changes in their development can be interpreted in terms of “drift towards consistency”. First, all Scandinavian languages have lost the so-called “sentence brace construction”. In a sentence brace construction, adverbials and objects are found between the finite and the infinite verb in main clauses, i.e. all constituents in the main clause, except for the finite verb, are arranged with modifiers preceding heads. The loss of sentence brace constructions (by many scholars interpreted as loss of OV) can be seen as a change towards more consistent VO patterning; cf. Vennemann 1974, 362–365. Second, in the Mainland Scandinavian languages, suffixes have gradually declined and been replaced by different kinds of periphrastic constructions, like prepositions, auxiliaries and modals; this development is typical in TVX languages, according to Vennemann (1974, 365). Third, the loss of impersonal verbs (e.g. OSw. *Mik angrar* ‘Me regrets’ > Mod.Sw. *Jag*

ångrar ‘I regret’) and the rise of passivized indirect objects can be interpreted as a growing tendency to interpret the first constituent generally as the subject, i.e. as a step from TVX to SVO (cf. Vennemann 1974, 350 on English). On the other hand, other changes go against the prediction. Most notably, the word order within the NP has developed in the opposite direction, from predominant postnominal modifiers in accordance with the VO pattern to predominant prenominal modifiers, i.e. an OV pattern (Hawkins 1983, 237; cf. section 3.). The development of the genitive is further discussed in Braunmüller (1982, 171 ff.). He represents the view that GenN word order in Old Nordic is to be interpreted as remnants of a more consistent head-final pattern, and that NGen word order is an innovation, caused by typological pressure. This shift is fulfilled in Icelandic (probably already in Old Icelandic), whereas it was restrained in the Old Mainland Scandinavian languages. A “counterdrift” (“Gegen-drift”) reactivated GenN order. Braunmüller seeks the causes for this counterdrift in prosodic patterns and the declining case morphology. Thus, according to Braunmüller, the development of the genitive in Scandinavian shows that morphology and syntax do not interact in the way proposed by Vennemann.

4.2. Other characterizations of preferred and unpreferred states

Consistency – or maximal harmony – identifies two “ideal typologies” or preferred states. However, an implicational universal identifies three possible states. The third possibility, the combination – P & Q in the implication $P \supset Q$, has been much more difficult to characterize and explain. Greenberg labelled the properties – P and Q ‘dominant properties’. Dominance says nothing about co-occurrences of word orders, as opposed to harmony. Instead, the dominant word order is the word order that can co-occur with any other word order combinations; it is the generally available disharmonic order, so to speak. On the basis of his universals, Greenberg identifies the following word orders as dominant: VO, prepositions, SV and NAdj. To account for dominance in terms of some deeper principle is more difficult; Greenberg gives the tentative suggestion that this might follow from a general tendency for comment to follow topic (1963/66, 79).

Whichever way dominance is motivated synchronically, the same principle(s) can be

given a diachronic impact, and word order changes that are not explicable in terms of harmony can be motivated by the principle(s) behind dominance. If we take DemN and NumN to be dominant word orders (cf. Croft 1990, 56), the changes within the NP in Scandinavian will appear less exceptional: the increasing occurrence of demonstratives and numerals in prenominal position is a move away from harmony but toward a dominant pattern. With an established prenominal position of demonstratives and numerals, the switch from NAdj to AdjN will then be motivated by (NP-internal) harmony, disregarding dominance.

Croft (1990) uses harmony and dominance to characterize stable versus unstable language types. First, he suggests that harmony puts a stronger diachronic pressure on language than does dominance. This hypothesis is based on the observation that for individual implications, harmonic patterns are generally more common across languages than the third possibility of dominant patterns. This, he states, suggests that harmonic patterns are more stable than dominant ones. Second, most of Greenberg's universals are statistical, i.e. we do find single counterexamples. Croft (1990, 209) suggests that counterexamples to synchronic universals also should be given a diachronic interpretation: they represent highly unstable states, i.e. languages in this state are likely to leave it. These statements of probability can of course not be contradicted by evidence from individual languages, but still we may note that the combination GenN & prepositions, excluded by Greenberg's statistical Universal 2, has not been unstable in the history of Mainland Scandinavian.

Another way to characterize preferred and dispreferred language types is found in Hawkins (1983). Three principles (Cross-Category Harmony, Heaviness Serialization and Subjects Front) and the interaction between them define degrees of preference. Cross-Category Harmony replaces Vennemann's Natural Serialization. Instead of identifying an ideal situation where all modifiers either precede or follow their heads, Cross-Category Harmony states that a balance is the preferred state, where equally many modifiers of V (now including subject and adverbials) and N precede and follow their heads. For example, for SVO languages, where the verb takes one modifier (the subject) to the left, other modifiers to the right, Cross-Category Harmony predicts that also the NP should show mixed order, with

some modifiers to the left, some to the right. In strict SOV languages, i.e. with all verbal modifiers preceding the verb, prenominal modifiers and postpositions are preferred, whereas in non-strict SOV languages, where certain modifiers can follow the verb, mixed order in the NP is preferred. Cross-Category Harmony has diachronical implications: there is less probability that a language that adheres to Cross-Category Harmony (and the other interacting principles that identify a preferred language state) will change than a language in a less preferred state (Hawkins 1983, 253). As an example of a language group with cross-categorical disharmonic word order patterns, Hawkins mentions the Germanic languages. According to Hawkins, Old Nordic shows great disharmony, with noun-initial NPs, verb-final clauses and prepositions. (This characterization of Old Nordic is not uncontroversial; cf. the overview in Braunmüller 1982, 113–144). Hawkins follows the evolution of Gothic and the West Germanic branches and concludes that there have been several short-lived stages, all characterized by strong disharmony in the history of these languages. Compare this with the Celtic languages, with maximal cross-category harmony (verb-initial, nominal-initial and prepositions) and few attested word order changes. What Hawkins' calculations of Cross-Category Harmony can tell us about the development in the Northern Germanic branches remains to be investigated.

5. Diachronic universals and principles

The goal of much recent research in grammaticalization is to explain synchronic universals and cross-linguistic patterns in terms of universal properties of diachronic processes. See e.g. Bybee's contribution in Hawkins (1988a). The harmony pattern stated in Greenberg's Universal 2 (NGen & prepositions, GenN & postpositions) has for instance been explained in terms of grammaticalization: when relational nouns with genitive modifiers are reanalysed as adpositions, head noun + genitive will give rise to prepositions, genitive + head noun to postpositions. Grammaticalization is of course found in the history of the Scandinavian languages as well, but this is not the place to relate different individual developments. Of more interest in this connection is whether facts from Scandinavian have

contributed to a more general theory of grammaticalization. Many cases of grammaticalization show predicted properties, such as phonological loss, semantic bleaching and syntactic decategorization. However, Scandinavian has also provided some counterexamples to hypotheses suggested by researchers on grammaticalization. The hypothesis that grammaticalization processes are unidirectional is contradicted by the development of genitival *-s* in Mainland Scandinavian (Norde 1997). The normal direction is that a clitic is re-analysed as an inflectional suffix. Genitival *-s* shows the opposite direction in Swedish and Danish, from an inflectional suffix to a clitic attached to the whole NP. Its clitic-like nature is seen most clearly in group genitives like Mod.Sw. [*mannen på gatan*]-*s* *åsikter* or [*Pelle och Göran*]-*s* *blommor*. The hypothesis that grammaticalization follows universal paths of development can also be questioned in analyses of individual changes. Christensen (1997) shows that the development of the Swedish future auxiliary *kommer att* has never had any meaning volition, a meaning that is an obligatory stage in a universal path of development of future auxiliaries according to Bybee/Perkins/Pagliuca (1994). In a pilot investigation of the development of four nouns to secondary adpositions in Old Swedish, Norde (1999) shows that each case has its own peculiar history and can not be captured by the grammaticalization clines suggested in the literature. The view that synchronic patterns are formed throughout by diachronic processes is also challenged here: prepositions developed from relational nouns, even though Swedish had GenN word order at that time. Future research on grammaticalization in Scandinavian will no doubt provide more contributions to the ongoing debate on diachrony versus synchrony.

23. Nordic language history and sociolinguistics

1. The scope of sociolinguistics
2. Macrosociolinguistics and language history
3. Interactional patterns and cultural change
4. The variationist paradigm and language history
5. Is a historical sociolinguistics possible?
6. Literature (a selection)

1. The scope of sociolinguistics

The field of research we now subsume under the designation of sociolinguistics or the sociology of language was from the beginning in the late 1950s and early '60s not a well-integrated discipline, either theoretically or methodologically. The founding fathers – most of them were in fact men – were not only linguists but anthropologists, social psychologists, sociologists, educationalists and social scientists, and they brought to the new field of inquiry different strands of thought and dissimilar scientific traditions and theoretical backgrounds. But irrespective of what level of description and analysis of the relation between language and society the investigations concerned – macrolevel language policy, language planning and multilingualism, mesolevel sociodialectology and language attitude studies, or microlevel interactional sociolinguistics and conversation analysis – the common denominator was their synchronic orientation and their preoccupation with present-day problems and contemporary linguistic material. The main interest was focused on the status of different languages and varieties in the society in question, on social aspects of linguistic behaviour and external societal forces influencing linguistic behaviour (and language structure), and on interactional patterns and communicative regularities in conversations. The investigations were overwhelmingly empirical, and the degree of descriptive exactitude and explanatory precision aimed at necessitated large and well-controlled corpora.

But it was not long until the inherent dynamics of language variation and language contact drew the attention of sociolinguists to the diachronic dimension of contemporary linguistic variation. Actually, Labov's first work bears the title *The social motivation of a sound change* (1963). The technical and economic possibility of including informants of several age groups, socio-economic classes and both sexes in a representative sample of

the speech community in question opened up the study of ongoing linguistic change, at least indirectly by dint of the theoretical concept of "apparent time"; that is, consecutive age groups are made to represent real chronological time. To do so is not unproblematic, and sociolinguists have increasingly gone over to testing other methods to get at the patterns of contemporary language variation and change. In the case of sociodialectology, this entails longitudinal studies where the sociolinguistic patterns of speech behaviour at two or more points in time are compared. This type of investigation can still be called synchronic even though the time span between the earliest and the latest sample is 30–40 years. From this interest in analysing ongoing processes of change, it was a short step to testing the applicability of sociolinguistic theories and methods on historic linguistic material. The hope was to be able to get more to grips with the causes of linguistic changes and the mechanisms behind them than had been possible in traditional studies of language history.

Whether we consider sociolinguistics as basically one field united by the endeavour to make clear the relationship between language and society as, for example, Romaine (1994, viii f.) maintains, or we think of it as two or more disciplines depending, among other things, on whether the main focus is on language use and linguistic structure or on society and linguistic motives for social strife as Fasold (1984, ix f.; 1990, vii) does, we are inevitably led into a discussion on the scope of sociolinguistics and encounter questions like: What is the real nature of the relationship between language and society; can language be used in contexts or for purposes that are not social in any sense; is sociolinguistics something other than linguistics? And, taking another perspective: How should the boundaries between sociolinguistics and, for example, political and cultural history, ethnography, social psychology, and education be drawn, and how much from these disciplines must or can we include and pay attention to in an investigation and still call it sociolinguistic? What kind of data do we need to elucidate the particularly social aspects of language structure and language use, and – concerning the social impact on linguistic structure – from which structural level should we preferably choose the variables? I am inclined to take a

rather broad view of sociolinguistics and include studies of any aspect of the interrelationship of language and society, provided that their initial assumption is that language and speech have social as well as communicative and cognitive functions, that the patterns of linguistic variation tell us something about social structure and individual social motives, and that the impact of society and language is mutual. This last condition implies that, by linguistic means, you can create or change the social context for individual speech events and state your (conception of your) social role in the situation at hand or, on another societal level, through language policy decisions, shape (parts of) the social structure of society. Conversely, language users are bound by linguistic group norms, social expectations and societal regulations.

For the sake of simplicity, I will organize my subsequent survey of sociolinguistic approaches to Nordic language history under three headings: macrosociolinguistics and language history, interactional patterns and cultural change, and the variationist paradigm and language history. Finally, I will summarize the prerequisites and possibilities of a historical sociolinguistics. Most of my examples will be taken from Swedish, but Danish and Norwegian will also be considered. Only exceptionally will I include studies on 20th c. language development. Onomastic studies will not be considered.

2. Macrosociolinguistics and language history

To apply sociolinguistic views and methods of description to historical language stages has been least problematic as concerns research on the sociolinguistic macrolevel. This includes studies of language planning, language maintenance and shift, language contact, and societal aspects of bilingualism; in short, studies that have to do with the relationships of one (often a national) language in its entirety to other languages and how its status is dependent on societal development and expansion. To a large extent this is a question of policy decisions and concrete measures concerning language choice and language use. Political and cultural ambitions as well as demographic and infrastructure changes have a decisive impact here. Factors like these may be traced and analysed by exploiting historical sources in the same way as students of political

and social history, sociologists and political scientists do. Written documents like decrees, enactments, protocols, minutes and records of diverse types as well as memoranda, diaries and letters are excerpted and assessed for this purpose.

A good example of historical research on extraneous, conscious manipulation of the code is the study by L. Svensson (1981). He documents the conscious efforts to clearly mark the Swedishness (and simultaneously the non-Danishness) of the official texts issued by the Royal Chancellery (and other text genres from 1612 onwards). His investigation shows the definitive substitution of *-a* for *-e* in certain suffixal morphological categories, e. g. the infinitive, the preterite of weak verbs of the 1st conjugation, and the present participle. This seems to be a good example of codification of an *Ausbau* language. Active Swedification policies were to be pursued during later periods as well. The most radical action against Danish influence in the 17th c. was taken in the three former Danish provinces of Scania, Halland and Blekinge following their conquest in 1658. The process in Scania is described by Ohlsson (1978–79); here the author uses a morpheme-based model to analyse the gradual language change seen in Scania court records from the last decades of the 17th c. This Swedification was realized through the so-called uniformity programme comprising public and legal administration, church ceremonies and the language of sermons and enforced with from time to time varying zeal. The strictly quantitative, sociolinguistically inspired method that is used is particularly suitable for an analysis of mixed languages (or varieties) provided that every morph can be categorized as belonging to either one or the other, both or neither of the varieties.

Other examples of conscious Swedish language policy – and this time the actions were not defensive as was the case earlier against Danish influence, but rather offensive with the aim of gaining Swedish supremacy over the Sami (from the 17th c. onwards) and the Tornedal Finns (from the middle of the 19th c.) – are described by a number of authors from the 1960s onwards. Among these may be mentioned Hansegård (1968; 1990), Wande (1989), and most recently Wingstedt (1998). The most rigorous pressure for Swedification in these northern areas was exerted in the last quarter of the 19th and the first third of the 20th c. In one respect Wingstedt's dissertation is an illustrative example of one of the dilemmas of

historical sociolinguistics. Her aim is to explore “aspects of language ideology and minority language policies in Sweden, both from a historical and contemporary perspective, [especially] the nature and functioning of *language ideologies*” (1998, 2). Language (and other) ideologies can be captured in principally two ways. One is to point to the actual measures and decisions taken by the government, other political bodies or pressure groups, the professed motives for the action taken and the political and other public debate on the issue. This will render the official picture, the opinions of the political and cultural elite. The other way is to map out the notions and opinions of a representative sample of the population in question by interviews or written questionnaires, or by other direct methods. If this is done well and the researcher is not too positivistically naive, this course of action will give a more detailed and multifaceted picture of the prevailing – and supposedly socially variable – attitudes and beliefs regarding the problem investigated. Thus, such a survey will also provide a basis for an assessment of the legitimacy of the political actions taken. But the method is only applicable to the contemporary state of affairs, and for historical eras one has to rely on traditional forms of content analysis of extant primary and secondary sources. Wingstedt uses both methods, the attitude test, of course, only for eliciting present-day opinions.

Another issue on the sociolinguistic macro-level is the acquisition and loss of domains of a language. As concerns Swedish, this has attracted the attention of several scholars. Apart from the transition of the church language from Latin to the vernacular in the 16th c., particular interest has been focused on the rise (and 20th c. fall) of Swedish as a medium for scientific discourse. The first academic lectures known to be held in Swedish were those given by Petrus Lagerlöf in Uppsala in 1691 on the cultivation of the Swedish language, now edited, published and commented on by Ronge/Tjäder/Widmark (1999; see also Widmark 1997). Although these lectures seem to have aroused considerable attention at the time, they were not printed, except for two dissertations written in Latin on the same subject. Admittedly, lecturing in Swedish was a bold venture at the time, but the text itself is full of Swedish-Latin code-switches, and there are other signs of uncertainty and hesitation regarding the handling of the new situation. A firmer basis for Swedish as a scientific lan-

guage was laid in the 1730s–40s, among other things by the decision of the Swedish Academy of Sciences to publish their transactions in Swedish. The development of terminology and textual and stylistic patterns in specific scientific text genres in economics, technology and medicine from the 18th c. (and later) has been analysed from a social constructivist standpoint in a number of articles by Gunnarsson (e.g. 1988; 1997 a, b). Scientific prose is a good example of the widening of functions in a specific language and a nice illustration of how a desirable quality, in this case “scientificness”, is linguistically constituted. It also evinces the role the development of a professional language plays for the socialization and self-identification of its users as members of the in-group. The status of Latin and Swedish respectively in 18th c. Sweden has been studied by Lindberg (1984).

Interest in the processes by which Swedish emerged as a fully-fledged national language available for use in all domains has been quite noticeable during the last two or three decades. The study of the standardization and functional extension of Swedish as a written national language serving public purposes has been most energetically pursued at the Scandinavian Department in the research programme entitled *Nysvensk språkhistoria i samhällsbelysning* [History of modern Swedish in a societal light]. These studies have been conducted within the framework of a theory most clearly developed by Teleman (1985), according to which the linguistic code is seen as part of history and the historically and socially created situations for language use condition communication, which in turn influences (perceptions of) the norm and the ensuing speech situations. The stabilization and functional extension of standard Swedish during the 17th, 18th and 19th c. are seen as a result of historical phenomena such as the system of public proclamations and the struggle for the economic, political and military integration of the nation, and also of ideological and material factors. Teleman discerns three forces active in the propagation of change: (1) functionality, (2) power and prestige, and (3) a tendency towards innovations versus preservative social control. His discussion of these forces is entirely sociolinguistic and moves over all three sociolinguistic levels, even if the written language with its typical genres is put first. Works within this programme include the articles in the anthology *Det offentliga språkbuket och dess villkor i Sverige under 1700-*

talet [The ecology of public language in 18th c. Sweden], the monographs by Santesson (1986, on an influential book printer who contributed to orthographical and morphological standardization in the middle of the 18th c.), J. Svensson (1988, on the interplay of macro-societal factors and the development of the media and public communication from the 16th c. onwards), and Pettersson (1992, on linguistic changes in Swedish legal texts since 1734, which are explained by judicial requirements and citizens' demands).

The spread of literacy and active use of the standard language in writing by more and more members of society during the 19th c. was largely a result of societal and ideological factors like those just mentioned. This growing importance of both production and consumption of written language among all social groups has attracted the interest of many researchers, as witnessed by the three conference volumes on the development of the written languages in the Nordic countries during the 19th c. (*De nordiske skriftspråkernes udvikling på 1800-tallet* 1–3, 1984–86) and the research programme *Svensk sakprosa* (1996–), which is investigating Swedish non-literary prose from 1750 onwards. The former deals with a large array of topics such as the reading and writing ability of the population, the formal and stylistic development of written texts, the prevalence and nature of both professional and private written genres, and more theoretical questions regarding the ideological background of language prescription and standardization. The ideologies treated are national romanticism and nationalism, Darwinistic evolutionism, rationalism and socio-political egalitarianism. These volumes deal with the situation in all Nordic countries. Even if many of the individual studies in the latter project are more text-analytic (investigating lexical and syntactic traits) than sociolinguistic, the major theoretical question addressed is the interplay and reciprocal relationship between discourse and society, especially the role of descriptive, narrative, expository, argumentative and instructive texts for societal and educational aims. Here the project exhibits a link with critical discourse analysis. Additional theoretical and empirical background to these investigations is provided by the language change model of Teleman and the studies by Josephson and others of the acquisition of a public language by the Labour movement in the late 19th and early 20th c. (Josephson et al. 1996). Quite naturally, these studies of codi-

fication, cultivation and extension of the standard language have combined linguistic methods with historical and sociocultural approaches. A project very similar to the Swedish non-literary prose project is the Norwegian *Norsk sakprosa* which is concerned with the role of the same genre in Norwegian public life for the period 1814–1990.

By far the dominant element in Swedish as well as Danish and Norwegian language planning up until the 20th c. has been work on the form and structure of the mother tongue, i.e. what Haugen (1987, 627, 630f.) has termed “codification”. Before the foundation of the Swedish Academy in 1786, such efforts were mainly the concern of individual grammarians and lexicographers. Most of these works had an overt normative ambition which can be seen e.g. in commentaries on critical editions or in treatments of the history of Swedish linguistics and language cultivation. Such works are, for example, those by Columbus (1963), Danielson (1976), Teleman (1984), Wollin (1984), Thelander (1985), Widmark (1997) and Ronge/Tjäder/Widmark (1999). The most heated discussions up until Leopold's dissertation on Swedish spelling (1801) seem to have been those on orthography (and morphology), e.g. the well-known struggle between Urban Hiärne and Jesper Swedberg in the first decades of the 18th c. (cf. art. 155).

One aim of present-day language planning and cultivation studies is to uncover the effect of linguistic prescription, the attitudes towards and the observance of the norms, what Haugen (1987, 627, 631f.) calls “implementation” or acceptance of norms. What impact on public (and private) writing did the views and recommendations of learned scholars have? This is not easy to discern. On the one hand, the production of written texts was small and in theory easy to control by the central powers through different forms of censorship (during the period 1686–1766 through the office of *ensor librorum*). But the language cultivators were few and unauthorised, and in many cases their works existed only as manuscripts and were known to a limited group of interested scholars. Danielson (1976, 55ff.) has ascertained that the now often cited treatise by Columbus, *En Svensk Ordeskötsel* [Tending Swedish words] (1679), was known only to a few of his contemporary and younger colleagues. On the other hand, Santesson (1986) has shown how, without much theoretical ballast, the influential printer Salvius

during the 1750s–60s decisively steered usage towards a standardized orthography and morphology. And Thelander (1985, vii) mentions that when Sven Hof's *Swänska språkets rätta skriftsätt* [The correct writing of the Swedish language] appeared in 1753, there were subscriptions for more than 280 copies – no mean number. Also Loman (1986, 3f.) points out in his penetrating account of the language cultivation activity of the Swedish Academy from its foundation in 1786 to the end of the 19th c. that the influence of this activity on general usage remains uninvestigated. The difficulties associated with getting a reasonably acceptable picture of the effect of language cultivation measures have not been overcome until our own time. In the account of the development of the Scandinavian written languages during the 19th c., the problem of dissemination of norms and the channels for this has been given a good deal of attention. In Denmark, Norway and Sweden, the most important channels were textbooks and school teaching (school attendance had become compulsory in all three countries), manuals, articles and other printed contributions to the public debate, and centrally issued proclamations, decrees and circulars. The clearest effect of these efforts was on orthography, and the debate and reforms accomplished after the important Scandinavian meeting on orthography in Stockholm in July 1869 have been well documented, e.g. by Ståhle (1970), Spang-Hanssen (1970), and Hellevik (1970).

What has been said above covers in very broad outline research on the growth of a written standard. The evolution of spoken standards in the Nordic countries is a much more complicated matter, both regarding the definition and the degree of homogeneity of the code as well as its origins and development over the centuries. The sources of today's Danish, Norwegian and Swedish spoken standards seem to be, in varying proportions over time and countries, recited written language, the spoken variety of the capital, and educated everyday speech (Widmark 1992; 1995a; 2000). The social and situational differentiation and stratification that this has given rise to will be treated in sect. 4.

To modern language planning researchers, Norway stands out as a paradise, and the development of the national language situation since 1814 with the two competing standards *Bokmål* and *Nynorsk* has been the dominant object of research in historical sociolinguistics. The standard work on the Norwegian lan-

guage conflict is that by Haugen (1966), but there is a huge bulk of literature on this subject. The special language situation in Norway during the 19th and 20th c. is a factor that makes itself felt in almost all writings on Norwegian sociolinguistic matters (cf. arts. 164; 182). A recent account of the national language question in Norway from the Viking Age until today is given by Sandøy (1999).

3. Interactional patterns and cultural change

For interactional sociolinguistics and conversation analysis, it is essential to base the analyses on recordings of authentic talk which is part of the regular activities of the speakers. Authenticity is also of primary importance to the ethnography of speaking, whose practitioners try to guarantee this by the data-collecting method of participant observation. These methodological requirements pose problems, of course, for the historic study of conversational patterns and their possible changes over time. We definitely have to content ourselves with those secondary written sources which exist. These include court records, minutes of discussions in a union or association which claim to be at least partly verbatim, personal letters, plays and literary prose dialogue and, finally, etiquette manuals and advice books. There are, however, theoretical problems inherent in all these types of sources.

Advice books often present rules of decorum and good manners in a general and ageless way. Such manuals were published in 17th, 18th and 19th c. Europe (Burke 1993, 96, 99f.) in great numbers. Among them are also a few manuals translated from German into Danish and Swedish that go into more detail about conversation. Hunold's *Compliment-Bok* (Swedish translation 1741) has been discussed by Lilius, who tries to apply Grice's conversational maxims to Hunold's rules of courtesy and to draw parallels to conversation analytic findings on compliment exchanges (1998, 122ff.). The impression this manual gives – which will, I presume, be corroborated by other similar publications – is that the conversations were very strictly structured and that different kinds of conversations were typically associated with particular social settings. Here, as in other cases, it is dangerous to draw any conclusions about the relationship between the prescriptions in the manuals and ac-

tual practice, but according to Burke (1993, 123f.) there is evidence that in Italy, France and England, the models in the manuals influenced conversational practice during the early modern period. During this period – in Scandinavia, however, mainly during the 18th and 19th c. – new forms of social intercourse, conversation and discussion emerged with the coffee houses, salons, clubs and academies. Burke (1993, 119) characterizes meetings in these settings as semiformal and half public. It is obvious that this type of sociability was reserved for the aristocracy and the bourgeoisie.

Quite different settings for conversation in a broad sense are those found within the Folk High School (particularly in Denmark and Sweden) and the Labour movement during the second half of the 19th c. In these frameworks, systematic training of debating and arguing skills took place in the form of discussion exercises on given topics (Josephson 1991; 1996; Josephson et al. 1996). Not only the content of the contributions but also their approximate form can be studied in extant minutes. Josephson characterizes the conversational style of these meetings as “considerate” in Tannen’s terminology (1991, 30).

Another type of source are the descriptions in travel books and diaries by travellers concerning conversational habits and style in foreign countries. Despite often stereotypical pictures rendering so-called national characters in a routine way, the contrastive approach may uncover interesting dissimilarities between the conversational culture of the foreign country and that of the visitor’s home country. The information these manuals and travellers’ accounts offer belong rather to the ethnography of speaking than to conversation analysis, i. e. they tell us who speaks (or may speak) to whom when, where, how, and about what. In a comparative sociohistorical perspective this may be of greater interest – and is more easily attested – than, for example, repair strategies or preference organization. Research into this kind of historical source is, however, scarce.

The most obvious and probably most reliable source for studies of concrete conversational sequences and interactional regularities in the past is contemporary realistic drama and dialogue in fictional prose. This means that nothing older than the 18th c. and no verse drama is of interest. During recent decades there has been a growing interest internationally in studying drama dialogue with sociolinguistic, particularly conversation analytic, methods (e. g. Burton 1980; Herman

1995), mostly 20th c. drama but also plays from earlier periods. In Scandinavia, articles by Rommetveit (1991) and Svennevig (1991) are examples of this trend; each of them has studied a play by Ibsen. An ongoing project in Uppsala, *Svensk dramadialog under tre sekler* [Drama dialogue in Sweden through three centuries], has as one of its objects to map out the conversational patterns and changes in plays over time (Melander Marttala/Östman 2000, 3f.; 8). One of the few earlier studies that has paid attention to dialogue as interaction is Widmark’s (1970) investigation of Gyllenborg’s comedy *Swenska sprätthöken* from 1737. Her main concern is the stylistic differentiation, but she also deals with turn-taking. Questions, imperatives, exclamations and turns initiated through terms of address, response tokens, interjections and the like are much more frequent than declaratives (1970, 8ff.). Still, to a modern reader, the majority of the turns are strikingly long and do not give the impression of a vivid and brisk conversation.

Although drama (and prose) dialogue are the best sources now available for the historical study of interactional patterns, these texts cannot be regarded as entirely true reproductions of genuine conversation of their time. Obviously, they are not authentic talk but, at best, the playwright’s perception of realistic utterances. There is also the dramaturgic, aesthetic aspect. Drama dialogue tends to be more condensed, more tense than everyday casual talk and allows little scope for phatic communion. The author is under an obligation to include in the utterances considerable background information for the audience which in comparable authentic situations remains unmentioned because it is common knowledge to the participants. As a consequence, the structuring of information is more stringent in plays than in real talk (cf. Svennevig 1991, 45f.). Thus written – and performed – drama texts can be characterized as both more elaborated and less verbose than everyday conversation. Eriksson (1998) compares the course of dialogue in two sequences containing the same adjacency pair, proposal – rejection, in an authentic conversation and in a contemporary play. He demonstrates through solid conversation analysis how in this case – which can probably be generalized – the real speakers try to avoid conflict whereas, in a drama, conflict is what is sought.

A sociolinguistic problem well suited to historical investigation is forms of address. The

subject matter is in itself sociolinguistic and cannot be dealt with non-sociolinguistically. It has indeed been studied before the mid-20th c. but new theoretical fuel was added by Brown/Gilman (1960). Presumably, address forms and comments on them in historical sources, realistic dramas and fictional prose, letters, reports and other written genres are quite authentic and mirror social stratification and relations of the period. As is well known, Swedish is in this respect more complicated than Danish and Norwegian, since it does not conform to the general European T/V system. During the 19th and 20th c. the Swedish address forms were a perpetual object of (at times) heated debate. A survey of relevant literature is given by Ahlgren (1978), which deals with the semantics and use of *ni* in a historical perspective. Widmark (1995b) widens the scope both historically to times before *ni* appeared and to the use of common nouns as address forms. A historic study of Danish forms of address has been presented by Nielsen (1948).

4. The variationist paradigm and language history

No change in the structure of a language comes about without a prior stage of variation and, vice versa, the diachronic aspect is present in practically all studies of contemporary variation. Studies on language variation and change in present-day speech communities have developed a large set of efficient methods to uncover regularities or tendencies in the patterns of ongoing change. A hallmark of these methods is that they are empirical and quantitative; they preferably use as data recorded speech (structured interviews as well as authentic informal conversations) but also elicited perceptions, opinions and attitudes about others' and informants' own language use. The prototypical linguistic investigation in this tradition builds on a large corpus designed in advance, well suited to statistical analyses and thus well controlled by the researcher. The theoretical conclusions are, among other things, that variation is part of linguistic structure and that speakers orientate themselves to a variational norm. Furthermore, not only does speakers' linguistic competence include the ability to vary their speech, but they can also interpret the social significance of the linguistic form of a message and act according to prevailing sociolinguistic norms and their

own social aims. The view of leading sociolinguists is that sociolinguistics must be incorporated in linguistic theory and consequently in any theory of language change.

To apply sociolinguistic concepts and methods to historical data is problematic, though. Research in the dominant Labovian paradigm is typically focused on speech and regards this as primary in relation to written language. Data older than ca. 1890 are all written. Furthermore, the most successful research into linguistic variation has concerned phonological variables, that is, variation in form that does not affect cognitive meaning nor, in most cases, the spelling, and detailed phonological analyses like those carried out in variationist studies are almost impossible to do on the basis of written historical texts. We have to stick to morphological, lexical and syntactic variation which, as far as the lexicon and syntax goes, involves variation in meaning in most cases. Another question is how reliably the historical texts that make up the data reflect actual social stratification and situational norms. In realistic contemporaneous drama, stylistic differentiation is often found to the effect that persons belonging to different social strata or appearing in varying social contexts express themselves differently (see e.g. Widmark 1970). How authentic is this variation? Are the presented social dialects – if the term is at all appropriate – reasonably true representations of linguistic variation in real life, or is their function just to indicate that here is a social difference between two personae which may be signalled linguistically without naturalistically rendered details? A comparison with the popular burlesque comedies of later eras and the stereotyped dialect we meet there should make us cautious when we interpret stylistic variation in older plays, even though we cannot deny that the best playwrights of earlier epochs had a keen sense of stylistic nuances. A further problem is how a stylistic continuum relates to a social one. Most present-day studies of spoken language that comprise both social and stylistic variation have demonstrated a parallelism between the two so that a variety (or rather a set of variants) used in formal situations by a lower-class person is equivalent to the variants that middle-class speakers use in informal contexts. Both groups of speakers display similar stylistic variation but at different levels (cf., for example, most variables in Labov 1966). So, if you have a corpus of texts from a particular period in history representing

different genres or text types, e.g. legal and official language, literary prose, epistolary prose, courtly or serious verse, religious moralizing verse and comic verse – which are the text types Romaine has chosen for her seminal 1982 book – is it possible to conclude that the observable stylistic variation corresponds to a sociolectal continuum in the period which the texts date from? That would mean that the linguistic form of official prose comes close to the speech of the higher social groups and that the style of comic verse narratives has many traits in common with a decidedly popular low style. It is true that the majority of sociolinguistic variables investigated from the latter half of the 20th c. display this parallelism between stylistic and social variation, but variables in the process of change – as, for example, postvocalic *r* in Labov's New York study (1966) – often deviate with a cross-over pattern; and there are other counterexamples too. No doubt, this problematizes the interpretation of recorded variation in terms of diachronic processes in the past, and we must rely on what external evidence that there is for our reconstruction of past linguistic processes in their social contexts.

When trying to reconstruct sociolinguistic stratification and processes of change, sociolinguists have generally acted on the “uniformitarian principle”, which means that we assume that “the linguistic forces which operate today and are observable around us are not unlike those which have operated in the past” (Romaine 1982, 122). This would imply, among other things, that the prevalence and character of well-attested present-day processes and forces like change from above and change from below, the attitudinal factors of overt and covert prestige, the gender- and class-related patterns of change, and the principle of chain-shifting which predicts that “tense [vowel] nuclei rise along a peripheral track” (Labov 1994, 176) can be inferred for historical changes; thus we can use “the present to explain the past” (ibid., 24). Where intralinguistic forces are concerned, there do not seem to be any valid objections to the uniformitarian principle; to our knowledge, human physiology and mental capacities have not undergone any changes that could have an effect on linguistic ability. But in the case of external social and cultural factors, we must use the principle with great caution. We know that social organization in Western and most other societies has changed radically over time, both the kind and degree of social integration and

compartmentalization, and we suspect that there have been equally important changes in mentality influencing concepts of self and societal roles as well as the linking of linguistic form and social significance. Increased length of life probably means that people nowadays are in contact with speakers representing a wider age-range than in the past. This would possibly have the effect of slowing down change, as would the exposure to public media and other channels of communication. To get a better understanding of this type of problem, sociolinguists must to a greater extent work together with students of social history and mentality. Until this has been attained, the uniformitarian principle is a good working assumption, as long as we are wary of its pitfalls.

Romaine (1982) discusses in great detail the epistemological and methodological status of sociohistorical linguistics, taking as her starting-point the claims for a sociolinguistic theory put forth by, among others, Labov, Bailey and Bickerton. She argues that a theory of sociolinguistics in the Labovian sense must include the diachronic aspect and must not exclude the written language; written sources are as valid as casual speech. The domain of the sociolinguistic variable should be extended beyond phonology so as to comprise syntactic traits as well, e.g. relative markers in Middle Scots, which is the object of Romaine's empirical investigation. Not only can we use the present to explain the past but also vice versa, use the past to explain the present by applying sociolinguistic methods and analyses. Although she is critical of some of the epistemological claims that have been made concerning the explanatory and predictive power of sociolinguistic analytic methods like cross-product analysis, implicational scaling and variable rule analysis, she practises these herself and shows that they give valuable insights into the structure of relativization in Middle Scots and its stylistic, and by implication social, variation. However, Romaine issues a warning against the power of these analytic tools. “Both implicational scaling and the [variable rule] program run the risk of exaggerating or imputing dynamic qualities to situations which may well have exhibited stable variability over centuries” (1982, 200). This inherent shortcoming can be counteracted, though, by taking into account extralinguistic – stylistic and social – factors which are “observed to condition the rate of application of linguistic rules” (ibid.). Romaine's own empirical investigation demonstrates that stylis-

tically stratified variability can exist over a long period of time without giving rise to change but while gradually assuming socially diagnostic qualities.

In Scandinavia, there are no sociolinguistic historical studies like Romaine's with such theoretical depth, size of empirical data and consistency in use of sociodialectological methods. Research on sociolinguistic variation in the second half of the 20th c. usually includes a diachronic aspect and makes reference to earlier studies building on material (partly) dating back to the 19th c. Such works are, for example, those by Ingers (1970), Nordberg (1972; 1975), Kristensen (1977), Thelander (1979), Ståhle (1981), Kotsinas (1989), Sandøy (1995), Ivars (1996). (See also arts. 35; 167; 192–194). Loman (1991) has given an exhaustive exposition and assessment of urban language studies in Norway and Sweden during the period 1850–1950. Although these studies were written before the variationist conceptual apparatus was available, most of them are in no way sociolinguistically naive, e.g. those by Amund B. Larsen or Olof Gjerdmann. These types of studies will not be given further mention here.

There are not an abundance of studies of earlier language stages and long-term changes that make use of sociolinguistically inspired quantitative methods. Nordberg (1980) applies a modified variable rule analysis to account for the historical development of the variation *ha* ~ *hadde* in the temporal-modal system of (spoken) Swedish from three different periods: the 1650s (Agneta Horn's oft-cited autobiography), the latter half of the 19th c. (Gustaf Ericsson's autobiography, written in Södermanlandian dialect) and the 1960s (casual urban speech in Eskilstuna). Five grammatical factor groups are distinguished, and it is shown that the strongest impact on the choice of variant has shifted from the verb's functioning as main or auxiliary in the older corpora to that of expressing modality in the Eskilstuna corpus. It is in expressing unreality – and particularly so in the lower social groups – that the *ha*-variant is significantly strong. Thelander (1991) demonstrates the applicability of quantitative analytic methods to uncover qualitative entities as social and stylistic varieties. He uses two data sets – one the present-day dialect of Burträsk, the other Agneta Horn's autobiography from 1657 – which both exhibit internal variation. By analyzing the co-occurrence of variants from two different systems in sequences of

varying length, Thelander attempts to establish, on language-internal grounds rather than contextual, two co-existing systems. According to Thelander, the possibility that linguistic variation should be conceived of in these terms rather than as inherent variation in one system always ought to be tested first. In the Burträsk case this analysis works well – three distinct varieties can be deduced – but in the case of Agneta Horn, data indicate a “gradual style slide” (1991, 89) rather than two consistent stylistic varieties. A third study in this vein is by Larsson (1988) on the indicative inflection in the plural persons of verbs in 15th – early 19th c. Swedish. His sources are dramas, documents, letters and memoranda. He views variation using a socio-psycholinguistic model of linguistic competence which stresses situational and interactional factors in a way reminiscent of social constructivism and conversation analysis. The analysis is based on statistical calculations of the relative influence of language-internal factors like subject type, word order, distance between subject and verb, phonological context and verb class. Although Larsson does not make use of variable rules or implicational scales technically speaking, he does analyse the mutual and combined effects of linguistic variables in a variable-rule-like way and orders verb groups in implicational hierarchies. But he also includes situational and socio-economic factors and shows that, as today, the social differences that can be established are quantitative and that no single social group can be made “responsible” for the breaking up of subject–verb concord. It is worth noticing that these three studies, as well as that by Romaine, trace their origins from research aimed at the linguistic analysis of social variation and apply methods worked out within that paradigm. However, when these methods are used for analysis of historical data, they tend to tell us more about other types of variation, e.g. stylistic and, first and foremost, structurally conditioned variation. This may be seen not only as a consequence of the insufficient social data from earlier epochs but also as a testimony to the viability of these methods for purely linguistic analysis.

Sociolinguistic studies on earlier epochs are scarce also in Norway and Denmark. However, Dalen's study (1991) on the 17th c. urban dialect of Trondheim may be mentioned here. He argues that this dialect is basically the same as the present variety, that there are signs of social variation within the dialect in the 17th c. and that the similarity with the dialects of

the non-adjacent coastal area is due to social and economic parallels. Brink/Lund's (1975) large-scale study of the phonetic development of spoken Danish must be mentioned, although its main focus is on the 20th c. The investigation was designed before the authors knew about Labov's New York study, but the approach is typically sociolinguistic. Brink/Lund trace the (rather late) emergence of and subsequent changes in the two Copenhagen sociolects, the high and the low variety, and their diffusion over other regions in Denmark. The time depth is impressive: the authors have made use of recordings of speakers born in the period 1816–1956. Their results rest on the assumption that no important phonological changes in the individual, at least not systematic ones, take place after the age of fifteen. That this is the case is not conclusively shown in the literature on variation and change.

Considerably more research has been done on stylistic, situational and social variation in the past that is sociolinguistically informed and uses sociolinguistic arguments without necessarily applying the specific analytic tools of the discipline. Most often these studies are preoccupied with varietal stratification during the past five centuries, especially the existence and status of a (spoken) standard (under diverse designations) and its relation to other varieties or with the stylistic variation in a certain text and its social significance at the time. In Sweden, Widmark in particular has contributed to this field with a number of papers. Widmark (1970) shows that colloquial forms in print are used by Gyllenborg and other playwrights for style-differentiating purposes during the Age of Liberty "Frihetstiden". Such forms signal both situational (for the upper classes) and social variation, and this is effected by a difference in number, not in kind. The informal, yet polished, variety used by people of the better classes in their private social lives lies between the public formal speech and the vernacular of uneducated people. The differentiation affects vocabulary, word forms, forms of address and syntax. This stylistic (and social) tripartition is well attested by, among others, the 18th c. grammarian Sven Hof and was still in operation around 1900 according to Noreen and Lyttkens/Wulff. Both these latter authorities, however, further subdivide the stylistic spectrum of spoken Swedish into six categories, still excluding rural dialects (Widmark 1991, 230; 1992, 158 ff.). The basic situational differentiation which apparently has prevailed for cen-

turies is the one between public and private speech, a distinction valid for the upper classes in particular. There also seem to have been e.g. regional variations or nuances in private speech. Socially conditioned variation in private speech is attested by Lagerlöf at the end of the 17th c. (Widmark 1991, 231), and it is probable that it dates back at least another c. (Widmark 1992, 166). Holm (1984) assumes that some sort of common, nationally applicable variety must have existed as early as the late Middle Ages for purely communicative, practical reasons.

A major issue in the debate on stylistic and social variation in spoken Modern Swedish is the relation between the three main varieties, their reciprocal influences over time, and in particular the origin of educated colloquial speech. These three varieties are in Hof's terminology "public speech", "the speech of social intercourse" and "the speech of ordinary people", and in Noreen's "higher", "middle" and "lower style". Two possible sources of the colloquial speech of the upper classes which exerted their influence during different periods are mentioned: *hovspråket* 'the court language' during the 17th and 18th c. and *boksvenska* 'bookish Swedish' during the 19th c. The court language may have had its roots in recited written official documents and ceremonial speech and may have spread to wider upper-class strata via conversational use in court circles (Widmark 2000, 24 f.). Bookish Swedish is a term coined by Dahlstedt (1978, 50 ff., 57 f.) and refers to the high variety of the peasantry which built on the language of sermons and of books and texts read aloud in schools. During the whole modern period there seems to have been a diglossic situation: for ordinary people the two varieties concerned were dialect and bookish Swedish; for higher-class people, educated colloquial speech and public speech. This rather strict system was in the process of dissolution around 1900, making room for the 20th c. system with a national spoken standard, regional standards and local dialects, mostly with smooth, continuous transitions between the lects.

Rather similar situations seem to have prevailed in Denmark and Norway with the same kind of varietal division. For Denmark, the stylistic and social tripartition is attested by Skautrup (1953, 224 ff.) and Pedersen (1997, 239 f.). According to Seip (1959, 41, 47, 67) the situation in Norway during the 18th and 19th c. was similar, with three relatively dis-

tinct varieties. In both countries the division between speech in public and private domains was maintained. As for the age of a *höyere talemål* 'H-variety', Seip (1954, 215 ff.) draws the same conclusion for Norway as Holm does for Sweden: some sort of a common high variety must have existed as early as the Middle Ages. In Denmark it is also possible to divine a higher variety used on certain ceremonial occasions (Skautrup 1944, 278 ff.; cf. art. 167).

The argumentation in this research, Widmark's and others', is based on, besides the actual extant texts, observations by contemporary grammarians, lexicographers, literary men, travellers and on linguistic comments by letter-writing laymen. The assessment of the quality of such evidence, of course, hinges on the aim and leanings of the written sources and on knowledge of the cultural milieu in which the document was written, i. e. on customary historical and philological criticism of the sources. But the interpretation must also be informed by sociolinguistic considerations, and so far these have to be built on what we know about present-day forces which influence variation and change. Thus Widmark, in her investigation of the origin and evolving social distribution of apicoalveolar [ʂ] in Swedish, makes use of well-attested present-day variation according to gender and social class and according to the social value of the variant and attitudes towards it that can be inferred from earlier statements and testimonies (1983, 92, 96 f.). And she gives the same explanation for the substitution of *dom* for *di* in subject position by Swedish immigrants to Stockholm in the 19th c. (1991, 232 f.) as she has used for the change in quantity of [u:] to [u] before *rt* in present-day central Swedish (1973, 21 f.).

Up until the 1970s, sociolinguistic issues had difficulty in being included in textbooks on language history. The shining exception is Skautrup's *Det danske sprogs historie* (1944–68). Skautrup consistently views language in relation to its changing ecological – i. e. cultural, social, political, material and other – conditions and pays much attention to domains and varieties. That language is something that exists within societies and is the object of attitudes and planning is clearly brought out by Haugen (1976). The latest Swedish language history textbook, by Pettersson (1996), allots considerable space to sociolinguistic, sociohistorical and language contact explanations of language change. It

is unlikely that future descriptions of Nordic language history will not embody sociolinguistic issues.

5. Is a historical sociolinguistics possible?

Besides giving a survey of the sociolinguistic research on Nordic language history, I have discussed in the previous sections theoretical and methodological problems connected with the different sociolinguistic approaches to the study of language history. The account in this section can thus be brief.

The fewest problems are associated with macrolevel studies of language planning, societal bilingualism and the overarching ecological conditions for developing different functions of language at various times. Apart from the often unpredictable supply of and access to relevant historical sources, the main difficulty seems to be in getting a satisfactory picture of the implementation of language norms and the attitudes towards enacted language policies. The connection between informants' professed attitudes and their actual performance is also indirect concerning present-day issues. Reports on (other people's) attitudes in bygone days, also by contemporaneous observers, are a further step more indirect and less representative than those we can capture today. All the same, we can get very detailed and tangible information on language standardization and the implementation of norms in historic times from investigations such as the one by Santesson (1986). Language ideologies and views on the relationship between nation and language in the past are accessible only insofar as they have been taken down by members of a political and intellectual elite. During the 19th c., and especially its latter half, participation in the public debate on linguistic norms widened, mainly as a result of the initiation of compulsory schooling and new popular movements, and the documentation of linguistic endeavours and attitudes increased accordingly.

The answers we can hope to find concerning conversational patterns in earlier periods are those pertaining to the ethnography of speaking rather than to conversation analysis. This is due to the nature of the data handed down to us. These can, at their best, give us some impression of interactional norms concerning

verbosity and silence, social constraints and mandates on conversation in terms of participants, setting, time, subject, code etc., and forms of address and expressions of courtesy and abuse. Testimonies about these kinds of issues can be found in writings by members of the cultural-linguistic community in question as well as by outsiders, i.e. they are products of either participant or external observation. Data of the latter kind, in particular, are often written from a contrastive cultural perspective and can in any case be subjected to contrastive analysis. Plays as evidence of interactional norms and processes should be treated with caution, as a couple of articles show (see 3.). It is futile to think that we can obtain ethnomethodologically valid data, i.e. from authentic, not preorganized conversation, on fine nuances of social interaction like turn-taking strategies, accountings and preference organization from periods prior to the 20th c. It may be the case, though, that these microsocioal mechanisms are so sluggish that what we discover about present-day patterns in a specific culture are valid for the past too. But we will never know for certain.

As for the study of language variation and change, we may decide that, in order to do fruitful research on historical material, we have to abandon the doctrine of the primacy of the spoken language and also include written language in the sphere of sociolinguistic interest. The best picture of linguistic variation at a specific time is, as a matter of course, given by investigations of sources from different genres or individual texts with inherent variation. However, applying conclusions drawn from the stylistic variation that will often be found in these types of studies to social variation of the same order must be done with precaution. Even though there usually is a parallel between stylistic and social variation, it is not a one-to-one relationship. Despite many common overall patterns, present-day social variation and change has proven to be so integrated with cultural and attitudinal factors, often of a local and/or transitory character, that it cannot be correctly explained without supplementary ethnographic and social-psychological information. The social value of a linguistic feature may change within a rather short timespan – or vary simultaneously between communities – as for example the open /*ö*/ and /*ä*/ variants in contemporary Swedish. Reliable and sufficient data of this kind concerning olden times are difficult to ascertain. On the whole, a crucial factor dis-

tinguishing between sociolinguistic investigations of present-day and historic language variation is the researcher's control of the linguistic material to be analysed. Contemporary studies can be designed so as to elucidate in a structured and consistent way the problems that they are supposed to solve (and in some cases an experimental set-up is the most suitable). This is very seldom possible with historic data that have to be analysed idiographically. The dissimilar empirical bases of studies of present-day and historical variation and change aggravate direct comparisons as these would be made, strictly speaking, between incommensurable entities.

Another uncertain factor when we use the present to explain the past are the differences in mentality and conceptions of social stratification that may obtain. Co-operation with social historians and researchers within the history of human mentality would probably eliminate some of the insecurities incident to the existing sociohistorical research. One risk that such co-operation could not remove concerns the degree of correctness and comprehensiveness of contemporaneous statements by linguists and others on the usage of the period in question. Although such statements are often referred to in the argumentation in historical sociolinguistic research – and it would be wrong to disregard them – they must not be taken at face value. It is not a sign of disrespect for these linguists to point out that they cannot possibly have surveyed more than a limited portion of the usage and attitudes of their contemporaries. Present-day professional observers may also go wide of the mark. For instance, the prevailing opinion of Swedish linguists and language cultivators is that the morphology of spoken language, particularly some nominal and verbal suffixes in the dominant Central Swedish variety, are changing rapidly towards the forms of the written standard. As shown by Nordberg/Sundgren (1999) in a comprehensive study of Eskilstuna speech, this is not correct. Only one out of seven variables displayed an overall substantial change over a 30-year period; all the others showed no or very little chronological change. The results are probably valid for the whole Central Swedish area with the possible exception of Stockholm. The point is that the conditions for observing and surveying contemporaneous usage have never been so favourable as in the latter half of the 20th c. Even so, existing statements are far from exhaustive or even correct. So, conclusions con-

cerning the accuracy of assessments of usage during earlier periods are obvious.

Is a historical sociolinguistics possible then? Despite all the difficulties, shortcomings and objections mentioned above, I am inclined to answer in the affirmative. But it will be a somewhat different sociolinguistics, less empirical in the sense that it must necessarily rely less on hard statistical data and be less prone to formulating rules and laws than has been the case in some sociolinguistic quarters. Some subfields will have to be given up altogether; it is not possible to conduct conversation analysis according to the rules on historical material. A historical sociolinguistics has to accept indirect, second-hand data. Findings concerning present-day sociolinguistic conditions cannot be applied to historical material straight off. This does not mean that they should be neglected. On the contrary, it would be impossible to engage in historical sociolinguistics without the theoretical and empirical basis of modern sociolinguistics, but, above all, the description and explanation of sociolinguistic states and processes in the past must be solidly grounded in the historical, social, ethnographic and mentalistic circumstances of the age in question. In most cases the best way to avoid anachronistic interpretations by uncritical use of the present is, of course, cross-disciplinary co-operation. Even if the available linguistic data and extralinguistic facts do not allow sociolinguistic methods to be applied strictly and systematically, it is evident that sociolinguistic thinking and sociolinguistic approaches may enrich diachronic studies and give us a more detailed and realistic conception of language history and the interplay between language and society during earlier epochs.

24. Nordic language history and research on languages in contact and on multilingualism

1. Introduction: Research on languages in contact and multilingualism
2. The range of contact phenomena
3. An outline of research on Nordic contact
4. Conclusion
5. Literature (a selection)

1. Introduction: Research on languages in contact and multilingualism

Research on Nordic language contact and multilingualism is an expanding field based on a 100-year-old tradition. Both diachronically and synchronically, a variety of contact phenomena, situations and results are involved. Nevertheless, the basic research tools have not been developed beyond the primary stages. The main reason is that contact research until World War II was intimately bound up with loanword studies in a neogrammarian vein. Although the fruits of this research on lexical loans were enormous, they necessarily remained one-dimensional, leaving aside various kinds of structural interference due to language contact as well as sociolinguistic effects of bilingualism (e.g. code-switching, code-mixing, and interlanguages of different kinds and degrees). Data that were hard to cope with in a neogrammarian framework had simply been ignored. Furthermore, precise standard terminology, which is a basic requirement, had not yet been developed (on this prerequisite, see 2.).

Modern contact research progressed after World War II with considerable speed. Two pioneering works that functioned as signposts for future research appeared in the same year: Haugen's *The Norwegian language in America* (1953), and Weinreich's *Languages in contact* (1953). Further impetus was given by Le Page (1959), who initiated the study of pidgin and creole languages. Le Page's background was one of a traditional philologist, but he turned to the pidgin languages of the West Indies which hitherto had been totally ignored by linguists. It had been noted early on that pidgin languages are structurally equal. Therefore, in the years 1965–1980, researchers on creole languages advanced the "monogenetic" (or "relexification") theory claiming a genetic relationship and a common origin for all pidgin languages (cf. Bechert 1991, 130ff.). This

model parallels the traditional IE family tree where a common proto-language is invoked. But genetic linguistics was unable to account for any linguistic transfer other than direct loan of elements (lexical transfer), since it had to exclude most kinds of structural interference and sociolinguistic data. A basic alternative of the "monogenetic" approach was the so-called "polygenetic" model. A touchstone of both models was Russenorsk in Northern Norway, which probably developed in the 18th c. and served as a basis of communication for about 150 years in the seasonal trade between Russians and Norwegians (cf. Broch/Jahr 1984; Jahr 1997). Russenorsk had been known amongst creole language researchers for a long time, and it provides a good example of a pidgin language which was difficult to explain in terms of the monogenetic theory. Russenorsk has been interpreted as a Scandinavian counterpart to other pidgin languages in the world (especially in the Atlantic and Pacific region).

Significant progress in contact research was made by Trudgill, whose work *Dialects in contact* (1986) is directly parallel to Weinreich's *Languages in contact* (1953). Trudgill differentiated between dialect contact and language contact as follows: "Dialect contact I define as involving mutually intelligible varieties, while language contact is concerned with non-mutually intelligible variation" (1994, 13). Dialect contact may lead to a new interdialect variety (with interdialect forms), whereas language contact leads to the development of an interlanguage. Typical characteristics of interlanguages are simplification and overgeneralization. This is the scenario where a *koiné* comes into being: "The dialect-contact counterpart to a language-contact pidgin is thus a *koiné*. A *koiné* is a new mixed dialect, just as a pidgin is a new mixed language" (Trudgill 1994, 19). In modern research, this essential distinction receives much attention (cf. Kotsinas/Helgander 1994).

An important contact phenomenon is the reduction of variants. There is a general tendency for the most simple and unmarked variant to survive, while all other variants are removed. In Trudgill's terminology, this process is called *levelling* (Trudgill 1994, 20). A condition *sine qua non* for dialect levelling is mutual understanding, or (at least partial)

bilingualism. As pointed out by Thomason/Kaufman (1988), the nature of contact-induced change is in part determined by the nature of bilingualism (i. e. its duration, type and degree). An example of dialect levelling is provided by contact between Low German and Nordic in the Hanseatic period (see 3.2.).

2. The range of contact phenomena

One linguistic subsystem which is extremely susceptible to contact-induced change is the lexicon; hence the prominent focus on lexical loans in traditional research (cf. art. 88). Haugen (1950) and Weinreich (1953) endeavoured to develop a systematic set of terms for this (the bracketed numbers tentatively indicate terminological correspondences):

<i>Haugen</i> (1950)	<i>Weinreich</i> (1953)
Linguistic Innovations	Lexical Interference
Borrowed	Simple Words
Loanshift	Transfer (5) (6)
Creation	New Function
Exact (1)	Homonymy (3)
Approximative (2)	Polysemy (4)
Extension	New Expression
Homonymous (3)	Compound Words
Synonymous (4)	and Phrases
Loanwords	Transfer (7)
Assimilated (5)	New Function
Unassimilated (6)	Loan Translation (1)
Native	Loan Rendition (2)
Induced (7)	Loan Creation (7)
Spontaneous	Hybrid Compounds

A terminological consensus concerning lexical transfer is far from established, and a systematic grid of different kinds of lexical interference is a *desideratum* to be worked on (cf. Oksaar 1984, 849f.). The situation is even more complex when contact phenomena beyond the lexical domain are included. It is generally acknowledged that transfer and interference pertain to all levels and subsystems of the languages in contact, namely vocabulary (lexical loans), phonology, morphology and syntax (structural loans). Note that the research on syntactic transfer (particularly a change in word order) faced particular problems since direct influence from one language on another is difficult to prove (cf. art. 21). The notion of structural influence had already been put forward by Hermann Paul (1909). He maintained that there are two basic influences exerted by a foreign idiom (Paul 1909, 339). First, foreign elements can be absorbed.

Second, native elements can be rearranged and structured to conform with a foreign pattern. This kind of impact is said to alter the *inner form* of the language.

A basic hierarchy of different contact phenomena is presented by Thomason/Kaufman (1988, 74ff.); their borrowing scale includes five different stages from casual contact (exclusively lexical loans) to heavy structural loans (under very strong cultural pressure). These structural borrowings culminate in an altered morpho-phonology, involving also typological changes, for example the neutralization of phonemic contrasts, variation in word structure rules, and the transition from a synthetic to an analytic language type. It is stated that grammatical domains differ in terms of sensitivity or degree of interference. Van Coetsem (1988, 28), for instance, maintains that different subdomains are not equally stable. In his view, the concept of stability correlates with the relative degree of structuredness of a domain or subdomain: the more structured, the more stable (cf. also Thomason/Kaufman 1988, 72–74). On the phonological level, a salient contact phenomenon is the reinforcement of sound changes through intimate contact (Schulte 2001 a).

Accent, pitch and tonemes are highly susceptible to language interference. Salmons (1992) carried out a systematic study on *Accentual change and language contact* in northern Europe, where he mainly dealt with the pre-literary period. Another important factor is the “typological distance” between contacting languages or dialects (cf. Thomason/Kaufman 1988, 73). It seems that a close typological fit between the subsystems of the source and target language would favour interference, although not automatically lead to it. In Trudgill’s model, this would be a clear case of dialect contact (see 1.). Examples of this are provided by Old Nordic-Old English contact in the Danelaw and by Low German-Scandinavian contact through the Hanseatic league (see 3.1. f.).

3. An outline of research on Nordic contact

Three periods can roughly be distinguished for Nordic language contact: (1) an early one (including the older runic period and the early High Middle Ages); (2) the (later) Middle Ages; (3) modern times.

3.1. Early contact

North Germanic contact with surrounding idioms started very early (cf. art. 88). Outside Indo-European, the earliest clear contact must have been with the Finno-Ugrians. On linguistic grounds, Finnish-Germanic as well as Sami-Germanic contact can be traced back to Proto-Germanic times (cf. Koivulehto 1999, 359–372). A dominant aspect of early Nordic and Pre-Nordic (Gmc) contact with surrounding languages is heavy borrowing of lexical items. Therefore, the investigation of early Nordic and Germanic (i.e. AN and PGmc) contact primarily rested on lexical loans. A sketch of loanword research to date on the pre-Hanseatic period is provided by Hofstra (1995). The author gives an overview over different strata of assumed Germanic loanwords in Baltic Finnish (cf. also arts. 67 and 88). Pioneering work in this field was done by Koivulehto, whose studies are now collected in a *Festschrift* (Koivulehto 1999). Koivulehto's main achievement was to establish a relative chronology of loanword strata on linguistic grounds. Apart from borrowings that can be traced back to Proto-Germanic, there are loans which belong to a specific stratum of Ancient Nordic, e.g. Finn. *katso*- 'guard' (← AN **gāt(i)ja*- < PGmc **gēt(i)ja*- > ON *gáta*), which belongs to the so-called *ts*-layer of early Proto-Finnish (see Koivulehto 1999, 258ff.). Research on early Nordic-Finnish contact was also carried out by Elert (1993; 1998) out of a Swedish perspective. In later periods, lexical borrowing continued, but with alterations due to North Germanic sound changes and dialect diversification. Note that research methods have been refined and the focus has significantly changed (cf. Koivulehto 1994). Modern research on Finnish-Germanic contact has turned away from lexical loan studies, and within Finno-Ugric research, a new school has emerged (cf. Wiik 1997b; Künnap 1998). Wiik (1997a), for instance, demonstrates why research into loanwords is insufficient. In diametrical opposition to traditional research, Wiik (1997b) focuses on phonetic interference between Proto-Germanic and Finno-Ugric, arguing in favour of an Uralic/Finno-Ugric substratum. However, Wiik's theories are much disputed.

North Germanic-Sami contacts have also been traced back to early times (see esp. Koivulehto 1999, 359–372). But the basic problems involved in this field of research have only been partially solved. First, the Sami lan-

guage is less conservative than Finnish, and hence there are more uncertainties in interpretation than for Finnish (cf. Koivulehto 1992). Second, Sami loanwords from North Germanic were in part borrowed via Finnish, and the Finnish structures are similar to those of Sami. Sköld (1961, 61), who is aware of this problem, maintains that the loanwords which reached Sami through Finnish make up a substantial source of errors in research on Nordic-Sami interrelations. Wickman (1982, 281) argued that both Nordic and Finnish exerted an influence on the Sami language and reinforced each other's impact on it. Summing up, there are three lines of transmission (cf. Jahr 1997, 945):

- (a) Nordic → Sami
- (b) Nordic → Finnish → Sami
- (c) Nordic → Sami ← Finnish

Apart from these linguistic problems, another difficulty consists in pinpointing the historical and geographic setting for this Sami-Nordic contact. It is said that "the forebears of the Lapps and the Scandinavians met in Northern Norway about the time of the birth of Christ" (Sköld 1979, 111). Undoubtedly, the domain of the Sami population has diminished since Ancient Nordic times (see e.g. Larsson 1992; Ureland 1995). There are typological parallels between Nordic and Sami, but it is uncertain to which extent they are contact-induced. Kylstra (1972; 1983) assumed that certain developments in Nordic and Sami were due to mutual influence. He observed that West Nordic preaspiration and assimilation of nasal clusters (-*NC*- > -*CC*-) also occur in Sami and Finnish (cf. e.g. Finn. *tuttu* 'known' < **tunttu*). Kylstra (1983, 173ff.) admits, however, that it is extremely difficult to reach decisive conclusions as to the origin of these typological parallels. On the whole, Sami-Nordic interference is a field of intense research, although evaluating the data is particularly problematic.

The earliest contact between Celts and Scandinavians is traceable to around 600 A.D. In Scandinavian language history, this is the end of the Ancient Nordic period which is mirrored in the older runic inscriptions (ca. 150–600 A.D.). The investigation of Celtic-Nordic contact is overwhelmingly lexically based. Basic research was carried out by Marstrander (1915). Geipel (1971) investigated *The Scandinavian influence on the English and Gaelic languages*. Historical and linguistic evidence for the Nordic connection to Ire-

land, especially to Dublin, during the years 795–850, was presented by Mac Mathúna (1997). More detailed phonological investigations of Old Nordic loanwords in Irish were presented by Schulze-Thulin (1996), and Nordic traces in Western Scotland were traced by Jennings (1996), while Fellows-Jensen (1996) studied Icelandic-Irish contact in Iceland on the basis of personal names and place-names. Another focus in Nordic-Celtic relations includes language death. An example is provided by Norn, a Nordic idiom formerly spoken on the Hebrides, the Isle of Man, the Orkneys and Shetland, where it was ousted by Gaelic (see Barnes 1998; cf. arts. 100 and 223). Modern research on language contact and on bilingualism investigates the causal factors leading to language death (cf. 3.3.).

Another prominent sphere of contact is between Scandinavians and Slavs. Nordic-Slavic contact is traceable from the 8th c. onward, but the main sources of evidence are Skaldic verses and runic inscriptions from the 10th and 11th c. Runic evidence has been evaluated by Melnikova (1998). For an in-depth discussion of contact between Vikings and Slavs, see arts. 67 and 116. As for East-West contact, Low German-Slavic interactions due to trade connections especially in the Hanseatic period are of major concern, too (see Andersen 2000).

A special point of interest is early Nordic-West Germanic contact in the wake of the Viking raids from the 9th to the 11th c. The Scandinavian settlement in England, the so-called *Danelaw*, set up long-term contact between Scandinavians and Anglo-Saxons. Both Danes and Norwegians were involved in this, but it is a difficult task to distinguish the Danish and Norwegian elements (cf. Fellows-Jensen 1988). Apart from personal names, placenames play a prominent role in this research (cf. e.g. Fellows-Jensen 1985). Different historical layers of place-names have been uncovered, including Scandinavian and Celtic ones. The course of English language history seems to have been determined by long-term contact with the Northmen. Nielsen (1998, 165f.) discusses the various linguistic effects off the Scandinavian settlement in Britain. Hines (1990, 31) sees the standardization of English as a normative process involving a dialectal continuum between the static pole of Nordic on the one hand and the innovative pole of West Germanic on the other. It is disputed whether the decline of the Old English case system and the shift from a synthetic to an analytic language type can be accounted

for in terms of language contact and bilingualism (cf. art. 115). There can be little doubt that language contact favoured morpho-phonological reduction of the inflectional system (cf. Norde 1997; Jahr 2001; Schulte 2001a). As Mühlhäusler (1986, 38) points out, “inflectional and derivational morphology... are the first victims of language contact”. There is a clear parallel with the swift typological shift of the continental Scandinavian languages in the 14th and 15th c. (cf. 3.2.).

Before turning to the Middle Ages, there is one further possible aspect of Nordic-West Germanic contact that stands in need of comment: the extensive borrowing of WGmc names into Nordic (cf. art. 88). Although the lengthy debate on this issue might not be over, modern researchers take a markedly critical stance on this. As the languages involved in this debate are genetically closely interrelated, there is the danger of circular arguments. Peterson (1994, 159) concludes that “the chosen subject of study is not a very suitable one for establishing the true nature of the relationship between Scandinavia and the Continent during the Migrations”.

3.2. Contact in the Middle Ages

It was pointed out in 3.1. that many early Nordic contacts continued throughout the Middle Ages. As for long-term Finnish-Nordic contact, there are lexical loan-studies attesting old Swedish-Finnish trading contacts (see Koivulehto 1996). Sami-Nordic contact also continued through the Middle Ages and into the present (see 3.3.).

The close interrelations within ON languages and dialects also form a major field of research (cf. art. 100). Chapman (1962) provides a classical study of ONorw.-OIcel. interrelations. Note that linguistic argumentation on this issue encounters the danger of circularity, since correspondences between ONorw., OIcel. and OFar. can be based both on parallel developments and long-term contact (cf. Werner 1994, 123). As far as continental Scandinavian is concerned, contact between ONorw. and OSw. in the 14th c. gave rise to a mixed Swedish-Norwegian variety, the so-called “Birgittine-Norwegian” (cf. Sandvei 1938).

A central and still expanding field of investigation is Low German-Scandinavian contact. On the whole, the German impact on the Scandinavian languages in connection with the Hanseatic League has been enormous (for

a historical outline of German-Scandinavian contact between 800 and 1600, see Engelbrecht 1993). As might be expected, the former focus of research rested on loanword studies; hence the abundance of works in this field (see e. g. Rosenthal 1987, with references). Various aspects of the Low German impact on Scandinavian have been dealt with in symposium papers and series, e.g. Hyldgaard-Jensen/Winge/Christensen (1989), Elmevik/Schöndorf (1992), Braunmüller/Diercks (1993), and Braunmüller (1995). Investigations include all kinds of Low German influence, for instance in terminology and the lexicon, translation practice, morphological and syntactical transfer. Morphological transfer involves questions of word formation such as the borrowing of German verb prefixes into Nordic (cf. Corfitzen 1989). It has been noted by Johannisson (1968, 619) that many Low German loanwords are high frequency words. An overview over Middle Low German influence on Swedish in a historical setting is provided, e. g., by Rosenthal (1987). As pointed out by Moberg (1989), the creative role of bilinguals in extending the lexicon by fusing elements of both languages must not be underestimated. It is often stated that interrelations between Low German and the Scandinavian languages especially in the 14th and 15th c. led to rapid inflectional (morpho-phonological) reduction. This change resulted in a typological shift to an analytic language from a synthetic one (cf. Jahr 2001). In this period, Low German and the Scandinavian languages must have been mutually intelligible, comparable to the situation among Danes, Swedes and Norwegians today (Haugen 1966; Braunmüller 1989). Thus, there was no need for an interlanguage (or a pidgin) between the Hanseatic traders and the Scandinavians (cf. Braunmüller 1997). Neither is the situation indicative of far-reaching bilingualism. Apart from the fact that Scandinavians themselves were used to semi-communication, the basic requirement for mutual understanding was fulfilled: a high degree of similarity, or close typological fit, in the phonological, morphological and also lexical subsystems (cf. 2.; see also Norde 1997, 395f.).

It has long been noted that the typological shift to an analytic language type occurred almost simultaneously in Danish, Swedish and Norwegian. All these languages were in long-term contact with Low German. Haugen (1976, 313) explicitly stated: "There can be little doubt that contact with other languages,

especially Middle Low German, but also Latin, was a triggering factor. The farther a region was from the traffic with the Hansa, the less deeply the old structure was affected". Ringgaard (1986) criticized this view; he regarded the loss of inflection as a purely internal matter, maintaining that reduction of the inflectional system in Danish had already started before there was on-going contact with Low German. However, modern research appeals to the factor of reinforcement through language contact to account for the swiftness of sound changes (cf. 2.). Norde (1997) and Jahr (2001) refer to the morphological and morphosyntactic effects of these interferences, whereas Schulte (2001 a) stresses the structure-based phonological interface. But modern researchers are aware of the fact that phonology and morphology are intertwined in various ways. Contact-based interference in morpho-phonological processes deserves further investigation.

3.3. Contact in modern times

Northern Scandinavia, especially Northern Norway, has been a melting pot as far as language contact is concerned (cf. Ureland 1987). The northernmost minorities in Scandinavia, the Sami and the Finns, are of special interest when investigating multilingual interactions between minority languages and larger languages (cf. Jahr 1997). The earliest Scandinavian contacts with these groups in modern times were documented in the 18th c. (see Jahr 1982, 308 ff.). Russenorsk, Europe's best documented pidgin language, was the result of language contact between Norwegians, Russians, Sami, Finns and Swedes (cf. 2.).

In the very north, the Sami shifted over to Norwegian in some cases and developed a Norwegian variety with significant grammatical simplification. For example, due to the lack of grammatical gender in Sami, the three-gender system of Norwegian was greatly reduced in "Sami Norwegian", in some areas to a unified one-gender system (cf. Jahr 1997, 944). As for structural influences, Wickman (1982, 282 ff.) discusses the possibility of syntactic loans from Nordic into Sami. Points under discussion are the introduction of the copula 'be' instead of original nominal sentences; SVO instead of SOV word order; the compound tenses perfect and pluperfect in addition to the old simple tenses of present and imperfect. As mentioned in 2., contact-induced change has affected the phonological

factor of stress. It has been observed that stress in Southern Sami differs from Northern Sami. Bergsland (1992) does not exclude Nordic influence as an explanatory factor. In his view, the Southern Sami innovation is due to an intensified stress on the initial syllable, which also conditioned the reduction of short, unaccented vowels: "The increased stress, actually stronger than in Northern Sami, could quite possibly be due to Scandinavian influence, but this is, of course, impossible to prove or disprove" (Bergsland 1992, 8).

There is interest today in the position of the Nordic minority languages and in the phenomenon of language death. The main present-day languages of Scandinavia that function as minority languages are Sami, Finnish and Swedish (in certain areas of Scandinavia). Hyltenstam/Stroud (1991) focus on the fate of Sami and other minority languages in a broader sociocultural perspective. By consensus, the minority position of a language is indicated by low historical prestige, a restricted domain of functions, and low social status. Recent contact-based developments have been studied in their sociocultural and historical setting. Thus, Tandefelt (1988) deals with the ongoing language shift from Swedish to Finnish among the Finland Swedish minority of Finland, and Martinussen (1996) discusses the dialect situation in Finnmark from a historical perspective starting with the German evacuation in 1944. In his report on the complex language situation in Northern Norway, Jahr (1982, 310ff.) mentions the special situation of Finnish as a victim of language death. Lainio (1995; 1997) discusses Swedish-Finnish interrelations and the sociofunctional position of Finnish in parts of Sweden, and Hyltenstam (1996) focuses on Swedish as a minority language in the European context. As for the region of Sønderjylland/Nordschleswig, various aspects of German-Danish language contact and bilingualism have been investigated (cf. e.g. Søndergaard 1981; Nissen/Pedersen 1988).

Another central topic of modern contact research concerns the Scandinavian transatlantic emigration to North America (on the historical background, cf. e.g. Blanck 1996). The important Scandinavian minority languages in America are Norwegian and Swedish. Since Haugen (1953) wrote *The Norwegian language in America*, much research has been devoted to Norwegian-English and Swedish-English bilingualism. Note that Haselmo (1974) in his treatise on American

Swedish dealt with code-switching, although he did not at that time make use of this technical term. Interlanguage studies pay much attention to Norwegian-American English and Swedish-American English interference, such as partial code-switching and phonological change (cf. Klintborg 1996; Hjelde 1996). For a comprehensive overview of various aspects of language contact in Northern Europe, see the handbook on *Contact linguistics* (Goebel et al. 1997).

4. Conclusion

The topic of Nordic language contact is extremely complex and multi-faceted. In addition, contact linguistics is a cross-disciplinary field focusing on the process of communication across all kinds of barriers – geographic, social and cultural (cf. Trudgill 1985). Over the course of Nordic history, many ethnic groups and speech communities were involved in contact. Many of these started in pre-literate societies and predate the beginnings of Nordic as a linguistic subgrouping of the Germanic languages. While research on older phases of contact is traditionally bound up mostly with lexical loans, the research on contact in literary times is broader based, allowing for all kinds of methodological approaches and foci, especially sociolinguistic ones (e.g. bi- and multilingualism, code-switching, code-mixing, interlanguages). This is particularly obvious with regard to the research on Low German-Scandinavian contact, where studies based on written sources have widened our perspectives. Bi- and multilingualism plays a central role in linguistic change. As has been argued by Moberg (1989), bilinguals partially fuse the subsystems of their languages (e.g. the lexicon of Low German and Swedish). On the whole, research on modern contact has a markedly sociolinguistic focus. Of particular interest are not only the Nordic minority languages *inside* Scandinavia (Sami, Finnish, Swedish, German, Romani and Russenorsk), but also *outside* Scandinavia (e.g. Swedish and Norwegian in America). In this context, language death is explained as the result of minority languages gradually losing their functional domain. Note that different aspects of Nordic language contact and bilingualism are also dealt with in other articles in this handbook (see esp. arts. 63–70; 88; 115–117; 135; 153; 174; 220–229).

25. Nordic language history and research on styles and registers

1. Introduction
2. Early and late Medieval Times
3. The beginning of the Modern Age
4. The Modern Age
5. Concluding words
6. Literature (a selection)

1. Introduction

The historical development of the Nordic languages is reflected in texts written for various purposes: religious, legal, esthetic etc. Structurally and linguistically different genres have been created and have changed over the course of time. The number of genres was very limited in the early Middle Ages. Research concerned with older texts has focused on philological aspects interspersed with stylistic analyses. Formerly, the concept of *style* mainly referred

to the linguistic variation that distinguishes genres and texts. In modern research, the field has been widened to include structure and narrative technique, rhythm and metrics, the structure of dialogue, elements related to the subject matter etc. Data processing has made it possible to examine and compare very large masses of text, which was not previously feasible.

The past fifty years of Nordic research on special genre and text features has therefore become very multifarious as regards both texts, aims and methods. This cannot be illustrated in any detail here. The present survey is based on a selection reflecting the choice of textual domains and trends in approaches especially in more recent times. The chronological division is roughly: (1) Early and late Medieval Times (approximately from the be-

ginning of the thirteenth century to the middle of the sixteenth century), (2) the beginning of the Modern Age (from about the middle of the sixteenth century to the end of the eighteenth century), and (3) the Modern Age (the nineteenth and twentieth centuries).

2. Early and late medieval times

2.1. Old Nordic literature

What chiefly characterizes the oldest period is that the texts are anonymous and superindividually tied to genre. Except for Icelandic (Old Norse) literature, a great number of the texts consist of translations, above all from Latin. Research on medieval texts has focused on Old Norse literature and is often concerned with text editing, textual comments and philological analysis. The literature on Old Norse texts is almost boundless, and new contributions are constantly being added. The survey below is an attempt to single out research that can be said to have a *stylistic bent*. Inquiries into genres, stylistic categories and style markers can be considered to form a basis for such a study, but no hard-and-fast delimitation can be made. The question of the oral background of the sagas is not merely philological but also contains a stylistic aspect. A symposium was organised on this theme (*Oral tradition*, 1977; cf. Pálsson 1999). Another symposium resulted in a report on *Structure and meaning in Old Norse literature*, 1986, which presents textual analysis of different genres, such as lyric poetry, family sagas and legends of saints. The analysis focuses on new methods of textual analysis, based on methods borrowed from related scientific fields. Structural analysis has revealed a consistent planning in saga texts which can be connected with persuasive linguistic features, for instance repetitions (Heller 1960). Structural and narrative technique can also be said to include dialogue structure, studied in sagas by Snorri Sturluson (Lie 1937). With consummate skill, Snorri included important information in the dialogue (Hallberg 1978). By studying the frequency of certain style markers, Hallberg had earlier been able to make a contribution to text attribution by showing that some anonymous saga texts had been written by Snorri Sturluson (Hallberg 1968). Similar studies have subsequently been carried out by other researchers. It is also of interest to note that modern speech act theory based on J. L. Austin has been used in studying episodes in sagas (Benson 1988).

Other investigations concerned with oral style markers focus on tense, kennings and formulas.

2.2. Other medieval texts

Here we leave Old Norse literature and pass on to other Nordic medieval texts. These can be roughly divided into (1) secular and (2) religious genres, either in prose or in verse form. Genres and texts which are not translations have been of special interest.

2.2.1. Legal texts

A genre in originally written language is thirteenth-century legal texts, which have been studied from both a traditional and a modern perspective. Good surveys of Danish legal texts have been presented by P. Skautrup (1944) and P. Diderichsen (1968) and of Swedish legal texts by E. Wessén (1965). The Swedish survey was preceded by research focused on stylistic features, for instance ellipsis, metonymy and proverbs (Stähle 1958; B. Pettersson 1959). In Old Norse legal texts, alliteration has been the subject of examination.

Contrary to the traditional view, according to which alliteration is a remnant of an older stage of language, it has been maintained that it is an innovation and a consciously employed stylistic device. This view is based on a statistical comparison between older and newer as well as between West and East Nordic legal sources (Ehrhardt 1977). Text structure and cohesion are new topics in research on legal texts (Naumann 1979). N. Jørgensen (1987) has studied syntactic structure based on the so-called macrosyntagm model (cf. sect. 4.3.). He has also studied the textual structure of ten Nordic medieval laws. The result shows such great similarities with other Germanic laws as far as structure and style are concerned that a tradition having Indo-European roots can be assumed.

2.2.2. Other secular prose genres

Other secular prose genres which have interested researchers concerned with the Middle Ages are tales of chivalry and historical texts, diplomas, judgment books and proverbs. In the same way as genres differ, so do trends in research. The analysis of textual structure in Swedish historiography in combination with grammatical analysis has shown what textual function grammatical units can have (Jørgensen 1990). Another approach is concerned

with the relationship between written and oral texts as studied through medieval Norwegian diplomas and late medieval Norwegian letters. In the latter, great differences have been observed between the educated Danish-speaking inhabitants and Norwegian of the people, while at the same time features of the development of the spoken language can be discerned (Grøtvedt 1970). Other researchers have taken an interest in individual differences between scribes who created texts of the same kind but used varying forms of language. Considering that a great many medieval texts reflect an anonymous, impersonal use of language, this approach is worth paying attention to (Utterström 1968). In addition, in the judgment books, i. e. reports of proceedings in medieval Stockholm, the interplay between Low German and Swedish in the language of two scribes who have been compared can also be studied. The outcome points to the significant role played by bilinguals in the development of the language, which throws new light on the influence of German (Moberg 1989). A different form of language contact is represented by the numerous translations from Latin into the Nordic languages. Some researchers have studied the translation techniques involved in such texts. For instance, the disseminated *Vitae patrum* in an Old Norse translation has been dealt with in a dissertation, which emphasises vocabulary and stylistic devices (Tveitane 1968). Another researcher has produced a theoretically profound and richly exemplified work concerned with translation from Latin into Swedish (Wollin 1981).

2.2.3. Secular verse genres

The secular verse genres of rhymed chronicles and ballads have also attracted attention, especially the latter. Basic general descriptions had been produced earlier (Wessén 1928; Skautrup 1947), and a survey of research right up to the middle of the twentieth century has been published (Dal 1956). Here we can also mention a charting of the origins of the oldest Swedish lyric poetry, which go back to Latin verse and to German *Minnesang* (Hildeman 1958). More recent research has been partly focused on formulaic ballad language, which on the basis of modern linguistic theory has been characterized as a style genre of its own (Holzapfel 1980). Also as regards the ballad, interest has focused on the role of the oral tradition (Piø 1985).

2.2.4. Religious genres

The religious genres include Scripture texts, legends of saints, prayer books and sermons. As Scripture texts have played an important part in the development of these languages, it is not surprising that they have inspired investigation. Old Norse Bible translations have been studied, mainly with the focus on the structure of the texts. The findings indicate planning, coherence and consistency between different units that have been linked to each other (Astås 1987). A neglected field of research has been the legends of saints. This gap has now been filled by a dissertation in which Old Swedish legends of saints from the fourteenth and fifteenth centuries, translated from Latin into Swedish, have been examined. In the investigation, translation theory, structural analysis, text linguistics and a socially oriented analysis of style are integrated (Carlquist 1996).

3. The beginning of the Modern Age

3.1. The Bible translations

The Modern Age in the Nordic countries can be said to have started in the first half of the sixteenth century when the first complete translations of the Bible into Swedish and Danish were printed. In connection with the new translation of the Bible into Swedish, a great amount of literature concerned with translation problems has been published representing different approaches: those of textual criticism, theology, linguistics etc. In addition, the first Swedish translation of the New Testament (1526) has been studied in relation to earlier translation models, which had previously been assumed to be Latin and German. The investigation affirms that for instance the Danish translation of 1524 also served as a model (Evers 1984).

3.2. The division into style periods

In the seventeenth century, the Baroque style was predominant, in Sweden represented chiefly by the poet Georg Stiernhielm and in Denmark by the hymn writer Thomas Kingo. Thus a more individual style emerged, which was important for language development. Important genres were also occasional poems, i. e. complimentary poems for weddings and funerals, and prose genres like official documents, letters, diaries and memoirs as well as the so-called biblical and school dramas. A

basic introduction to the genres and the linguistic usage of the period is found in P. Skautrup. The division into style periods for this era has, however, been called in question by the Swedish researcher B. Olsson (1980). On the basis of his large data base from the period 1600 to 1760, he has made a frequency count of nominal and verbal characteristics as well as semantic factors and characterizes the period stretching from 1640 to 1670 as Renaissance style and that from 1670 to 1740 as Baroque style, while he regards Classicism as beginning in 1740.

3.3. Studies in syntax and metrics

P. Diderichsen (1968, ch. 1) has, like G. Holm for Sweden (1967), strongly emphasized the influence of Latin on the Nordic languages and their genres. The influence of Latin on Swedish sentence structure was dealt with still earlier by Heuman (1960), who thus provided a theoretical basis for the analysis of sentence structure. A project at the University of Helsinki has studied earlier Swedish syntax in five text categories between 1520 and 1750, and these texts have been compared with fifteenth-century texts. The investigation focused on different aspects of sentence structure and is based on the macrosyntagm model (cf. 4.3.).

3.4. Versification and colloquial prose

A monumental work dealing with the development of seventeenth-century Swedish versification has been written by C. I. Ståhle (1975) and is mainly concerned with the metrical structure of various types of verse. He gives a prominent role to Georg Stiernhielm, whose great hexametrical epic *Hercules* has led him to be regarded as “the father of Swedish poetry”. Instead of the syllable count of Latin verse, he introduced the alternation between stressed and unstressed syllables in Swedish. The first Swedish poetics, written by Andreas Arvidi, is also dealt with by Ståhle, as is the early Swedish drama: the biblical drama and the school drama. More commonplace genres like letters and diaries have been studied from the period 1600 to 1700 and have provided information about how certain adverbs developed pragmatic and metatextual meanings (Lehti-Eklund 1990). It would be desirable for a similar investigation to be made concerning prepositions. In general, it can be said that there are great gaps in seventeenth-century research, for instance as regards drama and occasional poems.

3.5. The classicist literature

The Nordic countries in the eighteenth century were for a long time strongly influenced by French classicism, which had considerable consequences for genres and language. Literature achieved a central position through prominent writers who at the same time played an important role in the cultural life of their countries and through establishing standards of language usage. Poetry was enriched by new genres, for instance the idyll, satire, didactic verse and the epigram. Drama also reached a high-water mark, with tragedy being the most prestigious genre although comedies were in the majority, especially translations from French. In Denmark Ludvig Holberg's comedies became the first national dramas. But prose was also represented in travel accounts, diaries, memoirs and letters, in journals and scientific texts now written in the national languages. In addition, rhetoric in Sweden became a genre in its own right through the rhetorical commemorative speeches addressed to the Swedish Academy as competition entries.

The increased number of genres and texts in the eighteenth century was not, however, paralleled by a corresponding growth in research. The Swedish poet who has been most intensively studied is Carl Michael Bellman. His poetry has been analysed above all from the viewpoint of its vocabulary which, together with manuscript studies, has also provided material for, among other things, a glossary of *Fredmans epistlar* (Larsson/Hellqvist 1967). As the language of this epoch was strongly influenced by French, syntactic interference has been studied in Gustavian writers (Stenfors 1994). A great number of constructions influenced by French have been discovered, for instance in the use of prepositions, but they have only in a few cases taken a permanent foothold in the Swedish language. Swedish eighteenth-century comedies have been given some attention in research and have greatly contributed to our knowledge of educated spoken language during this period. The comedies also throw some light on the stylistic differences in the spoken language (Widmark 1970). The great number of translated comedies preserved in the theatre archives constitute, however, an ample source of unused research material. Research on the scientific Swedish language of the eighteenth century can be said to have started through a collection of studies about the writings of Carl von

Linné (Fries 1971), but joint Nordic research on the process of replacing Latin with the national languages would be desirable. Another promising field of research is represented by rhetoric, which played an important part in Sweden in the eighteenth and far into the nineteenth century. The scientific basis was laid by R. Hillman (1962) with a dissertation on the memorial addresses given during the Swedish Academy competition.

Danish eighteenth century writing was dominated by Ludvig Holberg, who, in addition to a great number of other texts, wrote the first comedies in Danish. Holberg research is represented by P. Skautrup's helpful survey and by a number of shorter studies as well as by the Holberg dictionary which was published 1981–88.

4. The Modern Age

4.1. Nineteenth century texts

4.1.1. Introduction

During the modern period, the number of genres and text types has constantly grown. Nordic literature passed through several golden ages with distinguished writers. But factual prose genres also arose concurrently with social development, which assigned an ever greater role to the mass media. Research concerned with the nineteenth century deals almost exclusively with literary texts.

4.1.2. Swedish texts

A comprehensive Swedish dissertation taking numerous angles of approach has been devoted to the typically romantic lyric poet Erik Johan Stagnelius. The study contains descriptions of different lyric genres, rhetorical means of expression and text structure as well as meter and rhythm, all viewed from a diachronic perspective (Malmström 1961). Carl Jonas Love Almqvist, who represents both romanticism and realism, has been the subject of two theses mainly concerned with questions of style, but most aspects of Almqvist as a master of language and a creator of new genres still remain to be explored. A versatile and fundamental contribution to the study of August Strindberg's language has been provided in a thesis on his innovative imagery and its function in his narrative technique (Kärnell 1962). The young Strindberg as a dramatist, compared with contemporary dramatists, is the sub-

ject of another large investigation, partly based on the macrosyntagm model (Liljestrand 1976; 1980; cf. 4.3.). Other aspects of Strindberg's language have also been studied in a number of briefer articles. However, a great deal of research still remains to be done on Strindberg's vast body of work, for instance on his wide vocabulary, which is to be recorded in a special dictionary.

4.1.3. Danish and Norwegian texts

Basic surveys of the language of Danish nineteenth-century authors can be found in P. Skautrup. One of these authors, Hans Christian Andersen, has been the subject of a study in which narrative technique occupies a central position, but in which stylistic periods and structural matters have been dealt with as well (Kofoed 1967). An important period in Danish prose literature is impressionism, the main representative of which is Herman Bang. The language of the impressionist authors has been described by S. Møller Kristensen (1955), and this study can be regarded as a sequel to P. Rubow's *Saga og Pastiche*, which was published as early as 1923. The representatives of Norwegian nineteenth-century literature who have attracted most attention are Bjørnstjerne Bjørnson and Henrik Ibsen. For instance, Ibsen's versification technique and vocabulary have been dealt with and an Ibsen concordance has been printed (1955). A thesis on Arne Garborg's language and style has been published by J.A. Dale (1950), but a great proportion of Norwegian nineteenth-century literature has remained uninvestigated, not least the differences between standard literary Norwegian, *Riksmål*, and the so-called New Norwegian language, *Landsmål*.

4.2. 20th century texts

The emphasis on literary texts continued during the twentieth century as well. A number of theses have been devoted to Swedish writers and deal either with their entire bodies of work or with individual works. Among Norwegian twentieth-century authors, Olav Duun, Knut Hamsun, Sigurd Hoel and Tarjei Vesaas have been studied (Sæteren 1953, Øyslebø 1964 and 1958, Mæhle 1964). The concept of *style* has got an ever wider meaning as far as content and method are concerned. The narrow linguistic approach has been extended to include, for instance, structure and textual coherence,

narrative and dialogue technique, elements of content and verse structure. Basic theoretical surveys have been written by P. Cassirer (1970) and N. E. Enkvist (1973). O. Øyslebø (1976) and B. Fossetøl (1983), the latter focusing on cohesion, have presented theories illustrated through samples of stylistic analysis. As regards methods in modern stylistic research, dominant features are the pursuit of precision in the definition of terms and concern with frequency, features connected with the development of data processing techniques. For comprehensive text corpora, an author's entire body of work and individual texts, words and other style markers are quantified and the results are printed, for instance in the form of word indices and concordances. In this way statistical comparisons can be made that were not previously feasible.

4.3. The macrosyntagm model

An important and fundamental method of linguistic text analysis has been developed by Swedish researchers. The macrosyntagm model for syntactic analysis was constructed in connection with research on authentic spoken Swedish. It has been described in two manuals: one focused on sentence structure (Loman/Jørgensen 1971), the other for the analysis of smaller syntactic units (Teleman 1974). A "macrosyntagm" can be defined as an independent syntactic unit, for instance a main clause, possibly with one or more subordinate clauses, or as independent sentence fragments and interjectional elements. When analysing sentence structure in a written text, no attention is paid to punctuation but only to syntactic independence. The two manuals referred to form the basis of over 60 analyses of various kinds of text, for example medieval Swedish texts, mass media language, colloquial prose, textbooks and advertising language. The literary language of novels, dramas and children's books has also been analysed using this model. In addition, Danish, Norwegian and Faroese texts have been analysed.

4.4. Literary texts; surveys and special studies

Some surveys of the development of style have been published. P. Diderichsen's *Dansk prosa-historie* (1968) is linked up with P. Skautrup's description in *Det danske sprogs historie I-IV* (1944-68). The development of the style of Norwegian prose has been presented by W.

Dahl (1969), while G. Holm has surveyed the development of Swedish syntax from medieval to modern times, focusing on the sentence structure of literary texts (Holm 1967). A comprehensive account of poetic imagery with a theoretical introduction and a wealth of examples is provided by P. Hallberg (1982). The material comprises chiefly Swedish metaphorical language from various periods. Versification technique is another area which has been studied. A Nordic conference on metrics resulted in a collection of articles on verse, meter and rhythm, from the meter of the oldest Edda poems to free verse (*Från fornyrdøislag till fri vers*, 1989, a later report from 1997). Other domains which indicate the breadth of stylistic research are represented in a thesis on symbols and recurrent themes in a novel by Eyvind Johnson (Söderberg 1980).

Basic works on dialogue technique in prose have been published by B. Liljestrand (1983) and A.-M. Londen (1989). Finally, mention should be made of contrastive stylistics or the study of style in translations, a form of research that has been gaining ground and which has produced larger and smaller works containing both theory and text analyses (Ingo 1990; Engvall/Geijerstam 1983).

4.5. Non-literary texts

More research has, however, been devoted to non-literary texts. The production and development of new genres have given rise to many new branches of research in connection with such texts. One pioneer in research on factual prose was S. Engdahl, who made a quantitative investigation into the sentence structure and the choice of words and forms in factual texts (1962). An important impetus has been provided by the concern for how texts influence and are understood by the reader, thus bringing the social function of the text into focus. An early field of research was public/official texts, for instance legal texts (Wellander 1974; Pettersson 1992). Methodological contributions were made in the 1970s, when reading comprehension was a topical branch of research. These approaches were, however, found to be methodologically unsatisfactory and have been supplemented by reader tests (Gunnarsson 1982). The language of the media has also attracted researchers: broadcasting media and newspapers (Svensson 1981; Nordentoft 1972; Chrystal 1988); advertising (Pettersson 1974; Hansen 1965), everyday prose (Westman 1974), and others. Language

for special purposes has also been given its own place (Nordman 1992). The language of recent translations of the Bible has been dealt with in Sweden for example by Ståhle (1970) and in two collections of articles (*Nyöversättning av Nya testamentet*, 1968, and *Språket i bibeln – bibeln i språket*, 1991). In Norway a translation of the Bible into the New Norwegian language has been studied by J. Bondevik (1992). Finally, mention should be made of a theoretically and empirically important work on text attribution by T. Johannisson (1973) which is based on a study of anonymous letters.

5. Concluding words

This presentation of the last 50 years of research on stylistics is by no means exhaustive. It nevertheless indicates the breadth of work with regard to different periods and genres. Traditional stylistics laid the main stress on a purely linguistic analysis of literary texts, frequently subjected to esthetical evaluation. Modern stylistics has a broader repertoire as regards approach, selection of texts and choice of research method. This is due to an increased awareness of the fact that texts do not merely consist of words but have many other dimensions: structural, text linguistic, narrative etc. In the study of factual prose texts, the aspect of purpose plays an important part whenever the intention is to discover the reader's comprehension of the text. The texts can also be oral, as case when broadcast texts are studied.

Future researchers will find several important fields to explore. Some ideas for such research have been briefly hinted at above in connection with older language periods. One such field is the development of public/official language. Another is the development of modern press texts, which comprise several genres. Such investigations could be carried out as joint Nordic projects. In the field of literature, important authors and groups of authors could be studied, also from a joint Nordic perspective. Dialogue in drama and fiction should be studied through methods used in analysing conversation. A particularly urgent task would seem to be the study of dialect in literary texts, a branch of research that has so far had a very modest start. And finally, it should be established whether new genres with their own language patterns and with elements from English are emerging, for instance in the world of Information Technology. In the light

of this, the stylistics of translations becomes more and more important. A branch so far almost completely neglected is the language and the narrative technique represented by literature for children and young people, which in Scandinavia has reached a high international standard, with Astrid Lindgren as a top figure.

Generally it would be desirable for research not only to concern itself with isolated objects but to present wider perspectives by crossing the boundaries between the fields of linguistics and literature, between and within genres, between different periods and between the Nordic languages.

26. Nordic language history and pragmatics

1. The concept of pragmatics in language history
2. History of pragmatic theory
3. Problems of sources and documentation
4. Oral vs. written texts
5. Written texts
6. Final remarks
7. Literature (a selection)

1. The concept of pragmatics in language history

The subject matter of pragmatics, i.e. the study of language use in social contexts, is difficult to define. When one transcends language, there seem to be no clear borders. (See references in Wille 1970; Jucker 1995; Haberland 1996; Meyer et al. 1994; Verschueren 1999, 254ff. For texts and pragmatic universals, see e.g. Togeby 1993).

1.1. Historical pragmatics is a matter of reconstruction because the methodological models and tools of pragmatic analysis are made and advanced to fit contemporary language use. For the language historian the subject matter, historical language use, has a different mode of existence in that, with the oral performance lost, the written form is embedded

in a secondary pragmatic situation, often even as text in a new text with its own sender and receiver (Haastrup 1988; 1994; 1995; 1997a). Analysis of text production and transmission for each single text is the first step of a pragmatic historical analysis. This is akin to textual criticism (cf. art. 56).

2. History of pragmatic theory

Scholarly work on older texts is normally not referred to as a branch of pragmatics, by either authors or readers (cf. e.g. Larsen 1965; Holmberg 1989), and pragmatic theory is considered quite new by many “pragmaticians”.

2.1. The emergence of pragmatics is a classic example (Gregersen 1991, 250f.) of the re-invention of old knowledge, in this case useful tools for text-processing in specific situations, e.g. not only reading and writing but also rewriting (*immutatio* and *paraphrasis*, see Lausberg 1998, §§ 541–98, §§ 893–910 and §§ 1099–1103) into different types of texts, as taught until a few centuries ago as part of Western secondary education. Pragmatics is thus a broader concept than that of neophilology (studies of modern as opposed to clas-

sical languages), and more like “nyfilologi” (Wollin 1997) using pragmatic perspectives.

2.2. There have turned out to be problems in positioning the interdisciplinary pragmatic approach in Faculties of Arts and within the history of the humanities. Nerlich et al. (1996) began their early history of pragmatics in Europe and America with the question “Is there a history of pragmatics?” and subsequently wrote a book on the period 1780–1930. Within this time-frame they found forerunners in the general, philosophical treatises by prominent thinkers, such as Kant’s discussion of positions taken by Locke and Hobbes. They obviously did not expect to find relevant and detailed expertise in pragmatics, in the fields of rhetoric, jurisprudence, moral theology, natural law, language pedagogy, courtesy and etiquette, dramaturgy etc., where most of the observations of pragmatics were made and published many centuries ago, but – admittedly – not always by members of academies (Toulmin et al. 1988). At the Danish equestrian academy in Sorø (17th–18th c.), proficiency in modern languages and courtesy was not taught by professors but by masters, on a par with other useful social and practical skills such as dancing, fencing and riding.

2.3. A few supplementary remarks: “Language use is action”, a rhetorical truth from antiquity (e.g. Lausberg 1998, §§ 257–279), was advanced at an opportune moment in academic philosophy by Austin as an important point (*speech act theory*, cf. Editorial by Andersen 1997). The concept of “situation” (the right moment: *kairós*, from rhetoric), was also a cardinal point in widespread casuistic works on proper behaviour in complex situations, called “occasions” (cf. Toulmin et al. 1988 for a catalogue of casuists in jurisprudence and moral theology). Textbooks in language pedagogy and etiquette offered models – arranged in the same way as search operators – for general arguments of rhetoric (i.e. *tópoi*, Lausberg 1998, § 160), for appropriate verbal behaviour, e.g. acts of conversation (i.e. “Umgang mit Menschen”, Knigge) in well-known situations, as well as general wisdom of everyday life (i.e. *phrónēsis* in Aristotle’s *Nicomachean Ethics*, Haastrup 1994). Pre-supposition, introduced into pragmatics by Strawson, was known through scholastic proofs of the existence of God (e.g. by Duns Scotus) and is recorded in English from the 16th c. (cf. OED 1989, XII, 429f.), later in

calque-translations in German and Danish. Further examples (particles) and reflections can be found in Pinborg (1980).

2.4. These remarks are meant as a plea for including and using these old ideas about text-processing which were current when the old texts were produced and read. These perspectives will put into focus reactions from contemporaries to texts, the interplay between partners in dialogues on the stage, in the classroom and in everyday life settings, as recorded in proceedings of law courts and as displayed in contemporary old textbooks (cf. 4.).

3. Problems of sources and documentation

Compared to the study of contemporary sources, a large amount of information is not accessible but has to be reconstructed – if possible.

Normative texts, e.g. models and instructions for the curricula of the grammar schools, provide knowledge of past training of authors and scribes (cf. the revival of rhetorical training today, Meyer et al. 1994). In the West, the supranational Latin grammar schools and monasteries taught the trivium – grammar, rhetoric and dialectic – by means of Latin for use in Latin, but as a by-product also in the mother tongue, which only later became a subject of learned study. Training in text processing also comprised interpretation procedures, e.g. translation, which was considered a kind of paraphrase. Translation was sometimes combined with change of text type – by expansion, reduction or alteration of artistic and figurative style, e.g. from dialogue or verses (epic or lyric) to prose, or vice versa (cf. Jacobsen 1958, and art. 56).

3.1. The curricula of the Latin schools play an important part in Diderichsen’s history of Danish language education (1968a) and of Danish prose (1968b), which stress the European perspective, e.g. that many Danes published in foreign languages (cf. Jensen 1995). Telling the story of pragmatics in Denmark, Haberland (1996, 36–40) mentions Diderichsen’s initiatives as important. Diderichsen’s perspective (1966, 118–29) was more syntactic, rhetorical and international than Skautrup’s monumental *Det danske sprogs historie* 1–5 (1944–70). Skautrup took into account many historical features of pragmatic interest, as opposed to Brøndum-Nielsen’s *Gammel-*

dansk Grammatik (1928–73), cf. Rischel (1996, 5f.). Skautrup's ideas of what oral language was like seem first of all based on the speakers' selection of words, which he considered "homespun frieze", i.e. rustic or even obscene at the moment used. His approach was linked to the societal circumstances of language use but was not "pragmatic" if this is understood as an analysis of dialogic texts – fictitious or not – in principle produced through the collaboration of partners, using deixis, anaphors, presuppositions etc., whether the partners were peasants or townsmen, nobles or learned people.

3.2. Texts reflecting conversation in former times are found in standard works (without philological ambitions) on everyday life from the Renaissance to modern times; cp. Troels-Lund (1879–1901) and Steensberg (1963–71) and the bibliography in Horstbøll (1999). For the Middle Ages, see a number of articles and references in *KLNM*. Scandinavian parallels to Skautrup's opus magnum have not yet been written, but parallels to Diderichsen's work on the history of prose were issued in Sweden by Ståhle (1958) and Holm (1970), and in Norway by Berulfsen (1948); for the areas where Old Norse was used, see Sørensen (1993) and bibliographies by Bekker-Nielsen et al. Diderichsen's plans, however, were more ambitious from a linguistic point of view (cf. his seminal book (1941) on the syntax of the *Skånske Lov*). His work was to be broader and meant to cover the period at least up to the 19th c. Unfortunately he died while writing it.

3.3. Which kinds of pragmatic questions, then, can the old texts possibly answer? Texts can be divided and subdivided in different ways, with criteria often overlapping each other (Togeby 1993, § 88): (a) 1st-order (primary) as opposed to 2nd-order (secondary i.e. "reported") texts, (b) oral as opposed to written texts, (c) normative texts (here: instructions to someone on what to say or how to behave, cf. sect. 4) as opposed to "non-normative" (e.g. demonstrative) texts. All 1st-order texts are, like other historical sources, written but sometimes reflect the author's own oral usage (e.g. as part of a regular correspondence); they are originals, even if utterly ordinary and trivial. 2nd-order texts, i.e. "reported" texts, recorded, edited, taken down in the proceedings of a court or from a performance on stage etc., reflect in principle – as regards language use – the reporter, although the substance of the information and parts of the

wording come from a 1st-order text, e.g. endorsed (sealed) by the primary author. In the 2nd-order "told" text, the reporter/editor/narrator's own 1st-person utterances are of course a 1st-order witness of his language use. If we could compare what was said – by e.g. witnesses in a court – with what the scribe recorded, the 2nd-order texts from courts would be our best evidence for how utterances used in former days were understood and received among contemporaries.

4. Oral versus written texts

For oral texts, those immediately experienced by the ears, we have examples only from the 19th c., i.e. sound-recorded texts (Brink/Lund 1975). Phonetic transcriptions occur earlier, but detailed and accurate ones are not much older than the mechanical ones. The reconstruction of the phonetic domain was crucial for the construction of the great theories of language genealogy and language change. Such reconstruction might be improved through studying recorded evidence of misunderstandings (e.g. in law courts) relating to categories such as focus, topic and irony. But misunderstandings of these kinds are seldom reported, because they often do not belong to the substance of a case.

4.1. Pastiche presents a special problem (the opposite of the imitation of Latin in the school tradition, cf. art. 56). Folk ballads and folk tales seem to reflect poetic language from old times, but we do not know whether they are much older than the century in which they were taken down. More interesting are the Old Norse sagas, which have come down as written texts. They resemble oral narratives, of course stylised when taken down. But do they represent an oral Icelandic tradition, and if so, what was it like? What do we have for comparison other than modern standards? Discussions of these questions are reviewed in a recent dissertation by Sørensen (1993), with many references to old and new proposals, some related to pragmatics, not least the points from anthropology made by Kirsten Hastrup.

4.2. The two kinds of normative texts of interest here are dramatic texts to be performed either in the classroom or on the theatre stage. Both can be connected to the real world (as "Theatrum Mundi", introduced into pragmatics by Goffman, cf. Gracian's *Oraculo Manual* from 1647). Drama texts are written texts,

but the ones we have do not appear to be records of oral performances but rather are models and instructions for them. Dramatic texts are fictional; this is a great asset, because the author can plan the collaboration between the players/characters, which will (re)produce a common text, modern or pastiche, illustrating and imitating human conversation. The real intentions of the players were sometimes told in monologues to the audience, but in real life they were normally put into words under the seal of confession. On the stage, conversational obligations (including politeness) are complied with, or not – as in real life, questions about obscure moves and replies are asked, speech acts have consequences, just as other actions do, until the final curtain falls.

The difference is, of course, that the performance is evaluated by an arbiter of taste – today, e.g., in a newspaper – and not in a court (cf. sect. 5, and the debate on the status of speech acts in fiction by Skalin 1991 and Andersen 1997). Stage directions to the players – or similar descriptions in narratives – about choreography, gestures, pauses, intonation etc. often give valuable information, e.g. in mystery plays and school performances from the Middle Ages to modern times.

4.3. Ready-made dialogues (in Danish, *parlorer*) combining the mother tongue with one or more target languages in phrase books and grammars were constructed as exercises, but also for subsequent use in real-life settings, often abroad. To function they have to be realistic, providing up-to-date, relevant and acceptable language use in typical encounters and situations involving typical themes. They are, of course, stylised, as linguistic shortcomings will not be prescribed for imitation. These Nordic parallel texts have so far not been used in a systematic way as sources for old everyday dialogues; cf. preliminary studies and discussion of source value in Haastrup (1988; 1994; 1995 and 1997). The ready-made dialogues are often found in textbooks, presenting the whole repertoire of standard grammars (Stengel 1889/1976), including wordlists arranged by subject in parallel to the dialogues, phrases expressing the same intention in different ways, e.g. speech acts (like commands) arranged according to politeness levels, and often means (e.g. particles and interjections) of expressing intensity: flattering your lord or his wife, scolding your servants or provoking a duel through insult. Although the textbooks explicitly inform their contem-

porary reader of instances of equivalence between two languages, they indirectly also may inform us of problems of equivalence within each of the two languages when the examples match in a way which makes it possible to use Hjelmslev's "principle of commutation".

Drama texts add stage directions. In a similar way, the ready-made dialogues can be supported by means of books on etiquette, courtesy and housekeeping. Even medieval Scandinavia had such books, the most famous being *Konungs Skuggsjá*, from the (13th c.) Norwegian court in Bergen. The author promises to offer advice for all kinds of people, but the manuscripts include only instructions for merchants and courtiers and the king himself. Later on, manner books for all classes were written. "Economies" (i.e. household books, with instructions for the paterfamilias, his wife, children and servants) are found in great numbers from the 16th c. onward, often as an elaboration on the part of Luther's catechism called *Oeconomia* (Dan. *hustavle*, cf. on casuistry 2.3.).

5. Written texts

Three instances of written texts have a special affinity to oral texts: private letters, memoirs/autobiographies and records of proceedings of the courts of law.

5.1. Letters of correspondence (Dan. *brevveksling*) are – as tradition tells us – a kind of 1st person dialogue, i.e. a collaboration on text production between communicators with a mutual frame of reference and detailed knowledge of each other, settings etc. A letter in the chain functions as a longer move in a dialogue, presenting features of face-to-face dialogue, such as deixis, of course with some complications in the use of "now" and "here" (cf. Haastrup 1997b). Letters are often impromptu, as dialogue often is, but the writing process could give room for reflection, and the more artificial letters of the past, made for publication, presuppose drafts and stylisation, like speeches produced according to the instructions in rhetorical textbooks; cf. the many manuals with instructions for writing letters (Haastrup 1997b), and, most important, the models (Haastrup 1997a, b) giving help to untrained authors with writer's block.

5.2. Recorded speech in legal sentences and records and registries of proceedings in the law courts (district courts: *herredsting*, provincial courts: *landsting* and supreme court: *kongens*

rettering) provide us with the negative counterpart to those in the etiquette books. Edited texts are often provided with a detailed index (over 700 categories, legal and non-legal) giving access to everyday life in rural villages in the 17th c. The nobility is dealt with in the supreme court. Historians of cultural sociology (often non-philologists) have conducted studies of these texts (Moberg 1992; Scocozza 1997; Jacobsen 1995). The texts reflect the oral evidence and testimonies given in court and sentences of the judge, recorded by the clerk using the wording (1st-person) or rendering the meaning (3rd-person) often as a summary – which the official regulations allowed if the texts seemed too long-winded or disorganised. Under the absolute monarchy (i. e. after *Danske Lov* 1683) the records are less interesting, because the procedures in court often were taken over by academic professionals (Appel 1998), who just asked the litigants to answer “yes” or “no”. Summaries by a higher court of the proceedings recorded at the lower courts use a more legal discourse and sometimes give a further identification of moves in terms of speech acts by the insertion of performatives. That is, there is often a legal categorisation of the moves, e. g. a quest for satisfaction for defamation, non-fulfilment of promises such as declarations made as part of amicable settlements testified by witnesses (source categories nr. 73, 121–122).

5.3. Autobiographies come in many varieties and are akin to novels written in the 1st-person. They are often half-fictional for purposes of self-justification. Among numerous examples is *Jammers Minde* by Leonora Christina (1621–98), daughter of King Christian IV, who was imprisoned for high treason. A new edition by Hjorth et al. (1998) includes a survey of the tradition and records the author’s own corrections – often of word order – and a very diligent description of the manuscript. Commentaries (in preparation) will cover aspects such as oral language use, often by lower-class people, and switching between levels of style and languages, mostly Danish and German. Markers of intensity, cursing etc. are found, and not least, politeness, because this proud princess carefully observed the respect paid by her interlocutors, as she always presented herself to the reader as innocent. As mentioned above, many memoirs were written and issued in Scandinavian languages. The style and language of *Jammers Minde* bear the stamp of extraordinary mental

energy. The dialogues – whether in direct or indirect speech (*oratio obliqua*, Brøndum-Nielsen 1953) – often seem to have been taken down immediately, but should of course be read with open eyes for the bias of this very intelligent female writer.

6. Final remarks

As a whole, memoirs, fictitious or not, may in some way be characterised and used as indirect commentaries on the way language is used, stories are told and facts explained. Direct commentaries on texts are also useful, e. g. explicit separate commentaries on Old Nordic texts as well as translations of classical foreign texts made by learned people for guidance over the centuries and millennia (Martens 1993), in contrast to the unarmed readers of old texts who do not realise that frameworks of human action and communication change over time as languages and readers do.

Niels Haastrup, Roskilde (Denmark)

27. Nordic language history and research on types of texts

1. Introduction
2. Text
3. History of text types
4. Theory of text types
5. Classification of texts
6. Literature (a selection)

1. Introduction

The concept of *type of text*, *text type* or *genre* is not a scholarly term with a fixed and broadly accepted definition; the English terminology in particular is somewhat inadequate compared to the German *Textsorte*, *Texttyp*, *Textform* and *Gattung*. But most people would agree that a list of text types would contain items like the following: anecdotes, comedies, descriptions (scientific or technical), editorials, essays, instructions, jokes, leading articles, legends, laws, minutes, narratives, new stories, novels, reviews, sagas, short stories, tales, and tragedies. In a general text theory, it is possible to define text type as a shared generic type which constitutes and determines common interpretations of a particular text.

2. Text

In traditional grammars and language history, neither text nor text type are defined concepts because they involve both a theory of speech acts and of textual connection, coherence and cohesion between sentences, which are normally not part of grammar.

In modern international and Scandinavian text linguistic research and writing pedagogy many attempts have been made to define the concept of a text (Beaugrande/Dressler 1981; Berge 1988; Brandt/Koch/Rosengren 1981; Enkvist 1974; Fossetøl 1980; 1983; Gradenwitz 1983; Gülich/Raible 1972; Hirsch 1967; Jacobsen 1960; Källgren 1979; Larsson 1979; Lundqvist 1980; 1983; Togeby 1993; Werlich 1976).

The most comprehensive definition of a text is Beaugrande and Dressler's, according to which a text is defined as a communicative occurrence which meets seven standards of textuality: (1) cohesion, the way in which words are mutually connected within a sequence; (2) coherence, the ways in which the components of the textual world (concepts and relations) are mutually accessible and relevant; (3) intentionality, the text producer's attitude that the

set of occurrences should constitute a cohesive and coherent text instrumental in fulfilling the producer's intentions; (4) acceptability, the receiver's attitude that the set of occurrences should constitute a cohesive and coherent text of some use or relevance to the receiver; (5) informativity, the extent to which the occurrences of the presented text are expected vs. unexpected or known vs. unknown/certain; (6) situationality, the factors which make a text relevant to a situation of occurrence; (7) intertextuality, the factors which make the utilization of one text dependent upon knowledge of one or more previously encountered texts. All other attempts to define text types contain some of these seven standards.

3. History of text types

The issue of text types is not dealt with in a theoretical way in the standard works on Nordic historical linguistics (Brøndum-Nielsen 1928–1973; Haugen 1976; Karker 1990; 1993; Skard 1967–1979; Wessén 1941–1956).

3.1. Skautrup

In Skautrup's culturally based history of language (1944–68), the textual sources from the eldest periods (200–1750) are divided into text types such as: runic inscriptions, law texts and legal documents, professional literature (medical texts), religious texts (legends, translations of the Bible), historical texts (chronicles, sagas), and poetical works (ballads). For later periods other text types are added to the list: the press, many types of professional literature, and many types of poetical works.

Obviously the criterion for the subdivision of texts is primarily situationality and intertextuality; text types are defined as texts that fit into the situation in which they are used. The criteria for the typology, however, are not made explicit, and the function of the text types and their stylistic features are not discussed. Nevertheless, many stylistic features are mentioned in the description of the texts: syntactic patterns, vocabulary, frequency of morphological forms, types of coherence (e. g. casuistic law texts).

3.2. Diderichsen

The most genuine treatment of text typology in Nordic language history is Diderichsen's

so-called *History of Danish prose* (1968). This work is a proper history of prose style, the first five chapters of which were published posthumously, and the rest, chapters VI–XV, are only known as mimeographs.

3.2.1. Classical rhetoric

In the first chapter Diderichsen sets up the system of text types developed in antiquity, taking the Aristotelian distinction between poetry (poesis) and speech (logos) as basic. Speech (including historiography and political speeches) is the art of persuasion (peitho) and deals with what really happened or what we intend to do, while poetry is the art of imitation (mimesis) and deals with what could happen possibly, probably and necessarily.

Speech is in classical rhetoric divided into three *genera*: the forensic speech of the courtroom, (forum), the deliberative speech in the senate, and the epideictic speech used at celebrations and festive occasions.

The distinction between speech and poetry is similar to the modern distinction between imaginative literature (fiction, drama and poetry, literary texts, poetic texts) and non-fiction (the English terminology is troublesome because *fiction* is not the opposite of *non-fiction*, but only one kind of non-fiction). Utterances in imaginative literature are not meant to be sincere or true, while in non-fiction any utterance should follow the Gricean maxim: “be sincere!”, which means that a statement and its presuppositions have to be true, and a promise must be kept etc. (Grice 1975).

3.2.2. History of prose

Chapters II–XV of Diderichsen’s *History of Danish prose* describe how several types of written texts have developed and crystallized as fixed forms of prose texts or prose genres in Denmark. From this point of view, text types are historically specific habits and conventions for textual structuring. Through the Middle Ages, many text types originated and developed in the institutions of the state, the church and chivalry.

One chapter is devoted to each text type or historical style: (II) Language of the law and style of the chancellery (departmental style), (III) Translations of the Bible (legends), (IV) Sermons, (V) Proverbs, (VI) Profane prose tales (chronicles, translations of European romances and novellas, translations of sagas,

(VII) Epistles (letters, diplomas and missives), (VIII) Autobiographical reminiscences, (IX) French court style and English domestic prose (verse drama, epistle, essay, philosophical tale), (X) Holberg’s prose, (XI) Sentimental prose, (XII) Danish prose of the fine arts, (XIII a) Ewald’s prose, (XIII b) Jens Baggesen, (XIV) National and popular styles.

Diderichsen’s description of the text types is primarily stylistic, i.e. deals with all seven standards of textuality, with the emphasis on cohesion and coherence. Each text type is characterized by the most significant stylistic traits, such as:

text composition (e.g. epistles are composed of a salutatio ‘greeting’, exordium ‘introduction’, captatio benevolentiae ‘good will’, narratio ‘the story’, petitio ‘appeal’, conclusio ‘conclusion’;

syntactic patterns (hypotaxis, parataxis, polysyndesis, asyndesis, Latin syntactic constructions);

word order (inversion, German word order with final finite verb, law of growing elements);

vocabulary (native words and loanwords and borrowing from Latin, German, French, English);

narrator type (omniscient narrator, free indirect discourse, vision avec, vision par derriere);

figures of speech (gradation, apostrophe, alliteration and metaphor, allegory, metonymy, synecdoche, litotes, sarcasm, satire).

3.3. History of types of imaginative literature

3.3.1. Imaginative literature defined

An explanatory definition of fictional text is given in modern text linguistics: a text in which the situation discussed stands in a principle alternative relationship to the accepted version of the real world (Beaugrande/Dressler 1981, 185). The fictional text world is a metaphor for the real world of the interpreters, while in non-fiction the text world stands in a metonymic relation to the real world, i.e. the text world is part of the real world (Kock 1979).

3.3.2. Types of imaginative literature

Imaginative literary texts are traditionally divided into three kinds or genres (German:

Gattung): poetry (poems, song lyrics), drama (whether in prose or verse), and fiction (novels, short stories, epics). The criterion for this division from Aristotle and Plato up to Goethe and modern times has been the manner of representation (or imitation): in poetry it is a first-person monologue by the poet's persona; in drama it is the third-person characters who speak with each other; and in fiction (novels, short stories, epics) there is a mixture of narration by the first-person narrator to the second-person addressee and dialogue between third-person characters. To these three kinds one can add very short imaginative text forms that are primarily oral and do not fall into any of the other categories: anecdotes, jokes, riddles, nursery rhymes.

IMA- GINA- TIVE LITE- RA- TURE	POETRY	first-person monologue	odes, elegies, songs, hymns, folk ballads
	DRAMA	third-person dialogue	tragedies, comedies, satires, musicals, farces
	FICTION	mix of message from narrator to the addressee and dialogue of third-persons	novels, short stories, myths, sagas, folk tales, legends
	SHORT FORMS	primarily oral and very short	nursery rhymes, jokes, witticisms, riddles, proverbs, anecdotes

Histories of literature and rhetoric (Albeck/Jansen 1964; Dahlerup 1998; Fafner 1982; Friis 1945; Jansen 1944–1958) take the genres of imaginative literature for granted. They all describe the texts in chronological order grouped together under headlines such as: law texts, chronicles, ballads, love songs, proverbs, and in most histories of literature subtle subdivisions are made for each genre, primarily on historical grounds, e.g., ballads are subdivided into ballads of chivalry, historical ballads, ballads about magic, ballads about giants, and younger ballads.

4. Theory of text types

4.1. Text types as generic types

In traditional grammars, literary history and language history *text type* is not defined but taken for granted. The definition of text type

is discussed in works on the theory of literature, and in works on text linguistics and pragmatics.

In general, two texts belong to the same type or category if they both have the traits that define the type. Text types are acquired types, that is, they are type ideas which derive from previous experience. All types are vague because they subsume a large number of particular instances. Type is a concept of the same degree of abstraction as the Kantian modes of perception: time, space, and causality (Hirsch 1967).

But texts are not classified in the same way that physical entities are. Texts do not exist through time the way stones, carnivores, or colours do. Texts are events in time, like a play, or an episode, interpreted in common ways by many people perceiving them and participating in them, and cannot be described or defined by necessary and sufficient conditions (Clark 1996). The concept of text type is in fact the bridge between the particularity of the utterance act and the sociality of interpretation during the process of reading and listening. Text types are tools for the interpreters and the communicator used in the process of communication, and thus part of the system of rules and conventions which make communication possible (Johansen 1970).

4.2. Text types and the hermeneutic circle

Text types play a crucial role in the interpretation of a particular text. Often, which type the actual text is meant to be an instantiation of is indicated in the beginning of a text by labels such as *Instructions* or *Novel*. The interpreters' notion of the type of meaning they confront will influence their understanding of details and the interpreters' preliminary generic conception of the text is constitutive of everything that they subsequently understand in the text. This is what is called the hermeneutic circle of interdependence of parts and whole: the whole can be understood only through its parts, but the parts can be understood only through the whole (Hirsch 1967).

This generic conception is apparently not stable but varies during the process of interpretation. At first there is a vague and preliminary awareness of the text type, and the interpreters have a feeling that the text will satisfy (meet) their inclinations; with further reading, as understanding proceeds, the text type becomes more explicit, the range of expectations to the text becomes narrower, and

the text functions as an interpretation of the interpreter's own bent (Wentzel 1981).

The only way we can understand the functional relationship of an early part of a text to the whole, before we have completed it, is by means of a generic conception that is broad enough to be perceived at the beginning of the interpretation and narrow enough to determine the meaning of all the parts. Text type is that sense of the whole by means of which an interpreter can correctly understand any part of it. Interpreters reason that if the meaning of the whole is of a certain type, then a particular detail carries a certain implication. The text type is always construed, i.e. guessed, and is in many cases not given (Hirsch 1967).

Text type is the bridge between the particular utterance act and the interpreters' common understanding, and the communicator knows that the type of meaning must be grounded in a type of usage, since it is only from traits of usage: headlines, types of reference, vocabulary range, relevance structuring, syntactical patterns, formulaic expressions, and so on, that the interpreter can work out the speakers' type of meaning. Text type is a structural necessity for communication.

4.3. Criteria for classification

A text type is thus defined as a shared generic type which constitutes and determines common interpretations of a particular text. As shared generic types, they constitute broad heuristic type concepts (text groups) when first approaching a text. These groups, law, teaching, negotiation and discussion are defined by the type of social relation between the communicator and the interpreter: symmetrical or asymmetrical power or knowledge (Wentzel 1981).

	power	knowledge
asymmetrical	law	teaching
symmetrical	negotiation	discussion

After a text has been read, it functions as a new texture of connections between traits of usage and types of purpose and intention. In the end, any text has a unique meaning, which is understood only because the interpreters recognize analogies to other texts and subsume the new text under previously known types in a process of the same kind as interpretation of metaphors. The preliminary text type group is based on loose family resem-

blance. The members are grouped together as a convenient prototype of conceptualization, but there is no single specific traits common to them all. There are also no clear and firm boundaries between the larger text type classifications.

A text type can be defined as a shared system of conventions. Text type conventions are properties rather than rules. All the elements of a text type point to the same controlling idea of the communicator's intention or purpose. To be consistent, all traits have to point to the same broad text type, to be congruent and to belong to the same style; otherwise the text is experienced as odd and incoherent (Werlich 1975; 1976).

4.4. Text types and speech acts

The term *text* is ambiguous in relation to the term *speech act*; in some cases one speech act constitutes a whole text that is composed of many sentences; e.g. the novel *War and Peace* can be said to be one single speech act or utterance act. In other cases we may say that a text is composed by many speech acts; a business letter may comprise several different illocutionary types: a date, a greeting, statements of fact, possibly an agreement, a greeting and a signature. This is an area which requires further study (Brandt/Koch/Rosengren 1981; Koch/Rosengren/Schonebohm 1978).

Since text types are the generic types of the speaker's purpose, it is natural to take the function of a text as the most important criterion for text classification. Attempts have been made to classify texts as speech acts. Speech acts have been classified by J. R. Searle (1976) as representatives, directives, commissives, expressives and declarations; by J. Habermas (1976) as communicatives, constatives, representatives, regulatives and institutional speech acts; and R. Jakobson (1960) differentiates between the emotive, referential, poetic, phatic, metalinguistic and conative functions of the speech act or text.

None of these classifications, however, are well suited to characterizing texts, because speech acts normally are one-sentence texts, whereas text types are defined as determining common interpretations of subsequent sentences in a long text if, because of the textual traits at the beginning, the text is construed as belonging to a particular type. Texts do not contain many sentences belonging to the same speech act type, such as commissives or institutional speech acts. But in a long text, one

sentence may be the core sentence which all the other sentences support. In a business letter, the agreement about some trade transactions may be the core function of the text, and all the other sentences have a supporting function in relation to this purpose or goal (Koch/Rosengren/Schonebohm 1978; 1979; 1980).

5. Classification of texts

5.1. Classification of non-fictional texts

Text could be classified according to the illocutionary force of their core sentences as informative text types (with constatives dominating), regulative text types (with directives, commissives or regulatives dominating) and declarative text types (with declarations, communicatives and institutional speech acts dominating).

If the semantic centre, the conceptual relations between propositions, the global pattern of organization of the text, and stylistic traits are taken as criteria for the classification of texts, we have three general text groups: descriptive, narrative and argumentative (Beaugrande/Dressler 1981):

TEXT GROUP	DESCRIPTIVE	NARRATIVE	ARGUMENTATIVE
SEMANTIC CENTRES	objects, situations	actions, events	beliefs, ideas
CONCEPTUAL RELATIONS	attributes, states, instances, specifications	cause, reason, purpose, enablement, time proximity	reason, significance, volition, value, opposition
STYLISTIC TRAITS	modifiers	subordinations	emphasis, insistence, reoccurrence, parallelism, paraphrase
GLOBAL PATTERN	frame	schema	plan

This taxonomy is unsatisfactory because text types such as law, instruction, and advertisement do not seem to be subsumed under any of the text groups.

If type of cognitive process and type of core sentence are taken as criteria, we have a more satisfactory division into five text groups: de-

scription, narration, exposition, argumentation and instruction (Werlich 1975; 1976):

TEXT GROUP	COGNITIVE PROCESS	CORE SENTENCE TYPES	TEXT TYPES
DESCRIPTION	perception of phenomena in space	phenomenon-registering sentences	expressionistic and technical description
NARRATION	perception of phenomena in time	action-recording sentences	story, narrative, news story, report, chronicle, annals
EXPOSITION	comprehension	phenomenon-identifying sentences; phenomenon-linking sentences	essay, explication, textbook, definition, minutes, text interpretation
ARGUMENTATION	judging	quality-attributing sentences	comment, scientific paper
INSTRUCTION	planning	action-demanding sentences	law, rule, agreement, directive

The most obvious disadvantage with this taxonomy is that widespread text types such as advertisements (commercials) are not represented in the system. The reason for this is that commercials do not have a standard set of sincerity expectations and purpose-signaling traits: they look like descriptions, but are instructions or argumentation.

When text types are seen in a procedural perspective, the mutual expectations and background knowledge of the interlocutors are important criteria for classification of texts. These expectations are very accurately dealt with in the framework of Harder and Kock's theory of presupposition failure (1976).

Deception is, according to this theory, defined by a situation where the presupposition of the utterance does not belong to the background knowledge of the speaker, while the interpreters assume that it does, and the speaker knows that they do; the presupposition does belong to background assumptions of the interpreters, the speakers know that, and that is what the interpreters believe.

Bullying is the name of a sincere speech act in which the speaker is showing non-solidarity, but does not care either whether he is caught in doing it; and he means no fun. An

example is the well-known question: *When did you stop beating your wife?*

It is a consequence of the theory of presupposition failure that advertisements and commercials are treated as a kind of deception or bullying (Togebly 1993, 687ff.).

5.2. Classification of all texts

An outline of a taxonomy of text types for all texts collected from all the quoted literature could be the following:

	MODE OF SINCERITY EXPECTATIONS	MODE OF REPRESENTATION	TEXT TYPES
TEXT	PRESUPPOSITION FAILURE	BULLYING	commercials
		IRONY	making fun, politeness
		DECEPTION	advertisement, commercial
	IMAGINATIVE LITERATURE	DRAMA	tragedy, comedy, parody, travesty, play, cabaret
		POETRY	poem, song, lyrics, hymn
		FICTION	novel, short story, story, myth, legend, folk tale
		SHORT FORMS	nursery rhyme, joke, witticism, riddle, proverb
	NON-FICTION	DESCRIPTIVE	word picture, expressionistic description, technical description
		NARRATIVE	narrative, report: news story, reportage, minutes, chronicle, annals, history book
		EXPOSITIVE	essay, definition (encyclopedia), explication (textbook), summary, text interpretation
ARGUMENTATIVE		political speech, manifesto, comment, leading article, review, scientific paper	
INSTRUCTIVE		instruction: recipe, direction, rule, regulation law

28. Nordic language history and phraseology/idiomatics

1. Introduction
2. Definitions
3. Historical phraseology
4. Synchronic phraseology
5. Literature (a selection)

1. Introduction

Following a steady growth of scholarly interest over the past twenty years, phraseology has now become a major field of theoretical and applied research for Western linguists as it has been, since the 1940s, for scholars in the former Soviet Union and other countries of Eastern Europe. Research on phraseology of the modern Scandinavian languages, however, is

still at its beginning. Traces of a developing interest in phraseology are best visible in the appearance of several phraseology-related dictionaries since the mid-1960s (for Swedish: Bendz (1965), Johannisson/Ljunggren (1966), Allén (1975), Holm (1975), Schottmann/Petersson (1989); for Icelandic: Halldórsson (1991); for Danish: Bruun (1978), Røder (1998); Toftgaard Andersen (1998); for Norwegian: Moter Erichsen (1996)). Studies investigating modern phraseology are still few, and studies that investigate historical phraseology are even fewer. Moreover, in many phraseology studies a synchronic viewpoint is combined with an interest in historical aspects. In order to point out what is missing in research

on Scandinavian phraseology, we shall therefore present both historical and synchronic studies.

2. Definitions

Belonging to a relatively recent field of linguistics, the terminology of phraseology is still subject to discussion. The term *phraseology* itself has come to denote both the object of study (the sum of all phraseological units of a certain language) and the discipline of linguistics that investigates this area. From a psycholinguistic perspective, phraseology is concerned with those groups of words that are likely to be stored as lexical unities in the mental lexicon. In phraseology studies, those groups are often ranged along a continuum from purely accidental collocations of words towards idiomatic collocations and proverbs. Such a continuum is presented by Allén (1975), who uses a statistical and then structural-semantic approach to define phraseological units. In his introduction, he subdivides the recurrent word combinations he found in newspaper language into three hierarchical groups:

- (1) *Combinations* are groups of at least two words (collocations) which appear at least twice in his material (e.g. *det är*).
- (2) *Constructions* are those combinations which have certain external features of structure and are therefore phraseologically relevant (e.g. noun phrases like *den stora frågan*, verb phrases like *kommer att fortsätta*, connectives like *därför att* and clauses like *som människa, jo då, det är svårt att veta hur*). This large group is often subdivided. The term *phraseological unit* (G *Phraseologismus*) can be restricted to a (relatively) fixed lexical group of words that is often subject to transformational restrictions and which contains at least one autosemantic (Schottmann 1998, 263).
- (3) *Idioms* are those constructions that in addition to the above features of structure are subject to semantic or lexical irregularities. Their meaning is not predictable on the basis of the meanings of their constituents (e.g. *vara på tapeten* in the sense 'be on the carpet', *dra örnen åt sig* in the sense 'become wary'). A special case of lexical irregularity is found in the so-called "cranberry" collocations, which contain a lexical item not found

outside the combination in question (G *unikale Komponenten*, e.g. *såta* in *såta vänner* 'close friends'). Moreover, the group of idioms can again be seen as a continuum. Anward/Linell (1976) see a scale from pure idioms (whose meaning has no relation to the literal meaning of their constituents, e.g. *ta ner skylten* 'to die') towards expressions whose meaning is almost one hundred per cent predictable from their constituents (*att bada naken* 'to bathe naked'). Clausén (1993) moreover points to the fact that the borderline between comparisons, idioms and sayings is often fuzzy (cf. *skåda/döma hunden efter håren* 'to judge sth./sb. by appearance' as an abbreviation of an original *man ska inte döma/skåda hunden efter håren* 'you must not ...').

Svensk konstruktionsordbok (cf. Clausén 1991b; Clausén 1992; Lyly 1993; Clausén/Lyly 1995) uses a hierarchical system similar to Allén (1975), listing under one headword first productive syntactical constructions, then phrases which have a certain lexical fixity but which are semantically transparent ("halvfasta fraser", cf. Lyly 1993) and finally fixed phrases (comparisons, clichés, pragmatic phrases, proverbs and idioms). Of course, combinations in Allén's sense are usually not regarded as a proper subject for phraseological research. Most research on the phraseology of the Scandinavian languages has been done on idioms and less on constructions, while historical linguistics so far seems to have focussed on proverbs. For both idioms and constructions in Allén's sense, we shall use the term *phraseological units* here.

3. Historical phraseology

3.1. Criteria for finding phraseological units

A problem for research into historical phraseology of the Scandinavian languages is that there is no corpus of phraseological units apart from collections of proverbs. All other phraseological units therefore first have to be extracted from texts or Old Nordic dictionaries. The amount of Old Nordic text production, however, is enormous (cf. art. 109). Moreover, the distinction between use-restricted phraseological units on the one hand and accidental collocations on the other can only be made by the competent native speaker who, of course, is not available for historical language stages. There are, however, theoretic-

cal foundations for the spotting of phraseological units (cf. Burger 1982, 347–382). The following criteria are particularly suitable in the case of Old Nordic (cf. Landolt 2001):

- (1) phraseological units often verbalize everyday actions (e. g. *ganga alfreka* ‘to relieve oneself’);
- (2) greeting formulas are often phraseological (e. g. numerous expressions containing *heilir*, like *farið heilir* ‘goodbye, have a good trip’);
- (3) phraseological units often appear in certain lexical areas, e. g. body parts (*elli sígr í augu* ‘old age gives poor sight’), seafaring (*draga árar* ‘exert oneself in order to achieve sth.’), war (*leika tveim skjöldum* ‘to play a double game’);
- (4) formal-stylistic evidence, e. g. pair formulas and comparisons (cf. 3.3.);
- (5) phraseological units are often formed along certain structural patterns, e. g. constructions with function verbs like *gera*, *taka*, *vera* (*gera at ágatum* ‘praise’, ‘extol’, *taka í arf* ‘inherit’, *vera at bók-námi* ‘learn’);
- (6) metalinguistic evidence, e. g. ‘as they say’, ‘as it is told’.

3.2. Metaphorical use

Phraseological units are called idioms if they are metaphorized in part or as a whole. Expressions around headwords from particular lexical areas, e. g. the body parts, seem to encourage metaphorical (idiomatic) use (e. g. *vex í/yfir augu/augum* ‘(sth.) gives (sb.) misgivings’, literally ‘(sth.) grows into (sb.)’s eyes’. Euphemization is found e. g. in *ganga/hava alfreka* ‘to relieve oneself’, literally ‘to drive away the elves’, while saga-like understatement appears e. g. in *elda mǫnnum baðstofur* ‘burn at will’, literally ‘warm up the steam-bath’ (cf. ONP 1, s. v.).

3.3. Pair formulas and comparisons

Belonging to a prominent group of Old Nordic phraseological units, pair formulas are often stylized rhetorically by the use of alliteration, assonance or, occasionally, end rhyme: *lífs eða líðinn* ‘dead or alive’, (*með*) *heilu ok hǫldnu* ‘safe, lucky’, *segja kost ok lǫst á e-m* ‘to name sb’s merits and faults’. Comparisons also appear in Old Nordic: *rauðr sem blóð* ‘red as blood’, *hvítr sem drift* ‘white as (driven) snow’. While most of the Old Nordic phraseological units seem to be native, expressions

containing loanwords from Low German can be found in this category: *frygð ok æra* ‘joy and honour’ (< LG *vröchde, ere*), *prýðr ok prakt* ‘decoration and splendour’ (< LG *prakt*), *finn sem spegill* ‘bright as a mirror’ (< LG *vin, spegel*), *fagr sem rósa* ‘pretty as a rose’ (< LG *rose*).

3.4. Proverbs

In contrast to Scandinavian phraseology in general, the study of Old Nordic proverbs already has a longstanding tradition, as shown by the collections by Kock/af Petersens (1889–94), Jónsson (1914), Gering (1916) and Vrátny (1917). Most frequently, proverbs appear in Icelandic sagas, but they can also be found in other fictional prose, e. g. *Landnámabók*, *Sturlunga saga* or *Snorra Edda*. *Njáls saga* has been shown to be particularly rich in proverbs (cf. Dopheide 1973). Employed by the author as a rhetorical ornament and with the intention of commenting on the actions of the saga characters, they are still known and used by Icelanders today (e. g. *Eigi fellr tré við hit fyrsta hogg* ‘A tree doesn’t fall at the first blow’, *Skamma stund verðr hǫnd hoggvi fegin* ‘The hand’s joy in the blow is brief’, *Kǫld eru kvænna ráð* cf. Chaucer’s *Wommenes counseils been ful ofte colde*).

Legal proverbs are handed down to us mainly in the Old Swedish *landskapslagar*, but they even appear in Old Norse saga literature (e. g. *Njáls saga*: *Eigi skal einn eiðr alla verða* ‘One oath does not determine all oaths’, or *Grettis saga*: *At lögum skal land vart byggja en eigi at ólögum eyða* ‘Our land shall be cultivated lawfully and not lay waste in lawlessness’). Wellerisms are most common in northwest and northern Europe and they usually have a tripartite structure, naming a speaker in the middle sequence: *Ofnær nefi, kvað karl, var skotinn í auga* ‘Too close to the nose, said the boy, when he was shot in the eye’, *Snæliga snuggir, kváðu Finnar, áttu andra fala* ‘Snow is in the air, said the Lapps, when they had snow shoes for sale’.

3.5. Loans from Middle Low German

Since the 19th century, a classic domain of Scandinavian historical linguistics has been contrasting Low German with Swedish, Danish and Norwegian and investigating the influence of German on the Scandinavian languages. Research on the transfer of phraseological units, however, is a relatively new

discipline. During the longstanding process of Low German interference with the Scandinavian languages, phraseological units have continually been transferred into the Scandinavian lexicon. While the first traces of this process are visible in Old Nordic sources from the 13th century, transfer reaches its climax in the Late Middle Ages, and it even continues when Middle Low German ceases to be a writing and printing language standard. In the 18th and 19th centuries, Low German phraseological transfer declines in significance, but it can still be found in dialects and sociolects of Swedish, Danish and Norwegian. The transfer of phraseological units is more or less contingent on the amount of Low German transfer in general. However, the transferred material is stratified according to different cultural, social and psychological conditions. Influence of Low German is particularly obvious in “cranberry” collocations (e. g. *ligga i själåtåget* ‘to be at one’s last gasps’ from MLG *sêletogen* (cf. Naumann 1987; 1992). As transfer into Danish differs from transfer into Swedish to some extent, the formerly postulated role of Danish as a mediator is rather doubtful.

4. Synchronic phraseology

Research on phraseology often has a historical element, even when it is concerned with modern languages. Many synchronic studies occasionally look back to older stages of language for their definitions of phraseological units or in explaining the similarity of phraseological units in related languages. Moreover, the use of lexically outdated dictionaries which often preserve expressions taken over from older dictionaries adds a vaguely historical element even to synchronic studies on phraseology. Modern dictionary editors and linguists try to avoid this by explicitly using informants (Clausén 1991a; 1991b; Krohn 1994).

In synchronic research on phraseology, interest since the 1970s has shifted from the investigation of phraseological systems towards both text-linguistic and culture-related issues. Just as the general interest in phraseology seems to have originated in didactic concerns over problems in second language acquisition, contrastive studies play an important role even in research on Scandinavian phraseology. Swedish is the language that has attracted the bulk of phraseological research, and it is most often contrasted to German.

4.1. Phraseological systems

The overview on lexicalised phrases in Swedish by Anward/Linell (1976) still constitutes the theoretical basis for many recent articles. Lexicalised phrases in Swedish can be recognized because of their connective prosody (“idiomatiseringsaccent”, “sammanfattningsaccent”), because of certain grammatical structures and because they are restricted as to possible transformations. Expressions which are most idiomatic are also least liable to transformations (e. g. *att bada naken* ‘to bathe naked’ > *Det var naken som Ulla badade*, but *att lägga rabarber på ngt.*, in the sense of ‘to appropriate sth.’ > **Det var rabarber han la på morbror Rubens cykel*).

Moreover, the Swedish phraseological system has been compared to that of other languages. Schottmann (1998) shows that the Swedish and the German phraseological systems are closely related to each other. One reason for the relative closeness of phraseological units in all European languages is common cultural heritage, e. g. the Bible. Of all German phraseological units that are obviously deduced from the Bible, Schottmann (1998, 270) found that not one equivalent was missing in Swedish.

4.2. Phraseological constituents

The constituents of phraseological units have often been subject to investigations either because of certain semantic properties or because of morphological or semantic irregularities. Particularly somatisms (phraseological units containing a reference to a part of the body) and “cranberry” constructions have attracted the attention of linguists. The studies concerned with somatisms in Swedish are largely contrastive. While Krohn (1994) is mainly interested in establishing the degree of equivalence between particular somatisms in German and Swedish, Lundh (1992) presents a new theoretical model for the analysis of such equivalence types. The findings of Krohn (1994) again show that about two thirds of the somatisms found in German also appear in Swedish and correspond in both form and meaning.

In the study of cranberry collocations, both synchronic and historical linguistics are combined. Some constituents unique to cranberry collocations (*G unikale Komponenten*) were productive free morphemes in earlier states of the language, and some of them are still used

in this way in some dialects. In some areas, a “unique lexical item” might still be known as old-fashioned, while it is unknown in other parts of the country. However, the presence of a unique constituent is usually taken to indicate that the phraseological unit in question is an idiom. The irregularities that Anward/Linell (1976) found in some lexicalised phrases are often due to the fact that elements of an older stage of language have been preserved. Older morphology appears for example in *i blindo* ‘blindly’ or in a number of constructions with *till* + gen., e.g. *till salu* ‘for sale’ or *hålla till handa* ‘have in stock’. Investigating and classifying about 500 instances of Swedish cranberry collocations, Naumann (1987) has shown that unique elements are often frozen inflected forms (e.g. *i sinom tid* ‘in due time’), loanwords from foreign languages (from LG cf. 3.5., from Lat. *inte ett jota* ‘not a jot’, from Fr. *göra sorti* ‘make one’s exit’) or from technical language (sailor language, legal terminology). Unique constituents are often used as reinforcements, e.g. *isande kall* ‘biting cold’. However, as Swedish has a tendency to write words which formerly were separated as one unit, the two constituents of a phraseological unit often change into one single lexeme. This is particularly frequent in the common type of preposition and noun, e.g. *ikapp*, *varsebli* (Schottmann 1998).

4.3. Culture-specific properties

According to Schottmann (1998), characteristics of a certain language and culture appear, among phraseological units, most often in the use of proper names or in references to history, customs and living conditions. For Swedish, this is shown in *inför gud äro vi alla smålänningar* ‘in front of God we are all little/from Småland’, *ha herr Ågren på besök* ‘to have a hangover’ or *mat för Måns* ‘a heaven-sent opportunity’. Phraseological units that are derived from ancient legal terminology are still preserved in modern Swedish (*varg i veum* ‘an outlaw’, *sätta ngn. i högsäte*, ‘to deem somebody very important’; Schottmann 1998).

Claiming that phraseological units accumulate in a particular language in areas that are emotionally loaded, Stedje (1989) has tried to find culturally dependent differences in the Swedish and German phraseological systems. Without actually listing her material, she applies an “ethnolinguistic perspective” to phraseological units concerned with expressions meaning ‘(not) to interfere’ (G *sich (nicht) ein-*

mischen) and ‘to reprimand’ (G *zurechtweisen*), resulting in her claim that, in Swedish, there are fewer phraseological units or verbs meaning ‘to reprimand’ than in German. Schottmann (1998) however criticizes her assumption that phraseological units or even the lexicon of a language are representative of either Swedish or German mentality. He in turn claims that both languages have a number of phraseological units for ‘(not) to interfere’ and ‘to reprimand’. The question whether or how it is possible to discover differences in mentality by studying phraseological units has therefore not been settled yet.

4.4. Textlinguistic studies

Newspaper language is a favoured corpus for investigations of Scandinavian phraseology. Skog-Södersved (1992) has contrasted the frequency of phraseological units in German and (Finland-) Swedish newspaper leaders. Investigating the occurrence of morphosyntactic classes and of occasional modifications (new use of a phraseological unit which has not yet entered dictionaries), she observes that Swedish newspaper language uses only half as many phraseological units as German ones. Clausén (1996) has investigated the use of idioms in Swedish newspaper language during one week. She found that idioms with a non-metaphorical parallel phrase can be used with greater variation. Indeed, only 3 of the 23 idioms she found were used as specified in the dictionary. Variation can affect morphology (*strö salt i såret/såren*), syntax (*inte veta på vilket ben man ska stå/vilket ben man ska stå på*) or the lexicon (*springa som yra/skrämda höns*), and it can use both abbreviation (*det är ingen ko på isen (så länge rumpen är i land)*), *vara femte hjulet (under vagnen)* and addition. Generally, this study shows that it can be particularly fruitful to look at phraseological units as they are actually used rather than as they are preserved in a dictionary.

4.5. New phraseological units and the influence of English

Both synchronic and historical linguistics meet in research on neologisms in the 20th century. Inghult (1991) is interested in the principles of lexical innovations in German and Swedish after 1945. In dictionaries of neologisms, he found that only 3% of new formations are groups of words, but 97% are word formations, and that idiomatized phraseol-

ogical units are rare. He also observed that composition is often found in Swedish where German has a phraseological unit. e.g. *eine kupferne Kanne* 'a copper can' versus *en kop-parkanna*.

Moberg (1996) investigates the influence of English on Swedish phraseology and finds that loans in this category often also encourage the construction of parallel and then new idioms in Swedish. While culturally loaded idioms like *it's not my cup of tea* or *to cry wolf* have only weak chances of survival in another language, others are more successful. Both *att lägga ngt. i malpåse* and *att bli tagen med byxorna nere* were originally English (*to put sth. in mothballs, to be caught with one's trousers/pants down*). Listing examples of loaned phraseological units from the 1980s, Moberg (1996) finally examines how the transfer of *to get cold feet* into Swedish *få kalla fötter* has encouraged the emergence of a large amount of new idioms since the 1970s: *ha varmt |bra |mycket| ordentligt* etc. *på fötterna*.

7. Desiderata for future research
8. Literature (a selection)

1. Historical contrastive linguistics

1.1. Historical contrastive linguistics comprises two major areas. *Historical contrastive grammar* compares the ways in which the structures of two or more languages or dialects develop over the course of time. The comparison may embrace related or not demonstrably related languages. Broadly understood, the term “grammar” includes the components of phonology, morphology, syntax, and semantics, the first three of which are currently of particular concern for cross-linguistic diachronic comparisons. Generally set apart from grammar proper, the lexicon is another significant aspect of cross-linguistic historical comparisons. This is the realm of *historical contrastive lexicology*. In addition, *text-linguistic*, *sociolinguistic*, and *pragmatic* investigations with a historical contrastive focus are to varying degrees possible or conceivable.

1.2. Historical contrastive linguistics in the sense just defined differs, if not always in kind, at least in degree from certain other research orientations. Traditional *historical comparative linguistics* compares demonstrably cognate languages in an attempt to reconstruct a common original grammar and lexicon, a proto-language, for these, and, if complete, delineates during the course of the reconstruction the chronological developments from the proto-language down to the individual daughter languages. Unlike traditional comparative grammar, historical contrastive linguistics is not limited to related languages and does not aim at establishing a proto-language. Secondly, historical contrastive linguistics differs from conventional *contrastive linguistics* or *contrastive analysis*, since the latter is synchronic and most commonly applied, with the ultimate goal of providing a basis for improved second language teaching, learning, and testing, translation practice, automatic translation, etc. Finally, historical contrastive linguistics differs from so-called *comparative grammar* within the framework of modern generative theory (the principles-and-parameters approach and minimalism) in that the latter compares languages, whether related or unrelated, ultimately in order to establish biologically endowed properties of human

language in general, the so-called Universal Grammar (UG). Historical contrastive linguistics for its part is not limited to a particular theoretical framework or to one particular theoretical goal. Ideally, it should provide a reasonably exhaustive comparison of all diverging, converging and parallel changes in the languages examined, whereas generative comparative grammar may restrict itself to the developments most obviously relevant to its universalist program.

Historical contrastive linguistics perhaps displays its greatest affinity with *historical language typology*, although, unlike the latter, it does not aim at hammering out general typological principles. Taking existing historical grammars as its point of departure, it rather seeks to determine structurally, lexically, and sociolinguistically significant parallels and differences in the developments of the particular languages selected (see further 7.1.). The contrasts thus established may be utilized for theoretical, typological, descriptive, applied, historical, or other purposes.

1.3. Historical contrastive linguistics as a separate, well defined, systematic field of study is still in its early infancy, if not, in part, at its gestation stage. This is true generally as well as with reference to the Nordic or Scandinavian languages. Comprehensive longitudinal step-by-step comparisons involving Scandinavian languages are rare. The work that comes closest to this goal is Einar Haugen's *Scandinavian language structures: A comparative historical survey* (1982), which might perhaps be taken to foreshadow the field of Scandinavian historical contrastive linguistics as a whole. In the words of its back cover, "[t]his is the first book in any language to provide a comparative survey of the historical development of all major linguistic structures in the Scandinavian languages". A historical contrastive approach is especially evident in its chapters on phonology and morphology. Phonological processes are described and morphological systems tabulated in such a way that it is clear which major phenomena are common to all the standard languages in Scandinavia, which ones are found in a subset of these languages, and which ones are restricted to individual languages. Aside from Haugen (1982), cross-language observations, albeit not as methodical, are part and parcel of many historical descriptions. Broad overviews of Nordic language history such as Haugen (1976) or Westén (1965) as well as the Nordic dialect history

by Bandle (1973) to a greater or lesser extent draw cross-linguistic parallels. Among later works, Barðdal et al. (1997), despite certain shortcomings, has the virtue of presenting the Scandinavian languages contrastively, and some of this extends into the diachronic domain. Similarly, Torp (1998) offers contrastive observations, some of them historical. Interesting diachronic-typological perspectives on Faroese are outlined in Rischel (1992). Where a historical contrastive perspective does surface in the literature, the primary focus is often on the Central or Mainland, as opposed to the Insular Scandinavian languages. Moreover, contrastive remarks on developments in the standard languages are overwhelmingly more frequent than those on dialectal changes.

In the survey that follows, only a small selection of the literature with a bearing on the field can be mentioned. Additional references are found in the publications cited. In line with the orientation of existing research as well as for reasons of space, we will concentrate on structural and lexical, rather than text-linguistic, sociolinguistic, and pragmatic, factors.

2. Phonology

In traditional accounts of the phonological history of individual Scandinavian languages, reference is often made to parallel or diverging developments in the sister languages. For the period under discussion here (i.e. from about 1950), the work by Hesselman (1948–53) achieves special importance, since it "aims at a comprehensive treatment of the more important questions about the changes in the spoken language in the Scandinavian linguistic area" (Hesselman 1948, V; my translation). Due to the author's death, however, this painstaking work could not be completed as planned, and the installments actually published are largely restricted to phonological weakening processes in post-stress positions (apocope, syncope, consonant reduction, etc.). Though not always dependable in its conclusions (cf. Ulvestad 1964), Chapman (1962) pursues interesting parallel changes in the West Scandinavian languages in the areas of vocalic and consonantal phonology. In an attempt to substantiate an alternative theory about the emergence of Scandinavian tonal phenomena (functionally, a stød-like phenomenon is taken to be original), Liberman (1982) pulls together a wealth of material from the literature, making frequent cross-linguistic and cross-dialectal comparisons, also of a dia-

chronic kind (cf. Ringgaard 1983, Eliasson 1986). Tracing the historical transformation of quantity in Icelandic, Árnason (1980) includes, in a special chapter, comparisons with the developments in the other Scandinavian languages. The historical interplay between quantity and quality in West Scandinavian vowel systems is the topic of Küspert (1988) (a similar goal is pursued by Widmark 1998 for Swedish). None of the works mentioned, or others like them, are as explicitly contrastive as the phonology chapters of Haugen (1982), but they offer numerous starting-points for further historical contrastive research. For orthography, likewise, there existed until recently no systematic historical contrastive study examining the detailed developments of the orthographies of most or all of the languages. Important aspects of such a comparison are now covered in the historically oriented sections in Lindqvist (2001), who studies the role of general orthographic principles in the formation and change of the Scandinavian orthographies (cf. also e.g. Werner 1994 and Nedreliid 2000).

3. Morphology

Change in Scandinavian inflectional morphology is governed by two fundamental, opposing, yet distributionally complementary, tendencies, both of which have been commented on extensively in the literature: the *build-up* of morphology in some domains, and the large-scale *erosion* of morphology in others. The build-up of new morphology (due to grammaticalization) is illustrated especially by the emergence of the suffixed definite article in $-(V)n(-)$ and the “mediopassive” in $-s(t)$, etc. These developments took place in all the standard Scandinavian languages, but with partly varying end results. In contrast, the extensive breakdown or simplification of other nominal and verbal morphology (of the categories case in nouns, number and person in verbs) is the paramount feature that sets the Central Scandinavian languages apart from the Insular ones. These simplifying developments result in the Central Scandinavian languages having fairly transparent morphology, illustrated e.g. by plainly agglutinative structures like Sw. *stol-ar-n-a-s* (chair-pl.def.pl.poss.) ‘of the chairs’. The generalization of the genitive ending $-s$ to new noun classes is accompanied by its use to mark syntactic group genitives, even including examples such as Sw. *på dom som beslutar bord, så att säga* [on the desk of (-s)

those (*dom*) who (*som*) decide (*beslutar*), so to speak] (the Swedish Child Ombudswoman, Radio Sweden, Program 1, March 25, 1993, 9.35 a.m.). Norde (1997) analyzes the Swedish case also in a Scandinavian and Germanic perspective (cf. Askedal 2000). The numerous major and minor morphological differences between the Scandinavian languages have naturally triggered many comments in the literature.

4. Syntax

Syntactically, the Scandinavian languages are highly similar, both in form and substance, but some interesting discrepancies do exist. As in phonology and morphology, studies on Scandinavian syntax from a combined historical contrastive perspective do not abound. Still, a few early works of a somewhat kindred nature may be mentioned. In two substantial synchronically contrastive volumes, which may well serve as a starting-point for diachronic investigations, Hulthén (1944–48) examines in detail similarities and differences between the syntax of written Standard Danish, Norwegian and Swedish. On a much narrower scale, Holm (1958) traces the history and areal distribution of the two Norse verbs *fara* and *taka/taga*, with the basic meanings ‘go, travel’ and ‘take, seize’, respectively, in ingressive, periphrastic, and related infinitive constructions (e.g. Mod.Icel. *fara að rigna* ‘begin to rain’). One outcome of his analysis, underpinned by philological and dialect-geographic evidence, is that *taka* is older than *fara* in ingressive constructions (for a critique of the work, see Ulvestad 1959). From a phonological and semantic as well as syntactic point of view, Markey (1969) traces the spectacular displacement of the native Scandinavian verb *varda* (etymologically = G *werden*) by the borrowed *bliva* (etym. = G *bleiben*) in large parts of Scandinavia, trying to establish the when, why and how of the change (on this class of verbs, note also Nübling 2000, 55–108). The expression of definiteness in Scandinavian noun phrases is the subject of Lundebý’s (1965) doctoral dissertation, which remains a valuable source of information. Not until the early 1980s, however, sparked by new developments in generative theory, did a Scandinavian generative comparative syntax emerge. Given the primary goals of generative comparative grammar and the availability of data, much of this work is synchronic in orientation, but sometimes diachronic considerations are

adduced in order to support the solutions proposed. A major, theoretically sophisticated contribution is that by Holmberg/Platzack (1995), who attempt to derive a large set of syntactic differences between especially Icelandic and the Mainland Scandinavian languages (cf. Holmberg/Platzack 1991, 95) from a fundamental difference in inflectional morphology between the two language groups. Whereas Icelandic has a well-developed system of subject-verb agreement and moderately rich case morphology, the Mainland Scandinavian languages have no subject-verb agreement and very little case-marking. Precise comparisons of the diverging diachronic developments are, of course, highly pertinent to this issue. (For an incisive, insightful review of Holmberg/Platzack 1995, see Thráinsson 1999.) Although the Scandinavian languages are syntactically strongly alike, striking differences appear in their noun phrases, which are the subject of Delsing's penetrating (1993) study. A readable survey of generative comparative research on Swedish and Scandinavian syntax up to the early 1990s is provided by Platzack (1994). Platzack distinguishes two main periods of Scandinavian generative comparative grammar. The first one, which extends from the beginning of the 1980s until the early '90s, focuses on comparisons of Icelandic, Old and Modern, with Central Scandinavian. The second period, beginning in the early 1990s, zeroes in on finer differences between the Central Scandinavian languages themselves. Platzack (1995) succinctly portrays some syntactic features of the highly archaic dialect of Älvdalen (Dalarna), drawing comparisons with other Scandinavian, Germanic and non-Germanic languages. Specifically, he explores the possibility of subject omission in the first and second person plural in the Älvdalen dialect as well as the absence of the standard Swedish rule placing the negation before the finite verb in dependent clauses. As before, he attempts to account for the differences by recourse to varying settings of parameters. In addition to providing a lucid introduction to generative comparative syntax, Delsing (2000) delineates the main steps in the collapse of the Swedish case system with a particular focus on the genitive. The description could be extended to the other Scandinavian languages (cf. also section 3 and Norde 1997). From a totally different, typological and semiotic, angle, Askedal (1997) submits that, of the two Peninsular Scandinavian languages, Norwegian tends to prefer a more

transparent coding of grammatical and lexical relations, whereas Swedish leans more towards compactness of expression. Again, this study is predominantly synchronic, but suggestive diachronic observations are included (ibid. 204–206, 207).

5. Lexicon

A wealth of research on the historical lexicology of individual Scandinavian languages, with frequent consideration of the sister languages, has been documented in many book-length studies as well as etymological dictionaries. Haugen (1982, ch. 7) offers a brief historically oriented survey of Scandinavian vocabulary. Barðdal et al. (1997, ch. 3) is more systematically contrastive. The dictionary by Lindgren et al. (1994), covering the Central Scandinavian languages Danish, Norwegian and Swedish and containing about 10,000 entries likely to cause misunderstandings in inter-Scandinavian communication, is strictly synchronic but might provide one of the starting-points for systematic historical contrastive lexicological research.

6. Scandinavian and other languages

Occasional as well as more systematic comparisons of features in the history of Scandinavian and non-Scandinavian languages are scattered over the literature. In phonology, Riad (1992) investigates syncope, vowel balance, and Swedish quantity shift, partly from a Germanic perspective. Salmons (1992) pursues North European stress and accent phenomena in pre-history. The wider areal-linguistic and synchronic typological context of the phonologies of the present-day Scandinavian languages is sketched in Eliasson (2000), though with no treatment of the diachronic dimension. Phonological as well as morphological comparisons between Late Old Swedish and Middle Low German are drawn in Moberg (1989). Braunmüller (1995) conveniently summarizes major morphological similarities and differences between Middle Low German and the Old Scandinavian languages. Nübling (2000) delineates the historical development of morphological irregularity in a set of high-frequency verbs such as *have*, *become*, *come*, *say*, *give*, *take* in ten Germanic languages, including Danish, Norwegian, Swedish, Icelandic and Faroese. She demonstrates that high-frequency verbs, rather than

being kept in check by naturalness principles, tend to become irregular in such a way that individual verb forms become more distinct. This differentiation, in turn, allows for phonetic reduction without the danger of creating troublesome ambiguities between forms (for a summary see Nübling 1998). Also, comparisons of Scandinavian syntactic developments with those of other Germanic languages are quite natural, and a number of works draw parallels of this sort. In addition to Proto-Germanic basic word order, Braunnüller (1982) analyzes, from a typological point of view, noun phrases in present-day Germanic languages and their historical antecedents. Braunnüller (1998) picks up the topic of word order in Middle Low German, Old Swedish and Old Danish from the points of view of language-internal change and language contact. Though synchronic in outlook, Ureland's (1973) dissertation on verb complementation after Swedish, German and English *verba sentiendi* also carries certain implications for diachronic research. Comprehensive comparisons of Scandinavian and non-Germanic or even non-Indo-European historical syntax, though very much in line with the generative universalist program, are still scarce, however. An informative discussion of German-Swedish historical contrastive onomastics (surnames) is contained in Nübling (1997).

7. Desiderata for future research

7.1. Ideally, though not always realistically, a systematic historical contrastive description would include at least the following steps: (1) a contrastive characterization of the original states of the languages or dialects studied; (2) a comparison of the precise course of change in each language or dialect; (3) a contrastive specification of relevant sociolinguistic conditions; (4) an approximate dating of beginning, height, and cessation of the change in each language; and (5) a contrastive characterization of the respective end states.

7.2. Among the abundance of works that have been published on the history of Scandinavian languages, extremely few can be classified as historical contrastive in a strict sense. At present, therefore, a paradox emerges. With infrequent exceptions, if a study is contrastive, it is not historical, if historical, it is not contrastive. At the intersection of the two research perspectives, a vast research territory lies largely fallow. Virtually every reasonably

complex phenomenon that varies cross-linguistically or areally may with profit be investigated further from a combined historical contrastive point of view. Hence, any listing of possible topics for future research can only be suggestive and exemplary.

7.3. Long known as major stumbling-blocks of Scandinavian linguistics, Scandinavian tonal accents, *stød*, and quantity lend themselves par excellence to extensive historical contrastive investigations, taking into account the precise twists and turns of their putative development in individual dialects and languages. Likewise, much valuable research notwithstanding, the exact ways in which the Great Scandinavian Quantity Shift has interacted with qualitative vowel changes (the Peninsular Scandinavian Vowel Shift *a*: > *o*: > *u*: > *ɤ*:, High Short Vowel Lowering, etc.) as well as ample secondary diphthongizations in different localities remain largely uncharted. In the consonant systems, the emergence of typologically not particularly frequent cacuminals, postalveolars, and retroflex flap ("thick *l*") on the Scandinavian Peninsula still harbors many riddles (origin, cause, stages, spread, dating), some of which might be illuminated by historical contrastive considerations. A case of ongoing change, the expansion of uvular *r* in Norway, sometimes with startling intermediate stages, could be studied in comparison with similar, long completed, developments (*Götamålsskorning*) in Götaland dialects in Sweden.

7.4. In the wake of recent progress in generative comparative morphosyntax, it is desirable to pursue further the alluring, yet elusive interplay between the fixing of word order and the massive breakdown of Central Scandinavian inflection so as to narrow down remaining controversial issues (cf. e.g. Thráinsson 1999). Similarly, changes in noun and verb morphology still harbor unsolved problems of detail that might be illuminated contrastively. One intriguing example is the emergence of the third weak conjugation in Norwegian and Swedish in the late Middle Ages, as compared to developments in Danish. The pathways of gender restructuring in large parts of Central Scandinavia might be put into sharper relief by historical contrastive data. From a sociolinguistic perspective, it would be rewarding to contrast the development of terms of address in the different Scandinavian languages. In the realm of lexicology, a special contrastive

history of the lexicons of all the Scandinavian languages is missing. A large-scale challenge to Nordic historical contrastive linguistics is to systematically compare precise details of the changes in Old and Middle Scandinavian to those of Middle Low German in order to determine any deeper, typological or other, parallels in the developments of these languages.

7.5. The Scandinavian countries possess a long shared history, cultural conditions in the region are strikingly homogeneous, all Scandinavian languages except Faroese exhibit a fairly long documented tradition, and particularly the Central Scandinavian languages form a closely knit group. Hence, as underscored by Platzack (1994, 40), the Scandinavian languages offer an attractive testing ground for comparative work, allowing the researcher to keep different synchronic or diachronic variables under control. Truly systematic historical contrastive investigations of the closely related Scandinavian languages may well yield new substantial insights into the factors that determine the outcome of structural change.

30. Nordic language history: Semiotics and the theory of naturalness

1. Charles S. Peirce: Icons, metaphors and symbols
2. Roman Jakobson: Motivated signs in natural language
3. Natural morphology: Natural grammatical change
4. Natural grammatical change in the Nordic languages
5. Literature (a selection)

1. Charles S. Peirce: Icons, metaphors and symbols

Semiotics is the general theory of signs. Interest in signs is not a modern phenomenon, but reaches back into Greek classical antiquity – one only needs to think of Plato's well-known

Cratylus dialogue. Since then, large numbers of philosophers, logicians and linguists have addressed semiotic questions (cf. Nöth 1990, 11 ff.). The work on semiotics by the American philosopher Peirce (1839–1914) was of particular importance for linguistics; he introduced the term *sem(e)iotic* for the theory of signs. Peirce was ignored by linguists for decades, while independently of his work a series of linguists, including Saussure, Bühler, Hjelmslev and Jakobson realised the great importance of semiotic connections for human language. In the 1950s and 1960s, Jakobson demonstrated the immediacy of Peirce's seminal ideas on the nature of signs for the study of linguistics.

Peirce's semiotics does not primarily concern language, but claims to be of universal

significance. The world for him is a world of signs. The sign is a triadic relationship, consisting of the actual physical sign itself (*representamen*) – the referent of the sign (*object*) – the meaning of the sign (*interpretant*). The core of his theory of signs is formed by the classification of signs, which is based on three trichotomies (!). The most important of these for him, and also for the linguistic questions being examined here, is the trichotomy resulting from the relationship between the sign and its referent. Peirce distinguishes three types of sign – the icon, the index and the symbol.

An icon is a sign characterized by a significant similarity between the sign and the referent; thus, for example, a photo is an iconic sign because it (as a picture) displays a similarity with the referent (that which is represented). Linguistic signs with iconic character are, for example, verbs such as German *piepen* and *brumm-en*, because they reproduce phonic characteristics of their referents, peeping and growling. Peirce further distinguishes between three sub-types of icon, namely image, diagram and metaphor. The image (icon in its narrow sense) is immediately perceptible, pictorially iconic, i.e. the sign directly demonstrates characteristics of the referent, as the above examples show. A diagram, on the other hand, is an “icon of relations”. Here, relations within the sign reflect relations in the referent, i.e. diagrams refer to the structural similarity of referent and sign. While images are open to direct interpretation, diagrams can only be interpreted against the background of certain conventions. An example would be the use of an illustration of the difference in unemployment figures between two years using two rectangles whose relative sizes reflect a quantitative difference. A linguistic example is provided by Jakobson’s observation that in many languages the positive, comparative and superlative of adjectives are symbolised by an increasing number of phonemes, as in English *high high-er high-est* and Latin *alt-us alt-ior alt-issimus*. Finally, in the metaphor, the resemblance is not between the referent and sign as wholes but between certain characteristics of both. Thus a memorial representing a human being in a certain pose can be a metaphor for war. The interpretation of metaphors, again, relies on conventions, which can be strongly culture-dependent. Natural languages are full of metaphorical signs, for example the names of tools or devices such as German *Fuchsschwanz* or *Katzenauge*.

In the case of the index, referent and sign are connected in a real rather than a representational manner. Smoke indicates fire, a pointing finger indicates a particular object. An index is basically a “sign of” something; it always requires an association to be made, which may be more or less obvious (e.g. the case of economic “indicators”). Linguistic indices are deictic elements such as the personal pronouns *I* and *you* and the pro-adverbs *here* and *there*.

The symbol is defined by Peirce as a purely conventional and thus arbitrary sign. There is no natural connection between the referent and the sign. Thus the convention for road traffic is that the colour red means “stop” or “danger” and green means “go”, whereas on the waterways the situation is reversed. One and the same animal is called *dog* in English, *Hund* in German, *canis* in Latin, *sobaka* in Russian, *kutya* in Hungarian etc. It is important to note, however, that “arbitrary” obviously does not mean that conventional signs can be freely exchanged for each other.

Peirce does not assume that the different types of sign ever actually occur in a “pure” form; a particular sign is characterised by its dominant characteristics. For him, ideal signs are ones in which iconic, indexical and symbolic features are more or less equally distributed. This view is in opposition to Saussure’s well-known position that the semiotic function is best performed by totally arbitrary linguistic signs.

2. Roman Jakobson: Motivated signs in natural language

R. Jakobson (1896–1982) was the first linguist to show the fundamental importance of Peirce’s classification of signs as icons, metaphors and symbols for the structure of natural languages. This classification provided Jakobson with a theoretical basis for working out the role of non-arbitrary signs in natural language and thus establishing their motivational potential. For Jakobson, linguistics should not ignore the motivations of linguistic signs and in particular view their diagrammaticity as being of marginal value, for this is in fact part of the essence of language: “... on a plain, lexical level the interplay of sound and meaning has a latent and virtual character, whereas in syntax and morphology (both inflection and derivation) the intrinsic, diagrammatic correspondence between the signans and signatum

is patent and obligatory” (Jakobson 1971a, 355). Jakobson clearly supports the position first taken up in Plato’s *Cratylus* dialogue by Socrates (which obviously also represents Plato’s own view) that motivated words have semiotic advantages over non-motivated words. Thus, Jakobson takes a stance clearly opposed to that of Saussure, who maintained that linguistic signs are essentially arbitrary (Saussure 1931, 79), a hypothesis accepted without questions by modern linguistics up to the 1960s and 70s. In his programmatic article “Quest for the essence of language” (1971a), Jakobson points out a range of different motivational phenomena from a variety of languages.

In the overall system of language, a relatively minor role is played by iconic formations (images). These include not only onomatopoeia (cf. again cases such as *piep-en* and *brumm-en*) but also “constellations of words having similar meanings tied to similar sounds” (354) such as the English “*ash*-verbs” *bash*, *mash*, *crash*, *dash* etc. To these can be added iconic-diagrammatic phenomena, such as those often found in the formation of diminutives with “diffuse” (high) sounds and augmentatives with “compact” (low) sounds. In such cases one can speak of sound-iconicity or sound-symbolism. Sound-symbolism can also distinguish different classes of morphemes: “... affixes, particularly inflectional suffixes, in languages where they exist, habitually differ from the other morphemes by a restricted and selected use of phonemes and their combinations”. In general, affixes are shorter than roots, and in Russian, for example, only four of the 24 obstruents occur in inflectional suffixes (352).

Far greater significance for language structure is held by diagrammatic motivational phenomena. The first of these is the uniformity and transparency of complex words. Uniformity here refers to the formal unity of roots in different words and word forms, and transparency means the formal and semantic analyzability (compositionality) of complex words. Jakobson emphasises that both phenomena can also occur partially and in varying degrees. Thus Saussure’s famous French example *berger* is not totally arbitrary, as the suffix *-er* also occurs in *vacher* etc.; the word is, therefore, partially transparent. Equally, linguistic signs can be partially uniform – for example, all Polish instrumental morphemes share the feature of nasality in their final segment, whether this be a consonant or vowel

(353). The second is that languages are constructed to a high degree according to a principle which, following the terminology of natural morphology, can be called constructional iconicity; this means that additional semantic content is matched by additional formal content. In addition to the example of the comparative already mentioned, Jakobson adduces the conjugation systems in French and Polish, where the plural form of each person is expressed with more phonemes than the singular; cf. *je finis – nous finissons, tu finis – vous finissez* etc. The third, which applies particularly to syntax, is the significant role played by serial iconicity: “The temporal order of speech events tend to mirror the order of narrated events in time or rank”: *Veni – vidi – vici* (352). Working from this, he shows that serial iconicity also determines the sequence of morphemes in a word. The substantive semantic contrast between root morphemes and affixes is reflected by their different positions within the word (352). Fourthly, and finally, he points to the existence of diagrammatic alternations in word stems: “There are ... specimens of analogical grammatical ‘diagrams’ with a manifestly iconic value in the alternants themselves” (355). Among the examples cited is that of reduplication as it occurs in plural, iterative and augmentative formations in African languages, for example.

Metaphors, Peirce’s third type of iconic signs, are also an essential part of natural languages. “*Star* means either a celestial body or a person, both of pre-eminent brightness. A hierarchy of two meanings – one primary, central, proper, context-free; and the other secondary, marginal, figurative, transferred, contextual – is a characteristic feature of such asymmetrical couples” (355).

In this article, Jakobson just mentions indexical signs. In natural languages they are typically represented (see above) by pronouns and pro-adverbs. However, using the case of the first person singular, Jakobson (1971b) characterizes their particular semiotic value using the designation “shifters”, which has now become generally accepted: “... the sign *I* cannot represent its object without ‘being in existential relation’ with this object: the word *I* designating the utterer is existentially related to his utterance, and hence functions as an index”. Since the same meaning is expressed in different languages by different forms, e.g. *I, ego, ich, ja*, the personal pronoun also takes on a symbolic character. Thus Jakobson speaks here of indexical symbols (132).

Jakobson not only showed the import of Peirce's semiotic theory for linguistics but also developed a number of novel ideas of his own. The most important of these is undoubtedly the notion of markedness, which he developed in collaboration with Trubetzkoy. The original notion was to express the non-equivalence of those members of a binary phonological opposition in which one member possesses a feature which the other phoneme does not, e.g. the feature of voice in the opposition /d/ vs. /t/ with /d/ being marked and /t/ unmarked (cf. Trubetzkoy 1931). Jakobson transferred the notion to morphological oppositions such as *G Eselin* vs. *Esel*, where *Eselin* not only possesses the semantic features of *Esel* but also has the feature "feminine", and is thus marked in contrast to *Esel*. This notion was later developed into a theory of markedness as a comprehensive theory of the systematic asymmetry of grammatical units in structure and change.

Jakobson did not systematically relate his insights into semiotics, motivation and markedness in natural language to the question of language change; with his findings, however, he paved the way for a theory of grammatical change.

3. Natural morphology: Natural grammatical change

Natural morphology (cf. esp. Dressler 1985a/b; 1999; Mayerthaler 1981; Wurzel 1984; 1994a/b) investigates the synchronic and diachronic morphological structure of languages from the particular viewpoint of markedness. Since morphology is always concerned with linguistic signs, morphological markedness has a semiotic base (as phonological markedness has a phonetic base). Thus natural morphology (along with other approaches which cannot be considered here) follows on directly from Jakobson in two ways.

Theories of grammar in their narrow sense tell us which structural characteristics natural languages must have and which ones they cannot have. Thus they are particularly concerned with the strict universal principles that make up Universal Grammar (UG). Theories of markedness, and thus natural morphology, on the other hand, tell us which structural properties languages (i.e. their speakers, of course) prefer over others (Vennemann 1988). These structural properties are typically widespread among the world's languages, acquired by speakers at a relatively early stage, less affect-

ed by pathological speech impediments, and crucially for this context – they are recurrent in language change. Grammatical phenomena displaying these structural characteristics are defined as unmarked/less marked. They are preferred because they impact the human linguistic capacity less than their more strongly marked counterparts. In natural morphology, the degree of markedness of grammatical phenomena is established by universal markedness principles (MPs: also known as principles of naturalness or preference). They take the following general form:

(1) A grammatical phenomenon G_j is less marked in regard to a markedness parameter M_i the stronger its degree of a property P_k .

Grammatical phenomena classified in morphology according to their markedness are word-forms, morphemes and non-morphemic signs (e.g. vowel alternations). MPs do not evaluate these generally, but always with respect to certain markedness parameters which in turn reflect significant structural aspects. Thus, markedness is always relative, never absolute (Vennemann 1988, 1). The properties on which markedness is based do not normally occur in binary form (P_k is present/absent) but rather in scalar degrees; thus, for example, a word-form can be more transparent or less transparent, cf. Fr. *berger*. As a result, markedness must also be defined in scalar terms; the simple distinction between "marked" and "unmarked" (as practised by Jakobson) does not suffice. Thus one finds statements of the type " G_1 is more/less marked in regard to a markedness parameter M_i than G_2 ".

Morphological markedness parameters are based to a large extent on the motivational phenomena observed by Jakobson in morphology. These include, for example, morpho-semantic transparency (including uniformity), constructional iconicity and serial iconicity. Motivatedness also provides the foundations for the parameters of system adequacy (morphological forms corresponding to the general structural traits of the system are preferred to those which do not) and motivated class membership (motivated class membership is preferable to arbitrary class membership). Parameters based not on motivation but on other semiotic conditions include those of uniform inflection (uniformly inflected words are preferred to those not uniformly inflected) and of morphological compactness (word forms consisting of a smaller number of morphemes are preferred to those consisting of a larger

number). MPs evaluate grammatical phenomena, but in themselves they say nothing about linguistic change. They are only relevant for language change when taken in conjunction with the principle of natural grammatical change, which states that:

(2) Natural grammatical change moves toward the replacement of grammatical phenomena more marked in regard to a markedness parameter M_i by grammatical phenomena less marked in regard to M_i .

Natural grammatical change, i.e. change which is initiated grammatically (“set by the system”, as opposed to socially motivated change) always leads to a reduction in markedness. In this sense it is directional. In processes of language change, speakers unconsciously behave economically and reduce the strains on their linguistic capacity. This principle does not, however, determine if and when a particular change will occur, as this depends on extra-grammatical social factors (which no grammatical theory is capable of defining). The rule is, therefore, that *if* internally motivated grammatical change occurs, *then* it always leads to markedness reduction.

It is important to note that as a result of their different parameters, MPs can lead the structure of natural languages in different directions, i.e. a decrease in markedness in regard to one parameter due to language change may well lead to an increase in markedness in regard to a different parameter. This becomes particularly clear when a morphological MP and a phonological MP are involved (as already noted – using different terminology – in Paul 1908, 196ff.). Thus a markedness reduction relative to a particular phonological parameter (the parameter of phonological substance of unstressed syllables; cf. Wurzel 1994a, 53f.) typically causes an increase in markedness in regard to morpho-semantic transparency, as demonstrated in German when verbforms such as (*wir*) *geb-en* [ge:bən] and (*wir*) *leg-en* [le:gən] are reduced to the monosyllables [ge:m] and [le:ŋ]. In these forms, the base morpheme as carrier of the lexical meaning is fused with the inflectional morpheme as the carrier of the grammatical categories, with the result that the forms are no longer (morphologically) analyzable. Contradictions of this kind also exist within morphology itself. For example, in certain complex words such as compound nouns, the MP of morphological compactness contradicts the MP of morpho-semantic transparency. If in

German compounds such as *Fern-melde-amt* and *Laub-holz-säge* are replaced by *Fern-amt* and *Laub-säge*, there is a reduction in markedness by the deletion of morphemes in the words. At the same time, however, this means that morpho-semantic transparency is also reduced, as the meaning can no longer be drawn from the meaning of the constituents. Thus a *Fernamt* is not a ‘distant office’, and a *Laubsäge* is not a ‘saw for cutting foliage’. The words have lost motivation. Cases of this kind occur frequently. The contradictions between MPs mean that natural grammatical changes do not lead to a continuous reduction of markedness in the system over the course of language history.

4. Natural grammatical change in the Nordic languages

It is well known that changes in the morphological structures of individual languages can take place at different rates within a given period of time. This can be seen, for example, when comparing Old Swedish and Modern Swedish on the one hand and Old Icelandic and Modern Icelandic on the other. Natural grammatical change occurs in practically all areas of language all the time, and for this reason it is, of course, impossible to give a comprehensive “natural historical morphology” of the Nordic languages here. We will therefore concentrate on giving the most illustrative examples of how individual markedness principles and the principle of natural grammatical change have given rise to morphological changes of theoretical and/or methodological interest in the history of the Nordic languages.

4.1. Morpho-semantic transparency and uniformity

The MP of morpho-semantic transparency, which also includes uniformity, can be stated as follows:

(3) A word-form is less marked in regard to morpho-semantic transparency the more it is structured in such a way that a combination of semantic units is symbolised by a simple concatenation of corresponding morphological units.

This MP contains two sub-parameters. Firstly, it favours forms in which there is a one-to-one correspondence between semantic units and morphemes (transparency in the more restricted sense), and secondly, it favours forms

in which the morphemes remain unmodified when they are linked (uniformity).

In the development of Mainland Scandinavian languages a well-known change can be observed which is atypical for Indo-European languages, namely the replacement of the old fusional gen.pl. forms of the type Sw. *hund-a* from the nom.sg. *hund* by agglutinating forms of the type *hund-ar-s*. This is a clear case of loss of markedness in morpho-semantic transparency: while in the older form *hund-a* the morpheme *a* simultaneously stands for the categories “plural” and “genitive”, the new form *hund-ar-s* displays a separate morpheme for each of the categories, i. e. the word is fully transparent. This example clearly shows the contradiction between morpho-semantic transparency and morphological word-length (shorter words are preferred): the change has led to the word lengthening by one morpheme, which in turn leads to an increase in markedness in regard to morphological word-length.

In the history of Icelandic, a morphological change took place exclusively in the paradigms of the two words *beykir* and *mækir*; cf.

(4)		Old Icelandic	
nom.sg.	<i>beyk-er</i>	nom.pl.	<i>beyk-ar</i>
gen.sg.	<i>beyk-es</i>	gen.pl.	<i>beyk-a</i>
dat.sg.	<i>beyk-e</i>	dat.pl.	<i>beyk-um</i>
acc.sg.	<i>beyk-e</i>	acc.pl.	<i>beyk-a</i>
		Modern Icelandic	
nom.sg.	<i>beyk-ir</i>	nom.pl.	<i>beyk-jar</i>
gen.sg.	<i>beyk-is</i>	gen.pl.	<i>beyk-ja</i>
dat.sg.	<i>beyk-i</i>	dat.pl.	<i>beyk-jum</i>
acc.sg.	<i>beyk-i</i>	acc.pl.	<i>beyk-ja</i>

At first sight it would appear that these words had followed the plural inflection of the type *niður*, which displays the same “endings”. This does not explain, however, why the change only affects two nouns of an inflectional class, moreover the only ones with a stem ending in *k*. A more adequate explanation is that we are dealing here with a reduction in markedness in regard to uniformity in the paradigm. As a result of the palatalisation of velars before front vowels, there are two alternating forms of the stem before the change, /beik^j/ in the singular and /beik/ in the plural. The change does not mean that the inflectional markers are replaced by others, but in the interest of uniformity the stem is unified following the model of the singular, i. e. after the change the nom.pl. form must be analysed as /beik^j + ar/, not as /beik + jar/ (compare to /nið + jar/).

4.2. Constructional iconicity

The MP of constructional iconicity can be stated as follows:

(5) A semantically more complex, derived word form is unmarked in regard to constructional iconicity if it is formally more complex than its semantically less complex base form; it is the more marked the more its symbolisation deviates from this structuring.

As is well known, Swedish shows a progressive loss between the 14th and 17th centuries of the formal distinctions between nom.sg. and acc.sg. (and also between nom.pl. and acc.pl.). The first stage of this development sees the strong masculine forms of the type OSw. nom.sg. *hund-er* – acc.sg. *hund* losing the nominative marker *-er*. This cannot be a phonological reduction, as the change affects neither stem-internal *-er*, as in OSw. *biter*, *viter* > Mod.Sw. *bitter*, *vitter*, nor the plural marker *-er* as in OSw. *bok* – nom.pl. *bök-er*, *natt* – nom.pl. *nät-er* > Mod.Sw. *bok* – *böck-er*, *natt* – *nätt-er*. Of further significance for the analysis is that the change starts well before the later general neutralization of the formal difference between nominative and accusative, while for example the differing forms of the weak nouns are retained until the 16th century; cf. nom.sg. *låg-e* – acc.sg. *låg-a* and nom.sg. *gat-a* – acc.sg. *gat-o* (Wessén 1969, 137ff.; 185ff.). We are dealing here with the very first morphological neutralization in the Swedish nominal paradigms. How, then, could the early appearance of this neutralization within an otherwise intact four-case system be explained? The accusative is semantically more complex than the nominative; according to the MP of constructional iconicity, it should be symbolized in more complex form than the nominative. This does not, however, square with the facts. In most of the noun declensions, OSw. acc.sg. and nom.sg. are formally equally complex; cf. alongside the weak nouns the strong feminines such as *graf* – *graf* and all neuters such as *skip* – *skip*. Thus we have a non-iconic symbolisation of the acc.sg. These acc.sg. forms are thus weakly marked. The acc.sg. forms of strong masculine nouns such as *hund*, on the other hand, are formally less complex than the nom.sg. forms such as *hund-er*. They display a counter-iconic symbolization and are thus strongly marked. Strongly marked phenomena are more likely to be changed than more weakly marked ones. Assuming that social conditions are favour-

able, one should expect a change from nom.sg. *hund-er* – acc.sg. *hund* to *hund – hund*, which in fact happened later. The change results in accusative forms which are only weakly marked, i.e. markedness in regard to constructional iconicity is reduced. It is worth noting that in Icelandic, which is more conservative, the same grammatical conditions did not give rise to an equivalent change; cf. Mod.Icel. nom.sg. *hund-ur* – acc.sg. *hund*.

In the development from Proto-Nordic to Old Icelandic, the opposite formal change took place, namely the introduction of an *-r* as an instance of constructional iconicity. In the case of the weak masculines such as *hag-e*, “sound laws” would have led one to expect the nom.pl. form **hag-a* (< Proto-Nordic **hag-an*), just as one would have expected to find the nom.pl. form **sqg-o* (< Proto-Nordic **sag-ōn*) in weak feminines of the type *sag-a*. The actual forms however, are *hag-ar* and *sqg-or*. *Hag-ar* could be explained as moving to the nom.pl. inflection of the strong *a*-masculines (cf. nom.sg. *arm-ur* – nom.pl. *arm-ar*). This explanation could not apply to *sqg-or*, though, as there was no nom.pl. marker *-or* in the system. What both cases have in common is that an inflectional marker consisting of only one segment (historically “worn out”) is replaced by a marker with two segments, and is thus formally strengthened. Instead of nom.sg. *hag-e* – nom.pl. *hag-a* and nom.sg. *sag-a* – nom.pl. *sqg-o*, we have *hag-e* – *hag-ar* and *sag-a* – *sqg-or*. A non-iconic and thus marked plural form is transformed into an iconic and thus unmarked plural form. Interestingly, in the case of *saga* a new marker is formed. It is not uninteresting that this new marker *-or* contains an *-r*, just like all other nom.pl. markers, i.e. *-ar*, *-er* and *-r*. All Old Icelandic nom.pl. markers then display a common phonological feature (cf. Jakobson’s example of the Polish instrumental inflections in 2), demonstrating a case of sound symbolism, with its attendant semiotic advantage.

4.3. Uniform word inflection

Let us turn next to the MP of uniform word inflection:

(6) A (morphological) word is unmarked in regard to word inflection if it has a uniform inflection; it is marked if it does not have a uniform inflection.

This means that a compound is marked for word inflection if its elements are individually

inflected, as in G (*der*) *Hoh-e = priester (des)* *Hoh-en = priester-s*.

Even in Old Norse, the formal combination of nouns and articles led in all Nordic languages to noun forms with a postposed article in which the noun and the article were declined separately, i.e. as two words; cf. the following definite forms in OSw.:

- (7) nom.sg. *hund-r* = *in[-n]*
 gen.sg. *hund-s* = *in-s*
 nom.pl. *hund-a(r)* = *n-i(r)*
 gen.pl. *hund-a* = *n-na*

(The second *-n* in the nom.sg. is not written, however it is articulated as a long [n:]; the two *rs* in the nom.pl. form are phonologically deleted at an early stage.) The definite word forms display inflection for number and case which corresponds to that of two independent words, and are thus marked in regard to word inflection. Over time, morphological change leads to uniformity in inflection, sometimes at different times, for the various inflectional forms, even if the definite marker continues to include different forms depending on number (and gender); cf. Mod. Sw.:

- (8) nom.sg. *hund-en* nom.pl. *hund-ar-na*
 gen.sg. *hund-en-s* gen.pl. *hund-ar-na-s*

In other words, markedness as regards uniform word inflection is reduced. As is well known, this reduction in markedness did not happen in Icelandic; cf. Mod.Icel. gen.pl. *hund-a = n-na* as in OSw.

4.4. System adequacy and motivated inflectional class membership

The MPs which evaluate morphological phenomena in regard to these two parameters together constitute system-dependent markedness. Like all MPs in natural morphology, they too are universal, but they affect different systems in different ways, depending on how these are structured (Wurzel 1984, 81 ff.). The MP of system adequacy can be formulated as follows:

(9) A morphological phenomenon is the less marked in regard to system adequacy the more it corresponds to the system-defining structural properties of the respective morphological system.

The system-defining structural properties are the superordinate structural traits which characterise an inflectional system. Putting it somewhat simply, those phenomena that

structurally “do not fit the system well” are marked. System adequacy has a number of sub-parameters. One of these relates to the sameness or difference of the inflectional forms in paradigms, i.e. the occurrence of syncretism. In Old Icelandic, most feminines of the \bar{o} - and the i -declension do not have a marker in the acc.sg. and dat.sg.; cf.

(10)		\bar{o} -declension	i -declension
	nom.sg.	<i>reim</i>	<i>qxl</i>
	gen.sg.	<i>reim-ar</i>	<i>axl-ar</i>
	dat./acc.sg.	<i>reim</i>	<i>qxl</i>

In both declensions, however, there is a subclass which forms the acc.sg. without a marker, but forms the dat.sg. with o ; cf.

(11)		\bar{o} -declension	i -declension
	nom.sg.	<i>laug</i> <i>kerling</i>	<i>qld</i>
	gen.sg.	<i>laug-ar</i> <i>kerling-ar</i>	<i>ald-ar</i>
	dat.sg.	<i>laug-o</i> <i>kerling-o</i>	<i>qld-o</i>
	acc.sg.	<i>laug</i> <i>kerling</i>	<i>qld</i>

There appear to be two conflicting changes from Old to Modern Icelandic in this area. Firstly, the inflection of the dat.sg. is deleted, cf. dat.sg. *laug* and *öld*, and secondly the inflection is transferred from the dat.sg. to the acc.sg., cf. dat./acc.sg. *kerling-u*. However, both these changes have one feature in common, namely that in the paradigm the dat.sg. and acc.sg. are given the same form. In Old Icelandic the correspondence between dat.sg. and acc.sg. in feminine nouns predominates in the system to such an extent that speakers regarded it as normal; it applies to all words of this gender with the exception of the cases mentioned and the three kinship terms *móðer*, *dóttir* and *syster*. It is therefore a system-defining structural property of Old Icelandic that feminine nouns (normally) have the same form in the dat. and acc.sg. The paradigms to which this does not apply are correspondingly marked and tend to reduce the formal difference. But why do they do it in different ways? The decisive factor here is that for Old Icelandic feminine nouns, two types of distinction are in competition, each with approximately the same number of type occurrences, namely “nom. = dat. = acc.” (nominative, accusative and dative have the same form: the larger sub-classes of the \bar{o} - and i - decl., $w\bar{o}$ -, $j\bar{o}$ - and \bar{m} -decl.) and “nom. \neq dat. = acc.” (dative and accusative are the same, but differ from the nominative: $\bar{o}n$ -, $i\bar{o}$ - and i -decl.). Thus the change is not uniform in this sense, but there are two competing strategies, the type

laug/öld (nom. = dat. = acc.) and the type *kerling* (nom. \neq dat. = acc.).

Let us turn now to the MP of motivated inflectional class membership:

(12) If in an inflectional system there is competition between two/several inflectional classes containing words with the same phonological, syntactic and/or semantic properties, a word is unmarked in regard to its class membership if it belongs to the class containing most of the words with the relevant properties; otherwise it is marked.

The inflectional class membership of words tends to rely on their independent properties, and in the majority of cases is predictable, i.e. does not need to be specially learnt. In such cases the inflectional class membership is unmarked. For example, it is well known that (in principle) all Swedish utrum nouns (syntactic property) ending in $-a$ (phonological property) belong to the or -plural class: *gat-a* – pl. *gat-or*. When historically an utrum noun developed the ending $-a$ (by intra-paradigmatic levelling), a class change occurred (with the exception of some words with ‘mixed’ paradigms like *timme-e/timme-a*, but plural only *timme-ar*, Wessén 1969, 191), cf. OSw. *logh-i* – nom.pl. *logh-a(r)* > Mod.Sw. *låg-a* – pl. *låg-or*.

It is important to note (following the formulation of the MP) that the same tendency also obtains when a word’s independent properties can qualify it for two or more inflectional classes, but one of the classes contains more words than the other(s), as in the case of Icelandic neuters ending in a consonant. In Old Icelandic the large a -declension (type *land*) was in opposition to the two much smaller classes of the wa -declension (type *hogg*) and the ja -declension (type *net*). Meanwhile, in modern spoken Icelandic, all the wa -nouns and a number of the ja -nouns have joined the a -declension.

Certain other transitions from one inflectional class to another in Nordic that seem to go the “wrong” way must also be considered here. In Proto-Germanic, feminines of the consonantal, the i - and the \bar{o} -declension were formally distinguished in their base form (the nom.sg.), cf.: **wik-z*, **leið-iz* und **man-ō*, whereas by Old Icelandic, phonological neutralization led to the disappearance of the formal differences between the three declensions. The words of all three classes all end in a consonant: *vik*, *leið* and *mōn*. Within these classes we can again observe various transitions. We

find, among others, words of the *i*-class such as *qnd* and *qlpt* and words of the *ō*-class such as *hind* moving into the consonantal declension; these changes have been carried through more or less consistently in Old Icelandic. This has happened even though the *i*- and the *ō*-class are each considerably larger than the consonantal class, and one would therefore expect that the change would go in the opposite direction. On closer inspection of the data, however, we notice that the class of consonantal feminines also contains a whole series of animal names such as *geit*, *gǫs*, *lús*, *mús* and *tík*, whereas the other classes only contain occasional animal names. The only possible interpretation of these facts is that speakers made the semantic property “animal” the criterion for inflection class assignment. Moving from the original random distribution of the words among the three classes, the consonantal class is interpreted as the preferential class for feminine animal names ending in a consonant, and words with the relevant properties are transferred into this class. Speakers determine inflectional class membership by a semantic property that was so far morphologically totally irrelevant, thus showing how strong the tendency towards motivation is in this field too.

Human language is – as Jakobson worked out based on Peirce – a semiotic system which is characterized in many areas by the non-arbitrary assignment of sign form and sign content. Natural morphology has demonstrated that grammatically initiated morphological change always leads to a reduction in arbitrariness. In this sense, such change is motivated and explicable.

31. Nordic language history and (lexical) semantics

1. Introduction
2. Traditional and structural semantics
3. Theory of semantic or lexical fields
4. Semantics of functional words
5. Semantics and lexicalization
6. Semantics and formal features
7. Cognitive semantics
8. Semantic integration of loanwords
9. Literature (a selection)

1. Introduction

In Nordic semantic research, a diachronic dimension in the true sense of the word was not introduced until the 1960s. Although for many years a specific group of Scandinavian linguists and philosophers were deeply involved in an ongoing discussion concerning semantics in the three Scandinavian languages, the perspective on semantics was strictly structural and synchronic and left no room for a diachronic or historical-genetic point of view (Diderichsen 1953, 249). The historical dimension of semantics was at that time still left to lexicographers and etymologists. It is also in the editorial circles of the large-scale, national historical dictionaries that the need for scientific tools and methods for lexical description of semantic development led to a general discussion of the issue.

Furthermore, the semantic theories of modern linguistics have mostly been explicitly designed for synchronic analysis and description. The introduction of modern theories into traditional semantics as well as the addition of a diachronic dimension to modern semantic theories are illustrated in this survey by focusing on some representative works published during the period in question. Etymological studies in general have been left out, including studies on the etymology of dialect words and names. The tendency towards a Swedish bias in the presentation is fairly well motivated by the number of diachronic studies dealing with the semantics of Swedish; the historical perspective on the semantics of the other Nordic languages does not seem to have attracted the same degree of interest among linguists.

2. Traditional and structural semantics

The first Scandinavian scholar to discuss the problems of semantic analysis in historical linguistics was Loman. In an outline of lexi-

cographic methods for semantic description, he relates the work done by etymologists to the systematic, lexicographic approach. While the etymologist basically studies the history of isolated words, he argues, the lexicographer treats the single word in relation to other words in the lexicon. The author points out that the theoretical development of semantics, including lexicography, has not kept pace with that of other branches of linguistics. He also laments the aim of lexicography, which consists of differentiating the various meanings of a word into categories in as clear-cut a way as possible, and illustrating the separate meanings by unambiguous, clear and simple examples. Semantically, it is the occurrence of a word in obscure, ambiguous and unclear cases that is the most interesting one, as such usage often indicates an ongoing change in the semantic properties of the word (Loman 1961, 362 f.). Thus the contribution of historical lexicography is in fact of limited value to the study of the semantic development of a word. Even if Loman primarily refers to the situation in Sweden, the state of the art at that time was very much the same throughout the field of Nordic linguistics.

In the guidelines for the use of *SAOB*, the shortcomings of the semantic analysis carried out by lexicographers and the lack of scientific methods in historical lexicography are emphasized again. The analysis cannot be anything but anachronistic, the authors maintain, since the lexicographer uses his own semantic competence to distinguish shades of meaning and senses of a word at earlier stages; stages which reflect the systems that agree poorly with the modern one (Ekbo/Loman 1965, 53). Careful, unbiased studies of the semantic system of early stages of a language make an important task for historical linguistics. The authors suggest that if the same structural methods used for semantic analysis in synchronic modern lexicography were applied to material from a specific historical period, the synchronic semantic system of that period could be established. Moreover, such studies could help elucidating the semantic structure in, say, a conceptual field, and the lexical and semantic changes in the corresponding word field could then be observed and described. Studies of this kind would also make a solid base for typological semantics, where semantic structures dominant at different stages in the his-

torical development of a language could be compared (Ekbo/Loman 1965, 85f.).

The first extensive survey of the mechanisms of semantic change dealing with a Nordic language was Wellander's study from 1968, where he outlines different kinds of semantic changes in Swedish. The primary aim of the study of meaning must be, he says, to pinpoint the usage of the single word or expression, from early on until today. Although based on semantic theories from the early 20th century, presented by A. Noreen and H. Paul, Wellander's contribution has been of great importance for understanding the mechanisms of semantic change. Like Loman, he criticizes the way in which the historical dictionaries present the result of their semantic analysis as it makes it difficult to identify real semantic changes and cases of semantic drift, where one meaning overlaps and eventually merges with another one. Wellander also emphasizes the distinction between different kinds of semantic relationships and processes. Semantic development proper can only be claimed to occur when one meaning of a word gradually changes and develops into another one as a result of the speakers' normal usage, and so such changes are different from the other kinds he distinguishes. These are creative changes due to metaphorical, euphemistic or other kinds of figurative usage, motivated by factors like stylistic ambitions or foreign influence. These changes are not semantic in nature, even if they result in new semantic properties of a word (Wellander 1968, 83f.).

This discussion was continued by Melin, who gives credit to studies like Wellander's mainly because of the great number of concrete cases and examples that are presented and discussed; but at the same time he criticizes this and similar studies for their eclectic, unsystematic framework (Melin 1997, 139). If the theories of the relationship between different meanings of a word were formalized, the traditional notions of semantic relationships like homography, homonymy, polysemy etc. could be better explained. He proposes a model of proximity between the original and new meaning, using a fourpoint scale inspired by the world of fashion: Small-Medium-Large-XL.

A contrastive investigation of the semantic systems of German, on the one hand, and Swedish, Danish, Norwegian and Icelandic, on the other, has been carried out by Schlesier (1997). His investigation is partly based on the semantic description in historical dictionaries.

Schlesier studies some etymologically defined lexical fields in the Nordic languages and compares their semantic structures to the corresponding fields in German one by one. The differences between the field in question as manifested in German and the other respective languages are explained in terms of the realization of the semantic processes in each language. With respect to semantic structure, the fields studied show greater similarity between the Scandinavian languages and German than between Icelandic and German. This can naturally be explained by less cultural and linguistic German influence on Icelandic than on the other languages.

Traditional semantics, sometimes combined with componential analysis, has occupied a strong position in Nordic semantics. Such works may indeed add to the knowledge of word semantics at earlier stages, even if they do not contribute to improving the semantic analysis or the theories. The semantic dimension is often difficult to separate from various cultural, social and other factors, which are also considered in the studies.

One of the first scholars to add a diachronic dimension to componential analysis was Nilsson in his dissertation (1974) on the development of terminology of science and technology in the 17th and 18th centuries. Again, Swedish is the main issue, but also the situation in Danish is briefly discussed. Nilsson has later studied the terms connected with the "perception of matter" and the terms for "surface", where he also treats the development of this field in Danish and Icelandic (Nilsson 1992).

Religious terminology has been the subject of a number of studies, often from a basically theological or literary point of view. The most extensive linguistic study was carried out by Thors (1957), when he treated the Christian terminology in Old Swedish. In Danish, Kruse-Blinkenberg has studied the field "reconciliation" in the different Bible translations. Walter and Astås have both studied the religious terminology in Old Norse. Walter's more purely linguistic work deals with Latin loans, concentrating on the fields of "sin" and "mercy" and their integration in Old Norse. Astås's studies are of a similar kind; he has in particular investigated the development of religious terminology in Old Norse compilations of Bible texts.

3. Theory of semantic or lexical fields

The general criticism directed towards the theory of semantic or lexical fields emphasizes the difficulties of delimiting the field. This is of course highly relevant to historical studies of semantic fields as well. Another basic problem is to decide whether the field is semantically or lexically defined. In spite of these problems, there have been successful attempts to shed some light on the semantic development of Swedish by approaching earlier stages of Swedish using field theory. Josefson (1976) was first to perform a strictly linguistic investigation of a lexical field on Old Swedish. She bases the study of the expressions for "size" and "length" observed in Old Swedish on the structuralist theories of lexical fields as formulated by J. Trier and formalized and systematized by E. Coseriu. Josefson's work reveals the semantic structure of the lexical field and also the semantic changes that resulted in some words falling out of use while others were maintained. Later on, the semantic structure of the lexical field "science" was described by Kukkonen (1989). The field is represented by 15 abstract nouns, whose semantic development is followed for the period 1477–1976. The theoretical perspective is both diachronic and synchronic, in order to discover changes in the field as well as to reveal the mutual relationship between the nouns at some specific points in time. The theoretical framework is the traditional theory of semantic fields as formulated by J. Trier and W. Porzig, combined with the model for analysis of semantic components and predication presented by G. Leech. Cultural and historical factors are also concerned in discovering how the field reflects the concept of science as a cultural phenomenon.

4. Semantics of functional words

Wellander calls attention to the lack of interest in the semantics of word classes other than nouns, adjectives and verbs (Wellander 1968, 104f.). It is not until the late 1980s that the first studies dealing with the semantic development of functional words were presented. The semantics of such words is always tied up with their grammatical, particularly syntactic, functions. The integration of grammatical and syntactic theories with diachronic semantics has indeed turned out to be very fruitful to historical linguistics in general. An eternal problem that must always be kept in mind,

however, is the role of etymology. If the meaning, the form and the function of a word all change, to what extent can it still be regarded as the same word?

Haskå has carried out a minor study concerning the relationship between semantics, syntax and various grammatical factors in the standardization of causal connectives in Old Swedish, basing her study on the theories of E. Traugott. She distinguishes different kinds of processes which led up to standardization, viz. reduction and differentiation. She also shows how the processes of grammaticalization and lexicalization exert some influence on the semantic properties of the causal connectives (Haskå 1988, 86f.).

The semantic development of connective adverbs have been investigated by Lehti-Eklund (1990). In her dissertation she applies the theory of prototypes as presented by T. Givón and historical lexical semantics of the Lakoff and Brugman type, and she also introduces pragmatics into the historical semantics of Swedish by applying the theory of pragmatic inference (H. P. Grice, S. C. Levinson) to seven connective adverbs. Her material consists of private letters from the period 1600–1900. The adverbs are studied with respect to their semantic, functional and syntactic development, with emphasis on semantic and functional changes. Special attention is paid to the study of the causes and mechanisms of semantic change. Two characteristics are stressed. First, a semantic change is caused by features that are typical of human communication; second, naturalness is important in semantic change. Lehti-Eklund shows that the meaning of an adverb changes along an implicational scale, from propositional via textual to pragmatic or, in some cases, metatextual meaning. The study also reveals how a semantic change of this kind is mainly triggered by pragmatic inferences and that the semantic change of the adverbs is closely linked with a change of function and category. While changing their meaning, the adverbs develop into connectives and further into pragmatic or metatextual markers; they also become more grammaticalized during this process. Lehti-Eklund has argued in a later study that the adverbs generally seem to change their meaning first, and that subsequently this change leads to further structural changes (Lehti-Eklund 1991, 130f.). However, the process of both the syntactic and the semantic change is complicated, and the original meaning of the adverb is one factor that can influence both the semantic and the

syntactic development of the word, even long after it has faded away.

5. Semantics and lexicalization

A rather new subfield of historical semantics is the study of the semantic development of compounds. From consisting of two distinct parts, morphologically as well as semantically, such words develop into a lexical unit with a non-compositional meaning. This is a process of lexicalization. In the Nordic area there are two scholars in particular who have tackled the issue of lexicalization with empirical material, viz. Bakken and Rogström.

In her doctoral thesis, Bakken (1998) studies the lexicalization process of some Old Norwegian compounds. Bakken has two aims: to formulate a hypothesis about the process of lexicalization and to apply this hypothesis to Old Norwegian noun + noun compounds. Her latter aim is also twofold in itself: to test the lexicalization hypothesis empirically, and to investigate whether this theoretical approach can help to shed new light on the Old Norwegian material.

Bakken's theory of meaning is based on the semantic theory of cognitive grammar as presented by R. W. Langacker and J. Bybee. Her model of the lexicalization process is based on semantic criteria (following L. Bauer, L. Lipka and U. Grimm) and on morphological arguments (in the spirit of M. Aronoff and S. Anderson). Bakken constructs a lexicalization scale consisting of three chronological phases. In the first phase, the conventionalization phase, a connection between the content and the form of the compound is created. The second phase implies that the compositional meaning of the compound merges into an integrated, non-compositional meaning. In the third phase the meaning of the compound becomes equivalent to the meaning of a simplex word, and the morphological structure of the compound is not semantically relevant to the speaker any more. The scale of lexicalization can also be used as a descriptive device in synchronic analysis. Any compound can be defined, at any moment, with respect to its degree of lexicalization. Bakken presumes that orthographic, morphological and prosodic changes that some compounds undergo are secondary to the semantic change due to the lexicalization process. Her basic claim is that the degree of lexicalization co-varies with an orthographic criterion, viz. the occurrence or

non-occurrence of a space between the components of the compound.

The degree of lexicalization of some words in 18th century Swedish has been discussed by Rogström (1998). She has used the same orthographic criterion as Bakken and her findings agree well with Bakken's results.

The model developed by Bakken certainly has some advantages over other methods of investigating the semantic dimensions of the lexicalization process in so far as it is based on strictly linguistic criteria. The problem of anachronism in historical semantics, however, is quite obvious in this study: how can speakers of today know exactly what a particular word meant centuries ago? Bakken's work is of great methodological and theoretical value, although the full relevance of her theory of lexicalization and her lexicalization scale is still to be proved, as it has not yet been tested on modern material.

6. Semantics and formal features

The relationship between the semantic and formal features of a word is certainly an intricate one. The introduction of theories of functional grammar and pragmatics into diachronic semantics has indeed meant a revitalization of the discipline, as it is now possible to study the interplay of semantic and other factors involved in the change of meaning. The investigations discussed above have revealed how semantic development can cause changes in the syntactic or other formal features of a word (Lehti-Eklund, Bakken) or be caused by formal changes (Haskå).

One case that has been studied in detail by several authors is the modification of the oblique subject construction in the Scandinavian languages, which entails a change in the semantic roles attached to the Old Nordic verbs of experience. Due to a number of syntactic and morphological factors, the meaning of the verbs in question changes from 'cause a feeling' to 'experience a feeling'. Accordingly, the semantic role played by the subject has changed from patient to agent (Sundman 1985; Falk 1995, 2000).

7. Cognitive semantics

One of the latest theories, and perhaps the one most important for historical semantics, is cognitive semantic theory. In Scandinavia it has been used by Lehti-Eklund, as already mentioned in 4, and also by Ruus and Ekberg.

G. Lakoff's theories about the human body, its conditions and constitution as being the basis of all cognition and understanding were presented by Ruus in 1990. Later she applied these theories to Danish material from the 16th century. She also discusses the general problems of diachronic traditional and structural semantics in relation to cognitive semantics: "Med den kognitive semantik [...] har vi fået en teoridannelse, som gennemhuller den ofte gentagede påstand, at al betydning er vilkårlig" (Ruus 1995, 85). Analysis on anachronistic ground is no longer the problem it was before, the argument goes.

Cognitive theories have been applied in a more formal way to Old Swedish and Middle Swedish by Ekberg. She has demonstrated how the meaning of the preposition and adverb *innan*, which in Old Swedish and Middle Swedish carried spatial, temporal and other more abstract senses, developed into a merely temporal meaning, 'before'. The author argues that the 'before' sense emerged from the temporal 'within' sense, and the semantic change is taken to be in line with the asymmetry principle formulated by E. Traugott (Ekberg 1993, 56 ff.). The cognitive reason for the development of the 'before' sense is assumed to be a universal, mental tendency to interpret simultaneous events as asymmetric or linear in time.

8. Semantic integration of loanwords

The semantic integration of borrowings has attracted a great deal of interest, which can be seen in a number of articles on "new words" in the yearbook *Språk i Norden*. Two extensive studies on the subject can be mentioned, viz. Clausén's dissertation from 1978 on loans in Faeroese and Chrystal's dissertation from 1988. Even though Chrystal's thorough investigation of the mechanisms of semantic and stylistic integration of English loans into Swedish is based on modern material, it indirectly illustrates the historical process as well.

In a more historical perspective, the effects of intense contact between the Nordic languages and Low German in the Middle Ages has been the subject of several projects in the Nordic countries and Germany. Research on this subject has recently been reported in the first volume published by the Nordic council of ministers (Jahr ed. 1998). Low German loans in Danish dialects have been discussed by Arboe Andersen (1995), the Low German influence in Old Swedish material was the sub-

ject of a dissertation by Moberg (1989), and Brodin has studied Low German loans in Swedish dialects (1999).

The influence of different languages on Swedish vocabulary from the Middle Ages till today has been investigated by Edlund/Hene (1992). Reasons for borrowing are discussed, and special attention is paid to the introduction and diffusion of loanwords. Different lexical strategies are analyzed as well as the adaptation of the loanwords. The authors point out a number of different tasks for further research in the field.

Edlund has also studied the growing influence of French on the Swedish lexicon during the 17th and 18th centuries, when a number of French military terms and words connected with the bourgeois lifestyle were introduced into Swedish. During this period, French had a strong position at court and in bourgeois circles, where many people were bilingual in French and Swedish. Even if a great number of the loans were assimilated into Swedish, it is a matter of dispute how influential French was on everyday Swedish, including the dialects. Edlund points out that even if this field has attracted some attention, more research is still needed. His appeal has, to some degree, been answered by Hallén. She has studied the distribution of some French loans into Swedish dialects. An interesting result is that many of these words seem to have gained a negative meaning, and some of them have lost their originally positive sense. Also Ernby has illustrated what has happened to the meaning of three old Frankish loans once they were integrated in the Swedish lexicon (Ernby 1988). Her study is based on Stern's important but all too often rather neglected writings on semantic change (especially Stern 1931). Ernby concludes by raising a number of questions about which factors might affect the semantic integration of a loanword, such as word-class membership, formal restrictions, emotive elements, communicative factors like misunderstanding, as well as cultural and social conditions. The answers to most of these questions are still to be found.

32. Nordic language history and computer-aided lexical research

1. General
2. The Swedish example
3. Other Nordic examples
4. Impact
5. Literature (a selection)

1. General

In my vision of an obliging world there is, for a language in focus, a linguistic database of great power. Consider a situation where you have an entity consisting of a lexical and a grammatical database, linked together and covering historical and contemporary, qualitative and quantitative, descriptive and normative aspects of the language concerned, both branches supported by a connected textual database containing well-designed corpora, important among other things to compensate for inevitable gaps in files of excerpts (Allén 1980). Such an entity would be not only a rich reference work but also, in its own right, a productive field of research into the language in question, not least for lexical investigations.

2. The Swedish example

On the basis of work in natural-language processing since the early sixties, I developed the vision just sketched during the seventies. In 1983, it was presented in a paper introducing a strategy for natural-language processing, where I called it the “Swedish linguistic database”. Focusing on this example provides a natural point of departure here.

The main components so far are the following. The historical lexical part is largely covered by the OSA / RSVP, the database version of *Svenska Akademiens ordbok* (SAOB). Drawing on experiments from 1980, this project started in 1982, before the launching of the New OED project. By scanning, the text of the 28 volumes published at that time was stored, tentatively checked, and structured according to various types of information. Today 32 volumes (A-S) have appeared. We now receive the text in electronic form from the publisher. The database is available on the Internet. It is widely used by the editorial group working on the next few volumes, as well as by professionals and interested people in many countries. Presently, it is accessed several thousand times every day.

Another database, originally called “Lexikalisk databas” (LDB) and now often GLDB, has a different set-up. It was created from scratch; it is not a printed dictionary gone electronic. Developed since 1976, the database is a description of the contemporary Sw. lexical system on the basis of the lemma-lexeme model (Allén 1981), defining the entries and characterizing them from several points of view: paradigmatic, syntagmatic, historical, etc. This is the database from which *Svensk ordbok* (SOB) was published in 1985 (third edition 1999), followed by the three volumes of *Nationalencyklopedins ordbok* (NEO) in 1995–1996.

The first fascicle of the SAOB was published in 1893, implying that there are significant gaps in its coverage of the 20th century; the section T-Ö has not yet appeared, and there are no instances older than 1521 quoted in the dictionary. The LDB, on the other hand, covers the contemporary vocabulary, the whole alphabet, and the year of the oldest known instance recorded in each case on Swedish soil (including runic inscriptions). The oldest occurrence, incidentally, is *ek* ‘I’ from about 200 A. D. Thus, the two databases mentioned are in a fruitful kind of complementary distribution. This, in turn, has been acknowledged by the Swedish Academy, which has decided to take the responsibility for the updating of the LDB.

Of course there are problems when a database grounded in the vocabulary system of today, captured by means of the lemma-lexeme model, is to be connected to one mainly based on an etymological type of entry. As an example, consider the words *fred* and *frid*. Since the 18th century, roughly speaking, they have been two distinct words in Sw., meaning ‘freedom from war’ and ‘tranquillity’, respectively. Etymologically, they are two forms of the same word and thus are kept together under the entry *fred* in the SAOB. The same thing applies to, e. g., *grädde* ‘cream’ and *grädda* ‘crème de la crème’, both accounted for under the single entry *grädde* in the SAOB.

Furthermore, in addition to entries based on unknown etymologies, there are cases where the etymological principle has been superseded altogether. For instance, today’s lemma *slag*, meaning ‘the act of beating’ and ‘sort’, has been split up into two entries in the

SAOB in spite of their etymological identity. Problems like these can be solved, but they require a fair amount of streamlining, facilitating access to the OSA from our present-day viewpoint. Other deviations from the etymological line are more easily handled. Among these we find *mossa* 'moss' and *mosse* 'bog', which are kept apart notwithstanding their original identity as inflectional forms of the same word, and the somewhat more sophisticated pair *skipa* 'to administer' and *ekiperä* 'to fit out', which are also kept apart.

The normative lexical aspect of contemporary Sw. is presented in *Svenska Akademiens ordlista* (SAOL). It informs users of the spelling, pronunciation, and inflexion of words. The entries also provide morpheme boundaries. Since the 10th, 11th, and 12th editions (1973, 1986, and 1998, respectively) are all available in electronic form, studies in the microhistory of the glossary can be undertaken by these means.

Quantitative information is obtainable from the four parts of the *Nusvensk frekvensordbok* (NFO) (1970–1980) with respect to graphic words, lemmas, collocations, and morphemes. The corpus is a collection of complete newspaper articles, established in 1965. Additional data are implicit in other corpora that have been made available.

The set of personal proper names constitutes a special group of words. They are frequent in running texts but are also found in the files of the national records. An investigation of the names of all Sw. citizens was carried out in the seventies, and the Christian names were published in *Förnamnsboken* (1979). It describes all such names as of January 1, 1973, and covers the development of naming customs since the late 19th century. A new investigation along the same lines, based on the situation on January 1, 1995, was published later that year.

In 1999, *Svenska Akademiens grammatik* (SAG) was published. This is a description in four volumes of contemporary Sw. grammar, focusing on words, phrases, clauses, and sentences. The text of the grammar, including its index of words, will be added to the database system in accordance with the project's programme. There are plans for a more sophisticated connection later on.

Språkbanken at Göteborg University, established in 1975 through a government decision, contains a number of corpora of various kinds. Among them are newspaper articles

(several corpora), collections of novels, editions of Strindberg, Almqvist, and Bellman, popular science, parliamentary debates, laws, old Sw. texts, etc. These corpora can be used in their own right or for the support they can lend to lexical or grammatical inquiries by providing further examples in relevant cases. To an increasing extent, they are being tagged with linguistic labels, which facilitates their use in many cases.

Reliable text editions make an indispensable tool in lexical and other investigations. In fact, language history is mainly based on written texts. Their quality can be greatly enhanced by computational methods. Word lists and concordances, e. g., are very helpful in editorial work. Furthermore, the publication of lexical results is certainly facilitated by computer programmes. There is also an important kind of reciprocity between dictionaries and text editions, since every instance in a text is a potential lexical specimen.

A linguistic database like the one envisioned here makes possible a variety of historical lexical investigations, short-term as well as long-term. Waiting in line are the chronological aspect of the vocabulary, the situation during specific periods, word-formation problems such as the set of suffixes designating people in various capacities, inflexional categories, semantic hierarchies, semantic change, genre characteristics, text attribution, etc. The emphasis of the investigations can be laid on analysis rather than the time-consuming compilation of material.

The results so far have been attained through co-operation between the Swedish Academy and the academic world, mainly Göteborg University, but also, as far as the grammar mentioned is concerned, the universities of Lund and Stockholm as well as the Swedish university of Turku. These joint efforts have been of great value.

Taking a wider view, and keeping the overall perspective in mind, we may note a number of groups currently involved in computer-aided projects in the domain under discussion, some of which will be touched upon here and in the next section. In Uppsala there is the register of runic words, keeping track of all instances of words (except proper names) from about 800 to about 1100. Other Uppsala projects and the Stockholm-Umeå Corpus are of special relevance to the language of today.

3. Other Nordic examples

The SWETWOL project in Helsinki is a relevant enterprise in the field of current language. The collections of words, stored mainly for normative reasons, at the language committees in all the Nordic countries should also be mentioned.

An important site is the lexical institute in Oslo (Norsk Leksikografisk Institutt), where the work on the *Norsk ordbok* is a momentous task, planned to comprise twelve volumes describing Norw. dialects and written Nynorsk. The basic material has been made available in electronic form and will, in due course, be connected to the dictionary. Among other things, mention should also be made of the register that aims at creating a complete record of Norw. words up to about 1550.

Danish contributions of great interest in this connection are *Gammeldansk Ordbog*, the supplement to the *Ordbog over det danske Sprog* (ODS), and *Den Danske Ordbog*. The nine volumes anticipated in the first case will cover the period from about 1100 to 1515. The ODS comprises words from about 1700 to about 1950. The third undertaking aims at a contemporary description and will present its result in six volumes. Another project is *Ordbog over det norrøne prosasprog* (ONP), dealing with Icel. texts from about 1150 to about 1540 and Norw. texts from about 1150 to about 1370. This is being carried out by the Arnamagnæan Commission in co-operation with the Norw. lexical institute and the corresponding institute in Reykjavik. In all, there will be twelve volumes.

Orðabók Háskólans in Reykjavik is another lively centre in the field. Its archives, containing excerpts from 1540 on, are being encoded, arranged, and made available on the Internet. In addition, Eiríkur Rögnvaldsson (1996) has reported on a project using a corpus of OIcel. texts for lexical and grammatical investigations. There is also an Icel. word bank, available on the Internet since 1997, under the auspices of the Íslensk málstöð.

A recent volume, *Føroysk orðabók*, is a generous account of recorded Far. words. This work, as well as all the other achievements referred to, has used computational methods of various kinds and many of them are available also on CD-ROM.

4. Impact

In fact, we have witnessed the emergence of a new linguistic paradigm of supreme significance to lexical enterprises: (computer) corpus linguistics. It is becoming increasingly clear that its results are having a considerable impact on views about language in general. On the basis of the collocational investigation underlying the third volume of the NFO (1975), I pointed this out in papers on phraseology in lexicology (Allén 1973, 1976), and also in the introduction to the volume mentioned (using the term *lexical blocks*). For a recent discussion see, e.g., Schönefeld (1999).

On the whole, empirically oriented work on language history cannot do without the aid of computers. Their data capacity, processing speed, and demand for explicitness provide reasons enough to utilize them.

V. Perspectives in research history IV: The contribution of Nordic dialectology

33. General history of Nordic dialectology

Preliminary remark:

When professor Kristian Ringgaard died in April 1998, he left a manuscript for art. 33 which may be considered more or less complete as to the scope of the topics, but which the author probably would have elaborated more, if he had lived.

Unfortunately it was impossible to find a dialectologist who was willing to check and eventually revise Kristian Ringgaard's manuscript, so the editors decided to publish it as the author had left it, leaving it to the chief editor and the language editor to make minor corrections. To write a general history of Scandinavian dialectology was indeed a formidable task, so it is no wonder that Ringgaard's text is not in every respect wholly satisfactory. The chief points are the following:

dialect geography is mentioned, but is far from being treated in full (e.g. Brøndum-Nielsen's *Dialekter og Dialektforskning* as a pioneering work has not been given the treatment it would have deserved), Danish structuralist dialectology is treated insufficiently, and no mention is made of the fact that there are also individual structuralists working on Swedish dialectology (Åke Hansson); Swedish traditionalism is on the whole too severely criticized, the paragraph on syntax is too short, Insular Nordic and its dialects are not mentioned, historical dialectology is missing, although it plays a great role e.g. in Norway, some factual errors (e.g. on tonality in Finland Swedish) have been corrected here.

In spite of such deficiencies, Kristian Ringgaard's article contains much useful information and testifies to the late author's great competence as a dialectologist.

As Prof. Ringgaard didn't compile a bibliography, it was the chief editor's task to do that; all subsequent errors he alone is responsible for.

9. Literature (a selection)

1. Words and the history of Nordic dialectology

The Latin language lost its dominant position in Scandinavia through the Lutheran reformation at the beginning of the 16th c. At the same time the new printing press revealed how different the spelling was in different old manuscripts. The first priority of the grammarians was therefore to create and agree upon a uniform orthography and a uniform grammar. It was slow going. The discussions lasted more than two centuries. Nobody spoke of dialects because everybody spoke a dialect. A uniform received pronunciation did not exist as yet.

During the 18th c. the picture changed slightly. Learned people fresh from the universities and capitals discovered with amazement how boorish and incomprehensible the speech of the common peasant was. At the same time an awakening antiquarian interest made people look for "rare" words, that is, curious and old words, maybe even words from the oldest times. This antiquarian collecting of archaisms was greatly furthered by influential people like Archbishop Erik Benzelius in Sweden, who encouraged theological students, and Matthias Moth, member of the King's Council in Denmark, who ordered parsons in Norway and Denmark to write down and deliver word-lists to them. A few were printed at the time in a parson's topographical description of his parish, but the greater part have had to wait two centuries for publication. Yet, as early as 1766, Johan Ihre published

Swenskt dialect lexicon containing parts of Benzelius' collection, while Christian Molbech in Denmark, although he started his work in 1811, had to wait until 1841 to publish his *Dansk Dialect-Lexikon* containing 6,500 articles.

The Romantic movement at the beginning of the 19th c. brought a radical change. Language was now what constituted a nation, and language was an expression of the nation's spirit, the people's soul. The purest expression of the national soul was found in the peasants' unadulterated speech, uncontaminated by foreign influence and foreign culture. Nearest the golden times of old were the "oldest" dialects. In Scandinavia these were the dialects that resembled the language of the Icelandic sagas the most. And even if the collecting of rare words was still predominant, grammar and vocabulary also were of interest.

Norway had been united with Denmark for centuries and thus had the same written language as Denmark. The Napoleonic wars changed the political map of Europe, and Norway became united with Sweden instead. The Norwegians did not like this and wanted independence. An integral part of independence was a Norwegian literary language. That was what Ivar Aasen wanted to create. As the eastern dialects of Norway were too similar to Danish, he preferred the western, more old-fashioned ones. In 1864 he was able to publish his *Norsk Grammatik* (as a successor to *Det norske Folkesprogs Grammatik*, 1848), which was followed in 1873 by *Norsk Ordbog* (the successor to *Ordbog over det norske Folkesprog*, 1850). As we all know, he succeeded inasmuch as Norway now has two official languages: Nynorsk and Bokmål; some people say there are really two and a half official languages, the third being Samnorsk.

Like Aasen, K.J. Lyngby walked through the country, interviewing farmers. His aim was not national in the same sense as Aasen's. He wanted to gather material for a modern dictionary giving pronunciation, declensions, conjugations etc. To that aim he construed a phonetic alphabet eminently suited for the dialects of Jutland. Nor was his historical interest identical with Aasen's. He belonged to the new school with its principle of sound laws without exceptions. He coined the expression, "If you place yourself in Old Danish, you stand as if in the hub of a wheel and are able to see all dialects as spokes radiating directly from the same point". His doctoral thesis (1863) is an expression of this view.

K.J. Lyngby died early, but his work was carried on by his good friend H.F. Feilberg who, after a busy life as a parson in different Jutlandic parishes, in his twenty years as a pensioner completed a dictionary of the dialects of Jutland (1–4, 1886–1914). It is a very comprehensive dictionary, giving pronunciation, declensions, conjugations, different meanings and even use in folklore of words from all over Jutland – an imposing achievement by a single man.

The 20th c. has seen an almost overwhelming number of such publications. Some of them are voluminous dictionaries, like Levander/Björklund (1970 ff.), *Ordbok över Sveriges dialekter* (1961 ff.), *Ordbok över Finlands svenska folkmål* (1982 ff.) and Ottsen (1961–69), while others are short word-lists. Some of them are old manuscripts found in archives, like Hagland (1980) or Søndergaard (1968), while others represent the happy culmination of a still living old man's life's work, like Espegaard (1972–74). – All these dictionaries and lists of words are of interest to the philologist, but their contents are traditional, containing nothing unexpected.

A new mode of description was devised by Peter Skautrup (1927–30), which attempted to give the whole vocabulary of a dialect not in alphabetical order, but arranged as to theme. An interesting special case is Anders and Marie Bjerrum (1974): the dialect of Fjorde (German Viöl) is now completely extinct. It existed for a century as a language island surrounded by Low German in the region of South Schleswig. Anders Bjerrum (1944) set himself the task of evaluating phonemically the phonetic notations of several former investigators in view of their own linguistic background in Jutland, Funen and Copenhagen.

Cities often develop their own peculiar vocabulary, characteristic of that community. Descriptions can be found in publications like the language of Kalmar, of Härnösand, of Göteborg etc. A beautiful publication is Pettersen (1996) on the language of Bergen.

The richness of publications is to a great extent due to the establishing of official centres for the study of dialects at the universities in Scandinavia. The oldest is that of Uppsala, from 1914, called Landsmålsarkivet (shortened to ULMA, now a department of Språk- och Folkminnesinstitutet/SOFI), followed by Copenhagen, also Lund, Göteborg, Oslo, Umeå, Bergen, Trondheim and Århus. An institute for dialectal studies seems to be a must for a university nowadays, and vast know-

ledge and large amounts of material are stored there. But as yet the professed goal of these institutions has not been achieved: the publication of all-encompassing dictionaries of all Swedish dialects, all Norwegian dialects, all dialects of the Danish islands and a new still more voluminous one of Jutlandic dialects.

But of course all these slips of paper and questionnaires and records and tapes could not rest idle. Especially in Sweden we have seen a long series of monographs and doctoral theses of different kinds: Wörter und Sachen, sometimes only one word, semantic fields, word geography. Good examples of Wörter und Sachen are for instance Manne Eriksson (1943), Lars Forner (1945), Sigurd Fries (1957; 1964). A fine example of single words is Thomas L. Markey (1969). Vidar Reinhammar, *Pronomenstudier* (1975), is really misnamed, as it is only concerned with the dialectal pronoun *hä*. Eva Kärlander (1993) investigates the dialectal words for being more or less (un)healthy. A very interesting analysis of 1008 expressions, biblical, happy, neutral, vulgar for being pregnant is found in Gunilla Byrman (1989).

Sweden's vast area of arable farmland invites studies in dialect geography. A pioneer was D.O. Zetterholm (1937; 1940–53), and perhaps the best known work in this field is Natan Lindqvist (1947). Denmark is really too small for such diversity; nevertheless, Niels Åge Nielsen, a disciple of Zetterholm's, has published quite a few minor articles. Peter Skautrup (1949) has made an extremely thorough and interesting investigation of names of cow-sheds and when and why from as far back in time as it is possible to find documents. From Norway we get the finest and most thorough studies, moreover beautifully printed with clear maps. Oskar Bandle set himself the task of discovering where in Norway the emigrants who inhabited Iceland came from. To that end he studied the terminology of domestic animals and their breeding, in Iceland and in Norway at the time of the landnám. Unfortunately no clear answer could be found (Bandle 1967).

The modern computer has now entered the world of dialect geography, which can be seen in the title of Inger Larsson's *Tätmjölk, tätgräs, surmjölk och skyr. En datorstödd ordgeografisk studie* (1988, with 28 maps). Still more ambitious is Åke Hansson's *Nordnorrländsk dialektatlas* (1995). It contains 140 computer-generated maps of different dialectal phenomena. Moreover, it introduces into

Scandinavia the new discipline of dialectometry, which is a statistical method of showing from which part of a country the immigrants came, in this case to the former uninhabited Norrland area of Sweden. The *Jysk Ordbog* from Århus makes extensive use of computer-designed maps; see Sørensen (1997).

In his article (p. 49) Sørensen also mentions his intention to publish via Internet. It is no doubt necessary. The printing of a dictionary with phonetic alphabets etc. is extremely expensive. The new electronic media will surely be cheaper. On the other hand developments in the computer world are very rapid and few elderly philologists understand much of it. So what should be done and which medium should be chosen? But the decision will have to be taken. However, dictionaries will soon face a much more serious problem. Even on the Internet an article will have to be edited by a knowledgeable person who knows phonetic alphabets, grammar, dialect – and the everyday life of common people in the days of old. During the second half of the 20th c. the fishing boats have changed to sailing factories, the farms have become cattle industries, chicken industries, swine industries. It will soon be impossible to find an editor who knows the life of the farmer or the farmer's wife first hand. It is understandable that the chief editors constantly ask for more money in order to hurry to keep up before it is too late.

2. Sounds and systems

When Rask and Grimm discovered the Germanic sound shift, they called it "change of letters". The (Scandinavian) dialectologists in the second half of the century knew, of course, that this involved sounds, not letters. But they never seem to have doubted the doctrine of sound laws and analogy. As far as I know, they never engaged in any discussions about this. They realized, however, that they needed a special alphabet for the many "new" sounds of the dialects. As mentioned before, Lyngby used an alphabet for the dialects of Jutland which was almost phonemic. Feilberg used the same alphabet with minor alterations in his dictionary, but phonemes had not yet been discovered. On the contrary, the cry was for much more precise details. So Lundell for Swedish, Storm for Norwegian and Jespersen for Danish created phonetic alphabets with more than a hundred letters plus several diacritic signs. Perhaps it was not a good idea

after all; Danish dialectologists have doubted both the faculty of the ear to hear all these and the faculty of former researchers to distinguish them.

Nevertheless those alphabets were used for several decades, and in Sweden they are still used in descriptions. The model was set by the venerable Swedish scholar Adolf Noreen (1877), and the alphabet was described by J. A. Lundell (1880). Several others followed. The best known among them are E. Wigforss (1913–1918); G. Kallstenius (1927), in Denmark: J. M. Jensen (1897–1903); Jens Lund (1932–1938). These descriptions are historical, naturally. The formula is “old short *a* before -ng becomes...”, “old short *a* before -lt becomes...”, then a list of words following the law and one or two exceptional words are mentioned.

A half-century passed before new theories and methods entered Scandinavia. You could say that the first introduction was A. Martinet’s description of Standard Danish (1937), but the Danish dialectologists took the phonology of the Prague school to their hearts. At first the descriptions were rather close to the phonetic reality, e. g. in Ella Jensen (1944; 1959). But gradually the influence of Hjelmslev asserted itself and they grew much more interpretative and at the same time much more bulky, containing interesting discussions of details; cf. e. g. Poul Andersen (1958); Inger Ejskjær (1970); Bent Jul Nielsen (1968). Norway can also boast of a fair number of phonemic studies, e. g. To mention some of them: E. Hovdhaugen (1967) and E. Papazian (1971). A more recent example is A. Dalen (1985); the author not only uses the Prague school’s method, but also Hjelmslev’s glossematics and Chomsky/Halle’s generative theories. Generative grammar is also found in a few Norwegian and Danish articles: Einar Haugen (1975) and K. Ringgaard (1974; 1975). The Swedes, however, have kept to their own tradition and shunned new-fangled ideas.

3. Syllabicity

It is believed that Old Scandinavian like Old Norse had three different syllable-lengths: short, long and over-long. This situation changed early in its history and changes continued, creating new borderlines between dialects. Overlength was shortened to length everywhere. In Sweden and Norway short syllables were lengthened. Monosyllabic

words lengthened the vowel in southern Sweden but the consonant in northern Sweden; cf. Sven Söderström (1972). Dissyllables at first had another development in northern Scandinavia. After a short stem syllable the vowel of the second syllable was strengthened and then influenced the vowel of the stem; in short: there was vowel balance, e. g. *vika* > *vöka*, *viku* > *vuku*. After a long stem syllable the ending was weakened, leading to so-called *e*-dialects. The ultimate result of the lenition was apocope, which seems to have taken place rather late in some Swedish and Norwegian dialects. More widespread is the Swedish apocope of the vowel in the first word of a compound, which is found north of the Swedish lakes and in Standard Swedish. In Denmark short syllables still exist everywhere in monosyllables, but very early on, dissyllables were lengthened and the ending weakened to schwa. In Jutland apocope began as early as the 13th c.

These phenomena are faithfully recorded in most monographs, but it is difficult to get a clear picture as the phonetic changes seem to have taken place long ago and interchanges between dialects never have been recorded. Early treatment of the problems is found in E. Jessen (1875); L. Levander (1920); H. Geijer (1921); E. W. Selmer (1930). K. Ringgaard (1963) argues that a long syllable is a prerequisite for lenition and apocope and that consequently the often-used term “compensatory lengthening” is a misnomer.

4. Tonemicity

The Scandinavian languages are blessed with a phenomenon that is unique in Europe. They have tonemes, two different ones that discriminate between words.

First a warning note on terminology which may be rather confusing. The two tonemes are termed *akut accent* and *grav accent* in Sweden, often shortened to *akut* and *grav*; the two sets of terms may be used interchangeably in the same article. Note that accent does not mean stress, but tone. In Norway the term *accent* may also be used, but the most common expressions are *tonelag 1* and *tonelag 2*. In Denmark the term is *tonal accent* or *musical accent*, which again most often means accent 2, as accent 1 seems to be of little interest. When dissyllabic words are apocopated, the tone is concentrated to one syllable. Such a pronunciation is in Sweden and Norway called *circumflex*. In Denmark a very large

part of the vocabulary consists of apocopated words. Nevertheless the term *circumflex* is not used, instead the term *accent* is kept. Some Danish dialectologists use the term *accent 2* for all reflexes of apocopated dissyllables when these words have not merged completely with monosyllables, thus adding to the confusion. In this article the terms for the whole of Scandinavia will be *tone 1* and *tone 2* or *toneme 1* and *toneme 2*, the intention being to use a uniform terminology, not to add further to the confusion.

Tonemes are used only in a small area of Denmark. The greater part of Denmark and Standard Danish use another distinction: *stød* vs. *non-stød*. As the distribution of the *stød* corresponds to the distribution of toneme 1, it is considered to be the same, although in another realization. The tonemes are heard in the greatest part of Scandinavia. Non-tonal languages and dialects are Icelandic, Faroese, northernmost Norwegian, Finland-Swedish, Danish (which as mentioned has the *stød*) and very curiously a circle round the city of Bergen. In non-tonal regions, tonemes are nevertheless found in some southern parishes of Finland (Western Nyland) and some discrete parts of Denmark (Rømø, Sundeved, Als, Ærø). Such a dialectal map might be interpreted as showing a spread from a central-Scandinavian region, but in that case it would be difficult to explain the tonal dialect in southern Jutland and southern Finland. Or it might be explained as a common feature, disappearing at the outskirts and only leaving some tonal islands.

Presumably on account of their uniqueness the *stød* and the tonemes have attracted a great deal of interest. Dialectologists, linguists, language historians and phoneticians have investigated, discussed, and disagreed about them for more than a century. Scandinavians and non-Scandinavians have taken part in the discussion. Some linguists are of the opinion that the Indo-European mother-language had tonemes. If so, the tonal contours must have changed considerably as a consequence of the Germanic shift of stress to the first syllable and the following syncope and apocope of vowels. It does seem probable, however, that Old Scandinavian was tonal in the sense that words of one syllable were pronounced with one tonal contour and words with more than one syllable with another tonal contour. These tones were not discriminating tonemes but so-called *begleit*-phenomena, which might explain why they

were not noted by the very sharpwitted grammarian who wrote the Old Icelandic *First Grammatical Treatise*. In the early Middle Ages different developments changed the picture. Insertion of schwa in clusters and enclitic article created dissyllables with tone 1. Vowel lenition added to the number of minimal pairs until the modern situation was established.

Unfortunately it has proved impossible to find early references to *stød* or accents. What some people have taken as a description of Danish *stød* are surely only disparaging remarks about the Danes' horrible pronunciation. First to mention the *stød* was Jens Høysgaard. He was born in or near Århus in Jutland and studied some time at the University of Copenhagen. He never passed his examinations, but was content to live a simple life as janitor at the university. He was well-read in the European linguistic literature of his time and was an intelligent and sharp observer of the spoken language. In two of his published books, *Anden Prøve af Dansk Orthographie* (1743), and *Accentuered og Raisonnered Grammatica* (1747), he describes the articulation of the *stød* in clear terms and gives it the name that it still bears. Moreover, he shows its distribution in the vocabulary through a series of accents – acute, grave, circumflex – just as today. He even mentions dialectal differences between the spoken language of Århus and Copenhagen. It was a long time before he had followers, but then this happened at the same time in all three Scandinavian countries. In 1874 Johan Storm delivered a lecture in Christiania: *Om Tonefaldet (Tonelaget) i de skandinaviske Sprog*; in 1876 Svend Grundtvig lectured on *Det danske sprogs tonelag*; in 1878 Axel Kock published *Språkhistoriska undersökningar om svensk accent*. The three of them were in perfect agreement. The distribution of tone 1 and tone 2 proved that tone 1 belonged in monosyllables and former monosyllables. Tone 1 in loanwords, especially in loanwords with Low German prefixes like *be-*, *er-*, *for-*, showed that tone 1 was more European than tone 2. The distribution of *stød/non-stød* showed a connection: the *stød* in Low German loanwords showed that Danish was spoken with tone 1 at the time of the great influx of Low German words. A welcome confirmation of this theory came in 1897 when Nikolaj Andersen's *Den musikalske accent i østslesvigsk* was published, which showed that dialects with tonemes still exist in Denmark and the distribution is as expected.

Since then our knowledge of the dialects has widened considerably. Nearly all monographs mention or demonstrate tonemes or *stød*. The dialectal differences as to distribution rules are greater than at first assumed, but by and large they are the same everywhere. A complication arose from the so-called West Jutlandic *stød*. In contradistinction to the common Danish *stød*, it is found in short vowels, not long ones, and, most peculiarly, in dissyllables and apocoped dissyllables, not in monosyllables. It existed in the dialects side by side with the common *stød*. Most Danish scholars were of the opinion that it was really the same as the common *stød*. Others equated it with the Icelandic pre-aspiration of stops, in spite of its being a closure, not an opening of the vocal chords. In Ringgaard (1960) it is argued that it has no connection with *stød* or tonemes whatsoever, but is a case of pre-glottalized stops in medial position.

Distribution of tonemes in the vocabulary is one thing; another is the manifestation of tonemes in speech. You do not have to have listened to many Scandinavians to realize how different the realizations can be. Now the phoneticians took over. Ernst A. Meyer, a German working in Sweden, was first. His only instruments were the laborious cymograph and a tone-measuring apparatus he constructed himself. In the course of his entire life's work he found the tone-curves for almost all Swedish dialects and a few from Norway and Denmark as well. The results are published in Meyer (1938; 1954). Since then, with better equipment, the work has been carried on by e.g. Knut Fintoft in Norway, Eva Gårding in Sweden and Eli Fischer-Jørgensen in Denmark. Everywhere the tone-curve of toneme 1 has only one peak. Toneme 2 normally has two tone peaks, but in some dialects we find only one peak. In these dialects the difference between the tonemes is that the peak of toneme 1 is at the beginning of the syllable, of toneme 2 towards the end. If the peak of toneme 1 and the highest peak of toneme 2 are found at the beginning, there is the auditory impression of a falling tone. Such is the case especially in West Norwegian. If on the other hand they are late, the impression is of a rising tone. That is the case in West Swedish and especially in East Norwegian. The difference is then considerable, so much so that toneme 2 of one dialect is just like toneme 1 of another. One can then speculate about whether the speakers are able to understand each other. But they are. Knut Fintoft let some

schoolchildren listen to isolated words from other dialects, and in most cases they identified the words correctly!

As mentioned before, the language historians of former generations did not doubt that the Danish *stød* had developed from tone 1. The question was how. Karl Verner was sure that the Danes had had rising intonation like the Norwegians from Oslo, that the tension had grown too much so that the vocal chords had snapped and closed. This is hard to believe when you listen to the Danes of today, nor have the eager Danish phoneticians found any vestiges of rising tones in connection with the *stød*. The historical problem was taken up again by Anatoly Liberman in his extremely erudite and impressive work *Germanic accentology 1: The Scandinavian languages* (1982). He overturns all former beliefs and thus invites discussion. Originally, he postulates, the Scandinavian languages were all mora-counting. The *stød* is a superb means of dividing a syllable into morae. Consequently all long voiced syllables were pronounced with *stød* irrespective of the number of syllables. Later on, morae lost their significance and syllables took over as a means of counting. Still later, free apocope caused doubt as to the number of syllables in a given word. To counteract this confusing situation tone 2 arose in dissyllables. In these words *stød* then became superfluous, which is why it disappeared. Now the opposition was a very curious and unstable one, namely *stød* \neq tone 2. As a logic consequence tone 1 was created and inserted in monosyllables except in Denmark. New eyes often see better than old ones. Liberman has read everything on Scandinavian dialectology, but nevertheless his theories seem inventions of the brain with no basis in reality. For one thing, apocope in Sweden and Norway came late, in the 18th c. or later, in remote regions far away from capitals or big towns, inhabited by late immigrants and Lappish-speaking nomads. It seems improbable that its influence should have spread so rapidly, at most in the course of a few centuries, to the whole of the Scandinavian peninsula. In Jutland apocope is very old, from the 13th c. Today only a small part of Jutland has tonemic language. The region has been much larger, but even so the *stød* has won the day and extended its territory. A confusing aspect of Liberman's work is that his use of the word *stød* shifts. At the beginning it means the Danish *stød*, a con-striction of the vocal chords. At the end it means the one part of an opposition, irrespective of pronunciation.

5. Morphology

There do not seem to be any deep-rooted dialectal differences in morphology, and consequently few overall treatments exist. Most of the monographs, the “form- och ljudlära” of a dialect, have extensive chapters on morphology, but they are enumerations of words of this or that declension or conjugation. Old Nordic grammar has changed in basically the same way everywhere.

Although the standard languages have only two genders, most dialects have retained three, but they only show up in the use of pronouns of reference. Case has almost disappeared. The dative is used more or less frequently and mostly in petrified expressions; see Maj Reinhammar (1973). The genitive is supplanted by prepositions nearly everywhere. It is remarkable that the vocative is stated to have been retained in two geographically opposite and far-flung outposts, Övre Kalix in Sweden and Sundeved in Denmark, but very curiously in the form of tone 2 instead of tone 1 in Kalix and tone 1 instead of tone 2 in Sundeved. In a central area of the Scandinavian peninsula the plural *-r* of an old declension has been retained, while it has disappeared to the north and to the south. Adjectives are of little interest. In Jutland they have no gender. On the island of Bornholm and in most parts of Sweden the masculine nominative ending *-er* is used, in Sweden also indiscriminately with feminines. Most work has concentrated on verbs. Among the very first to work on them was the founder of dialectal research in Denmark, K.J. Lyngby, mentioned earlier. Kjell Venås has intensively dealt with both strong and weak verbs in Norwegian. It seems that in most dialects old conjugations still exist, whereas many verbs have moved from one conjugation to another. In many dialects all over Scandinavia the ending *-r* of the present tense has been assimilated to dentals. The subjunctive is confined to oaths and pious hopes and to fossilised phrases.

It is a moot question if “definite” involves morphology or syntax. It has attracted great interest that while half of the peninsula of Jutland uses enclitic articles like all other Scandinavian-speaking areas, the western and southern parts of Jutland use a free definite article like almost all other West European languages. German politicians therefore declared, during times of antagonism in the 19th century, that Jutlandic was a German dialect. One scholar, P. K. Thorsen (1912) tried

to prove that the borderline was extremely old, as place-names showed the existence of a vast and impenetrable forest. Place-name specialists have since shown this to be incorrect. Old manuscripts seem to prove that the Jutlandic use of the article is just as old as the use of definite nouns in Scandinavia which was a gradually growing phenomenon in the early Middle Ages. But on the other hand it has been alleged that these dialects at first used enclitic forms and later on the article. And indeed some peculiar expressions can be unearthed, like *bysens*, *by-s-ens*, and *dawsens*, *dag-s-ens*, very old genitives no longer existing in the standard language. As yet however, no convincing theory has explained this exceptional Scandinavian difference.

In this connection it is worth mentioning that in West Jutland there is no gender or case, just like in English, but the common belief that Yorkshire lads and Jutland fishermen share the same language, is not true. Another peculiarity of the dialect in West Jutland is that although there is no gender, the old pronouns *den* and *det* are used to refer to countables and uncountables respectively – quite a new distinction in Scandinavian. In recent times this use of the neutral and non-neutral pronoun seems to have penetrated into Copenhagen speech and Standard Danish.

6. Syntax

It is impossible to find anything on syntactic differences, as before the tape-recorder nobody wrote down whole sentences, which indeed are not much used in everyday speech. The standard languages show interesting differences though. – Norwegian dialects have retained an old word-order: noun – possessive pronoun.

7. Maps

Maps are a very useful means to visualize dialectal areas and borderlines, in spite of some discussion as to how they should look, and what they should show.

In Scandinavia, Denmark was lucky quite early to get a very comprehensive atlas: Valdemar Bennike/Marius Kristensen (1898–1912). The authors were both teachers at Danish folk high schools where sons and daughters of farmers listened, read and studied for some months. Interviews and questionnaires enabled them to publish about a hundred maps and write 200 large, extremely

well-informed pages of comments. Most of the maps are historical, showing the reflexes of Old Danish vowels and consonants. Some are morphological and a few show the pronunciation of single words. Much later a similar work was published in Sweden, Sven Benson's *Südschwedischer Sprachatlas* 1–4 (1965–70), only not covering all of Sweden as the title indicates. Otherwise we find illustrative maps scattered everywhere where we might expect to find them, in books on dialectology and language history like J. Brøndum-Nielsen (1927); E. Wessen (1935); Peter Skautrup (1944–70, vol. 4); Einar Haugen (1976) etc. – Word-geography of course needs maps. As mentioned above, Bandle's work on domestic animals is a very beautiful example of this. Mentioned above are also the phoneticians' maps of the pronunciation of tonemes. Many monographs contain maps. The scattering has been so great that Gertrud Pettersson and Christer Platzack felt compelled to publish an *Översikt över svenska dialektkartor* (1976).

The modern world has now entered the world of dialectologists. The computer has proved to be an excellent means of making dialectal maps – easy, fast, and clear. Åke Hansson was able in a short time to publish 140 maps in his *Nordnorrländsk dialektatlas* (1995) and *Jysk Ordbog* has also published examples.

8. Conclusion

You cannot accuse the Scandinavian dialectologists of laziness. For more than two centuries they have worked diligently. At first this involved a rather vague interest in “rare” words, provincialisms, archaisms, Old Norse. In Norway it became part of the fight for independence, because linguistic independence equalled national independence. Dialectology became part of the growing interest in the people's language as well as the people's folklore. In continuation it became part of historical linguistics, only in Scandinavia it never entered into the discussion of sound laws, with or without exceptions. More and more small dictionaries of parochial dialects appeared. Centers for the collection of dialectal material came into existence, at the universities of Uppsala, Copenhagen, Oslo, and then at almost every new-founded university. The professed intention was the compiling of an all-encompassing dictionary, all Swedish, all Danish, all Norwegian dialects in one work covering pronunciation, morphology, seman-

tics, perhaps even etymology. In the meantime, publication of still more dictionaries of smaller regions, and first and foremost studies, dissertations of various kinds, continued. The collections had an impetus of their own. You could not ignore them, they lured, they seduced the scholars into their world. As time passed, it became evident that the collected material must be supplemented and analysed by competent philologists before the standard languages, through education, papers, broadcasting and television had eradicated all peasant speech and brought all peasant skills and tools into oblivion. Especially in Sweden there has been a long tradition of studies of different kinds, single words or word-groups, flowers, trees, male and female animals, illnesses, pregnancy etc.

But the dialectologists can be blamed for their isolation. Perhaps least so in Denmark. During the thirties interests changed, and since 1944 there has been a fair stream of phonemic analyses of sound-systems. In the seventies there was a sprinkling of generative articles, and now a Labovian project investigating the influence of a larger town on the speech of young rural speakers in the surrounding region is energetically under way. Norwegian dialectologists also are familiar with phonemic analyses and generative transformations but there are only a few examples of these. But in Sweden one gets the impression that the dialectologists have never even heard the name of Saussure, much less of Trubetzkoy and Chomsky. Although this is understandable in view of their splendid archives, it is nevertheless deplorable.

Another form of isolation is that: the Scandinavian dialectologists stay within national borders. Non-Scandinavian-born Scandinavists like e.g. Oskar Bandle, Einar Haugen, Otmar Werner and Anatoly Liberman insist on regarding Scandinavia as a linguistic entity; not so the Scandinavians themselves. Haugen once said that the only reason that Scandinavia has more than one literary language is that the king in Stockholm and the king in Copenhagen never quite succeeded in strangling each other. That this might well be so is underlined by the fact that one of those who were active in forming the Danish written language, Poul Helgesen, was born in Halland in 1480, and the two who were most instrumental in creating Swedish Standard were Haquin Spegel born in Blekinge in 1645 and often teased for being born a Dane, and Olof von Dalin born in Halland in 1708. I doubt that the present-

day kings have any intention of strangling each other and the dialectologists certainly have not. They don't cross the national borders. The Danes say Scanian is an East Danish dialect, and then leave it to the Swedes. The Swedes say the inhabitants of Bornholm speak a South Swedish dialect, and then leave it to the Danes. In Jämtland, Härjedalen and maybe even in Dalsland and Bohuslän they may speak Norwegian dialects, but no dialectologist has crossed the border since J. Reitan in 1930.

Luckily this situation is changing. Nowadays Scandinavians regularly meet at conferences on linguistics, phonetics and dialectology and thus get the chance to know each other and inspire each other. There is better hope for the future.

34. The contribution of Nordic dialectology to language history

1. Introduction
2. Dialect geography
3. Historical dialectology
4. Relations between dialectology and language history
5. Concluding reflections
6. Literature (a selection)

1. Introduction

Dialects as linguistic sources constitute independent entities, fully on a par with conventional written historical sources, and they can answer a number of questions which text studies cannot. Thus, dialect studies add further detail to, but also revise, the image of language

change conveyed by written sources. The importance of dialect material as a source of information was emphasised long ago by the Grimm brothers in their writings on language history (Sonderregger 1983, 1530), although the dialects were not subjected to any closer scrutiny in their studies.

Even though linguists have clearly been aware of the importance of dialects when describing language history, the evidence provided by dialects occupies a comparatively unobtrusive position in many language histories. The same may be said of many authoritative handbooks on Nordic language history, such as Seip (1955). Somewhat polemically, Haugen/Markey (1972, 79) characterise Seip's

history of the Norwegian language as “a fine example of the plenary paleographical interpretation of language history”, since Seip “was ever ready to propose that a scribal error, or a variant reading [...] reflected phonological and morphological change, and he used this approach to explain many innovations”.

By contrast, there are also good examples of the prominent part played by dialects in some important works on Nordic language history. Attempts in this direction can be found as early as in Rydqvist’s history of the Swedish language (Rydqvist 1850–1883; cf. Holm 2000a, 10f.). A work in which attention is paid to dialectal evidence in the description of language history is Skautrup’s *Det danske sprogs historie* (1–5; 1944–70). It was planned as a history of the spoken language, includes dialects and the standard language, and is a work in which the author has aimed to both describe and explain language changes. Furthermore, Skautrup’s language history “places language evolution squarely in the midst of history, geography, and social change” (Haugen/Markey 1972, 23).

Concerning the Norwegian language, Indrebø’s posthumously published work *Norsk målsoga* (1951) must be mentioned, since it deals with language history and dialectology material side by side, and stresses the continuity of Old Nordic in the dialects resulting in “Nynorsk”. The way in which Indrebø describes the language change that occurred during the Middle Norwegian period is interesting as it is primarily done through an analysis of the extensive diplomas (charters), most of which are dated and localised. He believes he can see an East Nordic language influence gradually spreading in Norwegian diplomas. Traces of Norwegian language usage can be observed, however, right up to the end of the 16th c., typically in the so-called *bondebrevene* (Indrebø 1951, 294; cf. Mæhlum 1991, 126ff.).

Kristensen’s book *Folkemål og sproghistorie* (1933) attempts to illuminate historical problems in the Nordic language history through a comparison with modern dialects, an intention which is not, however, fully realised, despite the programmatic title. The explanations in Kristensen’s monograph are, however, new and often convincing.

It is, however, primarily in Hesselman’s works, particularly his magnum opus *Huvudlinjer i nordisk språkhistoria* (1–3; 1948–1953), that the role of Nordic dialects in the description of language history is brought to the fore

in a more programmatic way. We are given a comprehensive account, backed up by an enormous amount of written and spoken language material, which includes both a penetrating analysis and a context-setting synthesis, although the focus lies on the sound system. The monograph shows, among other things, the effect of hiatus, metaphony, apocope, syncope etc. on the morphology. Hesselman has been influenced in his work by dialectologists and historical linguists such as Petrus Envall, Herman Geijer, O. F. Hultman, Marius Kristensen, Amund B. Larsen, Lars Levander, Jørgen Reitan, and P. K. Thorsen.

Of greatest theoretical interest are the methodical and theoretical stands taken by Hesselman. Among other things he maintains that the value of dialects as illustrators and sources of language history

lies in their abundance and in the great number of their variations; in the advantage of directly observing living vernacular; and in the possibility of controlling and supplementing the practically inexhaustible material. The series of dialects, ranging from the most archaic [...] to those which have undergone the greatest changes [...], correspond to and reflect [...] the changes in the texts in the same chronological order. There is a parallelism which safeguards the conclusions. The local variations – the dialect geography – convey an image in the spatial dimension of changes over time, an image which allows us to better see and understand what the changes really imply and why they occur, thanks to the rich detail and opportunities to study language change which they provide. (Hesselman 1948–53, 1; my translation.)

This applies primarily to language development in historical times, but the argument can also be applied to prehistoric development. “A theory that is able to connect [prehistoric development] to known neo-Nordic phenomena thus takes precedence over other possible hypotheses”, Hesselman stresses (1948–53, 2; my translation).

Hesselman also emphasizes the importance of place-names and their pronunciation as a source of language history:

The comparatively rich supply of older written forms of place-names can of course in many cases provide a basis for dating the changes which is not available to us elsewhere [...]. There are, however, two other circumstances that are theoretically of greater importance: (1) Because of the way in which they are used in spoken language, place-names are unusually well protected against outside influence [...]. The tradition of the spoken language in place-names is remarkably stable and

their local character is unmistakable. (2) Because of their construction, the majority of place-names, those that were originally compounds, offer a great variety of possible combinations of sounds as an arena for the phonetic laws. [...] Consequently, place-name studies are among the most important tools of historical phonetics, particularly with respect to (1) distinguishing the earlier and (relatively) indigenous, local characteristics from the more recent, (relatively) foreign, imported or influenced from outside, and (2) studying the effect of pronunciation habits in absolute and extreme cases. (Hesselman 1948–53, 3; my translation.)

Being strongly lexicalised compounds, place-names are subject to more radical phonetic changes than the appellative vocabulary in general, as in the examples *Miðhús* > *Mjos* and *Skeiðakr/Skiðakr* > *Skjåk*. Even in the appellative vocabulary, however, there are corresponding sound changes, as is indicated by such words as *fáhus* > *fjös* (with many variations of pronunciation in Swedish dialects such as *feos*, *fäks*, *fyks*, *fäjs*, *föjs*, *fjäs*, *fjus*, *fjäs*, *fös*, *fys* etc.; cf. Zetterholm 1940, 34–49, with map 1), *húsfrú* > *hustru*, and so on (cf. Bakken 1995, passim; 1997, 24).

An analysis of dialect forms sheds light on later language developments, but within Nordic language development there are also good examples of the analysis of dialect forms illustrating ancient language links as early as in Proto-Nordic times (see e.g. Holm 1977, 359ff.; L.-E. Edlund 1999, 191ff.). More speculative, however, are the attempts that have been made in Continental Germanic and earlier Nordic research to reconstruct tribal dialects and tribal areas taking a long temporal perspective (cf. Bandle 1997b, 38f.; Löffler 1974, 141–144). An example of the latter is Svend Aakjær's work from the interwar period on the Jutland area (cf. Gregersen 1993, 227ff.). Most of these reconstructions have later been rejected on very good grounds.

So far we have dealt with language history research which makes use of dialect evidence, but it is also relevant to consider dialect research that takes a historical approach. Many monographs on dialects, particularly older ones, use a historical perspective, so that we are able to follow the historically confirmed sound system – often the Old Icelandic forms – into modern dialects, or, conversely, we can trace the pronunciation of dialect back from the present day to their earlier forms. Such a historical perspective can already be found in some of the earliest works influenced by the

neogrammarians, such as Noreen's monographs on the Fårö dialect (1879) and the Dalby dialect (1879–1881). Another Swedish example is Lindgren's study (1890–1919) of the sound system of the Burträsk dialect. A Norwegian example in this area is Skulerud's studies (1922; 1938), in which the author presents the historical equivalents of contemporary speech sounds. There are also a number of minor works on Norwegian from the same school, cf. Haugen/Markey (1972, 84). More innovative is Christiansen's *Gimsøy-målet* (1933), in which the author carries out both a synchronic and a diachronic structural analysis of the dialect.

In some of these dialectological works the authors also try to date some of the sound shifts. This is primarily done relatively, by ranging them in chronological series, but attempts are sometimes also made to establish definitive dating. An independent successor in this tradition is Wigforss and his monumental work (1913–1918) on the dialects of southern Halland. In a summarising and problematising chapter entitled “Dialektgeografiska ock kronologiska frågor” [Questions on dialect geography and chronology] (594–692) the author develops his thoughts on the study of innovation in dialects, their age, extension and distribution channels. Central to his analysis are, among other things, the secondary diphthongisation of long /e/ (as in Swedish *sten*) and the lengthening of short root vowels. The purpose of this kind of study is, according to Wigforss (1913–18, 649ff.), to be able to draw a map at any point in time showing the spread of specific dialect characteristics. By so doing, we should also be able to observe the linguistic change of the dialects in relation to the political and cultural development of the area as a whole. Wigforss presents no less than an ambitious linguistic programme which, however, it has been difficult for later research to fully realise. Levander's *Dalmålet* (1925–28) is, however, a work that aspires in this direction. It presents the phonology and morphology of the Dalecarlian dialects and is also of considerable importance to studies of Nordic phonology.

2. Dialect geography

As pointed out by Hesselman (see 1.), the dialects convey an image in the spatial dimension of changes over time, an image which allows us to better understand the changes. Dialect geography focuses on the geographical dis-

tribution of different dialect forms. The approach and purpose of the studies can be many and varied: researchers can concentrate on individual word forms and apply an analytical approach to dialect geography or, by studying the geographical spread of dialect features, they can take a synthetic approach and seek to draw historical conclusions, thereby relating the geographical distribution patterns of language features to different historical and political data. Dialect geography of this latter type is more akin to cultural geography or cultural morphology (cf. Aubin/Frings/Müller 1926).

An early and important Nordic dialect geography survey is Bennike/Kristensen (1898–1912), which presents phonological, morphological, and lexical features and their distribution in Danish dialects. Lindqvist (1947) charts a number of dialect features (lexical, phonetic, morphological) in a part of south-western Sweden. Benson's work (1965–1970) resembles the German linguistic atlas: on the basis of extensive dialect records from southern Sweden he is able, for instance, to show how the variations in pronunciation over a large language area can be understood from a historical perspective, and how surveying can illuminate linguistic processes of change within a specific geographical region. In the Nordic countries, on the other hand, it is principally within the field of word geography that a large number of studies have been presented. One such work is Bandle's monograph on West Nordic terminology for domestic animals (1967a, 1967b) with its many detailed maps. Other examples are Modéer's study (1953) of Norwegian fishing terminology, Aune's work (1976) on Norwegian terms for sledge-type forestry vehicles, and Jenstad's studies (1995) of Norwegian folk music terms, violin terminology in particular. Among Swedish contributions we can note Zetterholm's studies (1937, 1940–53) of various terms for and ways of beckoning domestic animals in Scandinavian dialects, and Eriksson's work (1943) on dialect words for the top bunk in wall beds. Among Danish studies should be mentioned Jespersen (1931, 129 ff.); Widting (1931, 116 ff.); Skautrup (1949, 356 ff.); Andersen (1949, 309 ff.); and Nielsen (1956, 335 ff.), where specific semantic areas in different dialects are described.

The dialect geography survey of western Scandinavia carried out by Bandle provides important information on the Norwegian geographical background of Icelandic colonisers

(Bandle 1967a; 1973; 1994; 1996, 17 ff.; 1997b, 37; cf. Elmevik 1973, 108–115). In the same way, Jansson's (1942, 47 ff.) examination of linguistic features in the Finland-Swedish and Estonia-Swedish regions and their equivalents in Sweden provides important information on the history of settlement. Similar studies have been undertaken in northern Sweden by Holm in several works (e.g. 1997, 143 ff.) and by L.-E. Edlund in different works (e.g. 1999, 194–201), and, in northern Norway, by Christiansen (1967, 15–93).

The geographical analysis of dialect material often enables the linguists to solve different linguistic problems, since it opens the way to an analysis of major geographical regions (specifically, the Nordic region). However, researchers have not always chosen this pan-Nordic approach. In the Old Swedish text *Historia Trojana* he has studied, Fortelius (1966) has found a number of examples of *han* as an indefinite pronoun in the sense of 'one'. In order to explain this form in terms of dialect geography, Fortelius maps the *han* 'one' instances in modern dialects and in doing so he finds that this has primarily an eastern distribution in Nordic dialects (Fortelius 1966, 308 ff.). One Bohuslän example stands in complete isolation on Fortelius' map and is therefore considered doubtful. However, a Nordic mapping of the word would have shown that the form is also well represented in Norwegian dialects, thus indicating that the Bohuslän instance is not isolated and that the word *han* in the sense considered here can hardly be said to have a primarily eastern distribution (M. Reinhammar 1997, 58 f.).

A similar example can be found in Venås (1967, 19–20), where the Norwegian form *bi* (< *bliva*) is discussed without attention being paid to the similar Swedish dialect form. Had Venås looked more closely at the actual distribution of the form, the geographical circumstances would have become clearer, and this expanded material could have indicated that this sound change can be explained by the use of the word in weakly stressed positions (cf. Markey 1969, 166–167).

3. Historical dialectology

Within the research tradition known as historical dialectology, older texts are analysed from a spatial and temporal perspective. Since the middle of the 19th c., important contributions in this field have been given by German researchers. One of the Nordic pioneers was

the Norwegian scholar Marius Hægstad, whose life's work was *Vestnorske maalføre fyre 1350* (1906–1942, the latter parts published posthumously; see Rindal 1984, 167ff.). Hægstad works in a rather rigid neogrammarian tradition, and studies the testimony of the old written sources in relation to contemporary dialects, a method which is of course not without difficulties since it must be remembered that dialect boundaries have shifted since the Middle Ages. In addition, we cannot assume that the medieval documents directly reflect the spoken language. Nevertheless, Hægstad's work is of considerable importance to historical dialectology (cf. Venås 1992). The author has had many successors in Norway, including Seip's extensive linguistic works, and studies by Grøtvedt and Pettersen. Grøtvedt, for example, in a large number of studies has cast light on features of medieval documents from south-eastern Norway, thereby stressing the differences between spoken and written Norwegian of the time. Grøtvedt (1939; 1948; 1954) tests the theory that written and spoken Norwegian developed so far from each other that the written language fell into disuse, a theory which seems somewhat extreme. Grøtvedt's work on speech and writing in the diplomas (charters) from the Folden district from 1350–1450 (1–3; 1969–74) provides an important survey of language history. Pettersen (1975; 1991) deals with phonology, morphology and morpho-syntax in Western Norwegian from 1450–1550. Rindal (1981; 1989) and Hagland (1978) continue the work of charting the Old Norwegian dialects begun by Marius Hægstad. Hagland (1986) examines the scribal norms in 13th c. Norwegian, and the result is a considerable revision of earlier findings.

Historical linguists from Sweden have also made important contributions to this field. As early as in 1886, Kock sought to identify dialect features in early Old Swedish documents (Kock 1886, 489–533), and it was his results and other linguists' that were later summarised by Noreen in his historical grammar of Old Swedish (1904). Hultman (1904–1908) highlights important features of Old Swedish dialects in his linguistic study of a manuscript of the Hälsingland Law. Hultman suggests that there are different dialects in the manuscript (Cod. Ups. B 49) if the ending vowels *a*, *i* and *u* are considered. According to Hultman, this dialect mixture is chiefly attributable to the copyist: one dialect is his own, another is one he has deliberately tried to use. How-

ever, Hultman does not localise the dialects. Olson (1913, 60–64), on the other hand, suggests that different forms in a medieval manuscript can be explained in terms of more recent and earlier forms of the same dialect being used side by side.

A theoretically important contribution to this discussion is Beckman's work (1917). Beckman sees in the manuscripts the language spoken in the writer's home district, the language spoken where he works, the language of the original text, his teacher's writing habits and forms of writing in texts copied earlier. The shift over the centuries in the boundaries of different linguistic phenomena must also be taken into account. Despite the difficulties in the way of interpreting dialect features, Beckman presents specific locations for a number of Old Swedish manuscripts.

Jansson's study (1934) of *Fornsvenska legendariet* demonstrates how the language of a lost original can be reconstructed and then localised on the basis of preserved transcripts and the evidence of modern dialects. Later, Thorell in his studies of the Old Swedish paraphrase of the Pentateuch (1951, 214f.), Ronge in his Alexander studies (1957, 297; cf. Holm 1958, 212–226) and Moberg in his studies of *Konungastyrelsen* (1984) have tried to determine the provenance of different medieval manuscripts with the aid of modern dialectal evidence. In his monograph, Moberg demonstrates in particular the importance of word geography, for example when he uses the word *sodher* 'cattle', as a localisation criterion (Moberg 1984, 144–148). A recent contribution to the method of locating anonymous old texts is Holm (2000b).

Dialects have also proved important sources to Danish philologists, and considerable effort has been made to localise medieval texts on the basis of the language characteristics of modern Danish dialect, particularly in the sound system. One early example is Skautrup (1925) who describes the language in a manuscript of the Jutlandic Law (AM 286 fol.) in relation to modern Jutlandic. In this way he is able to show, for instance, that isoglosses have changed over time. Many works by Brøndum-Nielsen (e.g. 1955; 1951 passim) illustrate isogloss changes from the Middle Ages up to modern dialects. Brøndum-Nielsen's magnum opus, *Gammeldansk Grammatik*, is actually a survey of the Old Danish dialects as they occur in medieval documents.

The type of attribution that has been discussed here is complicated by a number of

factors, such as the need to take into account socially differentiated variations of spoken language alongside geographical variation in medieval Scandinavia; see for instance Brøndum-Nielsen (1928–1974, 1, 25), who discusses “Standssprog”; Seip (1934) and Loman (1993, 26f.). Seip is of the opinion that there must have been a reading pronunciation in the Middle Ages in which speakers tried to reproduce the conservative written norm. Seip’s ideas about “Et høiere talemål i mid-delalderen” [A higher form of spoken language during the Middle Ages] have since been rejected on valid grounds, since it is difficult to see that there were social, economic, or political preconditions for such consolidation and standardization of spoken language (cf. Mæhlum 1991, 127f.).

On the other hand, the writing tradition could conceal a large number of spoken language characteristics. Thus, for example, it is obvious that the verbal forms *gæra* and *gøra* have existed side by side in e.g. medieval Uppland, even though the Uppland Law manuscripts only present the form *giora* (Widmark 1996, 328f.). And, as Holm (1980, 101ff.) has shown, we also have to consider that the central Swedish dialects have preserved old diphthongs longer than the written sources would seem to indicate. These conclusions can be drawn, not least because of the fact that the colonisers of Svealand must have brought both the form *gæra* and old diphthongs with them when, as is commonly assumed, they arrived in the Swedish colonies in Finland in the Early Middle Ages.

4. Relations between dialectology and language history

4.1. Introduction

When illustrating the reciprocal relationship between dialects and language history, it can be advisable to distinguish the linguistic changes at a micro level from those at a macro level (cf. Bandle 1997b, 40). At the micro level, dialect evidence can serve as a foundation for illustrating changes at different linguistic levels, namely phonological, morphological, syntactic, and semantic levels, as well as lexical and word formation levels. An analysis of dialect material can also elucidate traditional philological problems. At the macro level, a number of issues related to sociolinguistics are raised, such as linguistic contacts, norm building, identification and prestige, the analysis of

linguistic strata, etc. At both micro and macro levels the analysis of dialect material contributes to the understanding of linguistic changes and their origin and distribution in the language community.

4.2. The micro level

4.2.1. Phonology

As stated in the introduction, one of Hesselman’s most important theoretical premises is that series of language changes can be illustrated on the basis of dialect material. Hesselman thus suggests (1902, 101–104), e.g., that the lengthening of syllables and changes in vowel quality can be studied in more detail with the help of dialect evidence. He illustrates, among other things, the development of the Finland-Swedish dialect quantitative and vowel quality changes, with the oldest features being preserved in the southern Finland-Swedish region and the most advanced changes being found in the Åland area. Hesselman also emphasises the relationship between the findings of dialectological studies and features recorded in the written language. In his early works on quantitative development in Swedish dialects, Hesselman observes that short /i, y, u, (o)/ in the Svea dialects are usually lengthened before /g, d, l, n, v, r/, while lengthening does not occur before /p, t, k, s/. It is interesting to note that the two groups of consonants are to be found in two natural phonological classes that are distinguished by the feature [\pm voice]. This description of change in terms of features means that the explanation can be related to more general phonological terms, since vowels tend to be of longer duration in a voiced than an unvoiced environment (Ralph 1983, 186).

The development of Old Nordic <þ> can also be profitably studied through dialects, in order to understand the process of this sound change. Old Nordic <þ> is preserved only in Icelandic; in all other Nordic dialects, Old Nordic <þ> has become /t/ or /d/ or, exceptionally, /h/. The pronunciation [ð] occurs as an allophone of initial /d/ in some Nordic dialects, e.g. in Älvdalen (Dalecarlia). In Swedish, Danish, and Norwegian, /d/ occurs in pronouns, some adverbs and conjunctions, while elsewhere it results in an initial /t/. Swedish dialects in Finland and Estonia have initial /t/ in pronouns as well. In Faroese the Old Nordic <þ> has in some cases resulted in /h/, namely in pronouns such as <hesin> ‘this’ from *þessi*,

and in some adverbs such as ⟨hagar⟩ ‘thither’, Old Nordic *þagat*. However, normally in Faroese, Old Nordic *þ* results in /t/, so that pronouns such as ⟨þú⟩ have yielded ⟨tú⟩, but in spoken Faroese there is also a [d]-pronunciation. Hægstad (1906–42; Section 2.2.2. Færøymaal, 84) has concentrated on this [d]-pronunciation and has described in detail its distribution in pronouns. A later study (Hagström 1970, 348 ff.) conveys an even more complex picture of the sound change than Hægstad’s. Hagström’s study shows how a phonetic change gradually rises to the phonemic level. The study “may shed light on past periods of the Nordic dialects, and help us to understand similar phonetic developments that must underlie such phonemic changes as are reflected in the written language” (Hagström 1970, 360). There is a corresponding variation between /t/ : /d/ both in contemporary Finland-Swedish and Estonia-Swedish dialects, and Middle Norwegian dialects (Indrebø 1951, 229).

Gunnar Nyström (2000, 25 ff.) has shown that the older dialects of western Älvdalen (Dalecarlia) make a clear distinction between a dental and an alveolar /n/: dental /-n/ occurs in all types of words in which it can be traced back to an Old Nordic /-nn/, and alveolar /-n/ occurs in the dialect when it originates in Old Nordic /-n/. The material on contemporary dialects gathered by Nyström illustrates language history processes from distant epochs. The sounds of the western Älvdalen dialects can also be placed in a larger, Nordic context, since it is clear that the /-nn/ in many Nordic dialects corresponds dialectally to a consonant of a different quality than the sound that can be traced back to short /-n/: in some dialects there is a distinction between, on the one hand, a palatalised /n/ and, on the other hand, an alveolar or dental /n/; in other dialects there is a distinction between /dn/ and an alveolar (and dental) /n/; and in yet other dialects, between a dental /n/ and a supradental or cacuminal /n/ (cf. Zetterholm 1939; Jansson 1944, 447 ff.; Sandøy 1993, 129 f.; 135 f.; Nyström 2000, 29 f.).

An examination of modern dialect can thus provide a relative chronology of linguistic phenomena, something already touched upon in the early dialect monographs of the neogrammarian-oriented school (cf. 1.). Thus, when Swenning (1909–10, 138–140) studies the diphthongisation of the older long /e/ in southern Swedish, he is able to show that the shortening of long /e/ before /m/ occurred be-

fore the change of long /e > æi/(/ben > bæin/), since *hem* – at least in some parts of the area – gave *hemm* and not **hæim*. However, the diphthongisation must have been completed before the lengthening of *wit* > *vet* (‘wit’) with a long /e/, otherwise the latter form would have been diphthongised to **væit* (cf. for this chronology also Wigforss 1913–18, 657–666).

Studies of monophthongisation tendencies in Nordic dialects can also throw light on historical processes. Moberg (1954, 87–129) provides the empirical background to these studies, as do Faarlund (1975, 160–189) and, in an analysis of later monophthongisation tendencies in Trøndelag, Dalen (1971, 39–51). It is interesting to note how Faarlund (1975, 174 ff.), on the basis of dialect evidence, seeks both to detail the changes in phonological terms and then to elucidate the historical processes.

Over the years, there have been several other diachronic studies, essentially based on dialect material. Moberg’s study (1944) of Nordic nasal assimilations and Widmark’s works on *u*-umlaut (particularly 1959) are sufficient examples of this. Later works can be exemplified by Riad’s study (1992) of, among other themes, vowel balance, vowel strengthening, and vowel levelling. Widmark’s study (1998) of quantitative and qualitative changes in the vowel system of Old Swedish, and Riad’s investigation (1998) of balance and harmony in Scandinavian dialects.

4.2.2. Morphology and syntax

Dialects also provide important linguistic evidence concerning morphological and syntactical development. Generally it can be asserted, for example, that a comparison between examples of the use of the dative in Old Swedish and in certain modern Swedish dialects shows that dative with verbs is more firmly established in the dialect than the Old Swedish sources generally show. The evidence provided by the Old Swedish sources has surely been influenced by foreign languages (to be specific, Danish and Middle Low German), while the spoken language has preserved more genuine patterns. Thus, when evaluating the dative forms in 16th-c. Swedish Bible translations, for instance, it is less likely that this occurrence is solely due to deliberate efforts to use archaic language (cf. Sjögren 1949, 113 ff.). Instead, the dative doubtless existed in central parts of Sweden during early modern Swedish times, which means that the case declension in older Swedish Bible translations is more

likely to have its roots in spoken language (M. Reinhammar 1973, 245–247).

On the basis of Old Swedish sources, Delsing (1991, 12ff.) has sought to show that the lexically governed genitive is replaced by the accusative with verbs and prepositions, that the genitive governed by adjectives displays a similar development, and, according to the texts he has studied, that this change took place approximately between 1250 and 1350. Delsing (1991, 12ff.), and before him Söderwall (1865) and Schwartz (1878) in their monographs, do not go into the possibility that the genitive could be succeeded by the dative. There are, however, as stressed by M. Reinhammar (1993), in Swedish and Norwegian dialects more than twenty verbs which originally governed the genitive with their object in the dative. In Old Swedish, evidence of the dative after the prepositions *till* ('to') and *mellan* ('between') is rare. In dialects which have case declension, however, *till* can be succeeded by the dative in expressions of time and when the governed word is a person. The preposition *mellan* more regularly governs the dative in the dialects. In view of this dialect evidence, there is no reason to doubt the Old Swedish evidence of the dative after what were originally genitive-governing words, and to consider them anomalies. Instead, they could reflect a living usage – a usage, what is more, that could have had an even greater geographical distribution in the Old Swedish period. Nevertheless, in standard writing, the objective accusative seems from an early date to have been more accepted than the dative. It is this norm which can be seen in Old Swedish but, as is evident, the picture can be considerably problematised, and thereby modified, with the aid of dialect evidence (M. Reinhammar 1993, 187ff.; cf. Widmark 2001, 41).

The origin of the Swedish pronoun *den här* 'this' has been discussed. One suggestion is that *den här* evolved from *thänne här* by syncope. But, on evidence of dialect geography, it must be assumed that *thänne* (*denne*) in the masc. and fem. sg. had a stem form in *-s(s)* with an ending *-n* in many Swedish dialects (Mod. Sw. dial.: *hisin*, *tässen*). The pronoun *den här* cannot be derived from this particular form. For that reason, V. Reinhammar has argued that *den här* contains Old Swedish *than* and is modelled on *den där* 'that'. The dialects in this case provide important evidence for solving this linguistic problem. See V. Reinhammar 1975, 57ff.; Hirvonen 1987, 409ff.; V. Reinhammar 1988, 72ff.

Also on the basis of dialect evidence, important observations can be made at the syntactic level. With his starting point in both Old Swedish texts and dialect evidence, Holm looks at Swedish *s*-passive (Holm 1952; cf. also Holm 1988, 31ff.). In dialect research prior to Holm, it was asserted – although alternative views were sometimes presented by individual researchers – that the *s*-passive had not to any great extent belonged to genuine spoken language, and that it developed essentially out of the reflexive form through the influence of Latin. Holm's findings make it seem likely, however, that some types of *s*-passive in Swedish dialects really are demotic and likely to be indigenous. Moreover, Holm shows that the use of the *s*-passive in Swedish dialects depends on various factors, such as the tense, the type of subject (personal, inanimate), etc. Interestingly, it can also be noted that there is considerable correspondence between the use of the *s*-passive in Old Swedish laws and its use in dialects, but it would be methodologically unsound to claim continuity over time on this basis only.

With genitive forms in dialects as a starting-point, we can examine how one grammatical feature can be replaced by another. For instance, Källskog (1992, 140ff.) notes how in the Swedish dialect of Överkalix the *s*-genitive can usually only be found in fixed expressions (*till skogs* 'to the woods') and in expressions denoting someone's farm, home, household servants, and so on. In the dialect, however, the possessive genitive and the partitive genitive are expressed through prepositional phrases, compounds, pleonastic pronouns together with proper names, etc. For similar tendencies found in the Finland-Swedish dialects of Österbotten, cf. Huldén (1997, 161–171).

4.2.3. Semantics

Dialects also shed light on the historical development of semantic relations. The fact that there is so much dialect material makes it possible to elucidate semantic conditions right down to the most detailed level and to register semantic changes with a high degree of accuracy. As will be seen (4.2.4. and 4.2.5.), studies of dialect vocabulary can thus illuminate different etymological and philological problems.

Semantic studies of dialects can be highly varied in their approach. In a monograph published in 1964, Fries describes the semantic development of one type of word formation,

namely that of an abstract verbal noun *stätt(a)* with the fundamental meaning 'the action of rising, the rising' originally a *-ti*-derivative of an ablaut grade of the verb *stiga* 'rise', that is, **stihti-*. Fries is able to show how this primary abstract noun developed different concrete meanings (e.g. 'stile'), and then demonstrates a well-differentiated semantic development in the Nordic dialects. Another example of similar semantic differentiation within a category of artefacts is Eriksson's (1943) study of dialect words for the top bunk in wall beds in Sweden and Scandinavia in general.

On the basis of words denoting terrain (hills/slopes and wetlands), Nyström (1988) and Wiklund (1992) have tried to produce a demotic categorisation by analysing material from geographically defined regions of Sweden. These studies use different methods for their semantic descriptions. Westum (1999) and A.-C. Edlund (2000) take a cognitive approach. The former monograph deals with Swedish (and other Scandinavian) dialect taxonomy of the children's illnesses known as *ris*, *skäver* and *skärva*. One of the aims of the investigation is to show how a folk conception of illness is reflected in word-formation strategies. The latter work, by A.-C. Edlund, analyses Swedish-speaking seal hunters' conceptual system for seals, a terminology that is both broad and varied. In the Swedish region studied, Botnia, there is variation in the structure of the conceptual system. In addition, there is variation between the different hunting seasons with respect to both vocabulary and structure. Popular figurative language – based on animal designations in metaphorical usage in Swedish dialects – is studied in Karlholm (2000). The animal designations studied are *björn* 'bear', *bock* 'buck', *get* 'goat', *katt* 'cat', *kråka* 'Crow', *märr* 'mare', *räv* 'fox', and *trana* 'crane'.

The role of emotive components in word formation is illustrated in several studies. Dahlstedt (1950) focuses on emotive word-formation strategies in the naming of wild berries in northern Swedish dialects. Kornhall (1968) and Ernby (1992) illustrate emotive features in word formation at a morphemic and submorphemic level in the naming of fish in southern and western Swedish dialects, while Svahn (1991) carries out a corresponding study on the words for grass and sedges in Swedish and Norwegian dialects. Jonsson's studies (1966) of the North Germanic words for 'body of water' demonstrates how linguis-

tic material in older written sources can be fruitfully analysed with the help of dialect material. Thanks to such material, the author is able to divide the words denoting 'body of water' into different semantic groups, which in turn supports the etymological discussion of the terms.

4.2.4. Etymology and word formation

The dialects often have preserved forms and/or meanings which guide the linguist in establishing the origin of a word. Dialect geography analysis (cf. 2.) is of vital importance to etymological work, especially when the researcher establishes the form that will be taken as the starting point of the derivation.

The Nordic words for 'key' (Mod. Sw. *nyckel*) are good examples of this. The word *lykil(l)*, *lyckel* and equivalents are found in Faroese and Icelandic, in the dialects of western and northern Norway, and in northern Jutland, but also in some places further east in the Nordic countries: in the Swedish dialects in Norrbotten, in Hälsingland, on Fårö, and in Estonia-Swedish dialects. Judging from medieval Swedish texts, the word *lykil(l)* also existed in the dialects of central Sweden. This dialect geography situation makes it reasonable to assume that *lykil(l)* – and not *nyckel* – is the original word and is, to all appearances, a formation from the verb *luka* 'close'. In the definite form of the word, *lyklen*, the initial consonant probably has changed through dissimilation (/l:l > n:l/), which resulted in the form *nyckel*; see Jirlow (1936, 74ff.), and cf. Brøndum-Nielsen (1931–32, 171–190).

Dialects can also cast etymological light on philological problems (cf. further examples in 4.2.5.). In Old Icelandic poetry, the noun *biqð* should be seen as a word in the neut. pl.; the common case of the word, not recorded in the text material, ought thus to have been *beð*. Owing to Snorri's use of the word as a so-called *iarðar heiti*, we can conclude that the meaning was probably 'ground, land'. Etymologists came to the conclusion early on that it was an Irish loanword in Old Icelandic, but a closer examination of the Nordic vocabulary indicates that there are equivalents to the word in Swedish Göta dialect, such as *bjäd* (neut.), *bjäde* (masc.), meaning 'embankment, bank'. Secondly, the dialect records (and some place-name forms) enable us to establish **beða-* as a Proto-Nordic word and, what is more, one

with equivalents in Baltic and Celtic languages (Moberg 1950, 38 ff.).

Similarly, Gustavson (1950, 170–174) is able to establish a link between Gotland dialects *ēs* ‘rein’ and Icelandic *æs* ‘the outer border, edge, esp. of a shoe or skin’, a word that can also be found in Faroese and Norwegian dialects. This word represents the regular development of an originally Indo-European word which remains in the Nordic languages only as a relic in the eastern and western fringe areas. This type of construction on the basis of dialect material can be made when material is available from different parts of the Nordic language area. The situation becomes more complicated when a word exists only in a small part of the Nordic language region. Bandle (1967a, 375f.) discusses an instance of a word for ‘ram’, *dorri* (masc.), which is found only in modern Icelandic. Today there are instances of the word only in western and south-western Iceland, but older written evidence indicates a somewhat larger distribution earlier in the Icelandic dialects. Etymologists have connected the appellative to the Indo-European root (**dher-*) **dhor-*, **dhṛ-* ‘cover’, to which, as far as can be established, no other Germanic words are linked, however. The limited distribution of the word *dorri* complicates the etymology, and, as Elmevik (1973, 107) has emphasised, one should perhaps try instead to connect it to more closely related Nordic dialect words.

Analysis of dialect material can reveal psycholinguistic conditions in the language which are otherwise difficult to trace in the historical language material. The power of the spoken word has meant that some dangerous things are not mentioned by their “real” names, but by noa terms, like *gullfot* (literally: ‘golden foot’) for ‘wolf’, or *tallbjörn* (literally: ‘pine bear’), *granoxe* (literally: ‘fir ox’), *trädräv* (literally: ‘tree fox’) and *granälg* (literally: ‘fir elk’) for ‘squirrel’. Words such as these are common amongst hunters and fishermen (Sahlgren 1918, 1–7; Solheim 1940, passim; Jakobsen 1957, 138–140; Hultkrantz 1992, 47–50; L.-E. Edlund 1980, 88–89; A.-C. Edlund 1992, 54 ff.). A corresponding usage can perhaps also be found with plants, such as the Faroese word *baraldur* for *eini/einir* ‘juniper’ (see Fries 1992, 93–94). Thanks to the copious examples dialect evidence makes available, the richly differentiated meanings it can demonstrate, and the possibilities of examining the contextual circumstances which it offers, such evidence can illustrate the course of language changes whose results we can see, but whose

underlying processes can otherwise be difficult to discover.

The extensive material that the dialects provide also affords the etymologist many excellent opportunities to analyse words formed according to “freer” word-formation patterns where it is not easy to establish more regular rules. The consideration of dialect material makes “unorthodox” etymologies possible for such authors as Torp in his Norwegian etymological dictionary (1919). Torp mentions “blendings”, e.g. *jopa* from *hopa* + *jaapa*; the use (often pejorative) of *j*-insertion, *bos* > *bjus*, *sabba* > *sjabba* etc.; and the presence of a “new” breaking and gradation phenomena, *pikk* > *pjakk* etc. (cf. Nes 1999, 47–48).

Later research has focused on these aspects of the word-formation system, and thus the dialect material has many times pointed the way. Nordic words that have been dealt with include those beginning with initial *j*-, e.g. *jolla*, *jolma*, *jolka*, *jollra*, *jalre*, *julre*, which are often unsupported by evidence from written texts but exhibit a large number of formations in dialects. These words are interesting not least from a semantic point of view, since they often denote sounds, but they often also contain the closely-related semantic component ‘chatter’, ‘slur one’s words’, and sometimes also semantic components denoting movement. The individual words exhibit a vowel and suffix variation which cannot always be linked to the corresponding differences in meaning. The words are often polysemic and are bearers of emotivity, and not infrequently undergo pejoration. The group is also interesting in that, through rhyme, variation and contamination, it touches other similar series of words, thereby forming entire clusters of pragmatically, semantically and formally similar words (L.-E. Edlund 1987, 136–139; Söderberg 1996, 371–372; cf. for further examples Brink 1990, 247–256). The dialect material provides extremely good access to these levels of word formation. In other words, dialect evidence makes important contributions to patterns of word formation beyond the framework of more regular word formation.

But, more generally, dialects also contribute important evidence to the illustration of patterns of word formation, their origin and development. An exposition of the dialectal material can often be important for the analysis. When Johannisson deals in his classic study (1939) with the important group in the Germanic languages of nouns and adjectives de-

rived from particle-prefixed verbs, he mainly uses diachronic evidence as his starting point. Among Johannisson's examples are derivations from a reconstructed verb **ab-etan*, which is reflected in the Old West Nordic *afát* (neut.) 'gluttony' and *afata* (fem.) 'bandit' (which also survives in some Norwegian dialects), and the Old Swedish *afata* (fem.) 'gluttony' (see Johannisson 1939, 53, 56, 258).

As Fridell (2000, 196 ff.) has shown, there is a good deal of additional illustrative material to be found in dialects, namely words such as *avåt*, *aväte* and *avät* (and other forms), which are used about blood-sucking insects and animals whose feeding damages crops, food, bait etc. (i.e. rats, larvae, wolves, seals etc.). The basic meaning seems to be 'animals that cause damage by eating'. Fridell goes one step further and also analyses the word *åt* (neut.), which is well represented in the dialects of northern Scandinavia with basically the same meaning as *avåt*. He thus appears to view the relationship between the words *åt* and *avåt* as follows: originally there was **etan* 'eat' with the derivative **ata*, and **ab-etan* 'damage by eating' with the derivative **ab-ata*. After Nordic syncope, however, this symmetry was broken and we got: *eta* 'eat' with the derivative *at*, and *eta* 'damage by eating' with the derivative *avat*. This asymmetry naturally prepares the way for the existing word *at* to receive a broader meaning through analogy and incorporate the meaning of *avåt*, which is thereby marginalised. The example illustrates how diachronic evidence and dialect evidence can successfully be analysed in relation to each other, when examining patterns of word formation.

Tamm (1878), and after him other linguists, have assumed that the derivative affix *-ande* which formed neut. abstract verbal nouns was modelled on Middle Low German patterns, namely the conjugated infinitive ending in *-ent* and *-end*, such as *etent* (neut.) 'eating'. This type of word formation has therefore been regarded as a written form. However, as Holm (1991) has shown in a monograph, it also exists in many Nordic dialects, and he outlines a possible internal background for the word formation, originating in indigenous abstract verbal nouns with the ending *-an*. Dialect material makes such a word-formation process plausible.

4.2.5. Philology and text interpretation

Analysis of dialect material can often elucidate passages in early texts which are otherwise

difficult to interpret (cf. 4.2.4.). Christiansen (1954, 425 ff.; 1958, 262 f.) has used northern Norwegian dialect material in her attempt to illuminate an obscure passage in *Grógaldr* 11. In this passage *Grógaldr* tells of a boy who seeks advice from his dead mother before going off on a dangerous journey. The mother sings nine *galdrar* 'charms' in order to transform the threats against her son into their opposite; in this way his enemies will become his friends. Thus, storms and severe mountain weather will not harm him, and when on a stormy sea he meets with a *lúðr*, the wind and sea shall die down and the son shall have a calm voyage. The word *lúðr* is obscure in this context, and philologists have had difficulties in interpreting it. Other passages in Old West Nordic literature have failed to shed any light on the problem. Instead, Christiansen refers for her interpretation to the dialects of fishermen in the north of Norway: a *lur* at sea is a wall of whirling snow or foaming water, a squall, swept along by the storm, and deadly dangerous to frail craft. In the same way Christiansen (1960, 383 ff.) interprets the kenning *eylúðr* in Snæbjörn's *Amløðe*-poem, with the help of the usage of *lur* in northern Norwegian dialects, as 'island-cradle'. "The compound *eylúðr* is *kenning* for the husking sea, rocking the isles", Christiansen (1960, 392) concludes.

Another example of how dialect material – and place-names – from different parts of the Nordic region can shed light on obscure passages in early literature is Johannisson's ([1954] 1975) analysis of *Atlakviða*'s "i qndugi at senda". With the aid of the Östergötland farm name *Ánväga* and Swedish dialect *köra i amnväg* (< *köra i andvæg*) 'to drive the opposite way' (literally: 'to plough across (the former furrows)'), Johannisson claims that a basic meaning 'in the opposite direction, the other way' can be established for the word. In the *Atlakviða* passage, Gudrun has just told Atle that he has just eaten his sons' hearts, adding that he can now digest his food and let the residue after consumption pass out 'the opposite ('other') way'. This interpretation makes good sense and, as was stated earlier, is given plausibility by the dialectal evidence.

In Nordic skaldic poetry, a substitution technique is sometimes used, known as *oflióst* (see Meissner 1921, 83 f.; Fidjestøl 1974, 32–34). In a *lausavisa* by Egill Skallagrímsson, it says: "eigum ekkjur/allkaldar tvær/en þær konur/þurfa blossa". Here Egill is complaining about his cold feet (literally: heels). But, in re-

ality, he is not speaking about his heels, but about his widows (*ekkjur*). This is explained by the fact that Old Icelandic *háll* denotes not only 'heel' but also 'widow whose husband has been slain'. This substitution technique has sometimes been considered artificial, but evidence from the living vernacular demonstrates that corresponding formations also exist in modern dialects (see Abrahamson 1930, 133 ff.; 1963, 221 ff.; cf. Jakobsen 1957, 138–140). The same can be said generally about kennings; in dialects there are kenning-like word formations, such as Swedish dialect (Bohuslän) *busksmitare* (from Sw. *buske* + *smitare*, 'bush + shirker') for 'snake', and *hagbrytare* (from Sw. *hage* + *brytare*, 'enclosed pasture + breaker') for 'bull', etc. (Abrahamson 1930, 141).

4.3. The macro level

4.3.1. Linguistic contacts and loanwords

Language contacts can be studied and analysed with the aid of dialect evidence. In the Nordic countries this is true of the interesting linguistic encounters both in the contacts – historical and modern-day – between indigenous Finno-Ugric languages (Finnish and Sami dialects) and Nordic dialects, and in the contacts between Nordic and Irish languages in different parts of the western Scandinavian area. These problems are dealt with in other articles, e.g. 66 and 67.

Intense international work on language contact has furnished dialect research with a number of useful perspectives. In the Nordic area this has meant not least a vitalisation of research on Middle Low German influence on Nordic dialects, as evidenced by a number of studies in the series *Niederdeutsch in Skandinavien* (1 ff., 1987). Equally interesting are the studies concerning the role of Middle Low German in typological and lexical changes in the Nordic languages (see, for example, Braunnüller/Diercks (eds, 1993; 1995)).

Among other things it is pointed out (by, for example, Jahr 1994 and Braunnüller 1994) that since Middle Low German structurally exhibited considerable similarities to Nordic languages it was quite easily understood in the medieval Nordic language domain, and consequently, communication became a sort of "semi-communication" of the same kind as is practised today among Danes, Norwegians and Swedes. In this way, Middle Low German

loanwords could relatively easily be incorporated into Nordic dialects.

Only a few studies on Low German loanwords in standard Nordic languages and dialects will be mentioned here. A number of these studies focus chiefly on loanwords in the standard languages, such as Seip (1915; 1919) and Wessén (1967), but other studies also include an analysis of Low German loanwords in the dialects. Low German loans in Danish dialects, particularly the Jutland dialects, have recently been dealt with by, among others, Nyberg (1988; 1989, 193 ff.); Andersen (1995, 181 ff.), and in Swedish dialects by Elmevik (1987, 120 ff.; 1992, 122 ff.); Brodin (1987, 257 ff.; 1999).

Studies of Low German loanwords in the dialects disclose, for example, the routes the loans have taken and can provide clues to their socio-cultural dimension (cf., for example, Elmevik 1987, 122 ff.). An example of this is the detailed study of the borrowing of *hyska* 'loop', 'hook' in Swedish dialects (see Modéer 1939, 116 ff.; 181). In addition, the lending dialect can be more precisely revealed as, for example, in a study of the Swedish and Norwegian dialect word *fräga* 'to ask' (Elmevik 1992, 122 ff.).

The borrowing of the Low German verb *bliven* 'become' and its gradual assumption of the meanings of the indigenous verb *verða* provides an interesting insight into the concrete borrowing process of a central word in the language (see Markey 1969; cf. also 2.). Among questions that have arisen in connection with this particular loanword the reasons for the rapid spread of this meaning into the domain of *verða* should be mentioned. One internal explanation for the borrowing of *bliven* could be the homonymy that arose between *vera* and *verða* when *ð* was lost after *r* in the latter word.

4.3.2. Socio-dialectal studies – from the forerunners to modern sociolinguistics

The social dimension of language and linguistic change was noted early on by linguists, and it is therefore misleading to attribute it to modern-day sociolinguistic research. Even the early neogrammarians highlighted the social dimension behind linguistic change (cf. Koerner 1978, 89 ff.). Socio-dialectal approaches are also represented early on in Nordic linguistics.

A highly independent pioneering figure is the Norwegian scholar Amund B. Larsen (cf.

Dalen 1997, 12 ff.). As early as 1886, in a work on dialects, Larsen used the term *naboopposition* (from Norw. *nabo* 'neighbour') to denote the opposition between the dialects of neighbouring communities, and he gradually elaborated the meaning of the term (see Larsen 1886, 52; 1917, 34–46). Larsen notes among other things that when a sound change is established in a certain dialect, often a similar change is rejected in the neighbouring one. This is often due to a conscious effort to preserve and even strengthen the differences between dialects. In reality this may be done through the establishment of hyper-dialectal pronunciation forms (for examples, see Larsen 1917, 34–46). In modern sociolinguistic terms we could speak of “prestige” and “identification”. Prestige presumes that there is in the language community some kind of agreement on which forms of linguistic behaviour are superior to others and should therefore be aimed at by ambitious citizens. This identification has the effect of encouraging the language users to reject unfamiliar features (see Thelander 1979, 117 f.; Widmark 1994a, 140 f.; cf. Dahlstedt 1987, 46 ff.).

The Swedish dialectologist Lars Levander also observes dialects from a socio-dialectal perspective (see Levander 1909, 39 ff.; 1950, 307–312; cf. Helgander 1997, 145 ff.). It is interesting to note, for example, how Levander analyses the development of innovations in the Åsen dialect (Älvdalen). He argues that the men's coexistence all winter long in log cabins with woodsmen from different provinces – chiefly Värmländers – was an important incentive for linguistic change (Levander 1909, 42). Levander also illustrates how linguistic variation can be used as linguistic markers. Thus, the individual can use different linguistic features in order to present himself/herself as an inhabitant of Älvdalen, of Åsen, living on this or that farm, young or old, man or woman, etc. At the same time, there is also room for the individual to accentuate his/her individuality (Levander 1909, 58–59).

Reitan's study of the Røros dialect (1932), which mainly deals with the sound system in the mining community of Røros, uses approaches which we know from the socio-dialectology of today (cf. Dalen 1997, 15 ff.). The Røros dialect is of special interest since it is a relatively new one in an area whose external history we are familiar with. How linguistic change behaves where spoken languages from different areas meet is interestingly illustrated by Reitan.

In Denmark, Jensen (1898, 213 ff.) provides an early example of research which, like modern-day socio-dialectal work, focuses on demographic and social factors and on the role of prestige and identification in the development of spoken language in the parish of Åby. Skautrup (1921, 97 ff.) poses sociolinguistically related questions in his study of the language of Tvis in western Jutland, and Jeppesen (1938) describes the development of a southern Jutland dialect – that of Løgumkloster – over two generations.

However, even though there are a number of early forerunners of sociolinguistically oriented studies in Nordic language research, it is in recent decades that Nordic dialect research has received empirical, methodological, and theoretical input. These studies focus on the social and situational circumstances of linguistic change and cast further light on the changes in different language varieties in the language continuum that covers everything from genuine dialects, through regional varieties, to modern Nordic standard languages, including a number of varieties and idiolect categories in between. These detailed studies of spoken language undergoing change also shed light on the historical changes encountered in written sources. A selection of some relevant studies should be mentioned, such as Nordberg's Eskilstuna studies (e.g. 1972, 14 ff.; Nordberg/Sundgren 2000, 294 ff.), Thelander's Burträsk studies (1979), Ivars' studies of Finland-Swedish urban dialects (1996; 1997, 173 ff.), and her Närpes investigations (1988). Notice should also be taken of the different Danish *stationsby*-studies (Ejskjær 1964, 7 ff.; Kristensen 1977–1979, 29 ff.; cf. Jørgensen/Kristensen 1994) and of different studies on the regional language of Jutland. Mention should also be made of studies of linguistic conditions in different parts of Norway, e.g. Steinholt (1964; 1972); Fintoft/Mjaavatt (1980); Gjermundsen (1981); Evensen/Tveit (1990), to name only a few. A summarising empirical study based on Norwegian studies can be found in Sandøy (1993, ch. 4 and 5). For the sociolinguistics of urbanization in the Nordic countries, see Nordberg (ed., 1994).

Interesting concrete efforts have also been made to connect experience from the sociolinguistic field with historical linguistic material. Mæhlum (1991, 114 ff.) discusses two phases in Nordic language development from such a perspective: the syncope period (500–650/700 A.D.), and the Middle Norwegian period

(from approximately 1370 to the beginning of the 16th c.). A further attempt to observe Nordic language development from a sociolinguistic perspective is made by Widmark (1994a, 139 ff.), who also seeks to understand the so-called “Birka Swedish” using a similar perspective (Widmark 1994b, 173 ff.; see 4.3.3.).

4.3.3. Dialects and the history of the Nordic languages – some examples

The attempts at grouping dialects bring to the fore a number of theoretical issues such as the importance of distinguishing archaisms from innovations, cf. Skautrup ([1937] 1976, 48 ff.; [1952] 1976, 126 ff.). These issues are of general importance in dialectology. If it is difficult to make adequate and meaningful groupings for Swedish, Norwegian, and Danish dialects, – however the grouping is made, it remains after all only a construction – how much more difficult it is if the field is broadened to include the entire Nordic language area. In Hesselman’s synthesising studies (especially 1948–53; see 1.) on Nordic dialects and language history, he rather seems to have abandoned his attempts to use dialects to divide the Nordic language area into different dialect areas. This is because there seem to be both many contradictions and a large number of intersecting dialect boundaries. Nevertheless, Bandle (1973) has accepted the challenge to divide up the Nordic language area primarily on the basis of the innovations that arose in different periods and which have come to characterise the different areas. In his synthesising monograph – a good representative of the symbiosis of dialectology and language history – Bandle seeks to discover which innovations originated in various diffusion centres, how the diffusion can be assumed to have occurred, and which dialect areas have been established as a result. An example of a western innovation is the older *u*-umlaut (cf. Widmark 1959). An eastern innovation is the lowering of long *u* to long *o* in hiatus and word-finally (*būa* > *bō(a)* etc.). Among southern innovations could be mentioned the post-vocalic consonant lenition *p, t, k* > *b, d, g* and the vowel merger *-a -i -u* > *-æ* or *-e*. Bandle includes in the northern innovations initial palatalisations, the loss of *-n* in the definite fem. singular form and the loss of *-t* in unstressed final position, as well as vowel balance. Bandle summarises his results (1973, map 22) by establishing a western, a southern and a northern Scandinavian area. The picture

he presents of the northern area is particularly problematic. A number of language features separate the northern area from the south and west, such as quantity regulation resulting in only long syllables, the shifting of the long vowels *a, o, u* etc. It is also clear that there are smaller zones within the larger ones, such as a northern Scandinavian area in a more limited sense, a Finland-Swedish and Estonia-Swedish area including eastern central Sweden, a Gotland dialect area, and a Göta dialect area which has the characteristics of a transition zone.

Like every classification, Bandle’s has its weaker points, as admitted by the author himself. For example, it has been pointed out that he should have treated Icelandic and Faroese as independent units rather than including them in the West Nordic area (see Torp 1983, 45 ff.; cf. Bandle 1997b, 37 f.). Nevertheless, Bandle’s general outline seems to capture the different linguistic zones of the Nordic area admirably, and also corresponds well with other cultural scientific evidence, such as ethnological phenomena and place-name types (Bandle 1994, 165 ff.; 1997a, 39 ff.).

It should, however, also be possible to look at historical features from a sociolinguistic perspective, something that Widmark (1994a, 144 ff.) has attempted. In so doing, she seeks to define what the linguistic boundaries actually represent, and to establish identification areas from a diachronic perspective. Thus, she regards, for example, southern innovations such as *p, t, k* > *b, d, g*, *tn* > *nn*, etc. as features that have been used socially as identity markers and could secondarily have become prestige features (see Widmark 1994a, 147–148). The northern Scandinavian area, which comprises large parts of Sweden and Norway, contrasts with the southern Scandinavian area. The common features of the northern Scandinavian area were earlier found in a larger Nordic area, often as variants, but they have been preserved and often strengthened in the northern area. Therefore, to Widmark the northern area is an identification area that has maintained its identity by accentuating features lost in the rest of Scandinavia. Bandle (1973, 111) identifies this northern Scandinavian area as a background to Swedish, but Widmark asks if it is not equally reasonable to let the eastern Swedish dialects constitute this background (Widmark 1994a, 149). In support of this she mentions the so-called “Birka Swedish” as a dialect which is to some degree linguistically expansive. The fact that

the East Nordic area does not exhibit the same linguistically expansive vigour as the southern Scandinavian area is in all likelihood due to the fact that Denmark's period of greatness after unification around the year 1000 partially coincided with the weakening of the Swedish realm. In this way the character of the eastern identification area appears less defined and is consequently more difficult for historical linguists to pin-point.

We can stay with "Birka Swedish" a little longer in order to further illustrate how possible language connections and streams of influence at the Nordic level in the past can be reconstructed on the basis of dialect material and from a sociolinguistic macro-perspective. "Birka Swedish" was discussed for the first time by Hesselman (1936, 127 ff.). His analysis focuses on the diphthongisation of long *e* – the Germanic *e²* – into *ia/iä* in the word *här*. The distribution of this feature in contemporary dialects is not unbroken, but the use of early written sources enables Hesselman to maintain that the diphthongisation took place in the entire Baltic area – from the northern part of the Gulf of Botnia down to Blekinge, and in Svealand up to upper Dalecarlia. In Denmark the feature can be found in southern Schleswig, according to Hesselman. Moreover, Hesselman suggests that we have to connect this development with the corresponding sound change on the continent, with influencing languages such as Old Saxon, Old Frisian and, in particular, Old Franconian. Hedeby (Haithabu), with its central position as a trading centre where northerners from the Baltic and North Sea areas met and where they also met people from the continent, is the real hub and starting point of the discussion. Hesselman's exciting synthesis has, however, been criticised by, for example, Olrik Frederiksen (1974, 232 ff.; 1986, 75–94) on a number of grounds, including weaknesses in the actual empirical evidence on which it is based. For different aspects of this issue, cf. Stoklund (1994, 109 ff.), and for a discussion of the historical context, cf. Lund (1982, 114–125).

Nevertheless, the "Birka Swedish" theory has recently been raised again (e.g. Widmark 1994b, 173 ff.), although, as Widmark points out, a more appropriate term might be "Hedeby Nordic", since the language features in question seem to have their background in Hedeby. Further material that supports a "Hedeby-Nordic" thesis has also been produced, and the arguments have basically been modified. Concerning the sound change which

Hesselman primarily deals with (*e² > ia/iä*), it can be shown that this type of diphthongisation is not only found in dialects in eastern Sweden but also in western parts of Sweden and in Norway (see Lagman 1990, 62 f.; Peterson 1992, 95 f.; Widmark 1994b, 177). It can also be shown that it is in the earliest material that we find most of the diphthongizations. Thus it can be concluded that these diphthongized forms began to retreat early on.

However, there are also other language features in Nordic dialects which resemble *e² > ia/iä* in their distribution patterns (Widmark 1994b). These include the monophthongization *au > o* (see, for instance, Moberg 1954, 115 ff.; Strid 1989, 5 ff.; Widmark 1994b, 178 ff.; and Elmevik 1997, 93 ff.; 1998, 586–588), whose distribution centre lay in dialects in eastern Sweden – primarily Svealand – but which also existed in western Sweden and in Norway. A monophthongisation is also found in Old Norwegian, which resulted in the writing of *u*, *o* or *a* for the older *au*. There are indications that this sound feature should be seen as connected with a corresponding change in Old Saxon, although such a supposition must naturally be regarded with reservations. Other sound features that can be examined from a similar "Hedeby Nordic" perspective are the development **singwa > sjunga*; the metathesis of initial *wr > rw* (see Eklund 1991, 130 ff.; 148 f.; 154; 158 f.; 170 ff.; 180 ff.); the loss of initial *h*; the development of *bn > mn*; and the development of the inserted consonants *b*, *d*, *p*. Whether all these phenomena can really be seen from the same perspective and be placed in the same macro-context is, of course, open to discussion. Since the issue concerns innovations, it is theoretically possible that influences occurred in different directions. There is also the possibility that identical sound developments arose independently in different places.

Even with these reservations, interesting perspectives can open up, with their starting points in the language features mentioned above and their Nordic distribution. Hedeby was indeed most probably a central meeting place for northern traders from different places and must have provided good opportunities for real language mixing. The northerners took home with them the features they had acquired in this environment, and this language must certainly have had the qualities of a prestige language. But even if "Hedeby Nordic" began to be a prestige language, it cannot have survived as such – the distribution of

“Hedeby Nordic” language features in the Nordic dialects shows that, generally speaking, they have receded. These features are best preserved in the Gotland dialect – which indicates the adherence there to the local language – and in the Dalecarlian dialects, where the old Hedeby features have apparently served an identification function.

From a theoretical point of view, it is interesting that, with the aid of dialect evidence – as “Hedeby Nordic” (“Birka Swedish”) possibly shows – we can reveal ancient linguistic language connections and distribution patterns, and these patterns can be analysed from a principally sociolinguistic macro-perspective.

5. Concluding reflections

In the diachronic language research based on Nordic language material, dialects have often played a major role in illustrating the processes of language change. This has applied at different language levels: phonological, morphological and syntactic, as well as in connection with phenomena concerning word formation and semantics. Moreover, philological and etymological research have often been able to use dialect material as the starting point for their analyses, as has been illustrated in this article. Among historical linguists it has been customary, more or less implicitly, to consider dialects as a kind of language history source, while the opposite viewpoint has hardly been expressed at all. In Sonderegger’s overview “Leistung und Aufgabe der Dialektologie im Rahmen der Sprachgeschichtsschreibung des Deutschen” (1983), it is the importance of dialects to language history that is stressed, rather than vice versa.

At the centre of diachronic language research stand questions related to the continual process of language change. Sociolinguistic research, which has developed considerably in recent decades, has deepened the understanding and analysis of linguistic change, and its origins in both internal and external factors and has, in the process, drawn attention to language users’ choices within a repertoire of language variants. Sociolinguistic research has often highlighted recent language material, but historical conditions can also, of course, be illustrated from a sociolinguistic perspective, even though it is more difficult to illustrate patterns of change more remote in time. In order for it to be possible to discuss historical linguistic material in the light of contemporary linguistic material, there has to be

some kind of common ground between past and present (cf. Labov 1975, 825 ff.; 1994, 9–27). Since sociolinguistic research often uses spoken language as its starting point, the sociolinguistic perspective has produced a number of interesting socio-dialectological studies in the Nordic countries. Through studies such as these, the sociolinguistic perspective can also be linked to the analysis of language history material as shown, for example, in the studies on “Birka Swedish” (“Hedeby Nordic”) discussed in 4.3.3.

It is important in the future to establish a historically-related form of language research which deals with language history and dialects in a truly integrated way, and where diachronic and synchronic perspectives are combined so that diachronic developments are illustrated with the help of recent material, and vice versa. What is needed, therefore, is a unified approach to the treatment of linguistic and dialectological phenomena which includes the dimensions of both time and space (cf. Bandle 1997b, 42 f.; Pedersen 1995, 33 ff.). Attempts have been made at this kind of research, which, accordingly, integrates a diachronic and a dialectological analysis; see for instance, Williams (1996, 433–439); cf. Palm (1992); Peterson (1996, 239 ff.). Far more attention than earlier, however, must be paid to methodological and theoretical issues.

In this respect, a work such as Rohlfs’ *Historische Grammatik der italienischen Sprache und ihrer Mundarten* (1–3; 1949–54) can serve as a model for this kind of analysis, describing as it does the development of both written language and dialects from common starting points and with the support of a vast source material which, in this particular case, enables the creation of a comprehensive view of the history of the Italian language. Similar monographs on the Nordic languages do not yet exist – even though, for instance, Skautrup’s language history (see 1.) has high ambitions in this respect – but should be placed high on Nordic linguists’ agenda.

35. Nordic language history and current trends in dialectology

1. Introduction
2. Urban variation
3. National or regional convergence?
4. Power and status of a standard language
5. Literature (a selection)

1. Introduction

Modern dialectology is characterized by attempts to understand language change and variation through the perspective of sociology and social psychology, i.e. to understand how various types of communities represent different conditions for language change, and to understand what mechanisms in personal interactions are relevant. This social dialectology does not lie in contrast to traditional neogrammarian or structural dialectology; rather, it complements it by focusing on some extralinguistic factors. It is based on the idea that language is characterized by variation, whereas traditional dialectology focused on language as being constituted by a structure.

This social perspective is not brand new in Norwegian dialectology. One of the early scholars who often included social history in his work was Larsen (1849–1928), who as early as 1886 introduced the concept of *naboopposisjon* ('opposition towards neighbours'), which refers to a hyper-dialectal phenomenon. In an article published in 1917 he elaborated on this explanation for linguistic change, characterizing it as a psychological or mental force that makes people exaggerate particular features by analogy. This can even trigger a "sound law", he claimed.

Larsen established a new discipline with his studies of urban languages: in 1907 of the Oslo dialect, in 1912 of Bergen and in 1925 of Stavanger, the latter two with a local co-author. For each of the communities he presented a social history as a background for understanding the linguistic characteristics. The Swedish linguist Gjerdmann expanded the method for studying urban varieties by collecting data from different social groups for his project on the dialect of Södermanland (1918; 1927), thus according variation itself a more important role than in Larsen's studies.

In the next sections the intention is to discuss the development of sociolectal variation and the diffusion of a standard language – two historical subjects often discussed in sociolin-

guistics. The Nordic countries demonstrate interesting differences in this respect, which can be interpreted as results of different political conditions.

2. Urban variation

Some language historians have taken it for granted that people of the higher classes during the Middle Ages cultivated a distinctive higher-class variety, cf. art. 10. Nowadays, however, most scholars assume that there were no sociolectal differences until the 18th century (Brink/Lund 1974). There is no documentation of sociolects in the Nordic countries during the previous periods, and modern sociolinguistic insights into language as a cultural symbol make us understand that language has only a potentiality for being utilized as a symbol of social differences; there is no necessity for its being a symbol. An interesting perspective to language history can thus come from studying what conditions promote the symbolic status of language.

According to Brink/Lund, the Copenhagen dialect split into a higher-class and a lower-class variety during the latter half of the 18th century. Two interesting trends can be observed in this process: (a) The low variety sticks to the old dialect forms, whereas the high variety prefers forms that correspond to the written forms: e.g. *kygen* vs. *køgen* 'kitchen', *hanses* vs. *hans* 'his'. Thus, there is an obvious influence of the authorized standard. (b) In cases like *sla* vs. *slå* 'beat', there were alternatives in both the spoken and written language, and the disappearance of the former variant in both the written language and the Copenhagen upper-class variety must indicate some interrelations or, expressed alternatively, the development of written Danish was dependent on the prestigious dialect.

The above differences were all of limited scope; they represented single words. However, during the 18th century more general phonological distinctions arose, reflecting a social tension between the classes. Quite a few systematic vowel changes took place, and interestingly, most of them started in the low variety and spread to the high variety (e.g. vowel lowering before uvular *r*, and *t > ts*). Nevertheless, some changes followed the opposite route from the high to the low variety

(e.g. fronting of low back vowels). The changes were neutral to the spelling system, except for the *ð*, which tended to disappear for some time, but regained its position, perhaps under the influence of the written language. The new syntactic pattern of using accusative pronouns in stressed position (e.g. *hende* instead of *hun* in *Hende, der går der, er min søster* 'She, who is walking there, is my sister') appeared in the low variety first and is spreading today into the high variety, in spite of the written language.

During the 20th century, the development of the two dialect varieties has demonstrated considerable convergence, because of the acceptance of the new changes in both varieties and the exchange of phonological features. It is a characteristic of the amalgamation process that features from the low variety have been accepted in the high variety more often than the other way round. Brink/Lund foresee that the generations born a few decades after the new millennium will show no social differences in their language; only stylistic variation will be left.

Swedish language history demonstrates a parallel development. By the middle of the 19th century there were obvious social differences in Stockholm speech. Kotsinas (1989) reports that strongly aspirated intervocalic *t* (*gathan* < *gatan* 'the street') as well as "European" long *a* were already characteristic of the higher-class variety 150 years ago. The distinction between *di* ('they' nominative) and *dem* (accusative) existed at that time in this variety, but disappeared later. The recordings of the 19th century's low variety demonstrates today's characteristics of a less aspirated *t* and a back long *a*, and today's generally accepted pronoun *dom* in both cases.

About the turn of the 19th century, Stockholm had a vast increase in population because of immigration from the countryside. From 1865 till 1910 the population increased from 105,000 to 305,000. This immigration resulted in a new Stockholm dialect, "ekensnacket", caused by the melting-pot effect. This dialect was characterized by some reduction phenomena, e.g. the weakening or loss of *r* (*ord* > *od*). Since the 1960s, Stockholm has assimilated vast numbers of immigrants from abroad who have contributed to creating "rinkebysvenska", the Swedish of Rinkeby, a part of Stockholm where the majority of the 14,000 inhabitants are foreigners and where more than 30 different mother tongues are spoken. Youths of Swedish parentage pick up

this new dialect with reduced vowel distinctions, a more marked *r* and a "foreign" *sj*-sound etc.

The first half of the 20th century was characterized by social levelling and sociolinguistic convergence. Consequently, people born in the inter-war period show less social differentiation in their language than previous generations. The latter half of the century has introduced a new difference between the traditional Stockholm dialect and "rinkebysvenska", but Kotsinas (1989) predicts that these varieties are going to merge in the future with some lasting traces from "rinkebysvenska".

As for Norwegian towns, we find the same historical process. There is little knowledge about sociolinguistic differentiation in Oslo until the last decades of the 18th century. In a description from this period, there is a comment that quite a lot of civil servants and merchants "did little or nothing to correct their speech in accordance with the written language, instead they practised the vernacular" (Larsen 1907). However, at that time Christian Kølle, a teacher at Bærum near Oslo, gave instruction in proper Danish, according to his own description from 1792.

Larsen described a situation at the turn of the previous century where the middle classes had no characteristic dialect; on the other hand, the members of these classes used partly "the dialect of the street", partly "educated" speech ("den dannede dagligtale") or partly a mixture. The mixture was characterized by the following forms from the upper-class variety: lack of the old diphthongs (*sten* = *stein*), past forms with *-et* instead of *-a* (*kastet*), definite plural masc. *-ene* instead of *-a* (*hestene*); and from the lower-class variety: definite singular fem. *-a* and "thick l" (a retroflex flap). In upper-class speech, on the other hand, thick l appeared only irregularly; efforts were made to extinguish the other retroflex sounds as well, but in vain, according to Larsen, and in some families the uvular *r* was used.

There is little data on the history of sociolect differentiation of Swedish in Finland. Today the situation is "normal" (for Europe), with a pattern where educated people tend to use standard language more than non-educated people, and the elderly use it more than middle-aged and young people (cf. Ivars 1996). This standard, in contrast to Sweden-Swedish, has unaspirated plosives, an affricated pronunciation of the *k* in e.g. *köpa*, and no retroflex sounds.

Data from an extensive project on language variation in Reykjavík has not been analyzed with regard to social differences, but its report concludes that a rough survey of the data has not revealed any social differences (Þráinsson/Árnason 1984). A parallel social homogeneity is characteristic of the Tórshavn dialect in the Faroe Islands, as well.

3. National or regional convergence?

The development of an upper-class (high) variety reflects a historical situation where a social class takes advantage of the potential symbolic character of a national written standard. By associating its own spoken variety with the written expression of national superiority and power, the socially dominating class obtained a cultural and ideological symbol of its status.

A closely related question concerns the influence which the combination of a national standard and social prestige has today on the general language development of an ever more integrated community. A well-known and popular concept is that a national oral standard is going to supersede local dialects in a type of simple unidirectional development. This has been only partially attested. Modern research reveals that language development is influenced by more complicated social forces.

There are obvious differences between the Nordic countries; a national standard language has become predominant all over Sweden and Denmark, whereas people in the other countries stick to their local dialects to a greater extent. In Finland and Norway, bi-dialectalism has mostly been a characteristic of urban areas, i.e. many urban people switch between a low and a high variety. However, there too, the dialects are continuously changing. In the sections below, patterns of development will be illustrated.

3.1. Diffusion models

Wave theory, forged in order to describe the diffusion of isoglosses produced by sound laws, has been indirectly tested by Steinsholt, who in a longitudinal project examined how the urban language of Larvik (Vestfold in Norway) expanded into the neighbouring rural district of Hedrum (1964; 1972). Through social contact and urban dominance, features of the Larvik dialect were gradually included in the dialects of the young generations, and Steinsholt was able to state that over an interval of 30 years (1938–1968), the frontiers

of the expanding features had moved some 20 kilometres into the countryside.

One central term in Steinsholt's interpretation was 'language missionaries', which he used to describe the social function of young girls who returned home after living in town for some time and introduced urban features which were accepted by their local friends. Another important group of language missionaries was the male adults who had been employed on whaling ships. These missionaries were influential because they were regarded as insiders in their home community. In a geographical perspective, they were instrumental in expanding the territory of linguistic features.

New features often spread from one centre to another before they are accepted in the rural area between the centres. Such instances could best be described in an urban diffusion model, which normally implies a hierarchy in which features jump from more populous to less populous areas. A very typical instance of this type of spread is the expansion of uvular *r* in Scandinavia. It seems to have been accepted in Copenhagen about 1780 (Skautrup 1953) and by the end of the 19th century in the whole of Denmark. By the middle of the 19th century it had spread to the Norwegian towns of Kristiansand and Bergen. Data from about 1900 display that this new pronunciation had diffused to Stavanger, a few tourist centres and the wider rural areas around these centres by then. During the 20th century we have been able to follow its constant advance, which now has resulted in a continuous uvular *r* area along the southern and western coast of Norway (Foldvik 1977). By 1890 the uvular *r* had spread to Scania, and since the 1930s it has remained stationary there (Chambers/Trudgill 1980).

From the 16th century the Copenhagen dialect has had an ever-increasing influence on other dialects in Denmark. New forms have spread from the capital to other towns and later to the rural communities (Brink/Lund 1974). In this way the dialect of the capital has in the course of three centuries gained the status of a national standard. The initiators of this development have been educated people, whose language in about 1700 was described by the grammarian Jens Høysgaard as encompassing great differences. However, 150 years later the linguist Karl Verner considered the speech of the same group to be practically the same throughout the whole country. At that time the last systematic features of a standard were fixed: the Copenhagen pronun-

ciation of the diphthongs and the depalatalized pronunciation of /g, k/ preceding high front vowels (*kjære* > *kære*).

The dialectal development among other social classes has followed in the same direction. Brink/Lund consider local forms to be absent in the speech of people born after 1920 in Zealand. In other areas of Denmark as well, the number of traditional local dialect speakers has decreased. A study of some communities of Jutland indicate that 1/3 of the children in a village speak the local dialect and 4/5 in the rural countryside (Bengtson 1985). The concept of 'local dialect' is, of course, in principle problematic; the point is, however, that the new language variety of the communities no longer is a gradually developed local dialect, but rather the standard with regional characteristics. The development in Danish is best described as a shift from dialect to standard. Ejskjær (1964) introduced the concept of "regional standard", which has more similarities with the standard than the local dialect – and which is felt by the speakers to be the national standard.

Despite the homogeneity that is the consequence of the diffusion of a standard (*rigsmål*), some dialect borders "survive" and move geographically. Whereas the Little Belt previously was felt to be a main borderline since it splits Danish into Jutland dialects in the west and island dialects in the east, nowadays the Great Belt is felt to be the most important dialect boundary since the Copenhagen innovations diffuse faster in Zealand than in the rest of Denmark west of the Great Belt. Moreover, one diffusion from Jutland has spread eastwards to Funen, i.e. in the opposite direction of the prevailing trends: the past forms with the suffix *-et* instead of *-ede*: *kastede* > *kastet* 'threw' (Pedersen 1991).

During the 17th century there was some controversy over the question of which spoken variety represented the most proper Danish; however, the Zealand or Copenhagen upper-class variety was soon generally accepted as a model. Schoolteachers taught this speech model and propagated the attitude that local dialects were wrong. Today, the standard or regional standard is the only acceptable language variety in all public contexts (Pedersen 1991).

Interestingly, Brink/Lund emphasize that language changes cannot be caused by the written language, as most phonological changes are either neutral as regards the spelling (e.g. the phonetic quality of the phoneme

/a/), or deviate from it (e.g. when /g/ is replaced by [w, j]). In some instances the high variety has accepted forms resembling the spelling, e.g. the pronunciation *ǿ* of intervocalic *d*: *gaje* > *gaǿe* (= *gade*), but the general tendency is that the low variety of Copenhagen is the innovating dialect. Thus, new features of the low variety are conveyed by the high variety to the national standard, e.g. the "flat *a*" in *land* > *lænd* (close to each other, but still different) and *t* > *ts* in *tivoli*.

A more sophisticated social understanding of the historical process is presented by Pedersen (1991), who considers 18th century society to be socially rather mobile but geographically immobile because of the restrictions on villeinage. People lived in small villages with strong internal ties and weak external ones. These conditions of strong local identity favoured the cultivation and maintenance of local dialect differences. During the 19th century, the restrictions were abolished, and agriculture was reformed through the reorganization of land ownership with the consequence that many families moved out of the villages. Geographical mobility increased, and class differences sharpened. People's daily lives after that time were characterized by a more individual style than the previous collective one. Some farmers bought more land and climbed socially, for instance by adapting standard language, through which sociolectal differences arose in the countryside. Thus, modern society created new feelings of community that were socially rather than locally based.

Standard Swedish (*rikssvenska*) has its historical origin in the Stockholm (Mälaren) area; however, the standard and the Stockholm dialect are not identical, a major reason for which is the dialect's independent innovations. The Swedish standard has had an immense impact on the dialects of the rest of Sweden during recent generations. The superior status of the standard has been effectively propagated by the school system from the latter half on the 19th through the 20th century, and educated people have adapted their speech to the standard to a greater extent than other social groups. Therefore, urban communities with their concentrations of civil servants and academics have led the way in this linguistic development. In Lund the standard has changed its role during the 20th century from being an upper-class variety to being a common way of speaking Swedish – although there still are groups of less educated people who use the local dialect. The sur-

rounding rural districts have followed suit in this standardization process. With regard to the causes of this development, Ingers (1970) stresses the general social levelling of Swedish society, and that groups with social ambitions are susceptible to negative attitudes towards traditional dialects.

The Swedish standard has regional accents; i. e. the phonology is characterized by a strong substratum of the local dialect. The standard in Lund, for instance, is pronounced with a uvular *r*, with some of the Scanian vowel qualities, and with a frequent dropping of *d* (*bad*, *god* > *ba*, *go*). The standard in other parts of Sweden has corresponding peculiarities, and when describing the Swedish language community it is – as for Danish – relevant to use the term ‘regional standards’ towards which the local dialect differences have levelled. Since the Second World War there has been a tendency for language policies to favour the regional character of the standard language (Loman 1991).

The gradual change from local dialect to standard Swedish is well documented in Nordberg’s study of the urban dialect of Eskilstuna in central Sweden (1972). Nordberg is able to demonstrate using statistical data that innovations are spreading from Stockholm to other urban centres, that people of academic and upper social groups are the first ones to accept new features, that middle-aged people lead in the process and that women precede men. The fact that middle-aged people (30–45 years) are in the vanguard is interpreted by Nordberg as a consequence of their having reached a time of life in which their careers are important, and that they therefore are especially sensitive to social evaluation and norms. The statistical patterns show, for instance, that the dialectal form of past participles of the 2nd conjugation of weak verbs (e. g. *köpi* ‘purchased’) has disappeared from the speech of social group 1 (being replaced by the standard form *köpt*), and the dialectal plural suffix *-er* (in for instance *öger* > *ögon*) is only present among people older than 60 – and only in social groups 2 and 3. The younger informants and those in social group 1 used only the standard form *-on*. Thus, there is a gradual social transition to the standard language. As “vanguard” groups continuously accept and adopt new standard forms, they thereby retain the sociolinguistic distance from the other social groups of the urban community.

Widmark (1977) in a research project on the spoken language of Uppsala has found a very

similar pattern: higher social groups tend to use the standard more, younger people give up local regional features more, and people with more contact with Stockholm use fewer local variants than others. In spite of this general tendency, Widmark focuses on an alternative question: how can local features survive in an academic centre like Uppsala? She noticed that several local expressions have a high frequency in the Uppsala speech variety although they are unknown in Stockholm and in the Swedish standard. She interprets her results as a manifestation of opposition to the established standard, and concludes that forms with an extensive regional basis do survive. She emphasizes that the prestigious language of the mass media does not automatically displace local group norms.

The urban diffusion and hierarchy model does not apply to all modern changes. Features that may be considered as language-internal simplifications may arise and spread in centres without following the hierarchical pattern. This is demonstrated in, e. g., the morphological levelling of nouns in central and northern Norway, where the simplest suffix systems, which have arisen in the smaller towns, seem to be on the offensive, gradually gaining more acceptance in the dialects of the dominating cities (Sandøy 1998).

3.2. Melting pots

A great many new urban societies have been established during the last century, where the population has increased from almost nothing to several thousands in one or two decades. Most often these are industrial centres. The first immigrants speak different dialects and, therefore, the new societies represent interesting linguistic melting pots during the first period when new language users have no conservative pressure from one language model. These societies have to establish new language norms from chaos. When the society has stabilized, the spoken language seems to become homogeneous in the third generation (e. g. in Høyanger, cf. Omdal 1977).

Two interesting cases are the two industrial communities of Odda and Tyssedal in Hardanger in western Norway, established 7 km apart during the two first decades of the 20th century. The proportion of residents from different geographic areas in about 1920 were recorded and the most important figures for Odda are: original population 13.8 per cent, from western Norway 62.9 per cent, from cen-

tral eastern Norway: 6.0 per cent; and for Tysedal: original population 3.4 per cent, from western Norway 29.9 per cent, from central eastern Norway 33.8 per cent. The new dialect of Odda has a few levelling features in its phonology and morphology compared to the neighbouring rural district, but it is a typical west Norwegian dialect – a fact that is easily understood from the large group of west Norwegian immigrants. On the other hand, Tysedal had the highest proportion of immigrants from central eastern Norway, and this has made an obvious impact on, for instance, the morphological classes and suffixes. The personal pronoun ‘I’ has the east Norwegian form /jæi/ in Tyssedal, and the west Norwegian form /e:g/ in Odda. The eastern impact is perhaps greater than the statistical figures can explain, a result that may indicate that central eastern Norwegian is a more prestigious dialect in Norway.

Interestingly, over recent decades a new tendency has emerged: Tyssedal is feeling the influence of Odda’s central role, with the result that dialect features from Odda are picked up by the new Tyssedal speakers, e.g. the pronoun /e:g/. What we observe may be interpreted as meaning that regional levelling seems, after all, to be the strongest factor on the development (Sandøy 2000).

3.3. Regionalization

A general trend in Norwegian dialect development seems to be strong regional levelling. Outside eastern Norway there is a strong tendency for urban sociolects to merge as a compromise variety where the local low prestige dialect dominates. This has been thoroughly documented in Stavanger, Haugesund, Bergen and Ålesund. In Stavanger, the language community has been characterized by sharp sociolinguistic contrasts. Berntsen/Larsen (1925) noted that the difference between the local urban varieties in about 1900 was too great to allow a mixture; “a single occurrence of a vernacular form would be offensive and comical” (Berntsen/Larsen 1925, 6f). This was more typical for women than for men. At the time of publication, Berntsen/Larsen discerned that middle-class speech was approximating the low variety. In the 1960s, Omdal reported that the high variety was more common among women than men, with about half of the women using it. Some of them had always used it and did not master the local dialect. Boys, on the other hand, did not normally

use the high variety, except in special situations, because they felt they would be ridiculed (Omdal 1967). By about 1980 it was hard to find any youngsters who used the high variety (Gabrielsen 1984).

These new urban dialects seem to play an important part in regional levelling. Rural informants tend to accommodate their language to the dialect of the nearest city even when speaking to people from Oslo. The regional capital thus seems to be the prevailing language model more than the national capital.

The patterns of regionalization are still unclear; however, a general tendency is that widespread regional features oust local ones, and that these regional tendencies win out over forms from central eastern Norwegian. This applies to phonological and grammatical features more than to lexical ones, as new words seem to spread rapidly on a national basis. An example of regional levelling is apocope in the county of Nordland. Traditionally there were different patterns in the local dialects, from apocope in quite a lot of morphological categories to apocope in only one. The new emerging regional dialect is a compromise in that apocope is restricted to a few morphological categories; however, this is now implemented in dialects with previously almost no apocope (Sandøy 2000).

The east of Norway, on the other hand, seems to be under intense influence from the capital, Oslo, although it is possible to discern subregions with particular characteristics. A containing factor for this sphere of influence is perhaps a common regional intonation pattern that limits the area in which it is unproblematic for speakers to sound like genuine central eastern Norwegians.

The general impression of the Norwegian language situation is that pressure from the dominating centre of Oslo exerts less influence on the other dialects than the capitals of Sweden and Denmark do in their respective countries. Therefore, “regional dialect” is a more appropriate term than “regional standard” for the modern Norwegian varieties. This may be due to the cultural conflict which has been expressed in the struggle between Bokmål and Nynorsk, and which has had its social and economic basis in regional conflicts and several anti-authoritarian movements. This particular aspect of political and cultural history has forged strong regional identities. Officially, Norwegian teachers have to accept the pupils’ usage of the local dialect, in accordance with a law of 1878; the teachers have to

adapt their speech to the pupils'. Even though this has not been practised in all urban schools, there has been a considerable acceptance of dialects in Norwegian schools – in contrast to the situation in Denmark and Sweden.

Swedish, as well, demonstrates some similar regional traits. Thelander (1979), in an extensive thesis on the dialect of Burträsk in Norrland (northern Sweden), has elaborated on statistical methods and the use of implicational scales to study the cohesion of variants or different variables in the dialect. He concluded that there are three language norms, or spoken varieties, in Burträsk, which he calls a traditional local dialect, the Swedish standard and a regional standard. This last one is a mixture of the two others with quantitatively stable proportions of both. In some cases a special regional standard variant exists, e.g. *stor* ('big' pl.) vs. the dialect form *stör* and the standard form *stora*. The local dialect dominates among elderly people, the standard and the regional standard among those under 40 years of age and with more than a minimal education. Sex and occupation seem to be of little importance.

Elert (1994) claims that local dialects are generally not used much in Sweden today; the regional standards dominate. Three varieties – as described by Thelander – are certainly found in areas where local dialects still persist and deviate a great deal from the standard. The regional standards are characterized solely by phonological and phonetic differences, and on the basis of such criteria Elert concludes that there are seven regional varieties, including Finland-Swedish.

The Finland-Swedish scholar Ivars (1996) regards Swedish in Finland as having a national oral standard, this variety being used by educated people. Otherwise, the situation in Finland is similar to Norway's, where most people use their local dialect. However, she remarks that there is possibly a tendency in Nyland to level out the local dialects into a regional dialect. Middle-aged and young educated people tend to use more regional forms, whereas elderly stick to the Finland-Swedish standard. This expansion of regional forms is interpreted by Ivars as being a linguistic consequence of social levelling after the Second World War – corresponding to Kotsinas' interpretation of the parallel development in Sweden-Swedish (Kotsinas 1988).

Denmark is certainly the Nordic nation with the most homogeneous standard speech. Ejlskjær (1964) has categorized five regional

variants of the Danish standard; however, the variation is relatively modest. Gregersen (1993) finds it difficult to single out segmental criteria for a definition of the Jutland regional variety. Only regional tendencies in intonation are left. Local dialects play a very marginal role in Denmark today.

3.4. Individual vs. collective solutions

All over Norway it is generally taken that the Oslo high variety is the most prestigious in Norway. This language variety has been characterized as a "neutral" and "supraregional standard" (Mæhlum 1990). Its alleged "neutrality" is, as with other language attitudes, a matter of ideology, which differs in accordance with one's sympathies and loyalties in cultural conflicts. There certainly are quite a few individuals who change their language in the direction of the Oslo high variety, especially those who move to Oslo or that region. This is evidence of the social prestige of this language variety in Norway. However, these are individual solutions to language conflict. The choices are often a consequence of individual preferences and loyalties and reflect a situation where people have cut their ties with their original community. In her Svalbard study, Mæhlum has found that the Oslo variety has played an important role as a language model for many young people on the island; however, this community is characterized by continuous instability in the population and by a weak local cultural identity.

The pattern of such individual choices should not be confused with the situation in a more or less tight dialect community. The selection of common norms for a community is a social process, not a simple total of individual preferences. Therefore, a community can produce what seems to be a contradiction: that regional norms are strengthened even though their users' attitude is that another language variety is more prestigious. The latest generation of sociolinguists, thus, more and more frequently have wondered: Why do low prestige languages persist?

4. Power and status of a standard language

The definition of a standard spoken language is problematic. It should have some connection to the written standard; however, this tends to be historical. This is the case with

Danish, which in its spoken form has been exposed to phonological changes that have to a great extent made it independent of spelling. For the other Nordic languages, there is a more transparent correspondence between spelling and pronunciation that makes the written standard a better guide and therefore certainly more influential.

Standardization as a process leading to a homogeneous language has certainly advanced the furthest in Denmark, with Sweden coming second. Nevertheless, none of the Nordic countries have a standard language that is totally independent of a regional substratum. Danish comes the nearest to this ideal, though regional varieties exist there, too.

As for the popular concept of what is “most standard”, it seems as if the upper-class variety of each capital has a superior status, except in Iceland and the Faroe Islands, where this is irrelevant. However, the extent to which this prestigious standard exerts an influence is a different question. The upper-class variety itself seems to be susceptible to influence from the low variety, and, therefore, change is not unidirectional. Moreover, the role of regional standards is as yet not obvious, i.e. whether they will play an independent role. In eastern Norway where the dialect of Oslo is influential, the regional standard (or dialect), which is characteristic of more and more centres, is fairly independent of the dominant variety of written Bokmål, as it is characterized by, e.g., diphthongs and the suffix *-a* in nouns and verbs (*rein*, *brøyt*, *kasta*, *boka*, *husa* = ‘clean, broke, threw, the book, the houses’). Nevertheless, this regional dialect can be regarded as a compromise between written Bokmål on the one hand – to which prestigious middle-class speech corresponds fairly well – and the many urban low-prestige varieties of the region on the other. In this respect the eastern Norwegian regional dialect shows similarities with the regional standards of Swedish and Danish.

Within the development of the Nordic languages, there seem to be different trends which may cast light on a complex of social forces and on the impact that different political and cultural traditions have on further development.

VI. Nordic language history as a part of social and cultural history

36. Nordic language history and studies in general history

1. Introduction
2. The role of language in general histories
3. The role of general history in language histories
4. Literature (a selection)

1. Introduction

About 1890, after the German engineers Gottlieb Daimler and Gerhard Benz had succeeded in building a road vehicle powered by an internal-combustion engine, the French, substantivizing an already existing adjective meaning 'self-moving', chose to call this new device *automobile*. The French designation, a hybrid based on Gr. *autos* 'self' and Lat. *mobilis* 'movable', was adopted in several languages, thus Scand. *automobil*. But in some Danish circles this foreign word was felt to be clumsy, and as the result of a public competition arranged by the Copenhagen newspaper *Politiken* in 1902, the abbreviated monosyllable *bil* soon came into general use, not only in Danish but in Norwegian and Swedish as well; cf. also the Icelandic adaptation *bill* used in everyday speech, though official language has the loan translation *bifreið* 'moving vehicle'.

Obviously, this course of events belongs to both general history and language history (cf. e.g. Carlsson/Rosén 1961–62, 2, 443; Skautrup 1944–70, 4, 294). The interrelation between the two points of view is, admittedly, easiest to recognize where new devices or institutions calling for appropriate designations are concerned. But the fact that language history implies research into and a detailed account of conditions, structure and use of one or several languages over time, often viewed as an important element in social and cultural development, makes it clear that language history should be considered part of general history (cf. Janson 1997). Consequently, any history of a nation should include its language

and any history of a language should refer to its social and cultural context. As to language history, the theoretical basis for this view has been expounded by Teleman (1993). Here, I shall only demonstrate the practical approach seen in a selection of works on Nordic general and language history. Because they do not take external history into account, I exclude historical grammars, not only Noreen's *Altisländische und altnorwegische Grammatik* (1884, 4th ed. 1923), Brøndum-Nielsen's *Gammeldansk Grammatik i sproghistorisk Fremstilling* 1–8 (1928–73) and the like, but also Wessén's *Svensk språkhistoria* 1–3 (1941–56), which, in spite of its title, is in fact a mere historical grammar.

2. The role of language in general histories

Apart from the fact that a few Nordic national histories have next to nothing to say about language (e.g. Holmsen/Jensen 1961–62, 1, 396, touching on Danish in Norway; similarly, Thorsteinsson 1985, 199, on Danish in Iceland), it is noteworthy that, generally speaking, they focus on the status rather than on the structural development of a given language. One remarkable exception is the concise history of Swedish presented by Bengt Loman in Grenholm (1966–68, 1, 32–34; 2, 70–73; 3, 60–62; 6, 191–192; 10, 168–171), though it is not clearly connected to the general history of Sweden. Some details of medieval Norwegian are referred to in Mykland (1976–80, 4, 243–246), and Mørch (1982, 283f.) mentions the cultural gap in 19th c. usage and the later rapprochement between literary and spoken Danish along with political democratization, whereas the naked lists of new words in a popular journalistic "chronicle" of post-war Denmark (Hammerich 1976–80, 1, 569; 2, 13; 3, 13) are essentially ornamental.

Addressing a wide public in his history of the Nordic peoples, Sørensen (1987) repeatedly, though briefly, refers to the relationships between their languages: the position of Swedish in Finland and of Danish in Norway, as well as the conflict between Danish and German in Sønderjylland/Schleswig. The importance of language to national identity, which is, of course, an essential theme in Feldbæk (1991–92) and Lundgreen-Nielsen (1992), is emphasized in several Nordic national histories, though less in Sweden than in Norway and Denmark.

In histories of Sweden, the safe position of the national language is, more or less, taken for granted; e.g., referring to foreigners holding leading posts in 17th c. Sweden, Carlsson/Rosén (1961–62, 2, 15) state that in the palace of the nobility in Stockholm “a number of different languages were spoken”, the native idiom Swedish being only silently implied. Yet the Swedish aversion to the Danish language, resulting from its influence during the Kalmar Union, is currently mentioned (e.g. by Andersson 1969, 158; Linton 1994, 22; cf. also Sørensen 1987, 157); in his history of the territorial conflict over Scania 1658–1721, Åberg (1994) devotes chapter 28 to the expulsion of Danish from this former province of Denmark.

Prolonged struggle with a foreign language is, by contrast, a major issue in histories of Norway and Denmark. Usually, a history of Norway will give a detailed account of the late medieval decline of written Norwegian and the ensuing take-over by Danish; the long-term effects of legislation in Danish (*Norske Lov-Bog*, 1604, translated from Old Norwegian; *Norske Lov*, 1687, almost identical with *Danske Lov*, 1683) are emphasized by e.g. Mykland (1976–80) and Helle (1994–98); cf. Karker (1984; 1989). Ivar Aasen’s 19th c. construction of a modern Norwegian standard (*Landsmål/Nynorsk*), the gradual Norwegianization programme launched by Knud Knudsen (*Riksmål/Bokmål*), and the ongoing competition between the two national standards are necessary elements of Norwegian historiography. Because the conflict over the duchy of Slesvig/Schleswig, originally a fief of the Danish Crown but from 1460 linked to German Holstein, proved fatal in the 19th c., the struggle between Danish and German language as symbols of national identity has been an integral element of any history of Denmark since Allen (1840).

3. The role of general history in language histories

While linguists are agreed that the history of a language is inseparably linked with the history of the society in which it functions (cf. e.g. Torp/Vikør 1993, 15–17; Pedersen 1996, 205), the social context may be more or less explicit in language histories. Separate surveys of the general historical background occur in several works, starting with Petersen (1829–30) and continued in Indrebø (1951); Skard (1972–73); Haugen (1976); cf. Widmark (2001, 125–128). Apart from this, the role of general history ranges from almost total absence in Karlsson (1989) and sporadic references in Bergman (1968) to full integration in Skautrup (1944–70). Skautrup’s achievement has been praised by Telemann (1993, 151) and Bandle (1995, 11); Walter (1997, 148) stresses that a similar approach will be desirable in the comprehensive history of Icelandic which is still missing.

General history may be important to special studies as well. In addition to the well-known Low German influence on Nordic lexicon and word formation, recent research has made it seem probable that medieval language contact with the Hansa was akin to modern Scandinavian “semi-communication” (see e.g. Braunmüller/Diercks 1993–95). Change in the relative social status of two languages has been attributed to external historical events e.g. by Allen (1857–58, Danish/German) and Matras (1958, Faroese/Danish; cf. Grundtvig 1845); Ohlsson (1978, 44) claims that the transition from Danish to Swedish in Scania “is immediately connected with a military-political-economical one-off event, namely the armed conquest in 1658”.

It is a common view (cf. Indrebø 1951, 145; Seip 1955, 105f.; Helle 1994–98, 3, 174; but questioned by Hagland 1986) that relocation of the government from Nidaros to Bergen and then to Oslo in the 13th c. was crucial for the development of an Old Norwegian written standard; but whether the relocation actually caused the linguistic development (as Almenningen 1981, 32, seems to say) is debatable. The basic problem of explaining linguistic change by means of extralinguistic facts or events has been exemplified and discussed in detail by Mæhlum (1999). In the following I shall quote a few additional examples.

In his history of the Danish language, Petersen (1829–30, 1, 227) claimed that the increasing “mollification” of Danish in the

Middle Ages, viz. the characteristic change of post-vocalic unvoiced occlusives into voiced fricatives, was due to the oppression of the common people. But he was soon contradicted by Bredsdorff (1831/1933, 36) who, pointing to the fact that the oppression came later than the 12th c. when the sound shift started, ascribed the development to “en i den menneskelige Natur indplantet Afskye for Anstrængelse” [the disgust for exertion deeply rooted in human nature] (cf. Skautrup 1944–70, 1, 228). According to Pedersen (1996, 188f.), the curious fact that even today the small Danish island of Møn is divided into two dialect areas was originally caused by social separation: farmers in the west who became freeholders in 1769 had limited contact with the remaining copyholders in the east.

While it is indisputable that, eventually, the long rule of Danish inspired the creation of two competing Norwegian written standards, Jahr (1989, 11f.) has asked the hypothetical question: what if the union between Denmark and Norway had been dissolved in 1714 instead of 1814? His point is that without the forceful ideological influence of 19th c. national romanticism, Norwegian language history might have taken a totally different course. In his account of North Germanic innovations, Bandle (1973, 113ff.) tentatively related his linguistic results to general cultural features and political history. Pettersson (1992), investigating development after 1734, has shown that the increasing complexity of Swedish legal language up to the 1920s was dictated by the increasing demand from professionalized jurists that laws should be sufficiently distinct to function as steering instruments, in line with the demand from citizens for security and equality before the law.

In a modern context, Henriksen (1991, 105f.) considers that shortcomings of the Danish translations of European Community texts are partly due to the long distance between the translators and their native country, whereas Karker (1997, 88) refutes her allegation that the translators have more or less forgotten their mother tongue. Sveinsson (1991, 95f.) points to the importance of a social development no less relevant in Scandinavia than in Iceland: nowadays children, besides watching TV, are likely to communicate more with other children of the same age in various public institutions than with their parents and grandparents who used to guide their linguistic education.

Sometime after 1959, the owner of a restaurant in Keflavík, Iceland, gave it an English name: *Starlight*. But he did not get away with it; the professor of onomastics at the University of Iceland reported him to the police who, under a 1959 law (cf. Sveinsson 1991, 100) enjoined him to choose a genuine Icelandic name instead – which eventually became *Glaumberg* (Grünbaum 1996, 177f.). While that is undoubtedly an instance of language change with an extralinguistic cause, few cases as yet seem equally clear-cut. Obviously, much research in this field remains to be done.

37. Nordic language history and archaeology

1. The interface between language and archaeology in Scandinavian research
2. The origin and the archaeological dating of the runes
3. Archaeological evidence and the Viking and medieval runes
4. Semantics, origins and datings of place-names
5. Literature (a selection)

1. The interface between language and archaeology in Scandinavian research

For a culture with practically no written sources, as in early Scandinavia, interdisciplinary studies are vital for delving as deeply as possible into our few and scattered sources in order to extract the small amount of information they conceal. This was an obvious fact for scholars working prior to the last three or four decades at a time when philology had a much stronger position in language departments (some highlights: Olsen 1926; Holmbäck/Wessén 1933–46; Hesselman 1935; Kroman/Iuul 1945–48; Ståhle 1946; Lindén 1947–54; Modéer 1953; Bandle 1967; Hellberg 1967; Foote/Wilson 1970), and when the concept *Wörter und Sachen* was still on the research agenda (cf. Schmidt-Wiegand 1981; Diebold 1987; Jenstad 1990). It is not the case that this methodological framework has become fruitless or less rewarding over time; instead scholars of today have found other, more linguistically orientated approaches (cf. Öhman 1994), and there is a new generation of students and scholars, more specialised than before – to become a language scholar now you study linguistic subjects, not history, history of religion, ethnology or archaeology as auxiliary subjects as was often the case before. As a result, there are few connections between archaeology and language history to be found in recent research in Scandinavia.

Internationally we have seen the opposite trend, with a growing interest in combining archaeological and linguistic argumentation in an interdisciplinary analysis. Partly this is due to the fact that in e.g. the US and England many departments have a mixed focus, integrating linguistics/philology and history/cultural studies. In many parts of the world this kind of research has a strong position, led by distinguished scholars, such as Marja Gim-

butas, Edgar Polomé, Colin Renfrew, James P. Mallory, John Hines, Matthew Spriggs, Roger Green and Andrew Pawley. This trend is reflected in the recent publication of *Archaeology and Language* 1–3 (1997–99) and the series *Studies in Historical Archaeoethnology* (e.g. Ausenda ed. 1995; Hines ed. 1997; Heather ed. 1999).

Of course, we do not totally lack written sources, since we have the extremely important runic material and place-names. Furthermore, archaeology becomes vital especially when discussing the origin of runes and for dating specific rune stones and objects with runic inscriptions. Archaeology also ought to be as important for the dating and semantic interpretations of place-names, which has been obvious to toponymic scholars in Scandinavia up to now (cf. e.g. O. Rygh in NG passim; Steenstrup 1894; Sahlgren 1920; Olsen 1926; Ståhle 1946; Sandnes 1965; Hellberg 1967; Brink 1984). In runic studies there is still co-operation between archaeologists and philologists when presenting and discussing rune stones and inscriptions, an interdisciplinary approach which is absolutely necessary for accurate results (cf. e.g. Gustavson/Selinge 1988). The same ought to be the case for toponymic analysis.

Internationally there has been an ongoing trend to combine historical texts with archaeological evidence. This field of research, especially in the early days of the 20th c., has been misused, producing a kind of “Biblical archaeology”, but the combination is fruitful and has enriched the discussion (see e.g. *Beowulf* 1998; Herschend 1997; Norr 1998). Of course, there have also been problems in this co-operation between archaeology – more generally, the dating of styles – and runology, since it creates the problem of circular evidence. An example of this is the dating of the runic inscription on a stone at Skjeberg church in Norway (NIyR p. 10, No. 7). It is said that the church is built in a style and fashion that may be dated to ca. 1300, and that the runic inscription may be given the same dating. However, in a footnote we read that the dating of the church relies on the dating of the inscription (cf. A. Bæksted in *ANF* 57, 1944, 262).

The main questions which have been discussed with varying intensity during the last two centuries regarding the interface between

language and archaeology are the origin and spread of the Indo-Europeans (for recent opinions see e.g. *Journal of Indo-European Studies* (1973–); *Proto-Indo-European: The archaeology of a linguistic problem* (1987); *Perspectives on Indo-European language, culture and religion* (1991–92); *The Indo-Europeanization of Northern Europe* (1996); Renfrew 1987; Mallory 1989; 1997) and the origin of the Goths (for recent opinions see e.g. Hachmann 1970; Wolfram 1990; Heather 1996; *Reall.* 12, 402ff.). The latter issue in particular has a tangible significance for Scandinavia, since one of the hypotheses is that the Goths originated in Scandinavia (see Art. 78).

Today the question of ethnicity often is addressed. For earlier periods, especially pre-historic periods, this is an extremely problematic aspect. In archaeology, certain “cultures” may be defined within more or less homogeneous regions. Some claim that such cultures may be identified with ethnic groups, while others disagree. Scandinavia has recently seen a discussion of this kind regarding the first appearance and spread of the Sami (cf. Zachrisson et al. 1997). From a linguistic point of view, Scandinavia is – seen in a wider context – uniquely homogeneous with no substrata or superstrata in the language or in the place-name material. What we can see is one and the same Germanic language spoken over time (apart from the areas with Sami language and place-names). However, I am extremely cautious about discussing ethnicity from linguistic or archaeological evidence.

2. The origin and the archaeological dating of the runes

For a discussion on the origin of the runes, it is important to stress that runes are not an exclusively Scandinavian phenomenon but rather a Pan-Germanic writing system during the Roman period (Stoklund 1996, 112). On the periphery, which was not influenced so strongly by Roman culture, this writing system survived and was extensively used in the Viking Period, especially in *Svitjod*, i.e. the provinces around the Lake Mälaren in eastern Sweden. We know now, after extensive archaeological excavations especially in Norwegian urban areas (Bergen, Trondheim, Oslo, Tønsberg; plus Lödöse and Sigtuna in Sweden), that the runes were the everyday writing system for messages etc. throughout the Middle Ages (Liestøl 1964; Svärdström

1982; Knirk 1994; 1995). There is a concentration of the older inscriptions from the Roman Age in Denmark (incl. Scania and Schleswig), and the character of the inscriptions of the older futhark is such that one may question whether their purpose was ever connected to a literary culture. The older runic inscription with its epigraphical and secret character must be a reflection of the use of an innovation, the runic writing system, in an oral society. As D.H. Green (1994, 35) has put it, it looks as if “instead of transmitting a communication the runes appear to have been used to conceal it, to wrap it up in mystery and magic.” He draws attention to the fact that the word *rune* was connected with mystery and secrets; Go. *rūna* meant ‘the mystery of the kingdom of God’, and similar meanings are found in OE and OHG. Thus the origin of the runes becomes not a particular Scandinavian problem, but a Germanic one.

In my opinion, the most probable hypothesis regarding the origin follows closely H. Williams’ (1994; 1996; 1997) argumentation that the runic futhark is a Germanic adaptation of the Latin alphabet, most probably within the contact zone between Romans and Germanic people, thus north of Limes (cf. Willems 1989), in northwest Germany or south Denmark, probably around 200 A.D. or in the 2nd c. This is in line with E. Moltke’s idea (1985, 64) that the runic script was created in the Rhine area around the year 1. *If* the Danish area proves to be the place of innovation, there are two probable periods to focus on, involving a social and economic upheaval and close connections with the Roman world. The first is during the early phase of the Early Roman Iron Age (ca. 1–50 A.D.), while the second is during an early phase of the Late Roman Iron Age (ca. 150–250 A.D.). *If* the runes were created during the Early Roman Iron Age, a probable “area of invention” could be Jutland, Funen or Lolland (Hedeager/Kristiansen 1981, 117; Hedeager 1992, *passim*). While we do not have any runic objects securely dated to this period, another possibility is around 200 A.D., when we have an “explosion” of runic objects (Ilkjær/Lønstrup 1981, 60). The probable area then becomes southeast Zealand, which by then seems to have taken the political and economical initiative. From ca. 200 A.D. Stevns in southeastern Zealand had a very prominent position, and extraordinary finds give us evidence of trade with the Roman empire, especially from a site called Himlingøje (Lund

Hansen et al. 1995). Another candidate must be Gudme in Funen, which had a settlement already during pre-Roman times which evolved into a veritable centre during the Early Iron Age (Henriksen/Michaelsen eds. 1995).

It is notable that many objects with runic inscriptions occur in wealthy graves from around 200 A.D. If runes were known and used before this time, one would expect to find some prestigious objects with similar runic inscriptions in graves from the Early Roman Iron Age (especially 1–50 A.D.), such as the graves at Hoby and Juellinge in Lolland, Stangerup in Falster, Byrsted in Jutland and others, but there are none (cf. Lund Hansen 1988). This fact – although *e silentio* – could perhaps act as an argument for the runes to have been “invented” ca. 50–200 A.D.

Thus, a bridgehead for the Roman culture and a kind of “innovation centre” for Scandinavia most probably could be found in southern Denmark during the Early Roman Iron Age, especially ca. 150–250 A.D., but distinguishing itself already during the 1st c., with centres indicated by artefacts and monuments in such places as Hoby and Juellinge in Lolland, Dollerup in Jutland, Stevns with Himlingøje in Zealand, and Gudme in Funen. This area may stand up as one of the most serious candidates for the creation of the Germanic runes, if we may assume just one place of origin. It seems obvious that the older runes were a writing system very much linked to the uppermost strata in society, the aristocracy (Knirk 1994, 170). In this sense the development and usage of the Germanic runes may be seen as an indication of the strong links and contacts between the elite in Germanic societies.

Why the runes were “invented” is also a matter for discussion. E. Moltke takes a utilitarian position when stating that runes may have been created by some Germanic merchant for practical and communicative purposes, while A. Bæksted (1952, 134) takes a totally opposite stance in regarding the runes as having no practical function at all other than to be used as epigraphic, formulaic statements on weapons and objects. B. Odenstedt (1990, 171) finds Bæksted’s position convincing which also is in line with Green’s arguments. This ties in very much with the idea that the runes served a magical function.

In the discussion about the “origin” of runes, dating, of course, becomes vital. However, there are practically no possibilities for dating the inscriptions linguistically, only for

placing them in stages of the language: PGmc, PN, ON etc. Instead one has to rely on archaeological datings of the objects. In 1971 Jan Eriksson evaluated the archaeological datings of the earliest runic objects and found that they were very problematic. Of the 19 oldest runic objects known at that time only 4 had been excavated in an archaeologically competent manner, and so the dating of these objects may have been wrong. His conclusion was that the datings of the earliest runic inscriptions were not particularly accurate. Today we fortunately have a somewhat better situation, especially due to new finds and renewed examination of older excavations, at Himlingøje in Zealand, Thorsbjerg in Schleswig, Vimose in Funen and Illerup in Jutland (Ilkjær/Lønstrup 1981; cf. Moltke/Stoklund 1981; Stoklund 1987; 1995). After J. Ilkjær’s and J. Lønstrup’s (1981) re-examinations of the datings of the earliest runic objects, none were considered to be older than ca. 200 A.D.; thus the lance head from Øvre Stabu in Norway, which normally is dated to ca. 150 A.D., should be at least 50 years younger. Recently Ilkjær (1993, 297f.; cf. Stoklund 1995, 318) has tentatively dated a comb from Vimose to ca. 160 A.D. (B2/C1a). If we ignore the problematic Meldorf inscription, this should be the oldest datable runic inscription, at least in Scandinavia. In other words, we end up with the interesting situation that around 200 A.D. more than 20 runic inscriptions appear in Scandinavia (Thorsbjerg, Vimose, Illerup, Himlingøje in Denmark, Øvre Stabu in Norway, Gårdlösa in Scania and Mos in Gotland etc.). This sudden occurrence must reflect reasonably contemporary events. From the above it seems probable that the origins of the Germanic runes should be sought quite near to ca. 200 A.D., perhaps sometime during the 2nd c.

3. Archaeological evidence and the Viking and medieval runes

There is also an obvious link between archaeology and runology for the Viking Age inscriptions, both in the excavation phase and in the interpretative phase, especially when looking at the pictorial representations on the rune stones. Dating Viking Age rune stones from sound changes etc. has been a rather hazardous task, for the obvious reason that the Viking runic inscriptions were produced only within a very short time span, not within the range needed for detectable linguistic changes

to develop (cf. e. g. Williams 1991). In this light it is interesting that archaeologists think they are able to establish a rune chronology – both relative and absolute – for central Swedish rune stones from stylistic criteria based on the runic animals (Gräslund 1991; 1992; 1998a; 1998b). In other cases runologists and archaeologists have in co-operation managed to reconstruct Viking Age “bridges”, consisting of one or more rune stones and an earth, gravel or boulder bank over marshy land (Brink 2000).

An extraordinary opportunity for runologists was created with the excavation at Bryggen in Bergen, Norway. In 1955 the old jetty in Bergen at Bryggen caught fire and a 5000 m² area with wooden houses was destroyed. Afterwards an archaeological excavation was undertaken which ended 13 years later. Today we know of ca. 650 objects bearing runes from Bryggen, mostly small wooden sticks, plates etc. archaeologically dated from the 12th to the 15th c. (Liestøl 1964; 1968; Fjellhammer Seim 1994, 279). The runic inscriptions on these small wooden objects are of an everyday character: labels and tags with a name (**ioana Jóhann á** ‘Johan owns’, **rannra:karn:pætta** *Ragnarr á garn þetta* ‘Ragnar owns this yarn’), small messages (**gya:sæhir:atþu:kakhæim** *Gyða segir at þú gakk heim* ‘Gyða says that you should go home’, **þorkællmyntæresenter þerpipar** *Þorkell myntari sendir þer pipar* ‘Thorkel the minter sends you pepper’), notes and declarations of love (**ost:min:kis:mik** *óst min, kyss mik* ‘my dear, kiss me’, **unþu mæR ankþær gunnildr kys mik kanekþik** *Unn þú mér, ann ek þér Gunnhildr. Kyss mik kan ek þik* ‘Love me, I love you, Gunnhild. Kiss me, I know you well’), some of a very indelicate character (**felleg:er:fuþ:sin:bylli** *ferleg er fuþ, sin byrli*) (Liestøl 1964). Thanks to this excavation we have a new and deeper understanding of the functions of runes and the practical usage of runic writing, especially during the early Middle Ages. The obvious conclusion is that runic writing was in full use – and obviously was the normal form of everyday written communication – in the Middle Ages, up to the 15th c., and that carving runes on wood must have been the common way of writing everyday messages. In addition, these messages were written to be read, hence a common knowledge of runes must be assumed. Since some of the inscriptions reveal the existence of a pagan cult, e. g. a verse in *galdratalag* mentioning Thor and Odin (Knirk 1995):

**heil:seþu:ok:ihuhum:goþom/þor:þik:þig:gi:
open:þik:æihi**

Hei(l) sé þú
ok í hugum góðum.
Þórr þik þiggi.
Óðinn þik eigi,

and a wooden stick was found inscribed with some kind of curse (dated to 1335), and these bear a striking resemblance to Eddaic poetry and phrasing, the conclusion must be that there was not an abrupt end to pagan cultic activities or to the knowledge found in the ancient Eddaic and skaldic poetry when Scandinavia became Christian. The Bryggen runes thus may be used as evidence for the transition between the early pagan culture and religion in Scandinavia and the “Continental” Christian culture, although they of course do not prove the existence of pagan religion in the 14th c. An older “hyper-critical” stance has been to assume that there was a fairly abrupt break between the two. Instead one may assume that pagan Scandinavian traditions continued into the Middle Ages in different degrees (Meulengracht Sørensen 1991; Brink 1996, 49f.; Steinsland ms.). Also interesting in this respect are the objects with runes found in recent archaeological excavations in Trondheim (Hagland 1994), from where we now have more than 110 runic objects, and in Oslo (60) and Tønsberg (30) (Knirk 1994, 172).

4. Semantics, origins and datings of place-names

One vital aspect of toponymy is the dating of place-names. To make use of toponymic material other than for pure linguistic matters, you need to have the names dated or at least have some rudimentary understanding of their chronology. The toponymists working in the 19th c. focused much of their attention on this, and managed to come up with a relative chronology for the major place-name types (Steenstrup 1894). This relative chronology is important, but is a blunt instrument for the actual dating of names. Absolute dating is a much more problematic and difficult enterprise. Here especially co-operation with archaeology becomes vital. There are several methods for arriving at absolute dates, and the most used sources for this work are archaeological findings, ancient monuments and pollen analysis (Brink 1984). The crucial point

for hypotheses about absolute dating is the question of name continuity. Much work remains to be done in this field before we can obtain a more solid grasp on the actual datings of name types and individual names.

For a general discussion and for references on the dating of the main Scandinavian place-name elements, see Hald 1965; Christensen/Kousgård Sørensen 1972; Ståhl 1976; Dalberg/Kousgård Sørensen 1979; Jørgensen 1981–83; Pamp 1988; Strid 1993; Sandnes/Stemshaug 1997. A wide-ranging attempt to discuss the chronology and semantics of several elements in a settlement historical context can be found in Hellberg (1967), where, however, a great deal of stress is put on meadowland, which was on the agenda in landscape research in the 1950s. For a discussion of absolute chronology, see Brink (1983). For an attempt to go a step further with new methods for the absolute dating of place-names, see Brink (1984).

When analyzing the semantics of place-names, toponymists should follow the steps of archaeologists very closely. We have a situation today where proposed meanings of place-names and place-name elements not only in onomastic handbooks but also in modern dissertations and articles reiterate the semantic content espoused by scholars such as Oluf Rygh and Jöran Sahlgren, who worked in close contact with archaeologists around 1900 and came up with possible denotations for names and elements relying on the contextual evidence known at that time. Many place-name elements were given the denotation 'farm', and more "prestigious" elements, such as *-tuna*, *-vin* and *-hem* were glossed as 'large farm' or 'the farm par excellence', while Sahlgren was influenced by contemporary geographers and presented a denotation 'seter, shieling (Sw. *fäbodställe*)' for several elements such as *-sal*, *-stadhir*, *-säter* etc. Of course, these denotations were based on the theoretical framework and empirical knowledge of that time. The hamlets were thought to have their origin in a farm, often called an *urgård*, i.e. a primary, first farm, and in line with the evolutionary theoretical framework, a more developed entity must have its background in something primitive, and since the geographers and ethnologists of that time saw sedentary settlement, agrarian farms and hamlets, as having evolved from a primitive stage of periodic settlement, transhumance and seters, the latter of course were given as the original denotations for many place-

names. The odd thing is that some handbooks still give these meanings without comment.

We have found methods for detecting the land use of different sites, and thus we are able to connect the kind of cultivation or land use to some place-names. For the place-name *Hoset* in Trøndelag, Norway, a combination of archaeological, geographical and palaeoecological analyses have come up with the following land-use sequence for this site: during the Roman Iron Age, the land was used for grazing and haymaking; around 600 A.D. cultivation of cereals started, which continues into historical times (Salvesen et al. 1977, 131 ff.; Brink 1984, 48 f.). In a toponymical context, we may state that the name *Hoset* (a name in *-setr*) probably was given ca. 2000 years ago denoting a 'meadow or grazing land'. Around 600 A.D. a farm was established along with cultivated crops; thus we have a shift in denotation for *Hoset* from a field name to a settlement name. Another example is *Vattjom* (a name in *-hem*, *-heim*) in the province of Medelpad, Sweden. Archaeological and pollen evidence indicates that this farm was established ca. 200 A.D. on this site, probably in a kind of *landnám*, with continuous cultivation into historical times (Brink 1984, 45 ff.). Hence, one may assume that the *-hem* name, *Vattjom*, is to be dated to ca. 200 A.D., which must give us the most securely dated ancient place-name we have in Scandinavia. Finally, we have also come up with a new method for dating and figuring out the denotations for several names in *-boda* in the northeastern part of the province of Uppland. Thanks to radiocarbon datings and macro fossil analysis, we can see that these farms originally were used for haymaking, but in the 13th c. they were turned into farms with cultivated crops (Windelhed 1984; 1995; Brink ms. 2).

Today a totally new picture has emerged with regard to the settlement structure over time in Scandinavia. Many single farms during the Vendel (Merovingian) Period, the Viking Age or the Middle Ages may have hamlets or even large villages as predecessors in the Pre-Roman or Roman Iron Age. In southern Scandinavia we know today of hamlets dating from the Pre-Roman Iron Age, e.g. at *Grøntoft* and *Hodde* in Jutland before and around the year 1, and *Norre Snede* in Jutland during the first millennium A.D. In central Sweden there were farms and small hamlets in the Late Iron Age on infertile soil and hills, but a fairly puzzling pattern of long

houses and pit houses on the lower-lying clay during earlier periods; whether they were independent farms or hamlets is difficult to say. In Öland a picture emerges with single farms or hamlets connected by an intricate structure of stone walls. It is obvious that the older denotations for these found in current handbooks are wrong but what the updated denotations should be is not known and has not been discussed. (See Hvass 1988; Egeberg Hansen/Mikkelsen/Hvass 1991; Fallgren 1993; Kyhlberg ed. 1998; Kaldal Mikkelsen 1999; Riddersporre 1999; Rindel 1999).

The Scandinavian place-name landscape has up till now been looked upon as more or less homogeneous, with as high a degree of consistency between names and landscape in for example Denmark as in western Norway or in central Sweden. This is not so. As part of a still unpublished project, I studied ca. 10 small regions or settlement districts all over Scandinavia, analyzing and comparing three factors: the settlement names, the archaeological evidence and the palaeo-ecological evidence in the form of pollen samples (Brink ms. 1). All three source categories are totally independent of each other. One clear result is that Scandinavia is toponymically heterogeneous, with Denmark and Scania having few Iron Age place-names in a district's settlement-name corpus. The same seems to be the case for Gotland. The province of Västergötland has a very similar pattern to Gotland, with one very old name, normally that of the parish church village, but the rest consisting of fairly young names. In the Mälardalen region and also in Östergötland, we seem to have a settlement-name landscape which was shaped very much during the Late Iron Age (the Vendel and Viking periods), with some very old names. The highest continuity in the place-name structure is to be found in Vestlandet in Norway and in northern Bohuslän in Sweden. Here we seem to have a large bulk of settlement names originating from the middle of the first millennium or the Early Iron Age (the Roman and Migration periods), and in Vestlandet there are even some names that presumably can be expected to have been coined during the Bronze Age.

38. Nordic lexical items and the history of material culture

1. Introduction
2. The Proto-Nordic period (ca. 400–ca. 800)
3. The Viking Age and Early Middle Ages (ca. 800–ca. 1100)
4. The High Middle Ages – Old Nordic from 1100 to 1300
5. The Late Middle Ages. From Old Nordic to Early Modern Nordic; from 1300 to 1550
6. Early Modern Nordic 1550–1800
7. The 19th and 20th centuries
8. Literature (a selection)

1. Introduction

In this article the interplay between the Nordic lexicon and material culture is traced in the lexical sources through the centuries – from the oldest runic inscriptions of the Iron Age to the predominantly electronic communication of the 21st c. In the oldest periods Nordic culture was expansive, resulting in the export of Nordic lexical items to neighbouring languages, while in later periods the Nordic lexicon was heavily influenced by cultures to the south and to the west, importing whole terminologies tied to new cultural phenomena.

The available diachronic studies of the Nordic lexicon concentrate on the division between native words and loanwords and in this way give indirect evidence of cultural currents – the origins of the names of imported articles may e. g. reflect the routes of trade. But a thorough history of the relations between lexical

items and material culture should be derived from exhaustive studies of the development of the Nordic vocabulary in a series of subject fields. Some of the Latin-Danish or Latin-Swedish vocabularies from the Renaissance are arranged according to subject, e. g. *Variarum rerum vocabula cum Sueca interpretatione* [vocabulary of various things with Swedish explanation] (1538, Danish edition 1576), but the subject classification does not necessarily reflect the subject fields of the contemporary Nordic cultures, as the vocabularies were meant to serve as tools in the acquisition of Latin, and their classification was consequently geared to this aim. Much later, P. M. Rogge's *Thesaurus of English words and phrases* (1852) inspired lexicographers to compile dictionaries of concepts for many European languages. Among these are two 20th-century dictionaries, *Svenskt ordförråd ordnat i begreppsklasser* (1930) for Swedish by S. C. Bring, and *Dansk Begrebsordbog* (1945) for Danish by Harry Andersen. Systematic investigation of vocabularies for specific subject fields has flourished since the 1930s, and extensive work in the area of language for special purposes (LSP) has resulted in theories of terminology in the latter half of the 20th century. If such theories were applied in the historical study of the lexicon, a firmer basis for generalizations about the relations between lexical items and cultural history would emerge.

The most reliable material-lexical evidence comes from objects with their names inscribed

on them like PN *horn* written in runes on the Gallehus golden horn. In other cases the connection between the words and the cultural phenomena they refer to is less certain and depends on intimate knowledge of the language and culture of the different periods. We have chosen to illustrate the history of the Nordic lexicon in relation to material culture by concentrating on everyday phenomena like food, clothing, and shelter.

The oldest linguistic evidence of material culture is found in runic inscriptions and OWN poetry. The primary medieval sources, earlier in Norway and Iceland than in Sweden and Denmark, are – in order of appearance – wills, customs accounts, account books, court records and inventories of possessions. Wills bear witness to valued private possessions, customs accounts show movements of goods out of or into the Nordic countries, account books keep track of expenditures on goods bought locally and of victuals to be prepared or conserved, local court records give evidence of possessions in dispute. Many such texts have been edited by historians and furnished with indexes of topics, and they have formed the basis of e.g. presentations of the history of commerce, but few linguists have made use of these valuable lexical sources.

2. The Proto-Nordic period (ca. 400–ca. 800)

2.1. Loanwords in Finnish

Compared to our knowledge of the phonology, morphology and even syntax of PN, our knowledge of the vocabulary of the period is remarkably poor. The contemporary sources – runic inscriptions in the elder fuþark – are short and often stereotyped, and Scandinavian loanwords in Finnish (and Sami), although they bear witness to a material culture that must have been superior in some areas, such as sailing and ship-building, tell us little about daily life in the Iron Age. The great majority of PN loanwords in Finnish, the unsynopated forms of which betray their age, are nouns denoting concrete phenomena. The spheres to which they belong include: social organisation, e.g. Finn. *kuningas* ‘king’, PN **kuningaz*/**kuningaz*, OWN *konungr*; commerce, e.g. Finn. *raha* ‘means of payment, money’ < PN **skrahō* ‘skin, hide’, OWN *skrá* ‘skin, hide, scroll of parchment’; handicrafts, e.g. Finn. *napakaira* ‘auger’ < PN **nabagairaz*, OWN *nafarr* ‘drill, auger, gimlet’; ships

and seafaring, e.g. Finn. *airo* ‘oar’ < PN **airō*, OWN *ár* ‘oar’; dress, e.g. Finn. *vanttu* < PN **wantuz*, OWN *vōttr*.

2.2. The runic lexicon

For reconstruction of other parts of the lexicon, we must rely on comparison between Old Norse and other Germanic languages. The major part of the vocabulary of ON belongs to the common Germanic stock, and there is no reason to think that such words – e.g. domestic terms like *borð* ‘table’, *spinna* ‘spin’, *vefa* ‘weave’, *grýta* ‘pot’, *fat* ‘vessel, garment’ – were not current in PN, even though they are not actually found in runic inscriptions. It is striking that while most of the Scandinavian loanwords in Finnish have close parallels in the later language, a substantial part of the vocabulary found in runic inscriptions in the elder fuþark is either unknown from the later language or, if the word is known from later times, the meaning often seems to have been different. Examples are nouns like *alu*, *laukaz*, which apparently carry religious or magic connotations not present in their ON counterparts *al* ‘ale’ and *laukr* ‘leek, onion’. The OWN form corresponding to the feminine noun *tal-* < *lg* > *ijō* on the Vimose plane (Funen) would be **telgja*, but in ON this noun is only found in the nickname *trételgja* ‘wood-carver’. Nouns that appear to denote social position, as *erilaz*, *witandahlaiba*, *gudija*, and adjectives and verbs of uncertain meaning like *ungandiz*, *aljamarkiz*, *taujan* and *wurkian*, either have no correspondences in ON, or if they do, as e.g. OWN *yrkja*, their semantic content appears to have changed. This might indicate that the runic language is a specialized dialect which did not contribute much to the later lexicon.

3. The Viking Age and Early Middle Ages (ca. 800 – ca. 1100)

3.1. The sources

While the only written sources for EN before 1100 are relatively short runic inscriptions of limited interest for the study of the vocabulary of material culture, WN Viking Age poetry, preserved in medieval manuscripts, has more to offer in this respect. In their written form, the two kinds of OWN alliterative poetry, Eddaic and scaldic, belong to the renaissance movements of the 13th c. and later, but most of this poetry must have been written down after a longer or shorter period of oral trans-

mission. Dating the individual poems or stanzas is, however, a problematic undertaking, especially in the case of the anonymous Eddaic poems, while the stricter metre of scaldic poetry and the fact that most of it is ascribed to named poets in the sources, give reason for greater optimism. In the kings' sagas and the grammatical treatises, prose works from the 12th and 13th centuries, a large number of stanzas are quoted as documentation for historical or stylistic facts, stanzas which may be regarded as basically genuine Viking artefacts, even though they may have changed somewhat in oral tradition. The stanzas in the sagas of Icelanders, on the other hand, ostensibly composed by the characters of the sagas in the 9th or 10th c., may in many cases be suspected of being of later origin and are best ignored as sources of Viking Age linguistic history.

3.2. Evidence of everyday life from *Rígsþula*

The Eddaic poems are mostly set among the gods and the heroes of the past, but some of them give interesting glimpses into the daily life of more ordinary human beings. This is true in particular of *Rígsþula*, a poem preserved in a later manuscript than most other Eddaic poems and in a defective state, but thought to have been composed before 1200, possibly with roots in the 10th c. The society depicted in *Rígsþula* may well be that of the 10th century; the poem distinguishes between three social classes – chieftains, yeomen and slaves (to which may be added royalty, which was treated in the now-lost conclusion of the poem). In *Rígsþula* we find lexical items pertaining to agriculture, cloth-making, (female) dress and meals. The vocabulary is WN without clear regional characteristics, but references to ploughs and carts seem to indicate a Scandinavian or British environment rather than the Atlantic islands.

Terms for buildings – in order of rising social standing – are *hús* (used in the sg. of the slaves' quarters), *hóll* and *salr*. The fields (*akrar*, sg. *akr*, 'cultivated field') are fertilized (*teðja*, derived from *tað* n. 'manure'), and two kinds of plough are used, the native *arðr* and the more sophisticated *plógr*.

Cloth-making and dress: (1) Words for textiles include *váð* 'woollen cloth', *ripti* 'linen cloth' (also of a married woman's head-dress), *dúkr* 'tablecloth' (also of a scarf (?) worn round a woman's neck), *silki* 'silk' (as material for a baby wrap and a shift). (2) Words for

tools used in cloth-making: *rokkr* 'distaff' and *rifr* 'warp-beam of an upright warp-weighted loom'. From other poetic sources we know that the word for the weights that kept the warp straight was *klé*, pl. *kljár*. These weights were often made from soap-stone, which derives its Norse name (not found in old sources) from this application: *kléberg* (cf. Mod.Icel. and Far. *kljásteinavefstaður* and *klíggjavevur*). (3) Words for garments: the only male garment mentioned is *skyrta* 'shirt', but there is a variety of terms for the head-dress of a married woman: *sveigr*, *faldr*, *lin* and *ripti*. Other articles of female dress mentioned in *Rígsþula* are the *serkr* 'shift' and the *smokkr*. The *serkr* is made of *lin* 'linen' or even *silki* 'silk' – the words *serkr* and *silki* both have their ultimate origin in the same Chinese word, meaning 'silk', but while *serkr* is borrowed from the West (OE), *silki* comes from the East (Slavic). The word *smokkr* occurs only here in ON, but it is found in other Germanic languages with the meanings 'woman's shirt' and 'petticoat', and it seems quite likely that it denotes the characteristic apron-like over-dress worn by Viking Age women. This dress was held up by shoulder straps, fastened with a pair of brooches, which may be what the poem refers to as *dvergar*, literally 'dwarfs'. The word *kyrtill* 'tunic', implicit in the epithet *geitakyrtla* 'wearing a tunic of goatskin', was later to become the common word for the medieval-type dress for both men and women in all the Nordic countries, and *smokkr* is perhaps an example of a word that has gone out of use with the garment it denoted. On the other hand, the lexical items are often more long-lived than fashions; thus EN *kjortel* (the counterpart of WN *kyrtill*) has survived in all the Modern Nordic languages in the form *kjol(e)* (Icel. *kjöll*, Far. *kjóli*), but the garments it refers to differ: the word means 'skirt' in Sw., but in the other Nordic languages (through influence from Dan.) 'woman's (child's, clergyman's) frock or gown' or, alternatively, 'man's dress coat, tailcoat'.

Meals: The meal is served on a *skutill* 'dish, tray'; for the slaves there is *soð* 'broth' in a *bolli* 'bowl', but for the chieftain *vín* 'wine' in a *kanna* 'jug', from which it is poured into a *kalkr* 'goblet'. *Rígsþula* speaks of *varðir kalkar*, probably 'metal-mounted goblets', but other poetic sources have *hrímkalkar*, literally 'frost-goblets', i. e. goblets made from (opaque) glass which gives the impression of frost.

The majority of the words in these three areas are native Nordic words, but there are

a number of early loanwords among them: *plógr*, *dúkr*, *kyrtill* are loans from West Germanic languages, some perhaps from Old Frisian, others from Old English; *lin*, *serkr* and *skutill* come from Latin through Old English; *silki* is ultimately from Chinese. Silk is not known in Scandinavia before the Viking Age, whereas the words *vin* and *kalkr* belong to the Pre-Viking Age stratum of loanwords in the Nordic languages and come from Latin, perhaps through Old Saxon. There is every reason to think that the loanwords in question were adopted along with the objects or material they denote.

3.3. Gaelic influence

A number of Gaelic loanwords in WN dialects must go back to the Viking Age and indicate that the Norse colonists in the British Isles learnt certain techniques of a mainly agricultural nature from their Gaelic-speaking neighbours and that they in some cases brought these back with them to their homelands. A number of these words are found in both mainland Norwegian and the Atlantic dialects: OWN **sorn* (*hús*) (Mod.Icel. *sofn* (*hús*), in analogy with *ofn* 'oven', Mod.Far. *sornur*) 'kiln for drying corn', *korki* 'cudbear, a lichen used for dying wool red', *tarfr* 'bull', *des* 'haystack', *kró* 'enclosure'. The inhabitants of both Iceland and the Faroe Islands seem to have learnt from Gaelic speakers how to supplement their diet with edible seaweed, as witnessed by the words *slafak* 'sea-lettuce', from OIr. *slabac*, and Icel. *myrikjarni* (*mari(n)-*, *marar-*, *murú-*, *maríu-*), Far. *mirkjalli* 'badderlock, *Alaria esculenta*' (< older **myrkjanni*), which clearly also derives from a Gaelic word (a variety of local forms exist, e.g. *mircean* in Scots Gaelic). The word *blak* (< older **blaðak*) 'buttermilk' (from Gaelic **blathac*, OIr. *blathac*) is found in Faroese only, as are a couple of words connected to seal-hunting: Far. *grúkur* 'seal's head' and *gassi* 'cudgel used for killing seals'. The word *ærgi*, from Gaelic *airge* 'shieling, summer pasture for cattle, herdsman's hut' forms part of Faroese place-names, but is found in neither Iceland nor Norway, where the words *setr* and *sel* were used with the same meaning.

3.4. Seafaring vocabulary

Ships and seafaring were of course a topic of central importance to Viking Age people, since their whole culture rested on the sail-

carrying, ocean-going Viking ships which had been developed out of the clinker-built rowing-boats used for coastal traffic in the previous period. These marvellous ships made possible the vast expansion of the Viking world in the 9th and 10th c. The area where WN was spoken expanded from Norway itself to include the British Isles and the Atlantic islands, the Faroes and Iceland, and from these settlements expeditions went farther afield, to the west coast of Greenland, the coast of Newfoundland and up the St. Lawrence river. The Viking ships also brought home from the south and the east the luxuries enjoyed by the chieftain class – wine, silk and jewellery, either bought or pillaged. Small wonder that a substantial part of scaldic poetry was dedicated to ships and sailing, and the scalds were obviously fascinated not only by the ships themselves, but also by maritime language, so that a rich and specialized nautical nomenclature has survived in skaldic stanzas. Here we find terms for different types of ships, as well as for nautical details. The main differentiation is clearly between war ships and merchant ships, but when individual type-names, for example *karfi*, *knqrr*, *snekkja*, *skeið*, are applied to archeological finds in modern times, it is without any real certainty that the appropriate term has been used. The chances are better of identifying terms for nautical details, words like *beitiáss* 'tacking-spar' (a spar used for keeping the sail close-hauled when tacking against the wind), *húnn* 'mast-top', *hofuðbenda* 'shroud', *stag* 'stay', *stýri* 'rudder', *segl* 'sail', *rá* 'yard'. Very few nautical terms in the Viking Age are of foreign origin, but a couple of central words must have been borrowed very early on, presumably before the Scandinavians established their maritime superiority, namely *bátr* 'boat' and *akkeri* 'anchor', both probably from Old Frisian. In the Viking Age many nautical terms were borrowed into other languages, notably Irish, Scottish Gaelic and French, where some of them have survived to the present day, for example Mod.Fr. *hauban* 'shroud' (< *hofuðbenda*), *étai* 'stay' (< *stag*), *hune* 'mast-top' (< *húnn*).

3.5. Nordic loanwords in English

In England (and Scotland), where there was a fair degree of mutual intelligibility between the native dialects and the speech of the Scandinavian settlers, more extensive borrowing took place and could go in either direction. The semantic spheres of the Nordic loanwords

in English include social organization: ModE *fellow* comes from ON *félagi* ‘partner, shareholder’; many place-names in England end in *-by* and *-thorpe*, both meaning ‘village’; clothing: *skirt* is a Scand. loanword, as betrayed by the initial *sk-*, and cognate with the native E *shirt* (both words are derivations of the adjective *short*); and foodstuffs: the Nordic *egg* ousted the native *ey*, although as late as 1490 Caxton, in a preface to a book printed by him, wavers between the plurals *egges* and *eyren*.

3.6. East Nordic

In Sweden and Denmark, vernacular sources are restricted to the numerous runic inscriptions. In these texts the dominant material culture is that of the runic monuments themselves. Many inscriptions include a reference to the monumental stone in the formula *NN risþi* or *sati stin þansi* [NN raised or put up this stone]. The seafaring culture of the vikings is occasionally referred to by the terms *skip* ‘ship’ and *skipari* ‘member of a crew’.

4. The High Middle Ages – Old Nordic from 1100 to 1300

4.1. The sources

In the WN area, the Latin alphabet was adapted for writing the vernacular ca. 1100, and following this, literary sources multiplied, especially in Iceland. For cultural history, however, the most relevant sources are law books and charters, while the narrative literature of the 13th c., from the romances translated from French at Hákon Hákonarson’s court (1217–1263) to the Icelandic sagas, bear a more distant relation to cultural realities. The Icelandic sagas, especially the sagas of Icelanders (*Íslendingasögur*) and the so-called “contemporary sagas”, do contain valuable information about daily life in Iceland, but in the case of the sagas of Icelanders, their action takes place in a period long before that in which they were written, and they cannot be expected to report cultural changes accurately. More reliable descriptions of e. g. housing and furniture are found in the contemporary sagas, which also give rare glimpses into the lives of farm-workers and other ordinary people attending to their everyday chores, like cooking or washing clothes in the hot springs of volcanic Iceland. The Icelandic word for such a natural washing basin is *hverr*, a word that originally meant ‘cauldron’ and was used

in this sense in Eddic poetry, but which the Icelandic colonists used referring to the geothermal pools in their new country. Over the course of time, the old meaning of the word *hverr* was forgotten, and the word ceased to be a metaphor.

In Sweden and Denmark, literacy in Latin dominated in this period, the notable exceptions being the provincial laws, a few municipal laws, translations of religious texts, and books on herbal medicine.

4.2. Housing terminology

In the Pre-Viking and the Viking Ages, Nordic farmers lived in buildings consisting of one long room with a single hearth where humans and animals lived together. In some cases the room was partitioned into living quarters for humans and stalls for animals. It would seem that one word for the longhouse was *eldhús* ‘fire-house’, and others may have been *salr* or *salhús*, *eldaskáli* (in Iceland) and *sethús*, literally ‘seat-house’ (still in use in the Faroe Islands about a single-family house).

In the early Middle Ages, living quarters were differentiated with separate rooms for the preparation of food, storing of provisions etc.; in areas where the local construction materials facilitated this solution, the rooms were located in larger buildings, while in other areas a farm consisted of several smaller buildings, each with its own function. This gave rise to varied housing terminology in the Nordic languages.

The great innovation of this period is the heated living room, *stofa* (Mod.Sw. *stuga* ‘small house’, Mod.Dan. *stue* ‘living room’), which was introduced in the Nordic countries in the 11th c. The main buildings of a medieval Norwegian or Icelandic farm according to the laws were the *stofa*, *eldhús* (used for sleeping, cooking and eating) and *búr* or *búð* (‘store house’). Other farm buildings could include *ffjós* ‘byre’ (< *fé-hús* ‘cattle-house’) and in coastal regions *hjalldr* ‘fish-drying shed’ and *naust* ‘boat-house’. In Norway the farm buildings are typically placed in the *tún* ‘plot of land’, a word also used for the whole complex of farm buildings. The original meaning of *tún* is ‘enclosure’; it is etymologically identical with Mod.G *Zaun* ‘fence’ and Mod.E *town*. In Iceland, on the other hand, where the buildings tend to be joined together for climatic reasons, the word *tún* is used in the sense ‘home-field’, the manured part of the farmland. Since the houses had no windows, the only daylight

coming through the *ljóri* 'louver', the lamp, *kola*, was an important piece of the household equipment which made it possible to work indoors (e.g. spin and weave). A *kola* was a small open vessel of soap-stone or iron, filled with oil (seal- or fish-oil), which derived its WN name, *lýsi*, from this function (a derivation of the noun *ljós* 'light'). Candles (*kerti*) made from imported wax (*vax*) were found only in churches and wealthy houses.

In Sweden, Denmark and eastern Norway *garth* (Mod.Sw. and Mod.Dan. *gård*, Norw. *gård/gard*), related to *gærde* 'fence', designated the collection of rooms or houses, *hus*, that constituted a farm. In Denmark the farms were mostly gathered in a village, *by*, while in the Western provinces of Sweden the farms were placed separately, each close to its fields. The Swedish regional laws have lists of houses belonging to a *garth*: *stuga*, *stekarehus* 'house for cooking', *visthus* 'storage for food', *kornherberge* 'storage for grain', *fæhus* 'cattle house'.

4.3. Norwegian town culture

WN vocabulary reflects the fact that society in Norway and Iceland developed differently in the Middle Ages. In Iceland there were no towns, and the farms (*bær*) were solitary, whereas Norway from the 11th c. onwards had several market towns (*bær*, *býr*, *kaupangr*), whose inhabitants made a living from commerce and trade. The crown and the church were important forces in the Norwegian towns, especially Niðaróss, Bergen and Oslo, which were all royal residences for prolonged periods. Niðaróss (the modern Trondheim) was after 1152 the archiepiscopal see ministering to the entire West Nordic area, while Bergen and Oslo were both cathedral towns. The market towns were the localities where contact with foreigners and foreign merchandise was most likely to take place.

The vocabulary connected with Norwegian towns in the early Middle Ages is well known from laws and documents, which i. a. contain detailed regulations concerning the streets (*stræti*), the houses (*garðr*) and the location of groups of specialized craftsmen who offered their services to the townspeople. These craftsmen include the comb-maker (*kambari*), the shoemaker (*sútari*), the tanner (*skinnari*), the saddler (*sqflari*) and the tailor (*sniddari*). These denominations are formed with the productive suffix *-ari* (< Lat. *-arius*), which could be suffixed to native words and loanwords

alike. The loanwords in this period are predominantly English, e.g. *stræti*, *sútari* (ultimately from Lat. *sutor*), but influence from MLG (*sniddari*) was also beginning.

The professional weaver (*vefari*) was among the craftsmen who plied their trade in the Norwegian towns, but the coarse, undyed *vaðmál* 'homespun' in which common people dressed was woven at the farms or imported from Iceland or Shetland. Fashionable townspeople had garments made from fine imported fabrics, often named after their place of origin, e.g. *enskt klæði* 'English cloth', *bryggist klæði* (from Bruges). The garments were still to a large extent similar to those worn in the Viking Age: *brækr* (pl. of *brók*) and *skyrta* 'man's shirt' or *serkr* 'woman's shift' under a *kyrtill*, and over that a *skikkja* 'cloak' or *móttull* 'mantle' (an old loanword, ultimately from Lat. *mantellum*). Fashionable clothes could have foreign names, e.g. *treyja* 'jacket', referred to as an article of luxury in the 13th c. (from LG *troye*, *troie* 'short coat or mail', probably borrowed from OFr.).

Food in the Norwegian rural areas and the Atlantic islands was probably much the same as it had been in the Viking Age, that is boiled meat, fresh or dried fish, milk products (*ostr* 'cheese', *skyr* 'curds', *brauð* '(barley) bread' and not least *grautr* 'porridge'), but in the higher circles in the towns, and especially at court, elements from contemporary European cuisine were adopted, and the dishes were seasoned with imported spices (*spiz*, *spizar(n)i*): *piparr* 'pepper', *gingibráð* 'ginger', *naglar* 'cloves', and *kanelabark* 'cinnamon'. The names of spices are predominantly English, as is the word for fine wheat flour (*flúr*) and the (wooden) plate on which the meal was served: *diskr*. Modern Icelandic and Faroese, as well as some Norwegian dialects, have retained this word (Far. as the compound *borðiskur*), while in most varieties of Modern Norwegian it has been replaced by *tallerk(en)*, which comes from LG.

5. The Late Middle Ages. From Old Nordic to Early Modern Nordic; from 1300 to 1550

5.1. The sources

In this period, all the Nordic languages except Faroese are well attested in several kinds of written sources, the most reliable for the study of material culture being wills, customs ac-

counts, account books, court records and inventories of possessions.

5.2. Middle Low German influence

The mid-13th c. saw the beginning of the single most decisive cultural influence on the Nordic lexicon that went on until the middle of the 16th c.: the great Middle Low German lexical influx that left its permanent stamp on all the Nordic languages. The rise and growth of Hanseatic commerce with settlements in all the major Nordic towns meant that there was German influence in most areas of Nordic culture. In Iceland, where there were no towns or even villages, this German influence was indirect, in the Middle Ages through Norwegian – spoken by visiting merchants, but also by high officials, especially several of the bishops – and later through Danish. The Hansa dominated foreign trade in Norway from ca. 1300. The main import article was bread grain from the Baltic and necessitated a new type of ship, the *kuggr* (< LG *kogge*), which carried 6–10 times the cargo of the slim and light Viking ships.

The most important Hanseatic place of contact over a period of four hundred years was the seasonal Scanian market at Skanør and Falsterbo. The basis for this market was the abundance of herring in the Sound; several hundred thousand barrels were filled with *sild* ‘herring’ each autumn, landed by over 30,000 seasonal fishermen coming from all over Denmark. The importance of commerce with the towns around the Sound is attested in sources from the biggest Hanseatic town Lübeck: in 1399 the value of Lübeck’s commerce on the Scanian market was more than 150,000 marks, whereas commerce with Stockholm and with Bergen each had the value of approximately 25,000 marks (Henning S. Eriksson, *Skånemarkedet*, 1980, 86). In the Scanian towns, agricultural products like butter, hides and skins, and meat were sold as well; in the charter for Malmø town from 1360, the king gives the townsmen a monopoly on commerce, as no foreigner is allowed to buy more of these goods than he needs to feed himself: “engen gest [...] ma køpe hwder, skin, smør elles flæsk meer æn [...] til sin eghen kost” (DGK 4, 40). The mayor of Malmø and his council in the same document get the right to organize wine and beer trade, “wiin elles tydest øll” and all cartage except the traffic in *fersk sild* ‘fresh herring’. Foreign merchants brought salt for the preservation of the herring and other in-

ternational goods like tools, spices and woven cloth. The terms of all the foreign goods and the names and terminology of many crafts like *drejer* ‘turner’, *rebslager* ‘ropemaker’, *remmesnider* ‘strap maker’, *skomager* ‘shoemaker’ and *snedker* ‘joiner’ were imported with the goods and skills; the LG word for goods *kram* is found in compound words like Dan. *isenkram* ‘hardware’, *urtekram* ‘groceries’ and in Dan. *kræmmer*, Sw. *krämare* ‘shopkeeper’. Many cultural areas were affected: the verbs *spise* and *koge*, the terms for eating and boiling in Mod. Standard Dan. are telling examples; they were borrowed from LG in this period and gradually supplanted the Nordic verbs, older Dan. *ætæ* and *siuthæ*. New kinds of tableware like Dan. *tallerken*, Sw. *tallrik* ‘plate’ and Dan. and OSw. *krus* ‘mug’ entered at the same time.

The Low German vocabulary adapted into Norwegian and Danish in the Hanseatic period was to a large extent the same, but the process of borrowing into Norwegian was direct and independent of Danish borrowings, as is borne out by a number of specific Norwegian borrowings, e. g. *hyssing* ‘twine, string’ (Dan. *sejlgarn*) and *spiker* ‘nail’ (Dan. *søm* n.). Both *hyssing* and *spiger* are found in Danish too, but with more specialized meanings (‘houseline’ and ‘large nail, spike’).

In Sweden the largest towns were dominated by the German merchants in the 14th and 15th c., and the vocabulary of commerce and crafts included hundreds of Low German terms. In Stockholm the products of the Swedish mining industry formed a considerable part of the Hanseatic trade. Iron, copper and silver was mined, transported mostly to Stockholm, weighed, and sold to the German merchants. Swedish iron dominated the North European market, the amount exported rising from an approximate minimum of 275 tons in 1369 to around 1100 tons per year in 1492 (*KLNM* XI, 568). The rise in production continued through the centuries; in 1983 Sweden produced 8.3 mill. tons of iron ore. In the 13th century the technique for iron extraction was improved, inspired by Germany – the term *hytta* ‘ironworks’ was taken over from German – as the introduction of water power meant higher temperatures and better products. Several kinds of iron were sold. The most widespread was called *osmund* all over Europe; the origin of the term is unknown.

Among the most important innovations in building conventions are glass windows and chimneys, which spread over the Nordic area

from the late Middle Ages onwards (glass windows in churches were of course known earlier). The word *skorste(i)n* 'chimney' was borrowed from LG into most Nordic dialects. A LG term for 'window' was borrowed into Sw.: *fönster* (ultimately from Lat. *fenestra*), while in Dan. and Norw. the old Nordic term *vindue*, lit. 'wind-eye', probably originally denoting an air hole, was transferred to openings primarily designed to admit light into a building (E *window* is a Nordic loan).

Commerce with the Hansa merchants also involved the export of agricultural and other products with native names like Dan. *smør* 'butter', Norw. *skreið* 'dried cod' which the Germans called *stokfisk*. Danish agricultural production gradually changed in the later Middle Ages, as more meat was produced and eaten. In Jutland and Funen, oxen were raised and exported to Germany. In the 15th century the oxen were exported in the autumn. The term for young oxen fed on grass in the pasture during the summer was *græsøxen*; by the end of the century between 12,000 and 15,000 *græsøxen* had been exported from Funen and Jutland. In the 16th century it became customary to feed the young oxen in the stable over the winter; with the change in the time of export to the spring came a change in the name of the product to *staldøxen*. This was a very profitable enterprise, and a decree from the king impresses on the noblemen that the number of *staldøxen* must be limited to the available amount of fodder, while another decree prohibits the export of *græsøxen* because they are needed for meat during the winter (*KLNM* XX, 674ff.). The oxen trade brought many people into contact with their German customers, their culture and language, and made possible the import of foreign goods and luxuries: *klenodier* 'treasures', *bradser* 'brooches', material like *fløyel* 'velvet', and *damask* 'damask'.

Men, women, and children all wore a *kjortel* 'kirtle' and *hue* 'cap'. Other garments mentioned in the 16th-c. lists of possessions are *kaabe* 'coat', *hoser* 'breeches', *trøje* 'jacket'. Many of the terms for garments found in the town culture of the first half of the 16th c., e.g. *hue*, *hoser* and *trøje*, were still used in the countryside in the 19th c. The old word for dress material, *klæði*, was used as the generic term for clothes in all the Nordic countries during the Middle Ages. This is still the case in the WN languages (in Icel. also *fatnaður*, *föt*) and in Mod.Sw. *kläder*; in Mod.Dan. the generic term for clothes is *toj* which was taken

over from LG *tūch*, initially with the sense 'dress material' still kept in Mod.Sw. *tyg*.

In Denmark the most common construction for both farm houses and town houses was half-timbering with one or more wings and with thatched roofs. The half-timbered construction was dominant in the towns throughout the Middle Ages, and prevailed in the countryside into the 19th c. Each house had several rooms, each with its own name. In probate deeds from the beginning of the 16th c. the possessions are listed according to their whereabouts in the house. In this way we get information about the layout of the houses and the names of the rooms. A Malmö town house in the first half of the 16th c. had a *keller* 'basement' used for storage, the ground floor had the following rooms: *forstue* 'corridor', *stue* 'living room', *stegers* 'kitchen', and *herberg* 'room without heating', while *loftet* 'the loft' was used as extra sleeping quarters (*Malmö Skifter, Bofortegnelser 1546–1559*, 1, 7f., ed. by Einar Bager).

6. Early Modern Nordic 1550–1800

In the course of the previous period, the Norwegian written language was gradually replaced by Danish, and it is symptomatic of the situation that while the Danes, Swedes and Icelanders had the Bible translated into their respective languages in connection with the Lutheran Reformation, in Norway (and the Faroe Islands) it was the Danish Bible (1550) that came to set the standard for the written language. Norwegian vocabulary, however, lived on in the rural dialects, but it was not preserved in written form, apart from shorter samples, word lists and the like, mostly collected for curiosity's sake. A more thorough inventory had to wait for Ivar Aasen's dictionary, first published in 1850 (*Ordbog over det norske Folkesprog*, new edition 1872–73 *Norsk Ordbog*). Aasen's dictionaries are, however, puristic in their intention, and hardly give a realistic picture of actual usage.

After the Reformation the ties between Norway and the Atlantic islands loosened, and from ca. 1600 commercial and cultural relations were no longer with Bergen and other Norwegian towns, but with Copenhagen. The old cultural and to some extent linguistic unity was broken up into smaller, isolated areas, where relations to the outer world were dominated by the Royal monopoly trade. But Icelandic, the most conserva-

tive of the Nordic languages, never suffered the break of continuity that affected the Norwegian written language so fatally. On the contrary, the medieval Icelandic texts, especially the laws, continued to be read and copied for centuries after the Reformation. Printed books from the 16th, 17th and 18th centuries – the great majority of pious content – are full of Danish and German loanwords, but the spoken language remained essentially intact, partly because social conditions did not change much. Reykjavík, by 1800 a town of ca. 300 inhabitants, was an exception in this respect; many of the townspeople were Danish by birth and language, and the language of their Icelandic neighbours was by all accounts heavily mixed with Danish. By the end of the 18th c., when the ideas of the Enlightenment reached Iceland, attempts were made to introduce new methods and implements into the Icelandic industries (agriculture and fishery); the advocates of these technical improvements made a point of creating Icelandic neologisms for the commodities in question, when the foreign names were not adaptable to Icelandic phonology and/or morphology. Many of the neologisms introduced in this period failed to gain acceptance in the language, but some are still in use, e.g. *steinolia*, literally ‘stone-oil’ = ‘petroleum, paraffin’.

In these centuries the written sources in Danish and Swedish abound; account books, court records and inventories of possessions are some of the most reliable witnesses to material culture in the everyday lives of the populations. In the records of the regional courts from the first half of the 17th c., the rural culture of the time is reflected. The terminology for farm buildings and their rooms may be compared regionally in the 17th-c. court records from the Skast district in Southern Jutland and from the Sokkelund district in Zealand, and diachronically; compare for example the town house terms from 16th-century Malmø in 5.2 and West Jutlandic farms in the 19th century in 7. A number of features are common to Skast and Sokkelund: both farms are called *gård* and consist of several wings; both have a *fæhus* ‘cattle house’ and *holade* ‘hay barn’; among the building materials, *tag* ‘rushes’ reveal that they had thatched roofs; several terms for rooms are similar to those of the Malmø town house: *kælder*, *stue*, *herberg*, *loft*. The terms for the wings of the farm and for the farmhouse show regional differences: the wings are called *hus* in Jutland and

længe in Zealand, the farmhouse is called *salshus* in Jutland and *stuelænge* in Zealand.

In Iceland, as a result of an increasing lack of firewood, the oven-heated *baðstofa* (literally ‘bath-room’), which in the Middle Ages functioned as a sort of sauna, took over the function of the *stofa* and became a living room. This development occurred over the course of the 16th and 17th c.; still later, as house-heating ceased altogether, the bedsteads were moved into the *baðstofa*, which became the room in which people slept, ate and worked, much as they had done in the Viking Age *eldhús* (cf. 4.2), but without other heating than the warmth from human beings. In some cases the *baðstofa* was placed on the second floor over the byre (*fjósbaðstofa*, the term is not attested before the 19th c.) in order to take advantage of the heat from the animals.

In all the Nordic countries, people’s clothing had changed from the medieval types, and there was an increasing differentiation between the towns, where relatively short-lived foreign fashions were accepted, and the countryside with its more conservative habits, which included clothing vocabulary. The great revolution in women’s dress happened around 1500, when women began wearing two-piece dresses, a skirt and a bodice, instead of the medieval one-piece *kyrtill*. The skirt was called *skjört* (a LG loanword, but ultimately the same word as OWN *skyrta*, cf. 3.5., E *shirt*) in Norway and the Faroes (where the modern spelling is *skjúrt*), but *kjol* in Sweden and *pils* in Iceland; for the bodice, especially a knitted bodice, the most widespread word was *troje* (Denmark, Sweden, Norway, the Faroe Islands, where the spelling is *troyggja*), but Icelandic differs by employing another loanword (of uncertain origin): *peysa*. Men’s trousers were not much different from the medieval *brækr*, but the new word was *bukser* (Sw. *byxor*, Icel. *buxur*, originally *buck-hose* ‘buckskin breeches’). Over the trousers Norwegian men wore a *kufsta/kofte*, made from *vadmål*. This garment became a kind of emblem for the farmer class in Norway, but the word *kufsta/kofte* seems to be imported; it is thought to have come from Turkish *kaftan*, a word which again has Persian roots. The corresponding garment in the Faroe Islands also had foreign names, despite their native appearance: *kot*, probably an abridgement of the Fr. *surcote*, or *sjóstúka*, literally ‘sea-shirt’, but probably a corruption of Fr. *juste-au-corps*.

Stability and stagnation characterized economic and social life in both Iceland and the Faroe Islands in this period. Wool – “the gold of the Faroes”, as the saying goes – was processed at the farms down to the 17th c. using prehistoric-type implements: the distaff (*rok-kur*, later *snældu*) and the warp-weighted loom (cf. 3.2.). In the 17th c. the spinning-wheel was introduced in the Faroes; the Danish name of this early type, which was worked by hand, was *skotrok* and may reflect a Scottish origin; in the Faroes, where it was first demonstrated by Shetlanders called in for the purpose, it was called *hjólrökkur*. Neither the spinning-wheel nor the horizontal loom was introduced in Iceland until the 18th century. Since the horizontal loom came to Iceland from Denmark, it was commonly called *danski vefstóllinn*, and the old warp-weighted loom by contrast was *islenski vefstaðurinn*.

Knitting is one of the most widely spread crafts: the oldest preserved knitted article in Scandinavia was knitted by a Swedish noblewoman, Sophia Vasa, in the first half of the 16th c. Knitted articles were imported, and they were produced on the farms; at the 19th-c. *bindstov* ‘knitting get-together’ in Jutland, women, men and children were all knitting. In her history of knitting terminology, Inge Lise Pedersen (1987) traces the craft of knitting from the Middle Ages when religious paintings in Northern Germany give the earliest evidence of knitting in Northern Europe. Evidence of knitting terminology is not found until the beginning of the 16th c., but in the following four centuries three verbs for knitting are found in Danish: *knytte*, *binde* and *strikke*. In its oldest usage *strikke* – the Mod.Dan. term for knitting – referred to imported articles, presumably with special patterns; *knytte*, borrowed from LG in this sense, and the native *binde* are found side by side; in some of the dialects of the 19th c. the two verbs designate different knitting techniques. In Sw. the craft is called *sticka*, in Far. *binda*, and in Icel. the term is *prjóna*, derived from *prjónn* ‘needle’, a loanword of uncertain origin.

Many of the new words from this period belong to different vocabularies for special purposes: the language of administration, the specialization of crafts with growing professional terminology, and new occupations and new technologies, e.g. mechanized workshops, among others a *tabach pibe værk* ‘pipe factory’. New exotic merchandise carried names like *appelsin* ‘orange’, *sokkelade* or *suk-*

kerlade (with reference to *sukker* ‘sugar’) ‘chocolate’, *thee* ‘tea’, *caffee* ‘coffee’, and *tabach* ‘tobacco’.

The cultural influence from Germany continued. Many inhabitants, especially in the towns, were of German origin and many people with Danish or Swedish as their mother tongue were fluent in German. In this period High German had replaced Low German as the most prestigious foreign language. The German influence continues in the terminology of the crafts and is otherwise noticeable in the area of abstracts.

The court, the nobility and the more influential citizens followed fashions from France in building, furniture, clothes, and in food and drink, and continued to do so throughout the 19th c. In Sweden the French influence was at its strongest in the reign of Gustav III in the last decades of the 18th c. French influence is reflected in building terms like Dan. *etage* ‘floor’, Dan. *entré*, Sw. *tambur* ‘entrance-hall’, Sw. *garderob*, Dan. *garderobe* ‘wardrobe’ and Dan. *boudoir* ‘boudoir’. Among the numerous words for garments are Dan. *chemise*, Sw. *chemis* ‘chemise’, Dan. *bluse*, Sw. *blus* ‘blouse’, Dan. and Sw. *permissioner* ‘pants’ developed euphemistically from *med permission* ‘with your permission’, and Sw. *kalsonger* ‘pants’. From the abundant terminology of dining borrowed from French, the following terms among many others are still in use in 20th-c. everyday vocabulary: Dan. *bøf*, Sw. and Norw. *biff* ‘beefsteak’, Dan. *sovs*, Norw. *saus*, Sw. *sås* ‘sauce’, Dan. *frikadelle* ‘rissole’, Dan., Norw., and Sw. *dessert* ‘sweet’, and Sw. *glass* ‘ice cream’.

7. The 19th and 20th centuries

In the centuries when most of the population lived and worked in the countryside, agriculture and its terminology was common knowledge; everybody knew how to keep cattle, grow corn etc. and were able to talk about it. The lexical items for agriculture were part of the general language.

Thorough investigations of regional languages in the 20th c. included many informants born in the preceding century. One notable example is Peter Skautrup’s complete inventory of the vocabulary of the dialect of Hardsyssel in Western Jutland based on interviews with his mother who also reported on the language of her father, who was born 1822. Consequently this inventory reflects the agri-

cultural terminology of Jutland in the 19th c. One of the basic characteristics of the agricultural vocabulary in this dialect was its stability. Agricultural techniques changed little over the centuries and terms from the 17th c. were still used in the 19th c. The Hardsyssel dialect had kept many of the housing terms mentioned in section 6: both *sals* (for older *salshus*) and *stuehus* were used for ‘farmhouse’, the wings were called *hus* as in the Skast district in the 17th c.; among the rooms were *stue* and *forstue*, and *tag* was the term for thatching.

In all the Nordic countries, the differences between the vocabulary of educated people, especially in the towns, and that of the rural population became more marked in the 18th and 19th c. than they had been before. These differences were partly due to direct foreign influence on the spoken language, partly to the fact that as literacy became more widespread, the spoken language, especially in the towns, tended to be influenced by the written language, both as regards pronunciation and vocabulary. This development was particularly striking in Norway, where the written language was Danish. Paradoxically, the impact of Danish on educated Norwegian, both written and spoken, grew stronger after the separation of the two countries in 1814. In the first half of the 19th century, pupils in Norwegian secondary schools were taught to write as pure Danish as possible and to avoid “provincialisms”. Among the blacklisted words were terms belonging to material culture, e.g. *lin* ‘flax’ (Dan. *hør*), *stry* ‘tow’ (Dan. *blår*), *nøste* ‘ball of yarn, knitting wool’ (Dan. *nogle* n.); to the same category belonged words like *fille* ‘rag’ (Dan. *pjalt*), *votter* ‘mittens’ (Dan. *vanter*), *fjøs* ‘byre’ (Dan. *kostald*), *kavring* ‘rusk’ (Dan. *tvebak*). We must conclude that such Norwegianisms belonged to everyday speech even in the towns. The efforts to eradicate them from educated language were only temporarily successful; after the middle of the century they were increasingly employed by Norwegian authors, whose language was in other respects more Danish than Norwegian (e.g. Henrik Ibsen, Jonas Lie), and in the 20th c. they were regarded as standard Norwegian terms, equally current in Bokmål and Nynorsk.

After the OWN written language fell into disuse in the 14th c., Norwegian rural dialects had no shared higher norm that could influence the spoken language. They were only marginally influenced by Danish, and were in-

deed the direct continuation of the OWN language. By virtue of this “purity” they became by the middle of the 19th c. the basis for Ivar Aasen’s constructed common written language for all Norwegian dialects. Norwegian 19th-c. purism was primarily directed against Danish influence (and specifically against the Germanisms adopted into Danish in the 18th c.), and Aasen’s dictionaries contain quite a number of cultural loanwords from the Middle Ages, e.g. *troya* ‘coat, jacket’, *buksa* ‘trousers’ (but not *skjørt* ‘skirt’; the common word for skirt in the Norwegian countryside being *stakk*), *skræddar* (or *skraddar*) ‘tailor’, *hyvel* ‘plane’; even the word *poteta* ‘potato’ is included, with the additional information that it is a new word in Norwegian.

Eating habits changed radically in Norway in the beginning of the 19th c., when herring and potatoes replaced barley porridge as the staple diet of ordinary people. Potatoes had been introduced to the Nordic countries in the 17th c. and were cultivated under various names: *kartofler* in Denmark (and, derived from the Dan., *kartöflur* in Iceland), but *potatis* in Sweden and *poteter* in Norway. In Faroese (and locally in Norwegian) the word for potato is, however, *epli* ‘apple’ (less common *jordæpli*, literally ‘earth-apple’, a calque from German or French). The fruit known as *eple*, *æble*, *äpple* in the other Nordic languages is called *súrepli* ‘sour apple’ in Faroese.

With growing specialization, the languages of the different professions were primarily part of the trades, and only the most basic terms from each profession were generally known. Mechanization through factories, machines, and instruments brought with it the international Graeco-Latin terms of technology: *instrumenter* ‘instruments’ and *maskiner* ‘machines’ (both words known in 17th-c. Sw. and Dan.), *elektrisk lys* ‘electric light’, *motor* ‘motor’; the birth of communication technology: *telegraf* ‘telegraph’, *telefon* ‘telephone’; vehicles like *cykler* ‘bicycles’ and *automobiler* – from 1902 *biler* – ‘motorcars’ appeared in the last decades of the 19th c. Although German cultural influence decreased in the second half of the 19th c., partly due to the wars between Germany and Denmark in 1848 and 1864, many of these international terms entered via German.

In Iceland the creation of neologisms gained momentum in the 19th and 20th c., as new commodities of all kinds which did not have Icelandic names flooded the country. The neologisms fall into three main groups: (1) cal-

ques, e.g. *hitamælir*, literally ‘heat-meter’ i.e. ‘thermometer’, *járnbraut* ‘railway’, literally ‘iron-road’ (cf. Sw. *järnväg*), *rafmagn* ‘electricity’, literally ‘amber power’; (2) adaptations of old words which were given new meanings; e.g. *simi* ‘telephone’, originally a poetic word for thread, and *skjár* ‘(television) screen’, originally a semi-transparent sheepskin membrane used for covering the louver (*ljóri*, cf. 4.2) in wet weather; and (3) creations based on indigenous linguistic elements, e.g. *tölva* ‘computer’ (from *tala* ‘number’ with an allusion to *völva* ‘prophetess’), *togari* ‘trawler’ (from *toga* ‘haul’). Many words were, however, simply adopted more or less in their foreign shape (but invariably with the stress on the first syllable), e.g. *tóbak* ‘tobacco’ (mid-17th c.), *kaffi* ‘coffee’ (mid-18th c.), *píanó* ‘piano’ (mid-19th c.). The abbreviation *bil* for the unwieldy *automobil* ‘motorcar’ was suggested by the Danish newspaper *Politiken* in 1902 and was an instant success in all the Nordic languages. The Icelandic form *bill* rhymes with *fill* ‘elephant’ (an old loanword from Arabic), and *still* ‘style’ (from Latin), and it fits neatly into the Icelandic inflexional system. The written language, however, prefers *bifreið*, literally ‘motion car’. With the proliferation of technical terms in the second half of the 20th c., the creation of Icelandic neologisms has become something of a national sport.

Faroese language policy in the 20th c. has been puristic, often inspired by Icelandic models. There is, however, less popular support for a puristic trend than in Iceland, and the gap between the spoken and written language is undoubtedly wider than in Iceland, at least in Tórshavn, where one third of the population reside. The majority of the population is bilingual, and spoken Faroese is said to be so tolerant of Danish vocabulary that virtually any Danish word may be used in a Faroese context, if marginally adapted to Faroese phonology and inflexions. Even in the written language we find examples of this: *marmuláta* ‘marmalade’, *sjokuláta* ‘chocolate’, *ballón* ‘balloon’, *bilur* ‘motorcar’, *bussur* ‘bus’, but in many cases the spoken language has a Danish form and the written language a more Faroese form. Thus one often hears *telt* ‘tent’ (Dan. *telt*), but the written form of the word is *tjald* (identical with the Icelandic word for tent). Another example is Dan. *hjul* ‘wheel’, frequent in the spoken language, while the correct written form is *hjól* (again identical with Icelandic).

Especially among the older generation of Faroese Islanders there is a certain reluctance towards neologisms, which are often regarded as Icelandic loans. It is true that Faroese neologisms often coincide with their Icelandic counterparts, whether this is due to imitation or parallel development: Far. *tyrla* ‘helicopter’ derived from *tyril* ‘whisk’ = Icel. *þyrlla*. Often, however, there are differences which show that the new words draw independently on the same linguistic material: Far. *flogfar* ‘airplane’ (Icel. *flugvél*), Far. *myndatól* ‘camera’ (Icel. *myndavél*), and some Faroese neologisms are created from specifically Faroese elements and have no counterparts in Icelandic, e.g. *floga* ‘compact disc, CD’ (original meaning ‘thin layer of hay’) versus Icel. *geisladiskur* ‘beam disc’.

Andreas Fynning has shown the lexical interconnections in 20th-c. Scandinavia in his *Sammordisk Ordbog* where he has registered 33,000 words that appear in Danish, Swedish, and Norwegian Bokmål. Like most dictionaries, *Sammordisk Ordbog* is alphabetical, and it lists the words, not their subject area. The preface states that the dictionary comprises all the common old native words and all the imported words that appear in all three languages, e.g. *kommunikation*, *information*, *teknik*, *tekniker* etc.

In the 20th c., cultural influence on the Nordic countries has shifted from the south to the west. In the first half of the century, the fashionable clothing style was British, and English terms for garment types were imported in great numbers. The following are found in at least two of the three central Nordic languages: *blazer*, *cardigan*, *jumper*, *pullover*, *shorts*, *smoking* (meaning ‘dinner jacket’); peculiar to Norw. are *dress* ‘man’s suit’ (Dan. *habit*, *jakkessæt*, Sw. *kostym*) and *genser* ‘sweater’ (E *guernsey* (*shirt*) ‘from Guernsey in the Channel’); in Dan. the E term *sweater* is used.

Especially after the Second World War – from 1945 onwards – cultural development has been dominated by telecommunication and computer technology coming from the United States of America and Great Britain. Dictionaries in these areas of technology appear intermittently, and because of accelerating development quickly become outdated. In some cases local terms are coined, e.g. for ‘television’: *fjernsyn* in Dan. and Norw., *sjónvarp* in Icel. and Far., but *tv* or *teve* in Swedish; for ‘computer’: Dan. *datamat* or *datamaskine*, Sw. *dator*, Norw. *datamaskin*, Icel. *tölva*, Far.

telda, but at least in Dan. there is a tendency for the Anglo-American term to take over: *tv* and *computer*.

In the last decades of the 20th c., there has been a growing reaction against Anglo-American influence on Norwegian, and as a result Norwegian has admitted fewer Anglo-American loans in later years than e. g. Danish. Modern Danish usage permits Anglo-American words like *sweatshirt*, *t-shirt*, *jogging-suit* (or *joggingtøj*), while Norwegian prefers *bomullsgenser*, *T-skjorte* and *joggedress*. While Danes speak of *handouts* and *e-mail*, Norwegians have made a conscious effort to replace the English terms with *stotteark* (literally ‘support sheets’) and *e-post*. An effort on a grand scale was made in 1982 by the Norwegian state oil company Statoil, when it decided to establish a consistent Norwegian petroleum terminology for use in (parts of) the industry, which had until that time been under almost total Anglo-American linguistic dominance. The Norwegian Term Bank at the University of Bergen took on this task, which was completed by 1985. Later the database has been expanded greatly (to 30,000 concepts, over 90,000 terms) and implemented in manuals for the Norwegian petroleum industry both offshore and onshore. In developing the new terminology, transparency has been a primary consideration; a Norwegian term should not just be a translation of an existing English term, but should ideally be self-explanatory; examples are *ventiltre* for ‘Christmas tree’, *tårnplattform* for ‘monkey board’ and *foringsrør* for ‘casing’. The idea that the words should mean more or less what one would expect them to mean in general usage was given top priority, while linguistic purism was a factor of very little importance.

Many other cultural areas are influenced by North American phenomena; new sports like windsurfing and skateboard acquired the Dan. names *brætsejlad* and *rullebræt* in the 1970s and the 1980s, but in the 1990s the Anglo-American terms began to take over. American clothes such as blue jeans, Dan. *cowboybukser*, Sw. *jeans*, Norw. *dongeribukse(r)*, *-jeans* (< *dungarees*) were popular among both children and grown-ups in the later decades of the 20th c.

The eating habits in the late 20th c. were influenced by many people going on holiday in Southern Europe and young people travelling to the Far East: *pasta* and *pizza* from Italian, *sushi* from Japanese, and many exotic fruits from all over the world. The new food

terminology in Danish is treated by Pia Jarvad (1995).

Material culture has diversified to a very large extent with lexical richness in the wake. The 21st-c. citizen masters those parts of the lexicon that match his or her interests, and communicates with people with similar interests, face to face or via the electronic media, but the terminology of very few trades is shared by 21st-c. language users with the same mother tongue.

Rapid technological development has meant a radical change in most parts of the material culture. Buildings are made of *beton* ‘concrete’ in the towns with many floors. Shipping has changed completely with the coming of diesel motors, container transport and steel constructions. Agricultural production has been mechanized with the consequence that the countryside has been depopulated, and agriculture has joined the group of specialized trades where only professional people are well acquainted with the terminology in its totality. This technological advance has changed the shopping habits of customers, too. With the general availability of *koleskabe* ‘refrigerators’ and *frysere* ‘freezers’, food is bought in larger quantities in supermarkets where the staff may be less knowledgeable about the goods than the customers. Pre-packed goods are labelled with the name and the quantity, and the lexical circle is closed (cf. section 1 *horn*): *løse ris*, *parboiled* ‘rice for boiling’.

Anglo-American cultural influence in the 20th c. seems just as strong as Low German influence in the Middle Ages. The Low German lexical items were successfully integrated into the Nordic languages; it remains to be seen if Anglo-American lexical influence will have the same fate.

39. Nordic language history and cultural geography

1. The cultural-morphological method and its Scandinavian representatives
2. The topicality of the method
3. Dialect geography and historical and cultural geography
4. Summary: Cultural geography and language history
5. Literature (a selection)

1. The cultural-morphological method and its Scandinavian representatives

The relations between language history and cultural history, which for a long time had been an important topic, have since the 1920s been developed into a special interdisciplinary variant, aiming at a synthesis of linguistics, dialect geography, history (especially medieval territorial history) and cultural history in order to throw light on both language history and ethnology and folklore. The discipline is often called “Kulturmorphologie/cultural morphology” and it is specifically German in origin, founded by Theodor Frings together with Hermann Aubin and Josef Müller (1926) and continued by other well-known Germanists such as Friedrich Maurer (1942), Ferdinand Wrede and others.

This method had its heyday in German studies between the two World Wars and continued several years after the Second World War, but it has not left many traces in Scandinavian studies. The best known scholar who tried to apply it to Nordic dialect material was Natan Lindqvist. In his studies on South Swedish dialect geography (1947) he drew a multitude of maps based on phonological and morphological phenomena and in particular on word geography; through these he estab-

lished an important linguistic opposition between Southwest and Central Sweden, which he then compared with cultural phenomena such as types of farms, types of houses, various tools etc. and he also tried to explore the linguistic dynamics behind present-day phenomena. Lindqvist has also made theoretical utterances about these problems. He refers explicitly to German dialect geography, but in part, he arrives at different conclusions: Lindqvist (1943, 62–64; cf. also Hesselman 1948–53, 5ff.) claims that territorial boundaries do not play the same role as in Germany, that the crucial point is communication in the widest sense. Another example of this sort of dialect geography is Broberg (1973), which was published thirty years later and considered a great number of factors, comprising not only linguistic geography but many cultural phenomena such as history in general, ethnology, folklore, topography, climate, communications etc. – it is indeed an excellent work which gives a comprehensive picture of language and culture in the province of Värmland (in western Sweden), but which is not well-known (Bandle 2000). Among other things it shows that in spite of Lindqvist’s assertion, cultural morphology is a reality also in Scandinavia.

More examples could be mentioned, e.g. northern Scandinavia, which displays several parallels between dialect geography and important cultural phenomena (Erixon 1945; 1957; Zetterholm 1937), and moreover, not only dialects, but also the distribution of place-name types can be compared with historical and cultural facts (Bandle 1997). To be sure, *exact* correspondences are rare; in particular those between dialects and old territorial units are in many cases uncertain or vague,

and therefore it may be understandable that this method, developed with reference to German conditions, has not become equally popular in Scandinavia.

2. The topicality of the method

In the meantime, however, the cultural-geographical method (also called “the Rhenish school”) has lost much of its fascination also on an international level, at least in part due to the opposition from structural linguistics with its emphasis on internal, systematic explanations for the rise and spread of innovations. While Frings and his followers believe that innovations spread through single words and continuously from one area to another, structuralists claim that common developments in different areas are based on a common predisposition, and this naturally excludes other than accidental connections with cultural and political factors. Höfler’s “Entfaltungstheorie/Theory of linguistic unfolding”), though not structuralist at all, is based on similar hypotheses and has contributed to weakening cultural dialectology’s position (Höfler 1955/56). Moreover, modern sociolinguistics such as Chambers/Trudgill (1980) have directed severe criticism against traditional dialect geography, finding fault with its lack of a theoretical framework and with its use of outdated materials from linguistic atlases, not to speak of the inexactitude of its results. It is therefore not surprising that works on general dialectology like Löffler (1974) or Grober-Glück (1982) describe Frings’ method as something belonging to research history, but the question is whether this exempts us from looking back and asking what this sort of dialectology has achieved in the study of Nordic language history.

The mutual elucidation of language history and cultural history has, all in all, brought language research considerable achievements. Not only have cultural areas become clearer in their geographical and historical dimensions, but cultural areas in the form of dialect areas can often serve as sources of language history. Dialectal kernel areas may e. g. indicate the starting point of a historical development; many examples show how modern dialect geography can confirm results from the study of older texts; in many cases our understanding of a historical development will rely on the linguistic feature’s geographical position – an aspect of special importance in a language area like Norway, where textual sources

are relatively rare. To mention just one example: the “East Nordic” monophthongization is only partly carried through in eastern Norway, and where there are new monophthongs, they are, in part, preserved as special phonemes (not merged with other monophthongs) (Bandle 1973, 64–66; Sandøy 1993, 114f., also Moberg 1953); and this indicates an intermediate stage in the development towards general monophthongization which otherwise is rarely testified (this agrees with the general distribution of monophthongization, which appears as a South Scandinavian innovation reaching far to the north on the eastern side of the peninsula).

3. Dialect geography and historical and cultural geography

Let us now try to sum up the cultural-geographical facts that may have been of some significance for Nordic language history.

3.1. Relations to prehistory and early history

At the dawn of modern historical studies, it was popular to relate geographically limited linguistic features to Germanic (German) tribes, but nowadays discussions about questions of that sort are not very acute any longer. To be sure, Kuhn (1951/52) does speak throughout of tribes and tribal boundaries, where Frings had considered medieval territories, and even in Frings’ own and several other scholars’ writings, there seems to have been some sort of revival of the tribal hypothesis which at that time already was at least disputed, but this has only left few traces in the field of Scandinavian studies. The best known scholar in this connection is Johan Götling (1940/41), who tried to relate a series of conspicuous dialect boundaries in the midst of the plain of Västergötland to conditions and events of the neolithic period: as there is no topographical obstacle in this area, he had no other explanation for these boundaries than the immigration of a tribe around 2000 B. C. Götling admitted that the dialectal features in question were not as old as that, but he supposed that they were “predestined” by the Stone Age – a rather mystical notion of continuity indeed! More exact is Lindqvist (1947), who also held that the Stone Age was the origin of the cultural contrast between Southwest and Northeast Sweden, but only in the sense

of preconditions in topography and communications; in 1943 he rejected tribal hypotheses altogether.

Something different are the relations between dialect geography and later migrations. With the help of word geography, Bandle (1967) tries to support the theory that Iceland was colonized from various areas of Norway and that dialect mixture resulting from the different origins of the settlers in the first phase was followed by dialect levelling, resulting in its turn in the well-known linguistic unity of Iceland. Especially from more recent times, the connection between language and settlement is well-known, e.g. from northern Norway, where the originally East Norw. dialect of Bardu-Målselv is still distinctly separated from its surroundings (cf. Bandle 1967, 481). Here as e.g. also in North Sweden, there is still much material to work with.

3.2. Relations to administrative and ecclesiastical boundaries

As already indicated, there is not much in the North Germanic area which could be compared to Frings' syntheses of dialects and territorial history. Lindqvist (1943), from his Swedish standpoint, mentions in extenso the restrictions on the results which Frings had attained in the Rhineland (the "Rhenish fan"). The parish (*socken*), which in former times had secular functions as well, is practically the only relevant linguistic unit, while larger linguistic areas usually are not related to administrative units – now and then a diocese is recognizable behind the geographical distribution of a linguistic phenomenon, but the "landscapes" (Sw. *landskap*) usually are not linguistic units, on the contrary, they are often crossed by distinct dialect boundaries; according to Lindqvist, boundaries of provinces (Sw. *län*) are rather more relevant. Lindqvist (1947) attains similar negative results: the distribution of Southwest vs. Central Swedish dialect features is only in a few cases in accordance with political, administrative or ecclesiastical units; what is essential for the spreading of linguistic innovations are the routes of communication, the intensity of cultural trends and the nature of the cultural and linguistic innovations. The old Swedish-Danish frontier in South Sweden certainly played a part in forming the dialect boundaries in that area, but of at least the same significance were the highlands of Småland as a communication barrier on the one hand and the waterways (rivers like Lagan and

Nissan) as paths of communication on the other.

As concerns Norway, Bandle (1967, 446 ff.) has also tried to establish relations between dialects (mainly the vocabulary) and older administrative and ecclesiastical units – with limited success. What he, on the whole, could confirm, was the comparatively important role of the *thing* districts, in particular the Gulathing, whose catchment area covered both western Norway and Hallingdal/Valdres on the eastern side of the mountains. The correspondence between dialect areas and dioceses, too, is comparatively well testified, e.g. the relations between western Norwegian and the chapter of Bergen or those between East Norwegian and the diocese of Hamar. In some cases there are parallels between dialect areas and the *fylki* of the 12th and 13th c., but more distinct are relationships not to whole areas, but to certain sections of borderlines, e.g. the great watershed between West and East Norway, the southern and northern boundaries of Trøndelag fylke and of the diocese of Nidaros etc., even if these correspondences are neither very precise nor numerous (for details, see Bandle 1967; 1994).

In particular, in southeastern Norway we observe that relations of the western boundary of this kernel area to territorial units are obvious, but the equally strong northern borderline of this same kernel area remains without such parallels, so that we might suspect that the correspondence is secondary, i.e. that it rests on common preconditions in cultural circumstances, ultimately in the network of communication (an area open to foreign influences vs. remote countryside in inner South Norway). Something similar could probably be said of the mountain range: that there are linguistic phenomena strictly confined to the fjord areas on the western side *and* phenomena reaching over to the eastern mountain valleys depends probably on the dual function – partly separating, partly connecting – of mountains, conditions which may also be responsible for the political and administrative boundaries.

3.3. Ethnological relations

Correspondences between the distribution of linguistic and ethnological phenomena are also apparent in the Scandinavian countries, even if they are not exact in all respects and the material has not yet been analysed completely. In Norway, the ethnological material

in question is rather sparse, but research work already done confirms on the whole the results of dialectology. The West Norwegian area, in particular, is distinct. Vreim (1933) mentions among characteristic phenomena farms in the form of irregular clusters (in contrast e.g. to quadrangular farms in East Norway), “smoke stove” (*røkovn*) in contrast to open fire-place (*peis*) with chimney etc. Erixon (1933) mentions some Swedish-Norwegian ethnological phenomena which confirm Southeast Norway’s position as a portal for eastern and southern innovations. Ethnological phenomena which support the southwestern and the North Swedish (North Scandinavian) cultural and linguistic areas have already been pointed out; most distinct are, however, not so much the cultural *areas* as the cultural *boundaries*. When we look round in Scandinavia, time and again we meet borderlines which are, in spite of overlappings, clear and distinct: one of the best examples is the borderline between eastern and western Norway; another is the salient borderline in North Ångermanland (Sweden), which in recent times has been the object of archaeological, ethnological, dialect-geographical and onomastic research and which is ultimately a consequence of settlement history (Westerdahl 1994).

In previous research, the focus has above all been on concrete ethnological phenomena, but we should not forget that possibly also social history and the history of mentality could be compared with dialect geography (cf. Øidne 1957). In any case, it seems certain that in spite of all inaccuracies in the details, parallels between linguistic and ethnological data could contribute to a deeper and clearer understanding of language history.

3.4. Relations to topography and general communications

In sect. 3.2. it was suggested that in various cases, where territorial relations may be considered, ultimately natural conditions and communications have top priority. Indeed, both Bach (1950; 1965) and Lindqvist (1943) maintain that it is these factors which are most important for the development of dialect areas and dialect boundaries. It is obvious that today it is above all the towns which, thanks to their significance to economy and culture, have the most influence over the linguistic conditions in their surroundings, but also for earlier centuries, we have to reckon with linguistic innovations emanating from the towns, not-

withstanding the question of territorial divisions. The influence of big cities like Copenhagen and Stockholm is well known; in Norway, it is not only the capital, Oslo, which sets the linguistic character of its surroundings, but also in the case of Bergen, where the influence of urban speech was apparent already in Late Middle Ages and Early Modern times, e.g. in the shape of loanwords and loan translations such as *manke* ‘mane’ or *springa* ‘to cover (animals)’ a.o., which have spread along the coast from Bergen all the way up to the distant north. Minor towns have also exerted such influence, e.g. Stavanger which nowadays is the centre of a distinct kernel area in Rogaland, or Hamar, an old market town (and also an episcopal see), which has had a central function in eastern Norway.

In particular, in a country with a varying landscape like Norway, however, the topographical conditions are also likely to be influential on dialect geography. This was certainly the case in many dialect areas which lack territorial parallels. In southeastern Norway, where at best the western boundary can be explained by territorial divisions, it is obvious that the open character of the landscape, which includes several important towns such as Oslo and Tønsberg, has been of considerable significance: in the Late Middle Ages and Early Modern times and indeed right up to today, it lay open to linguistic innovations, phonological, morphological and lexical ones (even modern specialized words such as *hingst*, *vallak* or *hoppe* came in here and some of them were passed on to other parts of the country). Trondheim was not only politically and ecclesiastically important, but the town and its surroundings were at the same time the natural centre of northern Norway, from which numerous innovations could start. It is particularly difficult to find reasons other than topography and communication networks for the formation of large dialect areas such as East Norwegian, including Trøndelag. The South Norwegian dialect area as well, which extends from the south coast to Central Norway, can only at limited points be compared with administrative and ecclesiastical boundaries, e.g. the distinct word geographic borderline between Numedal and Hallingdal (Bandle 1967, 486). In several cases it seems impossible to find either territorial or ethnological parallels even for minor linguistic areas: in northwestern Norway, between Nordfjord and Sunnmøre, a distinct kernel area has developed which lies across every known admini-

strative and ecclesiastical borderline and cannot simply be a relic area, because it also comprises innovations such as *e-mål*; the only possible conclusion is that it must originate from the communications along the coast and into the fjords.

4. Summary: Cultural geography and language history

From the point of view of Nordic linguistics, it might seem as if the gains from cultural-geographical or cultural-morphological methodology were not so great as its founders had thought; the mutual elucidation of language history and cultural and linguistic geography is, however, of considerable value. Several examples have been mentioned; here, we shall only sum up some of the results.

As Frings and his colleagues have shown, the cultural geography of the Rhineland gains considerable depth if it is related to the High German consonant shift and other linguistic developments which have proceeded from south to north (some critics have rejected this, but not convincingly). We can also mention Nordic examples of the significance of language history for cultural geography: the southwest/northeast opposition in Sweden, brought about to a considerable extent by the historical linguistic movements since Denmark's "great power" period in the High Middle Ages; the Northeast Scandinavian linguistic and cultural area, one of the centres of which we can reasonably assume to be Central Sweden; the cultural area of Southeast Norway, which on historical and also word-stratigraphic grounds appears to be a most important innovation area and thus demonstrates its great significance for the cultural and linguistic history of Norway since the late Middle Ages.

On the other hand, studies on cultural geography can often explain or supplement facts of language history, both individual phenomena and whole areas or language movements. E.g. the geographical distribution of the *e-mål* in South and Northwest Norway between areas of vowel balance and of generally preserved *-a* points to their origin in a compromise, and the case is similar for the development of *ll* > *dd* in the west of South Norway, between *dl* and *ll*. Sounds, inflexions and vocabulary of the Norwegian dialects give us deep insights into the dynamics of Norwegian language history: after a series of west-east

movements during the Viking Age and High Middle Ages, the southeast of Norway became active, accepted numerous innovations from the southeast and east and passed them on to other parts of (especially eastern) Norway, in this way contributing much to the structure of modern Norwegian, in particular Bokmål. The examples could be increased considerably: from the south of Scandinavia, where several dialectal innovations, arranged in the form of concentric circles, point to the expansive vigour of this area in the Middle Ages (Bandle 1973, map 15); from the west, where linguistic and cultural geography together demonstrate clearly the historical relationship between insular Nordic and the dialects of the mother country; from Central Sweden, where the Swedish standard developed at the crossroads of south and north.

Today, the topicality of the cultural dialectological method may be a matter of dispute. Sociolinguistics and urban dialectology seem already to have made it a bit obsolete, and the development of sociolinguistics and dialectology will certainly continue in this direction (towards a "sociodialectology") the more the old rural dialects die or are levelled. In spite of this and although cultural dialectology doesn't seem to yield such rich results in Scandinavia as elsewhere (in particular in the German-speaking area), we should not forget its achievements for Nordic language history; we should keep it in mind, together with a sociolinguistic view, also in the future.

1. The Regional Law period (The Viking Age and the Early High Middle Ages)

1.1. Sources

1.1.1. Runic inscriptions

The extant legal sources from the Viking Age consist almost exclusively of runic inscriptions, from which some legal information can be deduced. Examples of this are the Oklunda inscription from Östergötland, Sweden, and the Forsa Ring inscription from Hälsingland, Sweden, both dated to the 9th century (see Ruthström 1988; 1990; Widmark 1999). The latter inscription must be regarded as the only undisputably intact piece of a Viking Age law that remains today.

A project analyzing runic inscriptions as declarations of property and inheritance has been undertaken by Birgit Sawyer (1988).

1.1.2. Regional laws

By the end of the Viking Age the Scandinavian countries of today, that is Denmark (in this period including Scania, Blekinge and Halland), Norway and Sweden, were in the process of becoming three separate kingdoms, each one uniting a number of smaller regions. The regions were originally independent, petty kingdoms, each with its own law. The regional laws (see *Danmarks Gamle Landskabslove*, *Norges gamle love indtil 1387*, *Samling af Sveriges Gamla Lagar* and *Grágás*) continued to be in force throughout the Viking Age and the Early Middle Ages until national laws were given in Norway, Iceland and Sweden in the High and Late Middle Ages, in Denmark as late as 1683.

1.1.3. Town laws

As commercial contact with the outside world grew, special commercial sites or market places emerged, which called for separate sets

of legal rules. Such sets of rules were originally called *Björköa Laws*. Extant early laws of this kind exist from the towns of Nidaros (Trondheim) in Trøndelagen, Norway, from Lund in Scania, in those days in Denmark, and from Lödöse in Västergötland and (originally) Stockholm, Sweden (cf. Wessén 1980; Niitemaa 1980, 658 f.; Brattgard 1980; Meyer 1980). The town laws (see DGK, NGL, SSGL) were concise and appear to have been complementary to the regional laws.

1.1.4. National royal statutes

In accordance with the general ideas of 13th century Europe about the king's duties as peacekeeper and his right to institute laws, the kings of the Nordic countries – with the consent of an assembly of the principal men of each kingdom (national council) – began to create statutes which would be valid for the whole country. As time passed, these statutes (most often called *logh* or *handfæstninger* in Denmark, *nýmæli* or *réttarbætr* in Norway and *stadgor* in Sweden) were included in the (regional or national) law codex (Jørgensen 1982; Bøe 1982; Liedgren 1982).

1.2. Reading and understanding the laws – the point of departure

In the Nordic countries the laws are the oldest extant vernacular literary sources. Practically no other kind of contemporary literature exists, which could shed light on legal rules and customs in the Nordic countries in the Early Middle Ages. A remarkable exception to this rule is the Icelandic Saga literature. This exception has posed some very difficult questions for legal historians. Thus, on the one hand, the Nordic laws cannot be fully understood without at least a rough concept of the kind of society and culture of which they were part (cf. Wessén 1968, 7). On the other hand, however, the impression of that same society and culture which can be deduced from those same laws by careful reading cannot be corroborated or verified in the Saga literature in any simple way.

One initial issue is the problem how to evaluate the Icelandic law *Grágás*, since, in many respects, this law diverges from the other Nordic laws. A second issue is how to evaluate the legal evidence of the Saga literature, which

in its turn, in several respects, diverges from that of *Grágás* as well as from the Mainl. Scand. laws. A third issue – finally – is the question of the extent to which influence from foreign, in particular Roman, canon or Mosaic law, may be revealed in the laws. This subject will be treated in 1.3., and in connection with the exposition of the legal vocabulary of the sources.

1.2.1. Notes on research history

In political discussions in 19th century Germany and France, a central role was played by legal history, whereby the advocates of conflicting political views on constitutional and judicial systems made efforts to find arguments in the old Germanic laws for their respective standpoints.

A great benefit of the general importance assigned to the old laws in the legislation debate was that, by the turn of the century, a large amount of research of lasting value was carried out on the Nordic medieval laws by continental, particularly German, legal historians. Important names in this endeavour are Karl von Amira, Konrad Maurer and Andreas Heusler (see further 1.2.4.).

1.2.2. How to understand the constitution of *Grágás*

The Dan., Norw. and Sw. medieval laws all give fairly similar pictures of societies with a central, political power – a king – on a national level, and in which the authority of local powerful men or chieftains was always connected with a certain, delimited territory. In contrast to this, *Grágás* pictures a society which had no king or central political power whatsoever, neither on the national nor on the local level. The power of a chieftain, a *goði*, in this society was not connected with any specific territory.

The traditional view, as represented by legal historians like Ólafur Lárússon, has been that the Icel. type of constitution without a central, political power had been the original one in the Gulathing, the part of Norway from which most of the colonists came. This is claimed to be reflected in Ari Fróði's tale of *Úlfjóttr*. This man is said to have formed what was to become the first Icel. law in ca. 930 mostly after the pattern of what was the Gulathing Law before Norway was unified by king Harald Finehair and after hearing the advice of Þórlleifr the Wise, and to have brought it to Ice-

land from Norway (Lárússon 1960, 7; cf. *Íslendingabók II*, 17; Meulengracht Sørensen 1993, 41; P.H. Sawyer 1980, 57).

In recent times, however, the tale of *Úlfjóttr* has been severely criticized and its importance profoundly revised by Sigurður Lindal (1969). According to Lindal *Úlfjóttr*'s mission ought rather to have been to inquire into what was the accepted law in the Gulathing on specific, fundamental issues, thereby solving pendent legal conflicts in Iceland (Lindal 1969, 471–3).

There are factors which seem to favour the idea that the Icelandic constitution may have been an Icelandic innovation. First of all, Iceland was not conquered by its settlers. There was no need for the Nordic colonists to use force, as the island was not populated in the normal sense. Secondly, the peaceful colonization of Iceland was achieved by a great number of small, separate groups of people. This prevented the creation of regions dominated by one single family or clan. Thirdly, because of its remote geographical situation, the colonized island needed no defense against attacks from abroad.

Consequently, no organization for war, no national army was ever devised. These circumstances made it unnecessary to have a king or chieftain to command organized warriors (cf. Foote/Wilson 1980, 132; Ólason 1998, 29). They also prevented the emergence of individuals who could claim political power out of their domination of a whole region. All these factors must have been unique for Iceland. In this perspective, there seems to be more indicating that the Icel. constitution was an Icel. innovation than a Norwegian import.

1.2.3. The political and juridical title *goði* and religion

The title *goði* for a chieftain has never been recorded in the Nordic countries outside Iceland. Neither has the word for the office of the chieftain, *goðorð*. Etymologically the word *goði* is a derivation of *goð*, *guð* 'god', and there are instances of *goði* 'warden or priest of heathen temple' in runic inscriptions as well as in the Icel. saga literature. The traditional explanation has it that in Iceland the office of the warden or priest of the heathen temple gradually developed into a chieftaincy. This interpretation corresponds well with the idea of a very close relation between law and religion, which has been widely accepted when speaking of the West Germanic languages in connection with the WGmc words *ewa/eo/*

æ(w)e ‘secular law, legal system’, but also ‘divine law, religion’ (cf. v. See 1964, 105–109 with notes). The existence of the Icel. title *goði* for a chieftain with fundamentally legal duties has been used as argument for the idea that a close relationship between law and religion had existed in the Nordic countries as well (Ólason 1998, 26f.).

Critical arguments, however, have been put forward against this conclusion by Ólafur Lárússon (1960, 9f.) and v. See (1964, 108–110). The former draws the conclusion that the religious duties of the *goðar* must have been merely a secondary matter, and the latter claims that the office of the *goði* may merely have had a loose and superficial connection with the religious office. A later attempt to give a new interpretation to the sources by Ólason (1998, 27) does not seem to add anything to the facts stressed by Ólafur Lárússon and v. See.

Now a recent study proposes a new explanation of the terminology surrounding the Icelandic chieftain and of his office (Ruthström 1999). It argues from the point of view of the legal system that the office, *goðorð*, and not the holder of the office, *goði*, is the primordial juridical concept of the two and that *goðorð* and *goðorðsmaðr* were the original terms, the latter word being a rather overlooked synonym of *goði* only found in the sagas (v. See 1964, 109). The consequence of this would be that *goði* is merely a secondary term, possibly introduced ca. 965 in connection with establishing the territorial division of the island into Quarters.

The denotation ‘chieftaincy’ for the primary term *goðorð* is explained as developing from an original ‘(right to) speech or say or authority characteristic of a warden of a heathen temple’, in an intermediary phase lexicalized as a more general ‘authority over a parish or assembly of people’.

If the theory referred to is a correct interpretation of the historical development, it would in fact define the title *goði* for chieftain as a purely Icel. phenomenon lacking any original connection with religion in Iceland.

1.2.4. How to understand the Icelandic sagas

Legal process purports to be a means of putting an end to disputes in the Icel. family sagas. However, in the saga world, legal process tends to be but one option among several in what is called a feud, i. e. successive, reciprocal slaying of many persons in a lengthy, ongoing

fight between two families or kin groups. Within narrow limits, it was accepted in law to avenge oneself (*Grágás* Ia, 147). However, this and other legal limitations are completely disregarded by the saga characters. This brings into focus the difficult question of the reliability of the Icel. sagas in general and of the family sagas in particular, the latter purporting to describe events which took place two or three centuries before the sagas were written. The so-called Icelandic school, well known for its careful observation of source and manuscript criticism, and with Sigurður Nordal as a leading name, has shown that the tales that are told about named characters in the sagas cannot be trusted as historical truth. A different question, however, is whether the cultural setting, the social context, can be relied upon as historically trustworthy.

In the beginning of the 20th century, Andreas Heusler was a pioneer in treating law in the sagas seriously. In recent times, renewed interest in the social context of the sagas has been shown by scholars like Preben Meulengracht Sørensen (1993), Kirsten Hastrup (1985), Jesse Byock (1982), Theodore Andersson and above all William Ian Miller (Andersson/Miller 1989; Miller 1990). (For a research review, see Karlsson 1993). In Miller’s view the saga sources are “admirably suited to certain social and legal historical inquiries concerning the time in which they were written” (1990, 45).

The Icel. model of feud and of the dispute process was one of balance and reciprocity (*ibid.*, 183). Legal process is in fact shown to be part of the feuding process (*ibid.*, 235; see also Heusler 1911, 103; v. See 1964, 239f.). The structure of the constitution was devised to maintain the balance of power between the constitutional chieftains (*goðar*). The chieftains were key operators in this structure. Now Miller shows that the feud in Iceland was one of the key structures in which the political competition for dominance was played out (1990, 181). This makes sense, considering that the chieftains lived in a society where there was no traditional mainland Scandinavian mechanism of increasing status and power, like joining the retinue (*hirð*) of the local king or taking part in a local war or even defending the country against invaders. When all this is taken into consideration, the impression of the exceptional importance of the feud in Early Middle Age Icelandic society appears to acquire a domestic, Icelandic explanation, and the seeming contradiction between

Grágás and the Icelandic sagas in the matter of the feud appears to fade or vanish.

1.3. Germanic law versus Roman, canon and Mosaic law

Modern research has showed the considerable extent to which the medieval laws were subject to foreign influence channeled by the Christian church. The canon law of the Christian church incorporated the biblical law of Moses, Mosaic law, as well as Roman law.

Around the year 1220, a wave of activity swept through Europe, aimed at writing down the different vernacular legal customs or laws in the different regions. The activity was inspired and assisted by the Christian church. The results of this codification activity in any given region must have been a mixture of domestic and foreign law. It is the task of legal historians to find out the extent to which foreign law replaced old, domestic law in this process. Indications of foreign legal influence, as well as contrasting patterns of domestic law, can be found at all linguistic levels, from loanwords to stylistic features. We can sum up the characteristic features of all these linguistic levels with the expression “legal language”.

1.4. Legal language

The law’s need for specific ways of expressing legal categories, for linguistic clarity and consistency in legal matters, in short, for terms and terminologies of its own, demands a specific, professional legal language. Moreover, legal language not only reflects social reality, it also regulates it by means of words (cf. v. See 1964, 2; Koschacker 1947, 112). The development of a specific Nordic legal language, generally speaking, occurred in the Early and High Middle Ages (v. See 1964, 2).

However, the degree of exactitude of the Middle Age legal language is not considered to be very high. The principle of one meaning per word seems to have been poorly developed (v. See 1964, 4).

Sharply limiting the legal concepts in question, on the contrary, are so-called legal definitions. These are not so scarce as one might believe (cf. v. See 1964, 4f.). In the Sw. Östgöta Law, e. g., we find the following definition of a thief: “þri æru þiuaa en raþær ok annar stial ok þriþi takær uiþ” [there are three thieves: one who plots, another one who steals and a third one who receives].

A characteristic feature of Nordic legal language is the proclivity for establishing legal concepts by means of substantives. This is another factor which benefits conceptual clarity. An example: “allt þæt bondin ok husfrun kiöpæ samæn. baþi j iorþ ok lösörum. þæt kallær siængæ köp. aghi husfrun þriþung. ok bonden twælötinæ” [all that a husband and his wife buy together is called bed purchase. the wife shall own one third of it and her husband two thirds.].

Nordic legal language very early on attracted the interest of legal historians and historical linguists. Etymologies and efforts to reconstruct a Proto-Germanic legal language were then in the focus. Less interest was attached to studying the actual use of legal terminology both in individual laws and in an overall Nordic perspective. For research in recent times, see v. See (1964, 1 with notes). On the other hand, several studies of the syntax and style of the medieval Nordic legal language have been made (see de Boor 1922; Ståhle 1958; B. Pettersson 1959; Wessén 1968; Ehrhardt 1977, Naumann 1979; Jörgensen 1987; Wendt 1997 and 1999).

(a) Legal vocabulary

The complete vocabulary of the Nordic laws is laid out in dictionaries. The objective here is limited to giving a small sample of legal terminology. The words or denotations of words of each language are distributed into two groups, called domestic words and loanwords. In the loanwords group are included not only proper loanwords but also compounds with and derivatives of loanwords, regardless of whether these compounds etc., are proper loanwords themselves or formed long after their headwords had become integrated parts of the receiving language. Furthermore, I have included obvious loan translations – like OWN *tumd* after Lat. *decima (pars)* – in this group, in order to give a clearer impression of the combined impact of foreign cultural influences.

An early layer of loanwords has come from Old English, Old Saxon and, in some cases, Old Frisian. A late layer of such words, on the other hand, has come from Middle Low German (cf. Hyldgaard-Jensen 1992, 12). This corresponds on the whole with the presentation below.

(b) Legal terminology

Legal terminology includes single words as well as expressions or phrases composed of

two or more words, like *ganga a griþ ok göræ sæt* 'break a truce and concluded settlement' (ÅVgL O.2). This survey, however, must in principle limit itself to giving single terms, *griþ, sæt*.

1.4.1. The early layer of the Regional Law period – examples of domestic words

The survey is based here on Skautrup (1944–53). From as far back as Ancient Nordic times (ca. 200–800), there are extant words for social relations and stratification corresponding to OWN *friáandi* 'friend', *fiáandi* 'enemy', *konungr* 'king', *þegn* 'free man' and *þjófr* 'thief'. Several words for family relations corresponding to OWN *faðir* 'father', *móðir* 'mother', etc. are in fact common IE words.

From Runic times (ca. 800–1100) there are more extant words for social relations corresponding to OWN *bræðrungr* 'father's (or mother's) brother's son' and compounds like *föðurfaðir* 'grandfather on the father's side' and so on.

In the sphere of crimes, there are words corresponding to OWN *bardagi* 'assault', *dráp* 'slaying', *hefnd* 'revenge', and corresponding to OEN *styld*, *þiufnaþer* 'theft, larceny'. Words for a jurisdiction district are (corresponding to ODan.) *hæraþand* (corresponding to OSw.) *hundari*. The central word for jurisdiction assembly, corresponding to OWN *þing*, is common Germanic.

The OWN equivalents of the common PN words for 'law' and for 'right, claim', are *log* and *réttr* respectively. The latter is found in the compound corresponding to OWN *lýréttr* and extant in the expression *at liuþriti* 'according to the rights (of the people or society)', in the Forsa inscription from the 9th (or 10th) century (see Ruthström 1990).

1.4.2. The early layer of the Regional Law period – examples of loanwords

First, two old loanwords correspond to OWN *kaupa* 'buy' (orig. 'trade' with *caupo*, Lat. for 'innkeeper, merchant') and *ambátt* 'female thrall, bondwoman'.

In this period the Christian church was being established. The central power of the king in each Nordic country (except Iceland) was being consolidated, probably inspired by the contemporary feudal development in central Europe and underpinned by the

canonical doctrine of kingdom by divine right. Finally, mercantile centers developed into real commercial towns, like Hedeby (Slesvig) in Denmark and Birka in Sweden. With these innovations came new legal terminology.

The Christian religion came to Norway and Iceland from the British Isles and to Denmark and Sweden mainly from northern Germany. As a result of this, the clerical terminology sometimes differed between western and eastern Scandinavia.

Common Nordic loanwords (and loan translations) from this early period are e.g. (in OWN): *biskup* 'bishop' (ultimately from Lat-Gr. *episcopus* 'superintendent'), *kirkja* 'church' (ultimately from Gr. *kyriakón* 'belonging to God'), *kristinn* 'Christian', *prest* 'priest' (ultimately from Lat.-Gr. *presbyter*), *primsigna* vb. 'sign a person with the cross as a preliminary act to christening', *tiund* 'tithes' (after Lat. *decima (pars)*). An OEN word is *dæpa* 'baptize, christen' (< OSx. *dopjan*). OWN words are *höfuðkirkja* 'cathedral' (cf. *heafodcirice*), *biskupa* 'confirm' (< OSx. *biscopian*). Mercantile words are OWN *kaupungr*, OEN *köping*, *köbing* 'commercial town', OWN *penningr*, OEN *pænning*.

1.4.3. The late layer – examples of OSw. domestic words

(1) Words connected with the legal system and the structure of society: *Bo* 'farm', *bol* 'farm (where the landowner lived)', *byr* 'village', *folkvavn* 'customary set of weapons', *friþer* 'general peace and security, esp. against revenge', *fæ* 'property, belongings', *griþ*, *gruþ* 'peace and security promised to person who feared assault', *heþer* 'honour', *hirþ* '(the king's) guard', *hælg(h)* '(important) holiday when *friþer* was decreed, *friþer* of important holiday(s)', *jarl* 'the king's most highranking official', *laghmaþer* 'judge for a whole land', *land* 'region with its own law', *leþunger* 'military sea expedition including necessary, obligatory provisions, such levied provisions', *lænder maþer* 'man entrusted or endowed with land by the king', *lösir örar*, *lösöre* 'movable property' (concerning *örir* see Ruthström 1993), *manhælg(h)*, *manhælgþ* 'personal peace and security', *omag(h)*, *ovormag(h)* 'person under 15 years of age', *qvinnaþriþer* 'women's peace and security', *þokki* 'insult, offence', *þrætta*, vb. 'dispute, contend'.

(2) Words connected with marriage: *Brullöp* 'wedding', *bruþ* 'bride', *fylgþ* 'dowry', *gift*

(*gipt*), *giftarmal* (*giptar-*) ‘giving away of woman in marriage’, *hionalagh* ‘marriage’, *munder* ‘bride’s bargain’.

(3) Words connected with inheritance: *Arf*, neut., *arver*, masc., ‘inheritance’, *arvi*, *arvingi*, ‘heir’, *skötsætu barn* ‘legitimized child’, *ærv* ‘inherit’.

(4) Words connected with the acquisition, possession or use of land and farm:

Afraþ ‘land rent’, *jorþ* ‘estate’, *jorþafastar*, masc. pl. ‘trustees at land purchase’, *laghbúþ* ‘offer (of land) for preemption or for redemption’, *laigulenninger*, *landboe* ‘holder of land, tenant’, *oþolfastir* (*oþilfastar*), masc. pl. ‘trustees at purchase of *oþoliorþ*’, *oþoliorþ* ‘patrimonial land’, *umfærþ* ‘symbolic circuit performed at land conveyance’.

(5) Words connected with the acquisition, possession or use of property in general or of movable property, including claims: *Bolagh*, *fælagh* ‘economic partnership’, *inlaghs fæ* ‘deposited property’, *lana*, *læa* ‘lend’, *skyld* ‘debt’, *sælia* ‘sell’, *ut krævia* ‘claim’, *vin* ‘trustee at purchase’, *værþörrar*, pl. ‘currency’ (concerning *örir* see Ruthström 1993).

(6) Words connected with dispute, crime and offence in general: *Agnabaker* ‘crop thief’, *avugher skiold* (*bæra avughan skiold* ‘attack one’s own country, be a traitor’), *banaman*, *bani* ‘slayer’, *bunkabrytari*, *bunkabiter* ‘pirate’, *bælgmorþ* ‘criminal abortion’, *bæria*, vb. ‘assault’, *dræpa* ‘slay’, *fæarföling* ‘furtive killing of cattle’, *gorvargher* ‘cattle slayer’, *gorþiuver* ‘cattle thief’, *haldbani* ‘holder-slayer, assistant slayer’, *hordomber*, ‘adultery’, *kasnavargher* ‘incendiary’, *morþbrander* ‘arson’, *morþingi* ‘murderer’, *niþingsværk* ‘bastard’s work, villainy, esp. about class of very serious crimes’, *raþsbani* ‘plotter-slayer’, *rof*, neut. ‘robbery’, *ræna*, vb. ‘rob’, *stiæla*, vb. ‘steal’, *valrof* ‘plundering of the slain on a battlefield’, *viþertaku þiuver* ‘thief receiver’, *þangbrækka* (*bæra skiold ivir þ*. ‘attack one’s own country, be a traitor).

(7) Words connected with the process of dispute settling and crime punishing: *Akærandi* ‘plaintiff, prosecutor’, *asynar vitni* ‘ocular witness’, *basta* (*b. ok til þings föra*) ‘bind ((offender) and bring to court)’, *bot* ‘compensation, fine’, *bupkafl* ‘piece of wood used as fiery cross’, *domber* ‘sentence’, *dylia* ‘deny (in court)’, *döma* ‘to sentence’, *firigæra* ‘forfeit’, *hemuld* ‘legal guarantee or defense of right (to property)’, *hæfti* (*hæpti*) ‘imprisonment’,

jamnaper ‘equity’, *jarnbyrþ* ‘ordeal of iron-bearing’, *lagh lysa* ‘lawfully publish’, *laghsokn* ‘bringing of lawsuit’, *malsæghandi* ‘person aggrieved’, *mæta* (*ut sak mans*) ‘make distraint (of a man’s property)’, *nam* ‘(lawful) seizure of security or payment for debt’, *ora*, vb. ‘seek or achieve revenge’, *ransak*, neut., *ransakan* ‘house-visitation’, *sak* ‘lawsuit’, *saksöki*, *-sökiande*, *-sökia* ‘plaintiff, prosecutor’, *sandbani* ‘true slayer’, *sander* (*s. at sak* ‘guilty of prosecuted crime’), *sannind(i)* (*s. leta* ‘search for truth’), *skilia* (*s. lagh* ‘give official explanation of the law’), *skipa* (*s. lagh* ‘legislate’), *skyfla*, vb. ‘make execution of forfeiture’, *stæmna*, fem., *stæmpning* ‘summons’, *syn* ‘legal inspection’, *sæmia*, vb., N. ‘(make) agreement’, *sæt* ‘settlement’, *sökia* ‘sue, indict’, *sökianði* ‘plaintiff, prosecutor’, *urbota mal* ‘case which could not be atoned for by money, crime’, *utlægher*, *utlaghder* ‘outlaw’, *vereldi* ‘wergild’, *vita*, vb. ‘prove, swear oath’, *væria*, *værna* ‘defend in court’, *væþia* ‘to appeal’, *ættarbot* ‘wergild to be paid by the kin of the slayer to the kin of the victim’.

(8) Words particularly connected with the king:

Biltugha maþer ‘outlaw’, *biltugher*, adj. ‘outlawed’, *epsöris brut* ‘breaching of the King’s and the leading men’s sworn prohibition against certain high crime’.

(9) Words particularly connected with the Christian church:

Hælghis brut, *hælghudaga brut* ‘breach of the Sabbath’, *inleþning*, *inleþsla*, *inleþsn* ‘reintroduction of newly wedded or delivered wife into the Church’, *vighia*, vb. ‘wed’.

(10) Words connected with the growing trade and the commercial towns:

Byaman ‘town’s man’, *byamot* ‘assembly of commercial site or town (corresponding to *þing*)’.

1.4.4. The late layer – examples of Old Swedish loanwords

Loanwords were introduced primarily in connection with the activities of the Christian church, the legislative activities connected with the growing power of the king and of the emerging nobility, and the growing trade coupled with the growing number and size of commercial towns.

(1) Words connected with the Christian church:

Ban (< MLG *ban*, masc., at least in clerical use) 'excommunication', *döpile* 'baptism', *ferma*, vb. 'confirm', *gufbarn*, -*dottir*, -*faðir*, -*móðir* 'godchild etc.', *kalker* 'chalice', *kanuker* (*kanoker*, *kaniker*) 'a canon', *kapellan* (*kaplan*) 'chaplain', *klerker* 'cleric', *klosterlan* 'cloister', *kristna*, fem. 'Christendom', *kristnu rættir* 'laws concerning Christendom', *lybbiskoper* (cf. OE *leodbisceop*) 'suffragan bishop', *munker* 'monk', *offra*, vb. 'to sacrifice', *oling* 'extreme unction', *provaster* 'provost', *tiunda*, vb. 'pay tithes'.

(2) Words connected with the king: *Hærra* 'lord, master', *hærtugh(i)* 'army leader' (cf. Ahldén 1949, 19), *kanceler* 'chancellor', *krona*, 'crown', *læn*, 'royal grant or emolument', *læns herra* 'fief holder, governor', *lænsmaðer* 'bailiff', *riddari* 'knight'.

(3) Words connected with the growing trade and the commercial towns:

Borgha, vb. 'stand surety', *bysætia* 'imprison for debt', *diker* 'number of ten', *fals* 'fraud', *köpari*, *köpi* 'buyer', *liþköp* 'party celebrating purchase', *panter* masc. 'security, pawn', *strætis köp* 'purchase without witness', *stupa* fem. 'pole or block where criminals were punished, jail', *stupugrevi* 'jailer', *torghköp* 'purchase in market', *vinköp* 'purchase with trustee'.

(4) Other words:

Fangilse 'captivity, jail', *fanter* 'servant', *forgærning* 'putting to death by poison or witchcraft', *forværka* 'forfeit', *makt* 'power, ability', *openbar* (*o. vitni* 'evident testimony'), *röva* vb. 'seize, rob', *rövvari* 'robber'.

1.4.5. Legal syntax and style

There is clear evidence that, from the beginning, law was oral. Customary law was recited every year at the *þing* by a *laghmaðer* or *lög-sögumaðr*, and it was an important duty for all freemen to understand and remember the *laghsagha* that was recited at the *þing*. "Nw sculu mæn till thingx fara oc laghsaghu waræ hæra, hæra the sum hæ æru oc sighiæ them som hemæ sitiæ [Now, men shall go to the Thing and hear our law being recited; those shall listen who are here, and tell them, who are sitting at home; SmL] 2.

The question of what the original oral *laghsagha* really was like has been much discussed (cf. Utterström 1975, 1978; Ståhle 1976; Ehrhardt 1977). In principle, the laws represent an early stage of development, linguistically

only very little influenced by Roman and canon law. There is in the laws a characteristic general principle of conciseness and clarity with a laconic and sententious way of expression. Foreign influence can be seen most often in younger parts of the regional laws and in the town laws (Ståhle 1981, 174).

In contrast to the concise style of proper law language is the language of the medieval royal and regional statutes, which in many respects was created on the pattern of Latin (and MLG) (Holm 1969, 7, 20).

2. The Initial National Law period (The High and Late Middle Ages)

2.1. General remarks

The beginning of the National Law period witnessed the emergence of national legal vocabularies formed primarily out of the legal language of the leading laws in Denmark, Norway and Sweden. Norway took the lead in the 13th century, followed by Sweden in the 14th century. In Denmark the integration of legal language took place in juridical practice throughout the Middle Ages but without any expression in legislation.

From the beginning, in the politically independent period of the Icelandic Commonwealth, Iceland had developed a national legal language of its own. When Iceland gave up its political independence to the Norwegian king in 1262, this led to the old Icel. law, *Grágás*, being replaced with new legislation strongly influenced by Norw. national law. The consequences as far as legal terminology is concerned of these separate national processes of legal integration were, of course, that the former terminological regionalities were subject to corresponding processes of terminological integration. In this development, the emerging national terminologies were based on the language of the leading regional laws and town laws in each country.

2.2. National laws and equivalents (see *Danmarks Gamle Landskabslove*, *Norges gamle love indtil 1387*, *Samling af Sveriges Gamla Lagar* and *Grágás*)

Sweden: Magnus Eriksson's National Country Law of ca. 1350 (MEL) and Christopher's National Country Law of 1442 (ChL). Magnus Eriksson's National Town Law of ca. 1360.

Denmark: The Jutland Law of 1241. The Copenhagen Town Law of 1443 and the Malmø Town Law of 1487.

Norway: Magnus Lawmender's National Country Law of 1274–75. Magnus Lawmender's National Town Law of 1276.

Iceland: *Járnsíða* of 1271–73 and *Jónsbók* of 1281.

2.3. The Danish situation

Despite attempts, no national law was created in Denmark until 1683, when Christian V's National Danish Code came into force. In practice, however, the Jutland Law was used more and more in competition with the other regional laws in the rest of Denmark until, in the 16th century, it nearly took over as a de facto national country law (Jørgensen 1969, 42). In the Dan. towns, the Copenhagen Town Law of 1443 was directly or indirectly taken over in its entirety or with omissions or additions by a great number of towns in all parts of the country. (ibid. 104–5).

2.4. Legal vocabulary

Much of what is presented as country law terms were, in fact, used in town law as well. What is presented here as town vocabulary, on the contrary, was exclusively used in town law.

The interrelation between the two Swedish national country laws, MEL and ChL, has recently been studied by Wendt. The part of MEL that was taken over with unchanged contents by ChL shows little change in vocabulary (Wendt 1997, 48f.). Therefore, the words recorded in Swedish country law below (i. e. in MEL) are also to a great extent presented in ChL. If, however, a word is recorded exclusively in ChL, it will be marked with (ChL).

2.4.1. Examples of Old Swedish domestic words

(1) Country law.:

Frælsis man 'man exempt from tax, freeman', *landslagh* neut. pl. 'national country law', *utlagha* fem. 'tribute' (ChL), *vald(s) gæstning* fem. 'the act of obtaining accommodation by force'.

(2) Town law.:

Akærare masc. 'plaintiff, prosecutor', *handslag* neut. 'handshake', *skutman* masc. 'tax collector'.

2.4.2. Examples of Old Swedish loanwords

(1) Country law:

Bevisning fem. 'evidence' (ChL), *borghamæstare* 'mayor', *bödhil* (ChL) (cf. (2)), *friþsbref*, neut. 'royal letter granting peace to outlaw', *gæstgivare* 'innkeeper' (ChL), *hofman* 'courtier', *hækta*, fem., *hækte*, neut., *hæktilse* all 'imprisonment', *krono gots*, neut. 'national estate' (ChL), *landsfogate*, masc. 'governor' (ChL), *overvinna*, vb. 'convict' (ChL), *rækinskaper*, masc. 'accounts', *taverne*, neut. 'inn', *æmbetsman*, masc. 'official'.

(2) Town law:

Bort dobbla, vb. 'gamble away', *bure*, masc. 'burgher', *burskap*, neut. 'burghership', *bysætning*, fem. 'imprisonment for debt', *bödhil*, masc. 'executioner', *forlika*, vb. 'reconcile', *forsumilse*, fem. 'neglect, omission', *gubbar* 'godchild', *gæstgivare*, masc. 'innkeeper', *hofmæstare*, masc. 'steward of household', *kæmenær*, masc. 'accountant', *köpen-skaper*, masc. 'trade', *leydha bref*, neut. 'letter of safe-conduct', *orörligt gods* 'immovable property', *stadsskrivare*, masc. 'town scribe', *til tyghia* 'convict with witnesses'.

2.5. Legal syntax and style

Generally speaking, the different national laws took over most of the syntactic and stylistic characteristics of the regional laws and town laws on which they were based. In sections representing new legislation, however, influence can be noticed from the statute language used in the royal chancelleries (Ståhle 1981, 177). This applies in the first place to the development in Norway and Sweden. In Denmark, where the Jutland Law gradually took over in the other regions as well, comparably few and limited changes appeared as a result of manual copying. In the late medieval manuscripts of town laws, however, massive influence from Middle Low German and chancellery language can be seen (cf. Hyldgaard-Jensen 1992, 28).

3. The Integrated National Law period

3.1. General remarks

The formal integration of country law and town law into one single codex took place at different times in different countries. The development of legal language in Sweden and Denmark was characterized by conservatism

and continuity. In Norway, however, the medieval tradition was broken. Although the first integrated Norw. national law was Norw. in content, its language was Dan. The second integrated national law was Dan. both in content and in language. After 1814, legislation and legal language took an independent Norw. turn. In Iceland, the language of legislation and jurisdiction remained Icel., in spite of the continued political and constitutional changes which, more and more, brought Iceland in close contact with Denmark.

3.2. Initial legislation

The Swedish National Code of 1734, Christian V's Danish National Code of 1683, Christian IV's Norwegian National Code of 1604 (in Danish), Christian V's Norwegian national Code of 1687 (in Danish) and Icelandic *Jónsbók*.

3.3. Legal language – notes on Sweden (and Finland)

The Swedish National Code of 1734 was founded in as much as possible on the National Country Law and the National Town Law. Although ancient in its language, the simplicity, clarity and the conciseness of this law must have made it effective in communicating legal knowledge to the people. Formally, the Code of 1734 is still in force in Sweden.

Despite the advantages of the Code of 1734, it lacked a uniform and consistent terminology, and the degree of explicitness of the Code was low. In contrast to this, as shown by G. Pettersson (1992), precisely these features were taken up by subsequent legislation in the 19th and the first half of the 20th centuries. This development entailed longer legal texts and a more complex syntax, features characterizing contemporary chancellery style (cf. Holm 1967, 121–126).

Since the middle of the 20th century, however, genuine concern about the deteriorating accessibility to legal language has led to the result that, since the 1970s, trained linguists have been attached to governmental legislative work on a permanent basis (G. Pettersson 1992, 35).

Research on the comprehensibility of law texts has shown that what matters most to the reader of a law text is the degree of correspondence between the perspective expressed by the law text and the functional perspective of the citizen, who tries to apply the text to

a concrete situation (Gunnarsson 1982, 12, 266f., 317).

41. Nordic language history and the history of ideas I: Humanism

1. Humanism and its journey to Scandinavia
2. National historiography
3. Specialized historical scholarship
4. The position of the vernacular
5. Poetry in the vernacular
6. The achievement of Scandinavian humanism
7. Literature (a selection)

1. Humanism and its journey to Scandinavia

Humanism began in southern Europe around 1450 as a return to ancient Roman ideas, advocating a study of man for man's own sake in opposition to the absolute authority of the Catholic church and to scholastic philosophy. After the Turkish conquest of Byzantium in 1453, Greek scholars came to western Europe bringing with them centuries-old manuscripts from ancient Greek literature as well as their own linguistic competence. Coinciding in northern Europe with the spread of the craft of printing from around 1450, humanism extended its interest from scholarly edited classical texts to philological revisions of biblical and other sacred Christian texts. Language studies written in Latin and later also in

the various vernacular tongues, school and church reforms, academies sponsored privately or by secular rulers, new universities and the establishment of networks of free scholars are visible results of humanist ambitions. Thus a predominantly theological culture was superseded by a concept of a common European civilization.

Chronologically, humanism entered Scandinavia together with the Lutheran Reformation. Until about 1560 it tended to get lost in the turmoil of religious and political disputes, as Sweden in 1523 had a change in royal dynasty, to the Vasas, and Denmark experienced a violent, but brief civil war, the Count's Feud (1534–36). Only after the final establishment and consolidation of Protestant state churches in Scandinavia could scholarly energy increasingly be turned towards secular fields. Two of these stand out: history and language.

2. National historiography

Humanism changed the concept of history and thus the course of historiography. To those living in the Christian Middle Ages, history described a linear movement from the cre-

ation to doomsday, divided into two periods by the birth, life, death and resurrection of Christ. Medieval monks hence were satisfied to record in annals and chronicles what happened along the way, day by day, year by year. Shifting to patterns from classical antiquity, humanist historians examined cause and effect, looked for the psychological traits of individual historical characters rather than for traces of divine providence, stressed certain moral teachings, and discussed constitutional and political principles. They further emphasized the artistic presentation of material, e. g. by including more or less authentic speeches and conversations to summarize a situation or making them up, as the Roman historian Titus Livius in particular had done. One problem for humanist historians was the lack of published sources, and another was that their unshakable confidence in the written word sometimes seemed at cross-purposes with a critical evaluation of the sources. Nevertheless, without entirely losing the idea of history as an expression of God's will, the humanists made pragmatism a key notion.

Though warmly recommended by the chief reformers Martin Luther and Philipp Melanchthon, national history was late in being accepted at the Scandinavian universities – 1621 in Uppsala and 1635 in Copenhagen. Yet the rulers of both states understood early on how history could be used to establish and emphasize a politically serviceable national identity, through private as well as state-supported scholars.

The first book printed in Danish in Denmark proper, incidentally, was a commercial enterprise, the late medieval *Rimkronike* [Rhyming Chronicle] (1495), a long series of fictitious self-presentations of Danish kings in knittelvers. It was reprinted at least 8 times up until 1613.

2.1. Christiern Pedersen

In 1514, the then-Catholic scholar and later secretary of the Danish King Christiern II (1513–23), Christiern Pedersen (ca. 1478–1554), published Saxo's large chronicle of Denmark, *Gesta Danorum*, in Paris, in a truly majestic typographical style. Having been written in the decades around 1200, this work was an example of a previous humanistic trend, since Saxo had borrowed vocabulary and idioms as well as the content and structure of several episodes from Roman historians. According to his preface, Saxo also had picked

up native oral legend for his reconstruction of a venerable Danish national past comparable to that of the Roman empire. Among other things, he suggested that the greatest of the ancient Danish kings, Peace-Frothi, reigned in most of northern Europe at the time when Augustus was Roman emperor and Christ was born. Pedersen only with difficulty unearthed a fairly complete manuscript for this printing, after which it disappeared. Thus his 1514 edition remains the only authority on Saxo's full text. The elaborate Latin eloquence of Saxo thrilled even the greatest humanist of the age, Erasmus from Rotterdam, and the book left an imposing impression of the history of the Danish kingdom on its international audience. The edition was reprinted twice, in 1534 (Basel) and 1576 (Frankfurt a. M.).

Pedersen edited several other books, predominantly in Danish. His translations of two medieval chapbooks on Charlemagne and Ogier the Dane, both in 1534, gave the Danes a popular national hero, Holger Danske, who originally had been mentioned in the French *Chanson de Roland* (ca. 1060). Holger was unknown to Saxo, but Pedersen tried to substantiate his historical reality. At his death, Pedersen left a now-lost Danish translation of Saxo and also had worked partly on supplementing, partly on continuing Saxo's text. Some of his manuscripts have survived in transcripts, but most of them perished in the fire of Copenhagen in 1728, dimming the picture of Pedersen's efforts. In general he was an able editor and translator and may be considered the founder of the standard Danish written language.

2.2. The Magnus brothers

In Sweden, the equivalent to Christiern Pedersen as a historian was the leading Protestant reformer Olaus Petri (1493–1552), whose *Swedish Chronicle* from the 1530s unfortunately was too critical to benefit Swedish nation building and therefore was suppressed by the new king, Gustav Vasa (1523–60). Instead, Swedish national history was first of all dealt with by two Catholic brothers, Johannes Magnus (1488–1544) and Olaus Magnus (1490–1557). Living in Rome as refugees from their Protestant native country, they brought out two major historical works in Latin. The comprehensive and anti-Danish chronicle *Historia de omnibus Gothorum Sveonumque regibus* [The History of all Gothic and Swedish Kings]

by Johannes Magnus was printed posthumously by his brother in 1554 and translated into Swedish in 1620. In 1555 Olaus Magnus published a cultural history of Scandinavia centered on Sweden, *Historia de gentibus septentrionalibus* [History of the Nordic Peoples] – preceded by an excellent map of Scandinavia and its environment, the *Carta Marina*, 1539, which also was a graphic masterpiece. Olaus' book contained 476 chapters, lavishly illustrated with 481 woodcuts, and it soon appeared in several languages (yet not in a complete Swedish version until 1909–51). Both brothers reacted against the Hamburg canon Albert Krantz' elegantly written *Chronica Regnorum Aquilonarium* [Chronicle of the Scandinavian Kingdoms], printed in 1546. Finishing his work in 1504, Krantz had drawn heavily upon the then-unpublished Saxo, presenting Sweden as a vassal state to Denmark. For lack of genuine Swedish sources, the Magnus brothers had to rely much on classical literature as well as on Saxo and Old Norse tradition; about one third of Olaus' text consists of quotations. They both liberally sweditized the material, also adding self-invented events and heroes.

2.3. The origin of the Scandinavian nations

In the middle of the 16th century, a feud between Danish and Swedish historians broke out concerning which of the two Scandinavian kingdoms was the older. On each side arguments were diligently produced in accordance with contemporary historical methodology, i.e. by means of a free, at times really imaginative, combination of sources and not seldom through very speculative reasoning, bordering on pure fiction.

Johannes Magnus' chronicle suggested that the ancient Goths were "vagina gentium" [the womb of all nations]. He started there and continued all the way through Sweden's history up to Gustav Vasa. His description of the reign up until 1523 of the last Kalmar Union king, Danish Christiern II, is mercilessly rancorous. For European readers, Danish history written in Latin did not go any further than where Saxo ended, with Archbishop Absalon's triumphant conquest of the Wends in the year 1184. In 1575 Danish historian Anders Sørensen Vedel in his Saxo translation had added an account of 22 more years in order to report Saxo's supposed death in 1206, but at the same time Vedel wondered aloud why for more than 350 years nobody had

undertaken to continue Saxo's work. This was already a semi-official issue, since from 1553 the Danish crown increasingly had supported scholars to fill this gap. From 1594 (until 1882!) official Royal Historians were appointed. A doubt soon rose about which language to write in.

2.4. Anders Sørensen Vedel

During his career, Anders Sørensen Vedel (1542–1616), a historian supported by the Crown and one-time Copenhagen chaplain, wavered between using Latin and using the vernacular. In a report handed in to the royal Danish administration in 1578 on how to write the history of Denmark he used Latin, but in 1581 he rewrote it in Danish. Private entries in his manuscripts alternate between both languages. His Danish version of Saxo in 1575, commissioned by two successive chancellors, renders the artful medieval text freely in a deliberately archaic style that may not be as natural as it looks. Vedel toned down the rhetorical pathos of Saxo, omitted the intricate poems inserted in the part about the legendary past, added frank native idioms and in marginal notes included Danish proverbs as commentaries on the contents – a typically humanistic feature. In 1579 Vedel edited a Latin history of the Scandinavian church from the late 1000s, for the first time identifying the author as one Adam from Bremen.

2.5. C.C. Lyschander and Arild Huitfeldt

A Danish answer to Johannes Magnus' 1554 chronicle was presented in 1622 by the sixty-four-year-old Royal Historian C. C. Lyschander (1558–1624) in his volume *Danske Kongers Slectebog* [Genealogy of the Danish Kings]. Written in Danish prose, it maintained that Christian IV descended from a series of 135 ancestors, thus tracing Danish royalty back to Noah. Lyschander accepted among other things a fantastic fabrication from the 1550s by the vicar Niels Pedersen who, after nine years in the then-Danish Baltic island of Gotland, using certain local manuscripts and legends, produced documentation that the ancient Cimbrians not only came from Gotland, but also were descendents of Noah's grandson Gomer. His theory became known as the Gulland hypothesis, after the old Danish name for the island. His manuscript was utilized in Hans Strelow's *Gotland chronicle* from 1633 and was finally published in 1695.

In his genealogy, Lyschander even printed excerpts from Niels Pedersen in runic letters to lend an air of authenticity to the presentation.

But before that, the pragmatic and practically minded chancellor Arild Huitfeldt (1546–1609) had published an all-encompassing history of Denmark in 10 volumes in 1595–1603 – in Danish. It was a sober presentation, founded on numerous reproductions of genuine documents and written in a rather artless style. Along with a reprint in two folio volumes in 1650–52, it served Danish readers for more than a century.

3. Specialized historical scholarship

During the 17th century, history research in Scandinavia became specialized. Philology, archaeology and Old Norse studies emerged.

3.1. Saxo re-edited

Saxo had a scholarly revival, through an excellently revised text edited in 1644–45, with learned notes in Latin. For the first time a European medieval author was treated as accurately and meticulously as the acknowledged classical authors. The editor, Professor Stephanus Stephanus (1599–1650), had already published the much less extensive works of Saxo's colleague Svend Aggesen in a pioneer edition in 1642. Stephanus mastered both classical and medieval Latin authors and for his Saxo notes had procured assistance from Icelanders to be able to offer parallels from their native tradition. Generally Stephanus quoted Saxo's own possible sources and contemporary or later parallels quite at length, now and then noting discrepancies. However, his commentaries pertain to details and do not discuss the chronicle in its entirety.

3.2. The dispute over the runes

Not by accident, three quarters of Stephanus' annotations concern Saxo's rendition of the pagan period. A Dano-Swedish fight for the ownership of the pagan past by now had been going on for some decades. One battlefield was runology.

3.2.1. Ole Worm

In Denmark, Huitfeldt had reproduced a runic alphabet in his chronicle. But the important figure in this area was to be Ole Worm (1588–1654), who after lengthy European study

tours in his youth had become a renowned professor of medicine and a general practitioner in Copenhagen. He managed to dedicate much of his energy and wealth to exploring the customs of ancient Scandinavia, its original runic alphabet and its old inscriptions. Importantly, he came to humanistic studies on a background of natural science, having been taught to trust his own coherent observations from real life rather than to accept automatically acknowledged authorities such as Pliny or the Bible.

Worm started with a valuable book on runic perpetual calendars, *Fasti Danici*, in 1626, 2nd ed. 1643, hoping for a revival of them in modern life, but in vain. In 1628 and later he published sample papers on Danish runic monuments, including a hastily written book in 1641 about the image-covered golden horn found two years before at Gallehus in Slesvig. Finally, in 1643 he was able to publish his chief work, *Danicorum Monumentorum Libri Sex*, an attempt to survey and interpret all 144 Danish runic monuments known at that time (a supplement was added in 1651). Worm's woodcuts – retouched and polished by a carver who had not seen the original objects and only had very poor drawings to work from – and his linguistic interpretations do not impress modern readers, but for more than a century his book dominated the field and was quoted widely. A standard work of similar proportions was not launched until 1895.

In a theoretical introduction six years earlier, *Runer seu Danica litteratura antiquissima* [The Runes or the Oldest Danish Letters], 1636, Worm stated that runes were an exclusively Danish phenomenon and therefore did not pay attention to Swedish inscriptions, though he knew of them. True to his patriotic purpose, Worm argued that the Danish runes originated in the Hebrew alphabet, dating them back to at least six centuries before Charlemagne. Comparing runic language to contemporary Danish, Worm concluded that the Danish language should not be considered a derivation from German – on the contrary, a German-sounding word in Danish could always be better expressed by a genuinely native word. Worm's book in this way inspired budding Danish grammarians to feel proud of the national alphabet and language. It also created a sensation among European readers as the first thorough scholarly presentation of the topic.

Only a minority of the runic monuments Worm described had been inspected by him-

self, but already in 1622 he had been allowed by the king to call for reports on all of them and to demand copies of the inscriptions from the local clergy. This procedure marked the introduction of a felicitous cooperation between scholars and the populace which still exists in Denmark in fields like topography, archaeology, lexicography and folklore, even if runology has now become a discipline for specialists only.

Pioneering runology and archaeology, Worm, as compared to German and Swedish colleagues, succeeded in blending patriotism and scholarship in a palatable balance. In 1652 Worm even instigated a royal decree demanding that runic monuments from all over the kingdom should be dispatched to the capital. Fortunately only few arrived, most of which were destroyed in the 1728 Copenhagen fire.

3.2.2. Johannes Bureus

Swedes had in fact written about runes before the Danes, but with less impact. The Magnus brothers in their works of 1554–55 reproduced straight runic alphabets with Latin equivalents. Johannes Thomas Bure or Bureus (1568–1652) in 1599 edited a table showing 8 Swedish runic monuments placed around old Swedish runic alphabets, which was contrasted with a narrow column presenting only late medieval Danish runes. Thus Bure underlined Sweden's prior use of the ancient letters. In a small handbook from 1611, Bure tried to reintroduce the art of reading runes. But Bure's further efforts remained unpublished during his lifetime. In 1624 he finished recording 48 Swedish inscriptions inclusive of woodcuts, but for reasons unknown publication was stopped; a few copies were printed in the 1650s, and a third printing was issued in 1664. By the end of his life, Bure had produced about 200 plates, but again production stopped.

3.3. The Swedish Hyperborean School

Swedish self-esteem during the country's period as a Great Power in the 17th century required firm answers to Worm's usurpation of the runes for the Danes. King Gustav Adolf appointed two antiquarians in 1630 to gather Swedish runic texts. In 1652, Count Magnus Gabriel de la Gardie bought the library and collections of the late Danish professor Stephanius from his poverty-stricken widow, in 1658 he acquired the famous library of Dan-

ish nobleman Jørgen Seefeld as war booty, and in 1667 he instituted a Swedish Academy of Antiquities at Uppsala, stimulating some fruitful activity. Leading names there were Olaus Verelius (1618–82) and Johan Hadorph (1630–93). Hadorph inspired a royal decree in 1666 about the preservation of ancient Swedish monuments. Verelius was the initiator of the Hyperborean School. The term "hyperborean" has been taken from odes by Pindar and Horace, literally meaning 'people living north of the north wind (Boreas)'. Verelius perpetuated Johannes Magnus' viewpoint that human culture began in Sweden with the Goths; he firmly believed in the reliability of oral transmission of texts over very long periods.

The height of the nationalistic theory of Gothic origins can be found in the work of Olof Rudbeck (1630–1702). As a scientist, Rudbeck was a true genius, but when dealing with antiquities he was carried away by an uncontrollable imagination. His major work, *Atlant eller Manheim* [Atlantis or the Home of Mankind] (vol. I, 1679, vol. II, 1689, vol. III, 1698), was published in Swedish and Latin. It was dedicated to Verelius. By means of fantastic etymologies and bold combinations of historical and scientific facts, Rudbeck showed that Sweden was the cradle of mankind and all earthly civilization, identifiable with Plato's lost continent of Atlantis. He considered the Swedish language to be the mother of all other tongues and saw Greek and Roman mythology as distorted versions of now-lost Swedish proto-myths. The manuscript for volume IV as well as most of the print run perished in the fire of Uppsala in May 1702 shortly before Rudbeck's death (a reprint was issued 1863). In 1849 the Swedish critic and poet P.D.A. Atterbom termed the work one of the greatest follies in the history of the world. It could also be categorized as a beautiful piece of historical fiction. To conclude the topic, the Swedish historian J. Peringskiöld published *Scondia illustrata* in 1700–05, a lengthy history of Sweden from the Flood onwards left by Johannes Messenius (1579–1636), a one-time Uppsala law professor and state prisoner for 19 years.

Rudbeck's patriotic fervour was shared by some colleagues, while others such as Alsatian-born Johannes Schefferus (1621–79) anticipated Olof von Dalin's sober criticism directed against Rudbeck in the 18th century. Nonetheless, the Norwegian vicar and historian Jonas Ramus (1649–1718) tried to outdo

Rudbeck in his book *Ulysses et Otinus unus et idem* from 1702, proving the Greek Homeric hero to be the same as the Nordic god. Rudbeck and Ramus inspired Ludvig Holberg's parody in his *Epistle 193* (1750). Yet during their time, Rudbeck and the Swedish hyperboreans gave their country a feeling of glory which matched its political and military feats of the 17th century.

3.4. The Old Norse legacy

Another part of the common pagan past lay in Norway and Iceland, waiting for attention. Native speakers were instrumental in its rediscovery.

3.4.1. The Norwegian scene

In Norway, humanism came after the Reformation. The first printing shop was established in Kristiania as late as 1643. The complete body of national codes and the Bible having been printed abroad in Danish translations, the Old Norwegian language soon became a speciality for the very few. Higher education could only be obtained at the University of Copenhagen, so from their years of study academics born and working in Norway were accustomed to considering Danish as their literary language. The cultural center of Norwegian humanists was Bergen. Here in 1567, Absalon Pederssøn Beyer (1528–75), chaplain and headmaster, wrote an enthusiastic paper *Om Norgis Rige* [On the Kingdom of Norway] in Danish, reflecting upon the glorious past of his native country; his manuscript was time and again copied in handwriting. Also in Bergen, Laurents Hanssøn and Mattis Størssøn (1500–69) translated Norwegian Kings' Sagas. At Lister, rural dean Peder Claussøn Friis (1545–1614) completed a description of Norway as well as a free Danish translation of Snorri's Norwegian chronicle *Heimskringla*, published by Ole Worm in 1632 and 1633 respectively. Both helped to arouse national pride in Norway. A preface by Worm in the latter publication gave Snorri his well-deserved reinstatement as the authoritative historian of old Norway.

3.4.2. The Icelandic tradition

In Iceland, too, it was difficult to find anybody mastering the old poetry, since long and monotonous rhymed epics called *rimur* had taken the place of the Eddic and skaldic poems dur-

ing the late Middle Ages. Arngrímur Jónsson (1568–1648) turned out to be the person who could understand, revive and hand on the Old Norse material, and he had contacts with Stephanus as well as with Worm. Assisted by him and other Icelandic friends, Worm translated Icelandic poems into Latin or Danish, and in 1652 he published the death song of legendary King Ragnar, *Krákumál*, in Danish verse. Worm printed his Icelandic texts in runes and also used runes for the entries in his 1650 edition of Magnús Ólafsson's Icelandic dictionary 1650, *Specimen lexici Runici*, incorrectly assuming that the Icelanders wrote in runic letters.

After Worm's and Arngrímur's death, Brynjólfur Sveinsson (1605–75), Bishop of Skálholt since 1639, collected and had copied old manuscripts – some of the most famous of them actually were brought to Copenhagen through his efforts, such as the Codex Regius of the *Elder Edda* in 1662.

The Scandinavian nations also competed in Icelandic studies. Through the fortuitous capture of an Icelander as a prisoner of war in 1658, the Swedes were able to initiate an examination of Old Norse manuscripts, an enterprise supported by the administration in Stockholm through several more cases of contacting Icelanders and acquiring material from Iceland. So the Swedes were first to edit, translate and print Icelandic sagas. National antiquarian Verelius issued *Gothrici & Rolfi Westro-Gothiae Regum historia* in 1664 (co-edited by Schefferus), *Herrauds och Bosa Saga* in 1666, and *Hervarar Saga* in 1672. Texts that related to Swedish locations were preferred, because they helped to prove the antiquity of Swedish history. Verelius also published a handbook on ancient Swedish rune carving in 1675 and left a manuscript for an Old Swedish dictionary, published as the first of its kind by Rudbeck in 1691.

In Eddic studies, the Danes were ahead. In 1665, the energetic topographer P.H. Resen (1625–88) published Snorri's *Edda* accompanied by *Hávamál* and *Völuspá* (in Icelandic, Danish and Latin). Central parts of the *Elder Edda* – 104 stanzas altogether – were inserted in Thomas Bartholin Jr.'s 702 page comprehensive paper in 1689 on the reason for the contempt of death among the old pagan Danes. The book was in Latin, but the author's friend Árni Magnússon had selected quotes in Icelandic for him from yet unpublished poems. Unfortunately Bartholin died in the following year, only 31 years old.

At the end of the 17th century Danish historians abandoned Saxo's chronology in favour of that of the Icelanders. Icelandic-born historian Thormod Torfæus (1636–1719) completed a manuscript in 1664 called *Series dynastarum et regum Daniae*. His version of the chronology of Danish kings from Skjold, a son of Odin, to Svend Estridsøn drew upon Old Norse material and was known as the Icelandic Hypothesis, which endured well into the age of romanticism. Taking advantage of his immediate access to the mostly unedited Icelandic material, Torfæus maintained that the Icelandic historical tradition was as old as the language and much more reliable than the tradition recorded in Latin by Adam from Bremen or Saxo. When Torfæus finally printed his results in 1702, they had been improved upon considerably by Árni Magnússon.

Thus in the 16th–17th centuries a truly national humanism built upon Old Norse culture arose in Scandinavia, running parallel to the common European humanistic tradition rooted in ancient Greece and Rome. That the all-pervading historical focus often led Scandinavian scholars astray and resulted in the neglect of the religious and poetic qualities of the native sources was to become clear only in the following centuries.

4. The position of the vernacular

Besides national history, appreciation of the vernacular was a key notion of humanism as well as of Protestantism. But the vernacular was not part of the study programme at the universities, where Latin maintained its monopoly. Humanists had to be content with a position outside of the educational system. Through the art of printing, introduced into Denmark in 1482, in Sweden in 1483, they could survive as independent scholars, now and then supported by the king, the church and nobility, all of which at the time cooperated. A market for serious publications in the national languages grew only slowly. Works written purely for entertainment, sloppy translations of medieval texts and sensational versified news items dominated commercially.

While humanists in Germany, France, England and the Netherlands preferred to join the international brotherhood of scholars, promoting general enlightenment and the education of the European reading audience, their Scandinavian counterparts worked rather to encourage their own native culture inclusive

of the vernacular. In Denmark, as well as having royalty of German orientation, the Reformation imported from Saxony brought with it a heavy influence from the German language as it had been developed by Luther in his 1534 Wittenberg Bible. In Sweden the linguistic impact of German was felt less, since the country was reigned by native kings from 1523 onwards.

4.1. Linguistic initiatives

In Denmark, humanist scholars published no less than six individual vocabularies between 1510 and 1594, all of which were designed as Latin-Danish dictionaries, yet included interesting observations on the Danish words.

The internationally famous Danish phonetician Jacob Aarhus (1538–86) published in the year he died *De literis libri duo* [Two Chapters on Letters] in Basel, supporting the ideas of the French scholar Petrus Ramus (Pierre de la Ramée) on how to cultivate the vernacular through accurate descriptions of pronunciation as well as through reformed orthography. Passionate pleas for not neglecting the vernacular were repeated throughout the period by all scholars – in Denmark in printed prosodies and grammars from 1639 and 1663 respectively. In both cases even more manuscripts existed which were circulating among those interested as handwritten copies or excerpts.

4.2. Metrical and stylistic reforms

Academies for the advancement of national languages emerged in Europe, such as The Fruitful Society in Germany (1617). Poets and theorists of European fame like the Italian Julius Caesar Scaliger, the Frenchman Pierre Ronsard and the German Martin Opitz developed a new style and new metrics, breaking with the long-lived medieval tradition of poetry. During and after the Thirty Years' War, their principles spread in Scandinavia. Many terms for philosophical, scientific and scholarly ideas were still lacking in the vernaculars and had to be imported from Latin. The prominent Danish linguist Peder Syv sometimes offered a whole sentence in Latin in the middle of his Danish prose, "so that it might be better understood". Idioms and syntax could also be borrowed from High German and French, creating an impression of linguistic impurity and confusion, even if in the end a workable updated vernacular was produced.

Prosodist Hans Mikkelsen Ravn (1610–63) in his *Ex Rhythmologia Danica* in 1649 assured that Danish did not fall short of any other language regarding vocabulary, syntax, character or pronunciation. Professor of medicine Rasmus Bartholin (1625–98) gave a speech in 1657 at the University of Copenhagen in Latin on why one should study the vernacular, printed in 1674 as *De studio lingvæ Danicæ*. He optimistically predicted that the native tongue would be raised to a rhetorical level matching the achievements of Danish historiography, medicine and astronomy.

4.3. Dictionaries and grammars

In 1680, the Danish high official Matthias Moth (ca. 1649–1719) initiated a comprehensive Danish dictionary with Latin explanations, which at his death comprised 60 handwritten folio protocols. They have never been printed but form the indispensable background for later Danish lexicography.

The first Swedish grammar was published by Johannes Bureus in 1636 in Latin. His poetic and learned colleague Georg Stiernhielm (1598–1672), who asserted that the Swedish language was very old, published in 1643 the letter A of a huge dictionary which was never to be completed. To cleanse the vernacular from the taint of Latin, he advocated the use of dialects and archaic expressions. The first Swedish grammar in Swedish came as late as 1696 in the form of Nils Tjällmann's *Svenska språk- och skrif-konst*.

Danish Bishop Erik Pontoppidan (Sr.) (1616–78) published the first *Grammatica Danica* in 1668 – in Latin. It had been written twenty years before, but was revised to meet the demand for a well-regulated vernacular after the introduction of absolutism (1660).

4.3.1. Peder Syv

Five years earlier, in 1663, *Nogle betenkninger om det Cimbriske Sprog* [Reflections upon the Cimbric Language] by Peder Syv (1631–1702) was presented to the public. He merged linguistic and literary history, stylistics, metrics and poetics in a somewhat subjective manner, backed by bibliographic sections and a multitude of footnotes giving learned references. To Syv, the Cimbric language, which included Scandinavian, Gothic, Slavic (Wendic), German and partly English and Russian, was one of the oldest tongues in the world, coming from Babel, close to Hebrew and older

than Greek and Latin. While Syv did not dare to maintain the exclusive Danish origin of Cimbric, he opposed the desires of German scholars to claim it was originally German. At the end of the book, in 114 self-composed poems he gave examples of desirable standards of the lyrical craft. An ordinary Danish grammar, *Den Danske Sprog-Kunst*, followed in 1685, and a two-volume collection of Danish proverbs from 1682–88, including some Icelandic and Swedish examples, also contained alphabetical glossaries. Altogether Syv – in 1683 honoured with the unique title of Royal Danish Philologist – had taken advantage of the period's increasing knowledge of Icelandic which, rather than random lists of parallels to Hebrew, Greek and Latin, facilitated the understanding of the past and present Scandinavian language situation. Thus Old Norse antiquarianism brought about an advancement in national linguistics.

Syv was no scholar of great genius, but rather a well-read, careful and diligent worker with a nice common-sense approach to his issues. His rival Henrik Gerner (1629–1700) took a narrower focus, concentrating on spelling reforms. In *Orthographia Danica* from 1678–79, he gave practical reasons for the neglect of the native language: our forefathers – the reformers? – preferred contents to form, our schoolteachers are not competent and erroneously teach their own dialect, and foreign words have entered Denmark during the frequent wars through foreign soldiers, but all these evils may be remedied.

5. Poetry in the vernacular

To all linguists of the age, it really was a problem that modern national poetry in the vernacular hardly existed, so theory had to anticipate practice. Ancient pagan Scandinavian literature had been suppressed by Catholicism and was also rejected by the Lutheran reformers, and they in turn did the same to medieval Catholic literature. The native languages were not taught in the grammar schools, so samples of successfully innovative poetry had to be taken from the as yet small stock of printed books. In the age of Lutheran orthodoxy, the predominantly religious literature in poetry or prose largely consisted of dogmatically correct repetitions of the sacrosanct words of the Bible and other authoritative texts. For lack of better inspiration, the grammarians patterned their presentations on clas-

sical philology and composed many of the poetic examples themselves.

5.1. Old Danish ballads in print

One fruitful revival, however, had to do with national poetry. Anders Sørensen Vedel was commissioned by the Danish queen in 1586 to collect old Danish ballads in a manuscript for her, but instead in 1591 he presented to her a truly pioneering printed collection, *It Hundrede vduaalde Danske Viser* [A Selection of One Hundred Danish Songs]. Since ca. 1550 in Denmark, courtiers, noblemen and noblewomen had gathered and copied these presumably very old popular songs, but Vedel's book established them as an acknowledged literary genre of the day and very likely inspired more collecting as well as the creation of new songs or updated variations. Vedel's own interest in the ballads was primarily historical, though in a fine introduction he also showed his comprehension of their functional, aesthetic and linguistic value. The book was reprinted at least nine times, and from 1695 it was republished in a version augmented with another hundred songs selected and edited by Peder Syv. In the vein of Worm and Stephanius, 8 of the new songs had been imported from ancient Icelandic literature.

6. The achievement of Scandinavian humanism

Nationally oriented humanism was evidently something to apologize for. Time and again Peder Syv explained in prefaces why he devoted his time to the vernacular instead of, like so many other vicars and scholars, to the Bible and classical culture. His paragraphs 19–20 in the introduction of the booklet *Prøve Paa en Dansk og Latinsk Ord-Bog* [Specimen of a Danish and Latin Dictionary] in 1692 run as follows about the vernacular:

We gape at foreign languages and clothes, let us look a little to our own language, and not keep on being like a sharp-sighted lynx abroad, but blinder than a mole at home. Those who have studied wring out their material in Latin, those who have travelled do it in French, and all others ape both parties, but all of them spoil it. Let nobody blame me that I as a parson feel like dealing

with such trifles. I cannot as I would like deal with large questions, about which other great and learned men certainly will be writing, sometimes even too much.

He continues to defend his enterprise by mentioning earlier parsons in the same line: from Anders Sørensen Vedel to Henrik Gerner. The reflection concludes:

Many use up their lifetime working in the fields of either the well-known old frail languages or the new foreign ones, but the ancient Greeks and Romans took great pains exclusively with their own languages, looking for the origin, power and meaning of the words.

This defensive attitude seemed natural, until the Enlightenment and particularly Pre-Romanticism and Romanticism allowed for a merging of humanism and patriotism in a strong collective emotion. While pride in national history and in the vernacular during the learned humanistic centuries could mainly be found in limited circles of specialists, the new movement appealed increasingly to the whole people. But without the small dedicated groups of humanists thinly spread across Scandinavia, these ideas would hardly have survived.

42. Nordic language history and the history of ideas II: Rationalism and Enlightenment since the 18th century

1. Introduction
2. Orthographic problems
3. Language purity
4. The best language
5. Language and Enlightenment
6. Literature (a selection)

1. Introduction

1.1. Forerunners in the 17th century

The 17th c. was a chaotic period in the study of the Nord. languages. Viewpoints moved from deep despondency over the inferior state of expressiveness in more abstract areas such as poetry and philosophy to strong assertions that the Nordic countries were the original home of mankind and the cradle of culture. Olaus Rudbeck (1630–1702) claimed in his monumental work *Atland eller Manheim* (1679–1698) that Sweden was Plato's legendary Atlantis.

The incipient interest in the Nordic national language was closely connected with prevalent European cultural currents. We can see a similar interest in language and its cultivation among the Germanic sister nations – Germany, the Netherlands and England. The need to promote the mother tongues rather than classical languages for many uses must be seen in connection with the establishment of centralizing absolute monarchies in Denmark and Sweden. For example, a codification of the existing legal practice into a national body of laws was felt to be necessary. In the Nordic countries this resulted in texts of very high quality: in Denmark-Norway, Christian V's Danish Law and its Norwegian counterpart (*Danske Lov* 1683, *Norske Lov* 1687), and in Sweden the law of 1734 (*Sveriges Rikes Lag*).

The study of language at that time was rather primitive – as seen with modern eyes. This can be explained by insufficient knowledge of language history and adherence to the language myths of the Bible. Hebrew was the oldest “Adamitic” language and was regarded as the mother of all languages. In a more practical vein, the interest in the Nordic national languages was reflected in poetic works of a high standard, composed in typical baroque style. In Denmark, we can mention Anders Arrebo (1587–1637) and Thomas Kingo (1634–1703); in Sweden, Georg Stiernhielm (1598–1672), Haqvin Spegel (1645–1714) and

Urban Hiärne (1641–1724); in Norway, Petter Dass (1647–1707) was a typical representative of the movement.

The study of language in the 17th c. was characterized by etymological and comparative studies of a more or less imaginative character, e. g. Rudbeck's book mentioned above. In Denmark, Peder Syv (1631–1702) wrote *Nogle betenkninger om det Cimbriske Sprog* (1663) which was a little more down-to-earth (Bertelsen I, 75–270).

Orthographic problems were discussed eagerly, and the first grammars of Sw. and Dan. were written: Erik Pontoppidan's *Grammatica Danica* (1668) (Bertelsen II, 1–426) in Lat., Ericus Olai Aurivillius' *Grammaticæ svecanæ specimen* (1684, first published in 1884) also in Lat., and Niels Tiällmann's *Grammatica suecana Äller En Svensk Språk- och Skrif-Konst* (1696). Extensive lexicographic works were planned e. g. in Denmark by Matthias Moth (1649–1719), whose gigantic drafts, however, remained unpublished.

1.2. Language and society in the 18th century

The study of language in the Nordic countries during the 18th c. in many ways developed out of the linguistic pioneer work of the 17th c., but the often rather imaginative ideas of the baroque era were replaced by the rational spirit of the Enlightenment. The 18th c. is called the century of philosophy, and a large portion of the discussion about language during the period was marked more by philosophical than linguistic interests. Language first and foremost was seen as a tool for clear and logical thinking. At the same time, it should contribute to the common human process of improvement; the language had to be refined in order to refine the people.

Culturally and social-politically, the Nordic countries in the 18th c. development in a way that altered the status of the national languages in terms of both their actual development and the linguistic discussion about their form and importance. In the dual monarchy of Denmark-Norway, which included Iceland and the Faroe Islands, the form of government was enlightened absolutism. The king governed the state, but not as a ruler by the grace

of God as in the 17th c. The Danish kings were enlightened rulers surrounded by a host of competent officials; the king was the first servant of the people. In Norway, however, this led to the Danicization of the Norwegian written language, since these officials either came from Denmark or, if they were Norwegians, were educated in Denmark. The old Norw. language was regarded as a rustic dialect. The Icel. language, on the other hand, by and large survived the Danish influence, and the 18th c. in Iceland was marked by a number of authors who wrote in Icel. and introduced the thoughts of the European Enlightenment to that far-away island realm, e. g. the poet and natural scientist Eggert Ólafsson (1726–1768). An Icelandic public educational periodical was published in the years 1781–1798, *Rit þess íslenska lærdómslistafélags* (the Enlightenment in Iceland is treated in Sæmundsson 1996).

In Sweden the dreams of becoming a major power suffered a defeat with the death of Karl XII in 1718. An era of liberty was inaugurated in Sweden with the constitution of 1720, when an assembly of the Estates of the Realm ruled the country. The members of the parliament represented the nobility, the clergy, the common people and the peasantry. In practice the period was characterized by a conflict between two parties, “Mössorna” and “Hattarna” (the caps and the hats), largely comparable to Whigs and Tories in Britain. This period was brought to an end with a coup d'état by Gustav III in 1772 and was replaced by a sort of enlightened absolutism.

From a social point of view, the Nordic societies underwent great changes, which had a decisive influence on their linguistic development. A middle class arose which was fond of reading and had good purchasing power. The new citizens were not satisfied with learned dissertations in Lat. or weighty theological books. They wanted to be informed and amused by works written in a modern and easily read prose style and to become refined in the best spirit of the 18th c. The educational aspect was catered for by contemporary Dan. and Sw. original works covering such different topics as science, technology, economy, anthropology, philosophy etc., as well as translations of many central works of the European Enlightenment. The need for entertainment was fulfilled by a number of translations of English, German and French novels, besides original works of poetry in Dan. and Sw. The educational side was further served by what

we now call the mass media. The daily press flourished in the Nordic countries, and an abundance of often rather primitive periodical literature appeared, even such modern genres as periodicals for women and children.

An important element in the endeavours during the Enlightenment to educate and improve the citizens was the moral periodical. In Denmark and Sweden these had a great impact on the development of the modern written language. The most important of these periodicals mark the start of an epoch in Dan. and Sw. language history. In Sweden, Olof Dalin's (1708–1763) *Then swänska Argus* (1732–34) denotes the boundary between older and younger Mod. Sw., *äldre och yngre nysvenska*. In Denmark, Jens Schelderup Sneedorff's (1724–1764) *Den patriotiske Tilskuer* (1761–63) heralds the younger Mod. Dan., *yngre nydansk* period in the history of the language.

The great cultural project of the Enlightenment in principle included the whole of society from theology to science. Everywhere the prevailing impulse was to bring order and systematism into the world and let the bright light of reason guide mankind in its development, life and work. Yet this did not take the form of the abstract rationalism of the 17th c. as propounded by the great system-builders of that time, e. g. Descartes and Spinoza, but rather was an empirically founded study of man and the world. The title of a book by one of the fashionable philosophers of the time, the German Christian Wolff, translated into Dan. in 1744, exemplifies this mode of thought in a nutshell: *Fornuftige Tanker om det, som Menneskene have at giøre og lade, til deres Lyksaligheds Forbedring* [Rational thoughts about what man has to do in order to further his bliss].

The study of language and theoretical discussions of the topic in the 18th c. have to be seen in the light of ideas about cultivation and education. Language was regarded as a central element for developing the individual into a cultured and respectable citizen. But language was also, just as in the 17th c., a source of national pride, so it also had to be refined and cultivated. But the matter is even more complicated because language was both an instrument for implementing these ideas and in need of improvement itself. During the Enlightenment, the view of language followed the general views of the period about both the living and the inanimate world: language was structured according to a reasoned plan and regu-

lar principles. The task of the linguist was, through empirical investigations of living languages, to discover these rules and principles. Typical representatives of this point of view were: in Denmark, Jens Pedersen Høysgaard (1698–1773), e.g. Høysgaard 1747 (Bertelsen IV, 249–488) and 1753 (Bertelsen V, 1–550) and in Sweden, Sven Hof (1703–1786) (Thelander, 1985). The conception of language as a regulated system apparently ran contrary to the earlier view of language as being in decay or as an organism in a state of ill health. The anonymous author of the manuscript Gl.kgl.Saml. 789 fol. in the Royal Library in Copenhagen, who is probably identical with Hans Olufsen Nysted (1644–1740; cf. Henriksen 1976, 91ff.) can be quoted as an example of the theory of the sick language. Speaking for itself, the Dan. language describes its miserable condition and asks the doctors to help (Henriksen 1976, 136; the author uses ω for Dan. å and various diacritical marks for prosodic features):

Hvorlænge o mine læger! skal det være til forgæves at man beklager mig alleveine, retsom der var ingen der enten kunde eller vilde hielpe? jeg prot' teste' rer for Gud og min Fa' r imod Jer' alle som har i sø møder sat' Jerres pligt og Kærlighed til side intil denne dag! hvad vil vel undskylde Jer' efterdi I har vedst min ska', den I som Lægerne burde forlængst se' t he' let?
[How long, oh my doctors! shall it be in vain that everyone is sorry for me as if nobody could or would help me. I protest for God and my father against all of you who have neglected your duty and love unto this day! What justification can you give because you have known my injury, which you, as doctors, long ago should have cured?]

The conception of language as decaying is not quite correct. The rationalistic notion in the 17th c. of language as a logical deductive system was still a living tradition in the 18th c. (cf. Henriksen 1997). There is no specific evidence that the major work on rationalist and universal linguistic theory, Arnauld and Lancelot's *Grammaire générale et raisonnée* (1660), was known and read in Scandinavia. But Leibniz was frequently named as an authority in discussions on language purity in the middle of the 18th c., and Høysgaard discussed the difference between universal and language-specific grammar. The rules of a universal grammar were in accordance with the mathematical or philosophical method (Bertelsen V, 6), while a language-specific grammar in principle was a set of unordered rules "den ene speciale Sprogregel grundet ikke paa den

anden" [the one special rule of grammar is not founded on the other] (Bertelsen V, 6). Høysgaard's particular rules for Dan. grammar, however, are logically stringent. What bothered the philologists of the Enlightenment and contributed to the decay and sickness metaphor was not so much the language system but rather language use. And as the discussions of language in the century first and foremost were about language use, it is a fruitful starting point to study the sometimes fiery debates about language in Denmark-Norway and Sweden.

1.3. Main points in the study of language

The first point involved the fact that the Nord. written languages were characterized by a lack of uniform orthography. Admittedly, there had been attempts to create common national standards since the Bible translations of the 16th c., but the general impression was still that the situation was rather chaotic especially in the handwritten sources of the period, but book printers were also doubtful about the norm. An essential cause of this problem was the lack of authorized dictionaries.

Second, the issue of language purity was discussed. Up to a point this was a reminiscence of the nationalistic debates of the 17th c. which focussed on the status of the Nord. languages in relation to the great European languages. The national aspect was still of importance in the 18th c., but more substantial was the use of language in the general process of civil education. This meant that foreign words, especially of Lat./Gr. origin and other learned words, as far as possible had to be replaced by familiar words. The purpose of this was primarily to give the normal educated (but not necessarily classically educated) citizen an opportunity to take part in scientific and scholarly discussions. Even women were to be included in this enlightenment. To this end the best known Danish purist, Frederik Christian Eilschov (1725–1750), wrote *Forsøg til en Fruentimmer-Philosophie eller alvorlige og lystige Samtaler med et Fruentimmer om det, der er nyttigt og fornøylegt i alle Philosophiens Parter* (Kiøbenhavn 1749) [An essay on philosophy for woman, or serious and merry conversations about what is useful and pleasant in all areas of philosophy].

Third, there were still discussions about which was the "best" language variety. The Nordic kingdoms were peasant countries. The majority of the population lived in the coun-

try, and they seldom or never travelled outside the boundaries of their birthplace. Danish, Norwegian and Swedish towns were small and insignificant. The only large cities were the capitals Copenhagen and Stockholm. The upper classes in the small towns consisted of officials educated in the capital, and the rest of the population were artisans, shopkeepers, tradesmen, workmen, beggars etc. who spoke the same dialect as the peasants in the area. The language consisted of various dialects, and a spoken standard language in the modern sense did not exist. The question was, which of the many regional and social language variants should be considered the best and thus provide the best candidate for the standard. In Denmark and Sweden the answer was a foregone conclusion: the language spoken in the capitals and by members of the educated classes became the standard. In Norway the conditions were different due to Danish domination. Presumably a form of Dan. with Norw. pronunciation had developed among the officials and other citizens in Oslo (Torp/Vikør 1993, 118).

Fourth, the general role of language in the process of cultivation was discussed. The baroque writing style of the 17th c. and its later offshoot, e.g. Ludvig Holberg's strongly Latin-influenced prose style, was considered old-fashioned. A change in style was necessary. Denmark and Sweden took new stylistic ideas from the great European nations, especially England and France. From England came the *Spectator* genre, with Joseph Addison's and Richard Steele's *The Tatler* (1709–1711) and *The Spectator* (1711–1713) as the best-known examples. Later in the century, English novels by Daniel Defoe, Henry Fielding and Samuel Richardson were translated into the Nordic languages. From France, it was first and foremost the philosophical works of the Enlightenment that were translated in a modern prose style.

Four points were central aspects in the Nordic debates about language and the function of language in society. Each will be dealt with in turn, but of course other language issues were discussed at the time, e.g. the question of the origin of language. How language developed was seen as an integral part of the development of human rationality in general. Was language a gift from God at the Creation, or had it developed from a primitive level to modern perfection? The second point of view was supported by increasing knowledge about the languages of "wild" tribes; e.g. the lan-

guage of the Hottentots was viewed as a very primitive prototype. The authority of the Bible and the theories about the age of the earth supported the first point of view. (The Creation had taken place precisely 4004 B. C., stated e.g. in the Danish historian P. F. Suhm's *Samlede Skrifter* Vol. 9 (1792), 305).

2. Orthographic problems

Both in Denmark and in Sweden, the Bible translations of the 16th c. (*Christian III's Bibel*, 1550; *Gustav Vasas Bibel*, 1541) had epoch-making importance for the respective standard written languages. In spite of these relatively modern and uniform standards for printed works (especially in the Danish Bible; the orthography in the Swedish Bible was more conservative; Skautrup 1947, II, 320), there was a lack of agreement about a consistent orthographic standard in the period around 1700. Individual writers often used their own private orthography, and professional printers also disagreed about various details. In Denmark there was a relatively stable standard about 1700 (Skautrup II, 1947, 320), as can be seen in an important text, Christian V's *Danske Lov* (1683), which is characterized by its astonishingly uniform and modern orthography. In Sweden, a sort of orthographic degeneration occurred in the years before 1700, which in the early 18th c. resulted in a heated dispute between Swedish linguists. Urban Hiärne wrote in his *Orthographia Svecana eller den Retta Swenska Bookstafweringen*:

Den förste anledning til sådant olagh begyntes oförmärckt uthi Drottning Christinae sidste regiments åhr, då så många Frantzoser iemte andra fremmande i landet kommo och deras språk blef så högt skattet, ath uthi howfet föga annat hördes än Franska och den, som något wille gälla, måste sigh deruthi öfwa. Sij, det gjorde, at man om Swänskan begynte wara något mindre bekymrad [...] och begynte man sedan ibland gemena mannen icke så noga taga den sanskyllige skriffarten i acht (quoted from Hernlund 1883, 19).

[The first cause of this disorder began unnoticed in the last years of the reign of Queen Christina when so many Frenchmen together with other foreigners came into the country and their language was so highly estimated that only French was heard at Court and anybody who wanted to pass for something had to practice it. This meant that you became less concerned about the Swedish language [...] and ordinary people began not to be careful about the right spelling].

Why did this orthographic dispute arise just at the beginning of the Enlightenment? Of course this can be viewed as a continuation of the endeavours of the 17th c. to centralize all aspects of society, which was an offshoot of the absolute monarchs' wishes to establish homogeneity in their kingdoms. Just as in all other parts of society, language had to be provided with a fixed framework. But the debate can also be seen as a genuine manifestation of the efforts of the Enlightenment to establish order and rationality in the domain of language, to save language from total decay.

The outlook for a successful outcome from the debate was favourable. There was interested although limited public comment, the authorities viewed these efforts with approval, and both in Denmark and in Sweden there were gifted linguists who could shape the ideas on a professional basis.

In Denmark the debate was opened by the linguists of the 17th c. – Erik Pontoppidan (1616–1678), Peder Syv and Henrik Gerner (1629–1700) – and was continued in the 18th c. by Peder Schultz in *Om Danskens Skriverigtighed* (1724, Bertelsen IV; 1–154), the anonymous writer of the manuscript Gl.kgl.Saml. 789 fol. (1727, Henriksen 1976), Niels von Hauen (1709–1777) in *Et lidet orthographisk Lexicon eller Ord-Bog* (1741) and Jens Pedersen Høysgaard in *Tres faciunt collegium* (1743, Bertelsen IV, 185–216; in Dan.) and *Concordia res parvae crescunt, eller Anden Prøve af Dansk Orthographie, som viser skrevne Accenters Nytte og Vocalernes rette Brug* (1743, Bertelsen IV, 217–248).

In Sweden the discussion was carried on in the 17th c. by prominent linguists such as Samuel Columbus and Petrus Lagerlöf, and in the early 18th c. by the two quarrelsome men Urban Hiärne in the above mentioned treatise and Jesper Svedberg (1653–1735), *Schibboleth, Svenska Språkets Rycht och Richtighet* (1716). Later on the problem was discussed by one of the greatest Swedish linguists of the century, Sven Hof in *Swenska språkets rätta skrifsätt* (1753, Thelander 1985) and Abraham Sahlstedt in *Försök Till en Svensk Grammatika eller det nu för tiden brukeliga Sättet at tala och skriva* (1747).

The discussion about *det rätta skrifsätt* recalls the contemporary literary controversy between the “old” and the “modern”. The problem was whether, when using the authorized orthography, people should make allowance for tradition in order to preserve the continuity of the written language, or for utility

and establish an orthographic standard with maximal connection between speech and writing. It is a well-known fact that the final result became a compromise between the two points of view. But the “moderns” had the spirit of time on their side and were able to adduce the most effective arguments. They claimed that speech was primary and writing as far as possible had to be in agreement with the spoken language. That meant that the letters <c, x, z, q, w> had to be abolished, that mute letters had to be removed, a few very forward thinking linguists even proposed that the plural forms of the verbs should be abolished. In practice this did not happen until the 20th c., first in Denmark, later Sweden. In the heat of the fight, the debaters often used less urbane manners, e.g. the unknown writer of the manuscript Gl.kgl.Saml. 789 fol.:

Det er jo i sig selv en vrang, bagvendt, forvendt, forvirret, lumpenagtig og unaturlig handel, og et ufornuftigt forhold at skrive en bøgstav, men tale en anden, eller at skrive 2de eller 3de bøgstaver, og allene tale en bøgstav (Henriksen 1976, 410).

[In itself, of course, it is a wrong, awkward, bungling, confused, lubberly, and unnatural procedure to write one letter, but to pronounce another, or to write two or three, and pronounce just one letter].

The ideas of the writer did not succeed, nor did Høysgaard's proposal for an *accentuated* [accentuated] orthography evoke a response. In Høysgaard's *Accentuated Grammatica* (1747, Bertelsen IV, 249–488) the Dan. prosodic features of stress, length and *stød* (the special Danish glottal stop) are marked in print.

The discussion continued in Denmark throughout the century, but no official standard was established. The provisional solution was, if anything, in the spirit of Holberg, who wrote as early as 1726:

Om visse autoriserede Mænd toge sig for at give orthographiske Regler, vilde jeg være den første at rette mig derefter, endskiøndt jeg, efter mit tykke, kunde give bedre Raison til en og anden Ting: Thi, ligesom det er bedre at leve under harde love end under Anarchie, saa er det smukkere at alle skrive paa een Maade, skiøndt mindre beqvem, end at enhver bogstaverer ligesom han faaer Indfald til.

[If certain authorized men gave orthographic rules I would be the first to follow these rules although I – in accordance with my own opinion – could give better reason to one thing and another. Because just as it is better to live under

hard laws than under anarchy so it is more beautiful that everyone writes in one way, albeit less convenient, than that everybody spells according to his whims] (*Orthographiske Anmerkninger* 1726, Bertelsen IV, 159).

In an aide-memoire (1800) to the university and the bishops, the Danish Chancellery wrote that teachers of Danish in the grammar schools had to follow “Den Orthographie, som af Fædrelandets bedste og meest classiske Prosaister bruges” [The orthography used by the best and most classic prose writers in the native country] (Skautrup III, 1953, 163).

In Sweden the discussion proceeded by and large as in Denmark. In the beginning of the 18th c., a debate about orthographic problems was carried on with Hiärne and Svedberg as principals. Hiärne represented the conservative point of view whereas Svedberg maintained the modern one. The dispute was primarily about the orthography in a new hymnbook which Svedberg had edited and which had been rejected because of its modern orthography. A positive result from this Swedish dispute was Svedberg’s book *Schibboleth* in which he offered his general view of linguistic problems, orthography, grammar, vocabulary and linguistic correctness. In the middle of the 18th c., Sven Hof took part in the discussion in his book *Swänksa språkets rätta skriftsätt* (Thelander, 1985). He pointed out (p. 71) that “Swänksa språket har ännu icke något wisst, och genom allmänneligit bruk, wedertagit skriftsätt” [The Swedish language still does not have a fixed and, through common use, approved orthography].

Just like Høysgaard in Denmark so Hof’s main point was “write as you talk”. This involved among other things radical proposals such as writing words like *giva* ‘give’, *göra* ‘to do’, *genom* ‘through’ as *jiva*, *jöra*, *jenom*. Also, he wanted to remove the mute ⟨l⟩ and ⟨d⟩ in e. g. *ljus* ‘light’, *djur* ‘animal’ and write them as *jus*, *jur*. Yet Sven Hof, in the spirit of rationality, was not fanatic but gave his reasons as follows (Thelander 1985, 52):

Skulle man i det, som här anført är om g och j icke finna smak, och tro att myndigheten af wanan och bruket härvid icke står att öfwerwinnas genom några skiäl; så kan jag icke wara emot sådant, utan låter mig därmed giärna nöja.

[If you don’t appreciate what is said here about g and j and believe that the authority of custom and use cannot be overcome by any means, then I cannot be against it but I am content with it].

The heated dispute in Sweden did not result in the establishment of a standard but, in contrast to Denmark where the solution to the problem was to refer to the most classical prose writers as orthographic models, the Svenska Akademien in 1801 published an orthographic handbook *Afhandling om svenska stafsättet*. It is a wide-ranging publication, which served as the standard in Sweden up to the end of the 19th c.

Although the extensive and at times heated dispute about principles of orthography did not lead to major changes in the 18th c., it provides interesting insights relating to both linguistics and the history of ideas. The best linguists of that time presented excellent information about the pronunciation of Dan. and Sw. in the 18th c. The entire discussion also offers a real example of the mode of thought during the Enlightenment, as can be seen in Hof’s eminent example (Thelander 1985, 32):

Konsten att skrifwa och läsa bör giöras så lätt, som någonsin möjligt är. Ty att denna konsten är högst angelägen för alla, som i det borgerliga samhället hafwa något att uträtta, och så nödig och nyttig, som människornas brister, nödtorfter och sysslor äro mångahanda; det lär ingen neka. Men som de flästes beskaffenhet och lefwernes art är sådan, att de hafwa liten tid att härpå använda, och dem jämväl swårt faller att lära äfwen det lättaste sätt att skrifwa och läsa; så följer nödwändigt, att denna konsten, särdeles till deras förmån, bör giöras så lätt, som någonsin möjligt är. [The art of reading and writing has to be made as easy as possible. Because nobody denies that this skill is very important for anybody who is involved in civil society, and this skill is also so necessary and useful while the shortcomings, needs and occupations of man are so manifold. But as the conditions and mode of life of most people are such that they have little time to spend on this matter and they have difficulties in learning even the easiest mode of writing and reading, then it follows of necessity that this skill has to be made as easy as possible in particular to fit the needs of these people].

3. Language purity

The orthographic debate in the 18th c. was a typical product of the Enlightenment Age’s idea about clarity and logic combined with a serious desire for improving and educating the common citizen. The discussion about language purity can be looked at in the same light. While 17th c. endeavours above all aimed at upholding the status of the mother tongue as opposed to culturally dominant European languages, the 18th c. was characterized by a

wide range of popular and educational vernacular literature both in Denmark-Norway and Sweden. One of the representatives of this literature was Ludvig Holberg in Denmark, whose relations to purism were, however, complex: though in principle advocating a moderate purism he did use a lot of loanwords of Gr., Lat. and Fr. origin. As a purist he was clearly surpassed by other outstanding writers like the philosopher Frederik Christian Eilschov and the professors in Sorø, Jens Schelderup Sneedorff and Jens Kraft (1720–1765). In Sweden, thoughts about ennobling the language were represented by authors such as Olof Dalin (*Then Swänska Argus*, 1732–34) and by the scientist Carl von Linné (1707–1778), e.g. in his travel books. The theoretical discussion in Sweden was led by the competent linguists Abraham Sahlstedt (1716–1776), Sven Hof and Johan Ihre (1707–1780).

The discussion about purism was, as previously mentioned, first and foremost inspired by ideas about the role of language in the process of cultivating a civil society. The view at the time was that language had to be developed as an easy and elegant tool for thought, and even the most abstract philosophical or scientific ideas in principle ought to be expressed in the mother tongue. The model for these Nordic endeavours was Germany, where language purism was discussed eagerly. The philosopher Leibniz supported the movement, and the fashionable philosopher Christian Wolff carried the principle into practice in his many books with the words “Vernünftige Gedanken über [...]” [Rational thoughts about [...]] in the title. The dependence on German models lends a slightly comic air to the Nordic purists’ energetic attempts to create new words which often were translated directly from G, in many cases forming clumsy compounds, and only a few of the many proposals took hold in the languages. The aim was first and foremost to remove words of Gr. and Lat. origin. For example Eilschov, a typical exponent of the purist movement, proposed in his (Lat.) dissertation *Cogitationes de scientiis vernacula lingua docendis cum specimine terminologiæ vernaculæ* (1747) a list of 897 Lat. philosophical terms with a Dan. equivalent. Most of the Dan. words were taken from contemporary translations of German philosophical and aesthetic literature (e.g. Wolff, J. Chr. Gottsched); others were Eilschov’s, either his translations of corresponding G words or Dan. neologisms. A few examples from *Cogitationes* are: *Aands*

Nægtelse (materialismus), *Blad Viisere* (index), *Dømme Kunst* (critica), *Fjederkraft* (elasticitet), *Jord Deeleren* (æqvator), *Øye-Kreds* (horizon), *Bevægende Grund* (motiva); more fanciful ones include *Legems Nægtelse* (idealismus), *Langtfravisende Glas* (telescopium), *Dunst-Kugle* (atmosphæra). Many of Eilschov’s words are still alive in Mod. Dan., e.g. *Skarpsindighed* (acumen), *Spids-Vinkel* (angulus acutus), *Sandsynlig* (verosimilis).

In Sweden, Sven Hof expressed the idea about purism clearly in *Swänska språkets rätta skrifsätt* (Thelander 1985, 25):

Främmande ord böra lämpeligen och efter hand gifwas och förbytas med tianliga ord af moders-målet, som beqvämigen kan ske genom de, för ämbete, stånd och lärdom, anseligas bruk och myndighet.

[Foreign words gently and gradually ought to be replaced by serviceable words of the mother tongue; that can be done through the use and authority of those people who are distinguished owing to their post, rank and scholarship].

And just as Eilschov also wanted to philosophize for women in intelligible Danish, so Hof also showed consideration for the linguistic education of young Swedish women:

Lät dina döttrar lära Catechesen, Gudsfruktan, sedighet, hushåldning och skrifwa Swänska, men för ingen del att tala Fransyska: och föreställ dig, att de sedan icke mer lära skona någon, som i deras åhöra wille härmed förskämma språket, än den som i samtal med dem skulle slänga in en hop Latin och Grekiska, eller prata något för dem ur Logica och Metaphysica (Thelander 1985, 125).

[Let your daughters learn the catechism, fear of God, morality, housekeeping and to write Swedish, but not to talk French, and imagine that they afterwards will not deal gently with anybody who in their presence will disfigure the language or in conversation with them would throw in a lot of Latin and Greek or talk about logic or metaphysics].

This purism must be looked at in the same way as the spelling debate; its goal was also more modest than the heated disputes indicate. The most important problem concerning the vocabulary was the scholarly words of Greek and Latin origin, because they caused difficulties for the new readers. Many French words also had to be removed, not so much because they were unintelligible, but because they were regarded as a ridiculous fashion (cf. Holberg’s comedy *Jean de France*). Germanisms on the contrary were by and large tolerated. A real Nordic linguistic movement as

was seen in the 19th c. was not under discussion. When the poets of the late 18th c. dealt with Nordic topics in their poetry, they focussed on the morals and noble thoughts of the Old Norse gods and heroes and not so much on their language. However, the idea of a Nordic linguistic brotherhood can be seen in the Dane Sneedorff's *Den Patriotiske Tilskuere* (No. 32, 8/5 1761), where he expressed his wish for a Nordic linguistic community:

hvis vi til de Nordiske Nationers Ære [...] kunde finde et saadant Middel til at foreene det Danske og Svenske Sprog, at Indbyggerne i de tre Riger udgiorde kuns et Selskab i Henseende til Videnskaberne.

[if only we to the honour of the Nordic nations could find a means to connect the Danish and Swedish language so that the inhabitants in the three countries constituted only one society as regards the branches of knowledge].

4. The best language

A more concrete problem following from desire for uniformity and common national standards was which language was the "best" and consequently should become the standard. The question had two sides, a regional and a social one. The regional concerns the absence of a standard language in the modern sense of the word. Skautrup estimates (III, 213, 1953) that the number of people in Denmark speaking a sort of standard language rose from 5 per cent to 10 per cent in the period 1700–1870. In the 18th c. the number of standard speakers was very low. In Sweden the situation was the same or even more in favour of the dialects. The problem was, which dialect should become the basis for the standard language? On this point there was no doubt in Denmark and Sweden. In spite of the growing interest in the spoken language and knowledge of the dialects and their distinctive character, it was the language of the capitals, Copenhagen and Stockholm and their nearest surroundings, that was viewed as the exemplary form of the language. In Denmark the writer of *Gl.kgl.Saml.* 789 fol. wrote (Henriksen 1976, 382):

nør man rigtig vil vide hvad for bøgstaver et Dansk ord, i sær sø^nt et ord man tviler pø, eientlig skal skrives med, da skal man som ofte er sagt, konferere, eller her at si^, gi^noie agt pø den lyd som ordet høres med [...] nør det udtales av en Lerd mand der bøde har en re^ n stemme, sø og er fø^t i hovedstaden av Danske Forældre, og

tillige har ha^t^ li^gesø^ n person til sin Skolmester.

[If you want to know with which letters a Danish word has to be written, especially such words which you have doubts about, then you must as said before compare or pay attention to the sounds with which the word is heard when it is pronounced by a learned man who both has a pure voice and is born in the capital of Danish parents and also has had a similar person as schoolmaster].

Høysgaard in his *Accentuered og Raisonnered Grammatica* (1747, Bertelsen IV, 368) wrote: "Den beste Dialæct er efter de lærdeste og omhýgeligste Orthographisters skjønnende først dén i Roeskilde og dêrnæst den Kjøbenhávnske" [The best dialect is according to the opinions of the most learned and careful orthographers first the dialect in Roskilde and next that in Copenhagen].

In Sweden, Hof also emphasized the priority of the language of the capital and its surroundings (Thelander 1985, 80):

Den talarten som brukas i Stockholm och de nästgränsande landskap, särdeles i de förnämre och hederliga hus, må kallas den Upländske. Den Upländske talarten hålles och är ibland de Swänske, den bäste.

[The idiom that is used in Stockholm and the nearest provinces especially in the houses of distinguished and honourable people is called Uplandic. The Uplandic idiom is considered the best among the Swedish dialects].

Nor were there any doubts from a sociolinguistic point of view on the best language; the learned and educated citizens of the capital spoke the best language.

The discussion about the best language variety thus was entirely in the spirit of the Enlightenment. The most important function of language was to educate and improve the citizens of the country. An understanding in a deeper sense of the regional and social plurality of language belongs to a later time. Yet an incipient interest in these aspects of language can be seen. The writer of *Gl. kgl. Saml.* 789 fol. demonstrated knowledge of Jutlandic and Norwegian dialects and made many characteristic comparisons in tabular form (Henriksen 1976, 395ff.). In Sweden the first more detailed accounts of dialects and collections of words were published, e. g. Hof's *Dialectus vestrogothica* (1772) with a dictionary and a grammar of the Swedish Västgöta dialect. Johan Ihre published the first real dialect dictionary in Scandinavia in 1766, *Swenskt dialect lexicon*. Even in Norway, in spite of Dan-

ish dominance, there was a growing interest in the Norwegian language, e. g. in the form of lists of genuine Norw. words (cf. Knud Leem's *En liden Glosebog* ca. 1740, published in 1923; Laurents Hallager's *Norsk Ordsamling*, 1802). The relations between Dan. and Norw. in Norway are treated by Indrebø (1951).

5. Language and Enlightenment

The discussion about language in the Nordic countries clearly was connected with the general line of thought of the Enlightenment. The efforts of the 17th c. were chiefly aimed at upholding the value of the national languages and thus saving them from decay. In the 18th c., language was viewed as a means to expound new ideas about civil enlightenment and education. The language debaters of the time wanted to make their language a flexible tool of thought, but at the same time retaining elegance and good taste. The linguists of the 17th c. made a point of purity and gracefulness (*puritas* and *ornatus*) and had difficulties in tearing themselves away from the turgidity of the baroque style and dependence on poetry in verse form. In contrast the 18th c. was a century of prose. Modern European prose forms arrived on the Nordic scene from Germany, England and France and had a strong influence on views of language. Theorists both in Denmark-Norway and Sweden were heavily assisted by writers with good linguistic intuitions who mastered the new genres – popular science, essays and journalism.

The discussion was furthered by a fairly interested public participation. Concern about looking after the mother tongue can also be seen in the fact that the public or private learned societies both in Denmark-Norway and Sweden included language cultivation in their programmes, e. g. in the form of great dictionary and grammar projects, in Denmark, e. g. *Dansk Ordbog udgiven under Videnskaberne Selskabs Bestyrelse* 1–8 (1793–1905); as regards the lengthy history of this dictionary see Lomholt (1960); in Sweden, Abraham Sahlstedt's *Swensk grammatika efter det nu för tiden i språket brukliga sättet författad, af Kongl. Vetenskaps Akademien gillad* (1769), and his *Swensk ordbok med latinsk uttolkning, på Kongl. Majestäts allernådigste befallning författad, och i ljuset framgifwen af A. S., Kongl. Secret.* (1773).

In the last decades of the 18th c. a growing interest in Old Norse literature and culture

was typical in the Nordic countries. Old Norse texts were published, and the poets of the time e. g. in Denmark Johannes Ewald (1743–1781), Christen Pram (1756–1821), P. F. Suhm (1728–1798); in Sweden, Carl Gustaf af Leopold (1756–1829) used topics from Nordic mythology in their poetry.

The transition from the Age of Enlightenment to Romanticism was a gradual process, not a jump in development; the last two or three decades of the 18th c. are often named Pre-romanticism in the history of ideas. The great interest in the Northern antiquities can be looked upon as a manifestation of this current. The German philosopher Johann Gottfried Herder (1744–1803) was an important inspiration in the Nordic countries. His idea of a national genius (*Völksgesit*) and his emphasis on the importance of linguistic and literary tradition evoked a response among the intellectual leaders.

This transitional phase between rationalism and romanticism also showed up in the linguistic discussions at the time. The rationalistic tradition survived in the synchronic grammars of Dan. and Sw., e. g. in the form of greater reference books or text books. In Denmark, Jacob Baden's *Forelæsninger over det Danske Sprog, eller Resonneret Dansk Grammatik* (1785) was published in an abridged form as late as 1838; Baden's grammar was strongly influenced by Høysgaard. In Sweden, the grammars of the 18th c. survived the turn of the century, e. g. Sahlstedt's *Swensk grammatika* (1769) and Botin's *Svenska språket i tal och skrift* (1786).

The encounter of the old and new ideas showed up clearly in comparative, diachronic linguistics. The Dane Rasmus Kristian Rask (1787–1832) was the most prominent representative of these new views in Scandinavia. There is a typical duplicity in Rask's linguistic views; on the one hand a romantic, patriotic perspective was reflected in his extensive studies in OIcel. and his passion for the Nordic antiquity, on the other hand Rask's main interest in the study of language was systematism and classification. In principle, languages ought to be described in accordance with scientific methods in the same way as plants. Rask drew attention to the fact that he was influenced by Carl von Linné's botanical taxonomy (cf. *Breve fra og til Rasmus Rask I*, København 1941, 387). Rask's rationalistic, 18th century inspired, basic views on language is convincingly demonstrated in e. g. Hjelmlev (1951), Bjerrum (1959) and

Diderichsen (1960), most radically by Hjelmlev who regards Rask's later works as a sort of struggle for liberation from the romantic influence in his youth (cf. Diderichsen 1960, 144).

The national and historical view – inspired by the romantic ideas and comparative, historical linguistics – broke through in Scandinavia later in the 19th c.; e.g. in Denmark, N.M. Petersen's *Det danske, norske, og svenske Sprogs Historie under deres Udvikling af Stamsproget* (1829–30), in Sweden, J.H. Rydqvist's *Svenska språkets lagar* (1850–83) and in Norway, the *Landsmaal* movement with Ivar Aasen as the leading figure.

43. Nordic language history and the history of ideas III: Nationalism, identity and democratic movements in the 19th and 20th centuries

1. Introduction
2. Epochs in the history of ideas from Pre-romanticism to the present day
3. The history of ideas and language planning in the Nordic countries
4. Literature (a selection)

1. Introduction

The history of ideas in the Nordic countries is immense in scope, yet its influence on the study of language remains under-researched. The only major works seem to be Diderichsen's *Sprogsyn og sproglig opdragelse* (1968, posthumously edited) and Tarschys' *Svenska språket och litteraturen* (dissertation, 1955). Obviously, there are many valuable suggestions and lots of useful information in Skautrup's great work on the history of the Danish language, but there is no Nordic overview. Many ideas – and the very concept of idea is not all that precise – do not have any bearing on the study of language and vice versa. The present article thus does not try to cover the entire subject area but rather focusses on certain key concepts and particular periods. The time span covered is the period from the pre-romanticists till the present day.

In the study of language, as in the study of all subjects placed within the traditionally circumscribed field of the human sciences, we may for all epochs and all research traditions distinguish between at least four different levels of linguistic theory.

At the first level we find the objectification of data and possibly a declaration of which linguistic data the tradition does not aim to cover. Data are always constructed. This is evident in the case of dialect studies where the spoken language is recorded in one or more ways (by using phonetic alphabets directly, by using a tape recorder and afterwards transcribing the recordings, or by video recordings etc.). It is, however, also found in the programmatic statements at the beginning of any grammar worth being called a scientific grammar stating what kind of language is included (e.g. cultivated speech, not vulgar speech, written language only etc.). The data base is always a selection of what there is.

At the second level are the methods used for manipulating the data. Actual speech or writing typically constitute (various types of)

texts. But this text has to be systematically dismantled in order to furnish the material for a new text, viz. a grammar, dictionary, or treatise.

The third level consists of what is usually called the theoretical stance of the researcher, his or her conception of language and of what research can and must do to achieve the objectives the tradition has set for itself. At this level belong the “schools of thought” (e.g. Radnitzky), the “research traditions” (Lakatos) or the “paradigms” (Kuhn) of linguistics (or any other human science).

By including a fourth level of theory, I wish to draw attention to the fact that these various schools of thought all have ideological implications at the level of what we conveniently, but a bit vaguely, might call “world views”. World views may themselves be seen as variations on universal themes such as idealism versus materialism, realism versus nominalism, conventionalism or constructivism etc. The combinations of this limited vocabulary of oppositions and the various shades of stances are unlimited, and the particular aggregate of stances will always be a historical fact. Often a particular combination will be labelled an ideology by convention. The field of ideologies of language has in recent years developed considerably (Woolard 1998; Wingstedt 1998).

To complicate matters, we may further distinguish between the levels as applied to the object itself, i.e. in the study of particular languages, and to the conceptualization of the study of languages, i.e. to the object as constructed at a particular level. We use the expressions “object” and “reflexion object” (Gregersen/Køppe 1985) for these two levels. Most explicit thinking about the study of languages, i.e. most theorizing, will treat the reflexion object, while most empirical work will be about the object. In one sense we attempt to unearth the hidden presuppositions about the reflexion object when analyzing empirical work ostensibly about the object itself.

Returning now to the general history of ideas, the subject matter of this discipline may be found in principle at all the levels but most often will be found, most explicitly at least, at the fourth level of theory, the level of world views. This is also the level where scientific activities across the various disciplines at a cer-

tain point in time and space have most in common, cf. the idea of *Zeitgeist*. Thus we speak of the ideas of a certain epoch and often roughly delimit the epochs by focussing on certain characteristics while ignoring others. We shall follow this dubious strategy in order to give an outline of the period under scrutiny here.

2. Epochs in the history of ideas from Pre-romanticism to the present day

2.1. Herder and Pre-romanticism on language

Traditionally the ideas of J.G. Herder mark the beginning of a new epoch in the history of ideas in Western Europe (for Herder on language, cf. Diderichsen 1968, 129 ff. with note 2). The epoch may be viewed as characterized by the introduction of the complex of the *Volk* (cf. article 54). I think it is impossible to overestimate the influence of Herder's thought on contemporary ideas if only for the simple reason that it formed the basis for research and national language policies from then on. The very idea of a language must have changed. Obviously, many observers had noted that other people seemed to manage very well without using the same means of communication as the observer. Obviously, many people must have experienced not being understood. But the very idea of ascribing this mysterious importance to "language" must have sounded a deep note since it was accepted so quickly. Looking at empirical work in linguistics, we may ask what it meant to change the conception of language. First and foremost it meant that linguistics attained more prestige, and linguistic knowledge became essential knowledge since only through the study of language and literature could we begin to fathom the mind of the *Volk*. Secondly, the relationship between the sciences was changed so that the historical view united them in a never-ending quest for the origins of the present.

2.2. The romanticist complex of ideas: idealist historicism, the concept of *Volk* and its relation to language

Traditional histories of ideas name the entire 19th c. the epoch of historicism. Thinking in genetic terms became the dominant theme, and the origins and development of X became the dominant explanation for any X. Histori-

cism may, however, conveniently be divided into idealist historicism, dominant at the beginning of the century, and materialist or naturalist historicism, victorious at the end of it. At which point in time exactly the two change places is a matter for discussion. The important thing is to see this change in the light of the professionalization of the human sciences which took place during the 19th c. after the model of the Prussian Humboldtian university. The human sciences became the prime producer of nation state ideology and have only gradually freed themselves from this obligation – if, that is, they have yet. This task should not be seen as something imposed on the human sciences from outside. On the contrary, the scientists active in discussions in the public spheres of the newly created nation states all over Europe felt themselves that this was their very *raison d'être*: to put things right as to the history and mission of the nation and its people.

The beginning of the 19th c. hovers ambivalently between a "rationalist" search for the inner logic of languages and the historicist quest for the origins of present structures. This is nowhere felt more acutely than in the controversy surrounding the genius Rasmus Rask (M. Bjerrum 1979). Rask (1787–1832) can be seen as fundamentally a typologist concerned primarily with the structure of living (or dead) languages and the comparative analysis of these structures. In this view he is painted as a structuralist *avant la lettre* (or a rationalist *post festum*). This is essentially what Hjelmlev does in his *Commentaires sur la vie et l'œuvre de Rasmus Rask* (1951). Alternatively, Rask may be seen as the historicist founding father of comparative national philologies, as Holger Pedersen has it (Pedersen 1924; 1933). Crucially, Diderichsen, while studying the dissertation by M. Bjerrum (1959) on Rask's works on Danish, undertook a painstaking study of what views were held by Rask's teachers on matters linguistic (Diderichsen 1960). This unique book convincingly shows that Rask was heavily influenced by teachers who were imbued with the rationalist tradition and that this was what he brought to the study of the various languages of the Indo-European family and other languages he was concerned with. In a later paper, published posthumously, Diderichsen summarizes his results:

The chief merit of Rask is that he was the first who applied the theories and methods of eighteenth-century philosophical etymology and

grammar to all the main languages of Europe, Indo-European as well as others. [...] Rask was the first to demonstrate how the methods were able to solve problems of a highly complex type. [...] The predominant motivation for the work of the first comparatists was the romantic interest in old poetic, historical, and religious texts, and the national movements in Germany and Scandinavia. The edition and investigation of Old Norse “*edda*” and “*saga*”, Old German poetry, Sanskrit and Avestan forced Rask, the Grimms, and the Schlegels to painstaking grammatical and etymological inquiries; and this combination of text philology and comparative linguistics has continuously been an essential characteristic of the whole paradigm. (Diderichsen 1974, 301f.)

Only one thing need be added to this elegant and comprehensive summary of a complex change – viz. that the addition of an empirical facet makes all the difference. What Diderichsen, with reference to the eminent American theoretician of science Thomas S. Kuhn, calls “problem solving” in fact refers to the empirical stance: thinking about language is not doing linguistics; rather, doing linguistics is tantamount to describing without prejudice what is there in the sources, what is said by the speakers, in brief what the linguistic facts are. This takes us back to the basic level.

The consequences for the delimitation of linguistic facts of Herder’s ideas put into practice were obvious. As Diderichsen noted, the texts to cull for linguistic facts needed to change. First of all they had to be old and they had to be in the language of the forefathers. This, however, was not immediately practicable since the old texts were not printed and often had been transmitted through manuscripts which diverged significantly from each other. Thus the emerging field of Nordic philology had to purify and edit the sources so that they could be used for the historical grammars and dictionaries which would demonstrate the continuity and ancestry of the wonderful language used by the nation’s inhabitants.

In a paradigm such as this, it is important to know which “national” language is used in a particular text. Although the results are now uncontroversial, a significant number of texts from the Nordic countries are much more alike than they “should” be. It appears that there were not the same obvious limits between what was a text in Swedish and a text in Danish. Looking at this *Gründer* period, one may speculate how much the researchers were led to distill a language which was not yet in existence as “a language”. It would be

helpful to consider instead the various writing traditions without necessarily having to use the terms invented in later centuries.

The historical view led to the establishment of a new genre, the history of the Nordic languages. Niels Matthias Petersen, the first Professor of Nordic at the University of Copenhagen, taking his cue from the sketch of the history of Danish in Rask’s treatise on orthography (1826) and Rask’s inspired explanation of the endings and forms of Danish using the Old Norse language (1820), wrote his history of the Danish, Norwegian and Swedish languages in 1829–30. The Nordic ambition is logical, but the pioneering effort was felt by the author to be almost unbearably cumbersome since:

Ingen dansk Mand vil, uden et længere Ophold i Sverrig og Norge, og uden Adgang til de mange i Sverrig henhvilende Haandskrifter, være i Stand til paa en tilfredsstillende Maade at behandle disse Landes ældre Sprog; men Midlerne hertil stode ikke i min Magt. Med mine Lidelser i denne Henseende vil jeg ikke opholde Læseren; den som har erfaret, hvorledes man er tilmode, naar man hører Kilden risle i en Frastand, uden at kunne komme til at lække sin Tørst, vil kunne sige sig dem selv (N.M. Petersen 1830, 4f.).

The stylistic consequences of the changing conception of language in the 19th c. are usually summarized in terms of the influence of the Old Norse sagas on the thematic and stylistic choices of the contemporary authors. In short, romanticism itself influenced the translation of the sagas (N.M. Petersen was the first to translate the Icelandic sagas into Danish), and this translation shaped the idea of an Old Norse style, which in turn was imitated by e.g. the poet Carsten Hauch (cf. Rubow 1923, 95f.).

In all the Nordic countries the romantic invention of the *Volk* (cf. Burke 1978, part I, ch. 1) led to systematic attempts to reinforce and invigorate the written language by noting how people actually spoke the language. Thus Hans Christian Andersen’s prose style is an attempt to fuse spoken and written modes of communication in a specifically invented or construed genre, the fairy tale. The fairy tale used the format of the popular narratives collected and retold by the Grimm brothers in Germany but remodelled it thoroughly. The result renewed Danish prose style. It became legitimate to mimic a more oral and thus more popular style, less influenced by the Latin prose style of the learned writers: shorter sentences and an artful exploitation of the

possibilities of the sentences' first position, so important stylistically for the information structure of all V2 languages. Andersen's style remained a challenge for all later writers.

2.3. Naturalism

In keeping with the development of the university and the nation state, the second half of the 19th c. introduced a more materialist historicism, gradually replacing the earlier idealist trend. Naturalism, positivism and a host of other labels have been introduced to capture this change of climate, and in international linguistics this is normally seen in conjunction with the foundation and subsequent success of the neogrammarian school of linguistics. Diderichsen in his paper on Rask (1974) dismisses the neogrammarian school as a minor variation of an already fully fledged paradigm of historical linguistics. This may or may not be true – what is minor depends on the scale used in measuring the change. What seems important from the point of view chosen here is that the understanding of language as a physiological phenomenon with a psychological parallel separates this trend from its predecessors since it makes it possible to search for explanations of a type called “laws”. The controversy over the nature of sound laws is a *Lehrstück* in the history of linguistics (cf. the documentation in Wilbur 1977), but its significance lies less in the views expressed than in the aim of the discussion. While nobody in the early part of the century doubted that historical studies were relevant for the insights they gave into the spiritual side of the existence of the nation and its people, it now became obvious that linguistic facts could or ought to be explained by having recourse to more general laws of human nature. This at once puts universalism back on the agenda and squarely places it under an obligation to account for the linguistic facts, chronicled in an explosion of research since Rask, Grimm and Bopp.

Karl Verner (1846–1896), who formulated Verner's law, probably was the main representative of this new trend. He closely collaborated with German linguists, forming a closed group of like-minded scholars at Jena and Berlin, and he became famous as the linguist who had put the ideas of the *Junggrammatiker* to work in order to explain a hitherto mysterious exception. Verner's law thus became a symbol of the progressive nature of this particular research tradition, and his 1876 paper

can still be used as an ideal way to present a problem in order to solve it.

Verner was only one of a long series of eminent and very influential Nordic linguists belonging to the neogrammarian paradigm. Hovdhaugen et al. in their history of linguistics in the Nordic countries (2000) document thoroughly the fact that this particular research tradition has been very strong and very long-lived. One might say that the establishment of the Nordic philologies and the professionalization of this way of doing research led to a special fusion of philology and a positivist history of language typical for the Nordic countries (including Finland) and for Germany. The strong Nordic (and German) neogrammarian tradition was more or less responsible for the resistance to structuralism in the period between the two world wars. In Sweden structuralism never became the dominant paradigm. This has a great deal to do with the structure of universities. Structuralists are general linguists, but general linguistics is not a subject taught anywhere other than at universities. Thus general linguists have to influence researchers working in the various philologies because this is where the students are. This, of course, cannot always be realized.

The comparative philologist aims to (re)construct a proto-language which supposedly explains later developments. This led to a research practice looking backwards in time. This research tradition furnished the nation with etymological dictionaries and the *Stammbaum* model of family relationships between languages, thus creating order in the linguistic universe. At the same time the neogrammarians had to be able to work with sounds in order to corroborate their historical findings, their sound laws, by studying the dialects of the day. Neogrammarians thus were concerned with sounds as part of the physiological explanation of sound laws. The typical naturalist linguist – Lundell, Storm and Jespersen are the three heroes of this particular band – is an eminent phonetician and an ardent opponent of the traditional ways of teaching dead languages. They opposed both the choice of Latin as the reference language for grammar writing (cf. the warning against “squinting grammars”) and the muted voice of a dead language as the most important subject in schools, hence the “natural” method, focussed on teaching the pronunciation of living languages. Reinterpreting the historicist stance in evolutionary terms, Jespersen taught that language evolution was tantamount to progress.

The old languages, e. g. Gothic, simply used too many endings to express what in English could be said without any: cf. Go. *habaidēdeima* vs. E *had* (Jespersen 1891, 11 ff.).

For the naturalist linguist, linguistics is also a practical science:

It is, in short, clear that whatever may be the value of etymology as an intellectual stimulant, it does not afford an adequate basis for the practical study of languages. Our scientific basis evidently requires widening. What we want is an unhistorical philology, based on the study, not of dead spellings, but of living speech. Such a 'living philology', as it may be called, would start from the accurate observation of spoken languages by means of psychology and phonetics, and would make this the basis of all study of language, whether purely practical, or scientific and historical. A reaction in this direction has, indeed, already begun. [...] Indeed, the main impulse abroad has come from an important work by the Norwegian Professor, Johan Storm [...] (Sweet 1885, 5).

The reference to Storm is to his *Englische Philologie*, first published in German in 1881.

The practical study of language, or applied linguistics as we would now call it, included not only language teaching but spelling and curriculum reforms as well (cf. Gregersen 1991). Across the board, the naturalist fought the influence of the classical philologists (the "dead-letter people") and the etymologists, continuously striving for a better fit between speech and writing (Lundell 1886) and for the public recognition of modern languages. The result was a reform of language teaching, introducing English as the emblematic modern language, and stressing communicative efficiency in all the modern languages taught in school.

The naturalist tendency was strong in the Nordic countries, and the consequences for the choice of object were far-reaching. With Noreen in Sweden and Wiwel in Denmark (*Synspunkter for dansk sproglære*, 1901) we get the first analyses of modern national language. Noreen, in his introduction to the majestic *Vårt språk* with the significant subtitle *Nysvensk grammatik i utförlig framställning* [Comprehensive Modern Swedish grammar] writes about his definition of the notion of "a language":

Språkets byggnad eller struktur i det hela, särskildt den s.k. inre språkformen [...], dvs. det egendomliga sätt, på hvilket själslivets innehåll grupperas (i s.k. psykologiska kategorier) och denna gruppering får språkligt uttryck i s.k. grammatiska kategorier [...]. Som detta sätt vanligtvis – men långtifrån alltid – är gemensamt för en hel nation, på samma gång som det vanligtvis

– men långtifrån alltid – avviker från andra nationers, så benämns de hithörande olika slagen af språk efter de nationer som företrädesvis tala dem. (Noreen 1903, 22).

It seems to be difficult to define national languages if you are a naturalist. Their obvious existence is evidently all but obvious and has to be circumscribed with care. We further note the explicit reference to the idealist Humboldtian *innere Sprachform* and the use of the watchword of the next period, "structure", as equivalent to it. Noreen is concerned with precisely the specific patterns of the national languages and their psychological correlates. In this way the naturalists paved the way for what we may broadly term modernism and its particular branch of linguistics, i.e. structuralism.

2.4. Modernism and structuralism

The neogrammarian paradigm was part of a general trend towards a less idealistic science, a trend which has continued its logical course ever since. Modernism may be seen as a reaction to the breakdown of traditional society, but common to all the dominant reactions are their materialistic flavour and the introduction of natural science as the dominant model of thinking and economy as the dominant field of politics. This has created a wholly new situation for the humanities in general, and the linguistic sciences are no exception. While in the 19th c. the human sciences were central in the creation and use of the public sphere, they gradually lost this privileged position in the 20th c. The social sciences study the administration and economy of the nation states (national economy) and the more and more integrated global economies, while the human sciences focus on topics taught in the educational systems but otherwise relegated to "free" or leisure time. At the same time, consumption during the individual's leisure time has been made the strategic long-term target of a huge industry.

Whereas the political ideas of the 19th c. were concerned with equality and justice for all in the cultural sphere, the dominant controversies now revolved around how inequality in an economic sense leads to or determines inequality in other spheres of life. The problems surrounding the concept of equality were central to discussions inside the Nordic social democratic parties, all of them pivotal to the development of a much publicized Nordic model of society in the 20th c.

The Nordic model is characteristically a state model. The state regulates more and more facets of life. Art is subsidized on a grand scale, as are music making, theatres and opera. Education is free so that anybody can afford to be educated, and there is support for students while they study. Thus “democratization” became the watchword, and the great debate raged between the elitists and those in favour of mass culture.

But mass culture is no longer traditional or national. It is rather an industry, and the industry is profoundly influenced by American trends, hence the discussion everywhere in Europe of the consequences of “Disneyfication” of cultural traditions, fashions, etc.

While the human sciences receded into the background giving way to economics, biology, the natural sciences and the health sciences, linguistics went structural. Structuralism has various, in part very different, roots, with the Slavic branch featuring a more partisan organization and a broader field of interest than just language, the French branch being more sociological in its point of departure, the Americans being decidedly more practical and empirical, and the Copenhagen school being strictly immanent and theoretically minded. All structuralists, however, are united in attempting to create a new scientific linguistics with more rigorous and explicit methods and a more refined data base. Consequently, the terminology and key texts of structuralist linguistics are esoteric and elitist rather than popular in style. The difference between the naturalist who was talking directly to the (smaller) national reading public and the structuralist addressing an international public of like-minded scientists is striking. The structuralist influence on practical matters such as curriculum planning for the schools, reading methods, grammar books and so on is negligible (but cf. 3.5. for the second half of the century).

At the lowest level of linguistic theory, the structuralist stance means that data are reduced so that variation is removed. Only invariants take part in the deeper structures. The concept of the phoneme is e.g. conveniently defined as based on the difference (in expression) that makes a difference (in (denotative) content). Content differences thus do not include connotations.

The structuralists devoted an enormous amount of time and energy to delimiting the correct procedures for pruning the data base by codifying rules of e.g. complementary dis-

tribution and using them to reduce the number of elements needed to express content. A fixation on methodology was typical of American structuralist linguistics, which was the direct antecedent of the Chomskyan paradigm. With post-war American hegemony in all matters cultural, the Chomskyan version of structuralism has succeeded in reducing all other kinds of linguistics to peripheral status even in Europe, notably in Germany. This has not, however, quite been the case in the Nordic countries (cf. Hovdhaugen et al. 2000).

As to what kinds of data the structuralists worked with, this differs. In Denmark, a strong structuralist dialectological research tradition (Ejskjær 1993) took the lead from Louis Hjelmslev’s (1899–1965) work in general linguistics, partly dividing the Nordic dialectologists in two camps. The dialectological field worker had to be able to avail himself of techniques for finding the hidden structure of the dialect in question. Every dialect was treated as a national language and analyzed accordingly. In this way the sound system of all the dialects was revealed so that they could be compared and grouped into major regional dialect systems. But the dialectological field worker is not the typical structuralist. The typical European structuralist worked with any language, and preferably standard languages. The morphophonemic structure of Modern French, the phonemic system of English and the structure of grammatical categories such as case or comparison were among the favoured topics. In Norway and Sweden, structuralist influence was never as deep as in Denmark. Nationalism became a problem for the policies of the various social democratic parties in the Nordic countries, since the original labour movement was strongly international, looking at the nation state as a bourgeois entity created for and by the repression of the working classes. In Norway this problem has been analyzed in i. a. the writings of the eminent historians and prominent social democrats Edvard Bull and Halvdan Koht (Dahl 1970). Dahl’s conclusion is that these two academics represent the two stances which are in principle possible: for Koht, class is the subordinate concept while nation is the superordinate one, whereas for Bull it is the other way round (Dahl 1970, 29). This split mirrors precisely the problems the Nordic social democratic movements faced as they developed from their beginnings as the spokesmen for a particular class, thus being antagonistic to other classes, to become the

parties that embodied the state (Christiansen 1992). In Sweden this development is most relevant, since the Swedish social democrats were in fact able to govern alone for a long period. In an interesting paper, Gertrud Pettersson has shown that the legendary Per Albin Hansson, the Swedish social democratic prime minister from 1932–46, succeeded in appropriating the word *folk* for the social democratic movement (Pettersson 1994).

In general, the new social democratic welfare states are probably unique in their cultivation of the connotations of the “popular” (*det folkelige, folkhemmet*, etc.). The abolition of the pronoun of power and distance in address forms is almost universal in the Nordic countries and was the result of the combined effect of the ongoing democratization and the youth revolt of the 1970s.

The social democrats, aiming to build a strong welfare state, looked for partners. Both in Denmark and in Norway there was in the beginning a strong peasant movement which partly had the same ideals as the labour movements, and an important part of the intelligentsia (in Norway the original national liberal party was in fact named *Intelligenspartiet*) were sympathetic to the cause. The easiest way to include others is to choose an all-embracing idea as the rallying cry, and this was nationalism. Thus the social democratic parties developed into “folk parties” and by the same token adopted nationalism as a most valuable ideological tool. Once adopted, nationalism leads naturally to a language policy which seeks to protect the national language against attacks (a) on its validity in international communication (hence the adoption of all national languages as equally valid for communication inside the European Union) and (b) on its exclusivity within the borders of the nation state (hence efforts at teaching all immigrants the national language to perfection).

2.5. Postmodernism, new challenges for language policy and linguistics

While economics is still the central arena for politics and elections are lost according to the performance of the government in this respect, identity politics, cultural politics and image creation take on more and more significance as information density increases. This has led to a “linguistic turn” in various social sciences, including areas of economics, anthropology and history. The new study of “discourse” takes as its object the way social facts are put

into words in order to disclose the structures which are put to use, the stereotypes appealed to, the forms of narrative exploited. If the discovery of the phonetic side of language was a breakthrough in the later part of the 19th c., text linguistics and the study of discourse patterns may serve the same role in the 21st c.

The groundwork for this breakthrough was prepared by linguists working to transcend sentence boundaries thus making linguistics able to characterize texts and genres. While the syntactic studies by the transformational generative grammarians had rested squarely on the centrality of the sentence as the linguistic unit *par excellence*, the new theories changed this view of syntax and strove to put the study of syntactic structures at the service of semantics in order to create a genuinely functional linguistics.

3. The history of ideas and language planning in the Nordic countries

3.1. The framework

The theme delineated in the section heading is not quite so under-researched as a cursory inspection of the literature would lead one to believe. First and foremost, Bengt Loman in his useful introduction to a symposium in 1981 organized by the then comparatively recent *Nordisk språksekretariat*, has given the first review of the themes, facts, and the researchers involved. The next broader treatment is a report from a similar symposium five years later entitled *De nordiske skriftspråkenes utvikling på 1800-tallet 3. Ideologier og språkstyring*. More recently, Helge Sandøy et al. edited the papers from a symposium on *Språkideologi og språkplanlegging i Noreg* (1991), and Maria Wingstedt (1998) summarized ideologies of language in Sweden, focussing on the attitude to minority languages and the education of minorities in their own language. In what follows, the focus will be on the effects of three ideas on language development in the Nordic countries: nationalism and internationalism, purism, and democratization.

3.2. Nationalism and its impact

3.2.1. Nationalism and the Nordic nation states

Nationalism is a much debated issue in contemporary studies of European history and politics. The general consensus seems to be

that nationalism started out as a liberal theme of all citizens being equal before God. By being tied to the nation state, nationalism latched on to religious, linguistic and/or literary common histories in order to create the equality it presupposed. By being part and parcel of bourgeois revolutionary thinking, nationalism confronted earlier stable hierarchies and placed the individual as the central agent instead of traditional groups or networks. On the other hand, at the level of society, nationalism is an active levelling force. Thus any minority within the borders of a nation state faced hard times and often had no other alternative than to assimilate to the majority. Some nation states are predicated upon only one of these central defining categories of ethnicity, e.g. religion, but often religious and linguistic boundaries were solidified and transformed into national boundaries by the principle of the self-determination of "a people". Modern anthropological studies have looked at the concept of ethnicity or people as a cultural and social construct, and in this construction process linguistics played a significant role alongside that of archaeology, literary history and history proper (Gregersen 1994). National museums, national grammars, national encyclopedias and translations of the major works of European culture into the national language are sure signs of such national identity politics.

The three central Nordic nation states today, Sweden, Norway and Denmark, have different histories as nation states and thus also manifest important differences in the development of their national identity. Denmark is geographically closer to Germany and militarily hard to defend against intervention from the south. Furthermore, the concentration in Copenhagen of almost all the state apparatus makes it even harder to defend. Denmark was, and to a certain extent still is, a comparatively centralized state. Sweden had the most recent empire and is geographically and militarily further away from German influence, and Finland shields it from Russia, while finally Norway, just as far removed from Germany as Sweden, did not regain her independence until recently compared to the other two Scandinavian countries. The national question thus took different paths and developed along different lines in the three nation states.

At the beginning of the 19th c., Germany was not yet a military giant, and one way to see the idea of nationalism is indeed to stress its usefulness as a way of assembling a German

nation out of the many smaller states making up what is now the Federal Republic. The development of comparative philology soon pointed to the related nature of the Germanic languages, first and foremost as evidenced by Grimm's law. The linguistic facts were, in fact, open to various interpretations since the variations within the German-speaking area, e.g. in terms of dialect boundaries, were just as pervasive as those between the Nordic countries and the German-speaking area. This meant that the linguistic facts could be used to argue for the integration of (parts of) Denmark into a German nation, as was in fact done by Grimm in a paper in 1848 (cf. C.S. Petersen 1908, 12, note 1). This placed Danish linguistics in the awkward position of having to prove the nation's ancient right to South Jutland (Dan. *Sønderjylland* or *Slesvig*) by linguistic and historical means, while at the same time the people living there opted for one or the other by raising their children to speak either German or Danish, sometimes choosing a different family language than the one the parents had been brought up with (A. Bjerrum 1949).

We cannot understand the national question in the history of Danish linguistics if we do not realize that the two duchies of Slesvig and Holstein were the industrial centre and the richest part of the kingdom – and the closest to Germany. In Denmark the national question became formulated as the question of whether Denmark was to be an independent nation or part of a vigorously expanding greater Germany under the dominance of Prussia. The loss of Slesvig and Holstein to Prussia in 1864 was felt to be a national disaster and made many Danes very pessimistic about the future prospects of maintaining Danish independence.

In Sweden, no such thing could happen. Obviously, Sweden would be threatened by Denmark's succumbing to German expansionism, but since this did not materialize, the Swedish nation state evolved more naturally in the 19th c. linguistically speaking (Lindberg 1986). For Swedish linguistics, the romantic period with its nationalism seemed to be a logical development from the golden age of the empire (Lindberg 1986, 55). The crucial linguistic relics, i.e. the law texts, the rune stones and the ancient folk ballads, were edited and thus testified to ancient glory and a brilliant future.

In Norway, the national question became *the* question for the central human sciences of the 19th c. The Norwegian school of history

featured historians who based their insights on the teachings of linguistics or who used linguistic evidence as data for their theories of how the nation had a great past, which was not identical to Denmark's past, nor for that matter to Iceland's. In this period almost all research concentrated on the oldest valuable literature in a Nordic language, the Old Norse literature of the sagas and the Eddas. Since the sources themselves state that the Icelanders came from Norway (and went to Norway and bargained with the Norwegians), and since the Icelandic nation was not yet a nation state of its own, the historians concentrated on establishing the Norwegian character of the sagas and Norway as the place of origin for the Nordic people. In his analysis of Norwegian historical research in the 19th and 20th c., Dahl meticulously chronicles the various versions of the theory that the Nordic people came from the North (Norway) and East (Finland?). The main idea proposed by Rudolph Keyser was to show that the Danes represented a late settlement of the Nordic people who had defeated and subjugated the original Goths. This would supposedly explain the social stratification found in Danish archaeological remains but absent in Norway (Dahl 1970, 42ff.). For Keyser, the linguistic facts were central. Taking his point of departure in the fundamental distinction between Germanic and Nordic, Keyser notes that the purest forms are found further away from Germany, viz. in Norway. And "Hvad der [...] er sagt om *Sproget*, maa og gjælde om *Folket* eller *Folkestammen*, hvem Sproget tilhørte" [What goes for language has to be valid for the people or the ethnic group who spoke the language] (quoted from Dahl 1970, 43). Much here hinges on the concept of purity. If it means distance from Germanic, we have entered a vicious circle and I cannot see that any other definition of purity can be given.

In Norway the central national question was not, however, whether Norwegian had an old and honourable history but whether one could build a nation without a national written norm. The Norwegian language situation was akin to that of any new nation state in that one of the first essential symbols of nationhood is a written standard. The choice of a written standard is, however, circumscribed by the speech of the inhabitants. Since they vary as to dia-, regio-, socio-, and genderlect, as do citizens within the confines of any nation state, the choice of a norm to base the written norm on is the first problem. Ivar Aasen's feat

was to find the right blend of archaic (in the sense that those dialects most resembling Old West Norse phonology and morphology could be labelled archaic) and prestigious speech to base his written norm on.

The discussion of Aasen's work continues most fruitfully (documented in Røyneland 1997), but there is no doubt that he used Rask's methods to compare the dialects (Venås 1986, 84) in order to get at the essence of Norwegianness, itself a Herderian idea (Steinfeld 1997).

3.2.2. Scandinavianism

The central figure in Danish linguistics in the middle of the century was the first Professor of Nordic languages at the University of Copenhagen, N.M. Petersen (1791–1862), whose fellow student for four years, Rasmus Rask, had a lasting influence on him. Petersen was responsible for the popularization and later revision of Rask's ideas on orthography and he wrote the first history of the Danish, Swedish and Norwegian languages as a prize essay answering a question formulated by Rask, among others. As Professor of Nordic, he read through all that had been published within the confines of the kingdom, just as he had worked his way through the documents in the Danish State Archives after he had been appointed registrar there. The result was the first history of Danish literature (cf. Conrad 1996).

Petersen was a brilliant sociolinguist, as we can see from his insights into the language situation of the Nordic countries. In a beautiful passage written in 1844, he predicted that the Norwegian language would diverge from Danish as part and parcel of the independence movement. Yet, he argued convincingly that the only chance of a future for the Nordic languages would lie in the creation of a common Nordic written language. Since the Rask-Petersen programme for orthographic reform, in accordance with the subtitle of Rask's treatise on orthography (*med Hensyn til Stam-sproget og Nabosproget* [with reference to the ancestor language and the neighbouring language]) involved moving the Danish standard in the direction of the Swedish norm in a number of respects (most obviously in the use of *å* instead of *aa*), it is not surprising that he suggested doing so. But the timing was perfect. N.M. Petersen meshed with the broad Scandinavian and Scandinavianist movements which were developing in the middle of the century.

Skovgaard-Petersen has pointed to the fact that prominent Danes, e. g. the poet and publicist Carl Ploug, saw the Scandinavian movement not as an anti-German but as an anti-Russian force (Skovgaard-Petersen 1985, 203; cf. Tarschys 1955, 66 on v. Kræmer's poem on Scandinavism). This can only be explained by Russia being viewed as the conservative force in Europe, and this clearly shows the dual face of the national movements in the Scandinavian countries – they were simultaneously liberal and national (cf. Tarschys' analysis 1955, 343). The liberal strand stood for the abolition of the absolute monarchy and the creation of a bourgeois democracy. The national strand stood for the ideology of nationhood and could be flexibly interpreted depending on the fate of the liberal cause.

The idea of a common Nordic written language had its heyday in the period between the liberal 1840s and the end of the Scandinavian dream. Loman is precise here. He argues convincingly that the Norwegian independence from Sweden in 1905 opened the door for the final victory of national tendencies at the expense of Scandinavism (Loman 1981, 6; 12).

Realization of the idea of a common Nordic written standard was made extremely difficult by the rhythm of national language policies. Norway was in the process of separating Norwegian from Danish, whether doing it by reform (Knud Knudsen) or by revolution (Ivar Aasen), thus basing the orthography squarely on the spoken language. In Denmark and Sweden, on the other hand, the authorities were coming under pressure from the pedagogical necessity of forging an orthography which could be taught without too much trouble to the mass of people wanting to be taught. These orthographies were hotly debated, since the conservatives held the view that writing represented the highest authority in itself (the so-called "principle of tradition") while the reformers took as their point of departure the principle of the relationship between speech and writing modified by contemporary usage as the highest rule: writing should reflect speech, viz. the cultivated speech of the well-educated.

In Sweden the orthographic standard had been settled early in the 19th c. by C.G. Leopold in a treatise published on behalf of the Swedish Academy in 1801. This treatise is rather conservative in that it refuses to change spelling rules in order to narrow the gap between spelling and pronunciation where usage had found a principled solution. The

date is important here, for it meant that in 1869 when the opposing currents met on a singular occasion, the orthographical meeting in Stockholm (Lökke 1870; Lyngby 1870; Spang-Hanssen 1970; Ståhle 1970; Karker 1998), the Leopoldian orthography had already been established and used for ca. 70 years. The Rask-Petersen programme of revolutionizing Danish orthography had, however, only been accepted by some and thus was still highly controversial (Gregersen 1984). The meeting, which was attended by delegations from all three Nordic countries (among the delegates were Carl Säve and Henrik Ibsen; no representative of the Swedish Academy had been invited: Karker 1983, 290), decided on several reform suggestions which, properly coordinated, would make the written languages easier to understand and thus approach the distant ideal of a common written language. Karker summarizes the results as follows:

- (1) to abolish the use in Danish of capital letters for common nouns which, on the model of German, had prevailed since about 1700;
- (2) to change the Danish digraph *aa* to the Swedish letter *å*;
- (3) to change *gj, kj, skj* in Danish to *g, k, sk* before a front vowel, *j* being silent (the traditional spelling reflected a transitory tendency to palatalize *g, k, sk* in these positions, as in Swedish);
- (4) to change *ei, ai, oi* in Danish to *ej, aj, oj*;
- (5) to change double vowels in Danish to single vowels (e. g. *Huus* 'house' > *hus*);
- (6) to change *qv* to *kv* in both languages;
- (7) to change *x* to *ks* in both languages;
- (8) to change *e* to *æ* and *ä* respectively if pronounced [e];
- (9) to change *f* and *fv* in Swedish to *v* if pronounced [v];
- (10) to spell such foreign loanwords which may be considered fully adopted according to the rules of the native language. (Karker 1983, 291)

The immediate result of the deliberations in Denmark was that Svend Grundtvig, assisted by K.J. Lyngby, produced a dictionary following the conventions recommended by the Stockholm meeting. The dictionary (Grundtvig 1870) was meant for the schools but was much too liberal and thus was immediately followed by another edition of the dictionary (Grundtvig 1872 with several later editions), which hastily reinstated the much-debated capital letters in all the substantives. Capital letters for nouns were actually not abolished until 1948, that is shortly after the Second World War when the Nordic argument had gained force and anti-German feeling was at its second height (Karker 1998). Since the 1948

reform, the Nordic languages have not grown closer to each other orthographically. The 1869 idea of a common Nordic language seems as far away as ever.

The Nordic meeting in Stockholm in 1869 is a focal point for this article not only because it is paradigmatic in the efforts to put into practice the ideology of Scandinavism, but even more so because it failed. The fate of the suggested orthographies tells us more about the role of ideology in language planning than volumes of theory.

I have said that the rhythm of language politics in the three Nordic countries was different: Denmark had had its theoretical discussions on orthography in the period from ca. 1800 until 1830 (cf. Skautrup 1953, 162ff. with bibliography), and the various ideas had crystallized into comparatively consistent systems. Norway was taking a nationalistic road away from the dominance of Danish and through this was building on the spoken language of the people, thus confronting the variation inside the nation's political borders head-on. Finally, Sweden was peculiar in that a learned and conservative body, the Swedish Academy, was seen as the highest authority, and the Academy was in no mood to follow the practical needs of teachers or researchers (cf. Tarschys 1955). Thus the Nordic meeting was a brilliant attempt to reconcile conflicting interests and developments and undoubtedly it remains a very illuminating episode in the history of the language. As Carl Ivar Ståhle noted:

Man var förvånande fast och enig i den optimistiska övertygelsen att en ljudenlig stavning i stort sett skulle närma skriftspråken till varandra, och man tycks ha varit helt aningslös inför vådorna av den huvudprincip, som Hazelius formulerade så: 'Riktigheten måste nödvändigtvis ställas i främsta rummet. Först i det andra borde fråga uppstå om enhet.'

Termen "riktighet" gör naturligtvis satsen oanriplig, men eftersom riktighet i stort sett jämfördes med ljudenlighet blev innebörden i själva verket att det nationella uttalet som norm var överordnat den nordiska samhörigheten och därmed i princip borde följas även då det särade de nordiska skriftspråken. (Ståhle 1970, 8)

It has universally been the case in the history of the orthographical wars in the Nordic countries that those advocating a phonetically based writing system were the radicals, the democrats, the naturalists, and its opponents have always been conservatives, elitists and

idealists. The opposition to the measures proposed by the Nordic meeting is no exception to this rule, as witnessed by the bitter confrontation which followed between the Swedish secretary of the meeting, A. Hazelius, and the former reformist, now academician, J. E. Rydqvist (Ståhle 1970).

The reason for this state of affairs is not easy to uncover. The theory of writing has developed considerably since the structuralists first undertook analysis of writing systems as systems. The result of this renewed scrutiny is that it is possible to discern opposing principles in any orthography. Seen from the beginning writer's point of view, a phoneme-grapheme one-to-one correspondence seems very favourable. This would make a writing system easy to learn (and presumably to teach as well). Seen from the beginning reader's point of view, morphological constancy is a paramount wish so that the mental representations may be fixed graphically once and for all. This would mean a writing system that keeps a morpheme constant no matter what morphophonemic processes operate at the boundaries or within the morpheme. Since synchronic morphophonemic processes in the Nordic languages very often reflect historically pertinent processes, there is a certain tendency in pre-Saussurian literature on writing to label this drive for morphemic constancy the "etymological" principle (cf. e.g. Berg 1902, 14). Apparently, the radicals take the language production point of view, whereas the conservatives are the readers' spokesmen. Avid readers are more or less identical with the cultural elite.

It is an interesting fact that the idea of democratization has been present in Norwegian discussions from the start much more than in either Denmark or Sweden. But once the idea of democratization was taken into consideration in orthographic matters, it was very effective. Mass education became a fact in the Nordic countries over the course of the 19th c. Accordingly, a new role for teachers developed, and they were instrumental in bringing about both the reform of Danish orthography and the comparable Swedish reform somewhat later. The arguments were strikingly similar: it is not possible to teach an orthography which cannot be described with (relatively simple) rules. The traditional writing systems in Denmark and Sweden are complex primarily as the result of historical developments in the spoken language which the writing system did not keep pace with. This puts

a heavy burden on teachers, who have to spend an enormous amount of time teaching the minutiae of a writing system which some of the pupils will never master. This creates cultural boundaries within the country, and the art of writing becomes (or rather remains) the privilege of the upper classes.

A common theme in the teachers' arguments for a more regular orthography is the assumption that if this problem is solved once and for all, they will be free to teach many more interesting skills (Lundell, quoted in Berg 1902, 40). Seen at a century's distance, the optimism is striking, even somewhat touching. On the eve of the modern welfare state, the belief in education as a democratic force was widespread.

What remains to be discussed is whether Scandinavianism is a kind of nationalism or not. It is relevant here to remember that nationalism originally was a battle cry for drawing new borders of political entities. Obviously, this was the case for Germany. So what prevented one from heeding the linguistic facts and uniting three regions speaking dialects no more different from each other than, say, the dialects spoken within the French nation state? This idea has two different versions: One is that the three states should be united as one *political* entity, and this was a short-lived idea which was mostly considered totally unrealistic. The second version, which is more pertinent to language planning, is that the three different nation states should develop into a single *cultural* entity, united e. g. by a common written norm. The road to this cultural unification might be a long and winding evolutionary trail, or it might be conceptualized as a revolution. Again, the latter idea was not entertained seriously by anyone.

Actually, the problem remaining in perhaps all the Nordic countries, but certainly in Denmark and Sweden, is the need to cater more for producers' needs and less for consumers': phoneme-grapheme correspondences become ever more difficult to master as the spoken language evolves (Brink/Lund 1975). But changing the orthographies so that they become more consistent in this respect in order to serve the Scandinavian cause presupposes that the spoken languages of the Nordic countries evolve in the same direction. Sadly, they do not, and the radicals of today cannot at the same time be Scandinavists (Karker 1998).

The reform of orthography foregrounds a problem which Moltke Moe has formulated

most precisely (although I do not think he has solved it completely); why do orthographic principles raise so many emotions in the populace, and why are all spelling reforms the result of bitter fights? This problem may have to do with the role of speech and writing in nation states whose cultural traditions supposedly constitute the national identity. Everybody knows that one person speaks differently from the next, and hence, speech cannot be the basis of a national identity predicated upon sameness. Writing is different. Writing is not acquired, but is learnt (and obviously taught), and some people do not learn it so well. These people, the so-called functional illiterates (Elbro et al. 1991), in fact make up quite a substantial part of contemporary societies. One reason why spelling reforms are greeted with mixed feelings is precisely that those who are right today are wrong tomorrow, and the whole point of having a norm is to tell people what is right and what is wrong. Thus none of the liberal and culturally advanced Nordic societies have any qualms about producing dictionaries or word lists which tell their citizens how to correctly spell a given word. There is thus a premium on being right in writing (notwithstanding the fact that almost everyone makes spelling "errors" every day). The parallel notion in speech has a different status. How would we defend a given pronunciation system as the right one in view of the dialect, regiolect, sociolect, chronolect and genderlect differences which we know exist in all the Nordic countries? Thus national languages are represented by the written form, and all language policy is directed towards regulating written language. However, prestige does not stop at the borders of written language, but filters through to spoken language as well – most non-linguists do not differentiate between the two anyway. Consequently, for many na(t)ive speakers "educated" or "correct" speech ought to sound like spoken writing. In fact some of the phonetic developments in Danish have brought speech closer to writing.

For the orthographic reformers, this turns the issue upside down. For Rask and for Aasen, as for all language planners who are faced with the problem of defining a suitable base for a writing system, speech is the basis for writing, and the writing system should consistently reflect the main phonological system of the common speech core. Given the fact that writing enjoys the prestige which is accorded to anything that must be taught and thus will be a good not acquired by all (only

the elite know how to write), the elite feel that any orthographic reform that brings writing closer to speech makes the writing system vulgar (which is indeed correct in the most original sense of *vulgar*). It is a fundamental fact of Danish that nobody is able to hear the difference between the present tense of *r*-verbs like *horer* and the infinitive *høre* ('to hear') but nobody has until now proposed spelling them exactly alike, e.g. *hoå*. If you show a segment of phonetically transcribed speech to a well-educated person, the certain reaction is "I do not speak like that" which we can interpret as "I do not want my speech to be written like that".

Recent research has stressed the fact that writing as such has other purposes than representing speech; it was invented in order to solve the communication problems that speech could not solve. Writing has become independent of speech, if it ever was dependent on it in the first place (Olson 1994; Perregaard 1999).

3.3. Purism

Purism is given the following working definition by Thomas:

Purism is the manifestation of a desire on the part of a speech community (or some section of it) to preserve a language from, or rid it of, putative foreign elements or other elements held to be undesirable (including those originating in dialects, sociolects and styles of the same language). It may be directed at all linguistic levels but primarily the lexicon. Above all, purism is an aspect of the codification, cultivation and planning of standard languages (Thomas 1991, 12).

The advantage of this broad definition is that it locates purism as part of a process of standardization. Standard languages in the Nordic countries are invariably written languages. The period under scrutiny here falls in the middle of the process, since standardization had been going on before this and continues after the important codifications of the written standards at the end of the 19th c.

Purism is mainly directed at the lexicon, Thomas says. Under purism, loanwords are seen as unnecessary and unaesthetic. These are evaluative judgments, based on a norm of the "pure" language. But the norm presupposes that we are able to accurately distinguish what may be called a regular Dan./Sw./Norw./Icel. word and what may only be termed a foreign word. This is easy in most cases where the donor language is recognizable by its orthographic conventions. But any Nordic lan-

guage will contain several layers of loanwords, some of which are loans from each other, but most of these have been fully integrated into the native orthographic system. A particular strategy, used most forcefully by Icelandic and Faroese language planners but also found to be appealing by some of the Norwegian language planners, is to create new words from already existing native roots to fill a need instead of importing foreign words. In this way, by creating so-called *aflosningsord*, the need for integration does not arise at all.

It is interesting to note with Loman that the negatively loaded terms Danicism, Norwegicism and Swedicism were frequent in stylistic analyses around 1900 (Loman 1981, 10f.). Ibsen was taken to task for his Danicisms and Snoilsky and af Geijerstam for their Norwegicisms (and af Geijerstam for Danicisms as well, cf. Skautrup 1953, 452 on the rich literature on Danicisms in the language of Swedish poets of this period). For a linguist, these stylistic judgments are interesting in that they seem to prohibit the invention of constructions akin to those already known from some other closely related language. Purism coupled with nationalism leads to a very conservative critique of style indeed.

But sometimes even the most ardent purist must admit that there is no known word in the language with that particular meaning which the speaker intends to convey, which is precisely the reason for the appearance of a foreign word in the first place. This may lead the purist to propose the creation of new words. All Nordic languages have had linguists or non-professional private individuals who tried their hands at coining new words in order to make foreign words superfluous. Some of these neologisms have indeed been successful, but the most interesting aspect of this is that we still know very little about why some words are accepted by users and some aren't (cf. Jarvad 1995; Sandøy 1997). This ties in with the fact that we know even less about why people feel attracted to using loanwords. The ardent purist's only suggestion for a motive is the attraction of following the latest fad or an equally unhealthy tendency to show off. This may be true at some particular time and for some specific people, but it cannot account for the large-scale influx of borrowings among certain sections of the Nordic populations. The users obviously feel that these foreign words have the right connotations being foreign or the right meaning, or they simply come to mind more easily. And if this is the

case, no amount of moralizing will stop them from using such loanwords.

3.4. Internationalism

Nationalist purism is by its very logic conservative. Internationalism has been seen as the peak of progressivism, and coupled with rationalistic naturalism it was responsible for the attempts at introducing one common international language, Esperanto or Ido or Novial etc. These efforts have remained singularly unsuccessful due to a surprising lack of sensitivity to the sociolinguistics of national languages. The naturalists who were active in this type of internationalism, notably Jespersen, were all rationalists who were not themselves aware of the importance for the national ideology of having a mother tongue. Jespersen firmly believed as did many other scientists in the inter-war period that a rational approach to the problems facing world peace would solve them. The parallel with language is obvious.

3.5. Structuralism and language planning

Structuralism introduced a new note in language planning. In principle, close scrutiny of the structure of the lexicon and the subsystems of phonology and graphematics (Spang-Hanssen 1947; 1959) would pave the way for insights into what were accidental gaps (and thus could be filled without any structural upheaval) and what changes were structurally impossible to introduce. This programme was put into practice in the development of terminology (importantly, the Norwegian project on oil terminology) and in the quiet but thorough pruning of the orthographical systems so that they became more consistent (notably, the new Danish dictionaries 1986 and 1996). Linguistics had acquired a new subdiscipline, applied linguistics.

3.6. The postmodern situation

Historically, the time of the nation state has passed. Regions and unions are beginning to dominate, and the cultural and linguistic homogeneity which the nation state had tried to construe as its *raison d'être* was seen to be non-existent in fact. The dissolution of the colonies became an obvious fact in European cities, notably in France and Great Britain, but soon it dawned upon the nation states that multicultural cities would gradually lead to multicultural societies. This fact has triggered vari-

ous responses, some of them neonationalistic, some of them even close to earlier chauvinism, if not (inspired by) Nazism. Curiously, this multiculturalism, which would be accompanied by linguistic heterogeneity, goes hand in hand with the cultural levelling and internationalization which has been construed as "globalization". The currents are interrelated and both put the national system under stress, from within and from without.

3.6.1. The threat from English

In post-war Europe, American influence created a new international language which was also a European language, viz. English. Striking parallels have been noted between the Middle Ages and later so-called "learned" periods when Latin was the common language of education and thus scientific treaties were written only for an international audience, the difference being that Latin was not the native language of any population. In the Nordic countries, the reactions to this development were at first positive. Active support for classes taught in English together with a liberal attitude towards the import of American cultural artefacts created an atmosphere which furthered the use of English by and for all. This climate has changed, though, starting with the Norwegians, but the Swedish and lately the Danish language politicians quickly followed suit. Since the actual policy with regard to English is still being formulated, only the following observations can be made:

(a) The loss of domains where there is exclusive use of the mother tongue is drawing attention in the Nordic countries to the question of which domains, or "spheres" as Skastrup calls them, are now and should in the future be reserved for the use of the mother tongue, and which domains should be bilingual. In the latter case, the question of translation services arises. Finally, some domains have already been "lost": most natural and medical scientists write their papers in English now.

On the other hand, there is still a cultural public sphere concentrated in some of the more elitist newspapers which is Danish/Swedish/Norwegian-only territory, although as described above, loanwords abound there as well.

(b) The question of language authorities and an active language policy is being actualized in a manner resembling that of the earlier discussion on the proper way to effect changes

in orthography. The question involves the role of the body politic and the role of linguists, in particular those working on the various language boards (*sprognævn/språkråd/språknämnd*).

(c) Finally, the common denominator being the pressure from English, there is an interesting opportunity for a new, active, realistic and operational Scandinavism. Nothing unites people like a common threat from abroad.

44. Nordic language history and religion/ecclesiastical history I: The pre-Christian period

1. Language, religion, origins
2. Religious change in Old Germanic times
3. Inscriptions in the older and younger futhark
4. Bracteates
5. Names
6. Linguistic material in non-Nordic sources
7. Recent Nordic sources
8. Terminology of the pre-Christian religion
9. Literature (a selection)

1. Language, religion, origins

1.1. Contemporary sources regarding the pre-Christian religion of Scandinavia are generally not in Old Nordic language but are descriptions by foreign observers of local religious facts in their own languages. Our sole linguistic sources are runic inscriptions or single words reported by foreigners; it is debatable which of these refer to religious concepts. This kind of evidence needs interdisciplinary interpretation, involving archeology, history, history of religion, and philology. Many of the sources are not of a religious nature themselves. Rich 13th c. material is available which, however, must be regarded as having been manipulated according to its authors' or their masters' motivations. As this sort of mythology provides insufficient information about pagan cults, corroborative methods are indispensable, especially etymological studies of religious terms or the interpretation of place-names indicating sites of worship dedicated to divinities.

1.2. Philology so far has taken less advantage of the results of history of religion than vice versa. Such attempts were indeed undertaken regarding the question whether Bronze-Age rock carvings (especially those of a relatively recent agricultural and mainly southern Scandinavian civilization) may be regarded as being related to a later Nordic religion, and – if so – whether continuity of religious concept might indicate linguistic continuity. Today, a clear no is the answer to such questions. Almgren (1934) produced evidence of parallels to Scandinavian rock carvings that point to Egypt rather than to any specific Indo-European culture. The hypothesis that there was a Bronze-Age Indo-European language spoken in Scandinavia, which later on gave rise to the Germanic languages, is based on

findings of artifacts belonging to the object culture (e.g. war axes similar to Aegean ones) rather than on religious evidence. Interpretations of isolated elements of rock carvings as representing Germanic divinities are associative rather than methodically authenticated: e.g., a one-armed personage (Lökesberg carving) as the God *Týr*, or a phallic, oversized spear-bearer as *Óðinn* (de Vries 1970, 2, 24). Such elements may signify completely different things in religious contexts unfamiliar to us. The assertion that the spearman must be Odin is contradicted by Schier (1992, 199f.), who argues that a personage without spear, represented on Gotlandic pictorial stones, is interpreted as Odin on account of the eight-legged horse he rides.

1.3. Týr put his hand into the Fenriswolf's jaws to confirm his oath (Snorra Edda 37). Týr, the God of Justice (notwithstanding von See 1988, 56ff.: the Roman interpretation of a Germanic divinity as "Mars of the Thing Assembly" proves that he must have held the functions both of a God of War and of a God of Justice, so he could have been no other than **Tiwaz*), was punished for perjury, the position of a divinity within this mythological system being such that he himself could be found guilty of violating universal order, and must therefore suffer punishment even if his infringement of the law were essential to uphold the universe. Loss of a hand for perjury is symbolic punishment: when taking an oath, one raises one's fingers. Snorri's myth is a reflection of the moral code and of the inevitability of punishment. Whereas the one-armedness of a Bronze-Age image does not suffice to identify Týr, the Trollhättan A bracteate image (about 500 A.D., Axboe et al. 1985ff. no. 190), "animal biting off four fingers of a man's hand", has more in common with the myth. Similar bracteates show different versions and complicate the question; however they may be identified with Týr. De Vries (1970, 2, 23 and Dumézil 1988) quote yet other Indo-European myths involving one-handed war-divinities, such as Mucius *Scaevola* ('the left-handed') euhemerized by Livius (II, 12–13): captured by the Etruscans, he himself burned his right hand, thus proving that he was unafraid of torture, after which he perjured himself swear-

ing that he was only one of 300 conspirators. The surname of the other Roman hero fighting the Etrurians, Horatius *Cocles*, which may be interpreted as “the one-eyed” (although the myth does not report him as being such) is proof to Dumézil that both the Germanic and the Roman mythologies are acquainted with one-eyed and one-handed personages (Tyr-Odin : Scaevola-Cocles). According to Livius, the false oath follows the loss of his hand. If the loss of a hand as punishment is not Snorri’s invention but rather the original version of an ancient myth, then it is obvious that Snorri safeguarded its true sense better than the Roman did. The fact that there may be a pre-Germanic version of this myth casts doubt on the Germanic origin of the carving, even if the identity of the one-armed personage were assured.

1.4. As religions and languages often spread at different speeds and cover different areas, the question of the ancientness of religious structures and essential elements of the North Germanic religion is treated separately from the question of language age. Terminology is not really precise: one may refer to “Germani” in a linguistic but not in a religious sense and, vice versa, to religious Germanic elements that may have been also practised by non-Germanic-speaking peoples. Tacitus refers to the Germani as religiously heterogeneous: not all of them worship the same divinities. He considers Germanic to be a bundle of characteristics, the most significant of which is language. If a population lacks some of these characteristics, he hesitates to call them Germani. The question, how well-informed Tacitus’ sources were, remains open. Nor does he tell us whether his Germani conceived of themselves as a unity. The modern expression “Germani” applies exclusively to “members of the same linguistic family” rather than to communities with an identical origin or self-identity or religion; and we don’t know the criteria for self-identification of these peoples.

1.5. Tacitus (*Germania* 2) mentions mythological historic poetry: “in their quaint chants, which are their sole mode of memorizing history, they celebrate Tuisto as a divinity, the earth’s offspring”. Tuisto’s son was called *Mannus*; he was considered *origo* and *conditor gentis*, ‘origin and founder of the people’. The word is etymologically cognate to E *man* etc. In other Indo-European languages the ancestor of man bears a corresponding name; the

concept is considered to be Indo-European. We are not sure whether the sequence God-Hero-Man applies to Germanic tradition as well; in any case, Mannus and the generations following him are not simple human beings. Three sons are attributed to him, whose respective offspring form three groups of Germani: *Ingvaeones* (sic Plinius), *Hermiones* and *Istvaeones*. The Ingvaeones are reported to live in vicinity of the North Sea; Plinius calls the Cimbri, the Teutones and the Chauci of Jutland and of the adjacent North Sea coast Ingvaeones. An “East-Danish” hero *Ing* is found in the Old English Rune Poem (discussion: de Vries 1970, 2, 166; Baetke 1964, 153ff.); *Ing* cannot be etymologically separated from the Tacitean ancestor of the *Ingvaeones*, nor from the corresponding names in Old English royal dynasties, nor from *Yngvi*, the surname of the god *Freyr* mentioned by Snorri, *Heimskringla* I, 23 (likewise *Lokasenna* 43: *Ingunarfreyr*), nor from the royal dynasty *Ynglingar* descending from Yngvi according to *Heimskringla* 10. The literal sense of *Ingvaeones* is ‘Ingvi’s people’, and Ingvi is probably the later Nordic divinity. Belief in a mythical ancestral community of origin does not necessarily imply a communion of cult like the common cult which is testified for the Suebi, which form a part of the Herminones; it does neither for all Mannus peoples together nor for each of their three branches. Further on, Tacitus mentions differing traditions as to the mythical original community, which attribute more sons to the divinity: tribes of growing importance were keen to appear in those myths (according to Tacitus, the Marsi, Gambrivii, Suebi, Vandilii) and manipulated them accordingly, passing off each respective version as the “ancient truth”. There is no Nordic tribe amongst the Mannus peoples. Tacitus reports the Mannus genealogy in chapters dealing with the Germani in general; however, we think this was an exclusively West Germanic tradition (though the Vandilii are East Germanic); Tacitus’ or Plinius’ informants could only report about tribes they actually knew.

1.6. *Tuisto* (or *Tuisco*) is related to E *two*, *twin*, G *Zwitter*, Lat. *duo*, etc. and must be a hermaphrodite. The concept of a primordial androgynous being is also present in the North: *Ymir*. Snorri described “somewhat disorderly” (Meid 1992, 495) the rime giants as Ymir’s offspring: man and woman grew under his arm, and one foot begot a son with the other

foot (*Gylfaginning* 4). Nevertheless, Ymir is not man's ancestor. Etymologically, Ymir is cognate with Lat. *geminus* 'twin', OInd. mythology mentions *Yama* and *Yami* (the names of the first human couple, twins); Latvian calls a double fruit (i.e. a nut with two kernels) *Jumis*, which is also the name of a cereal demon who may assume bi-sexual, male, or female guises (Neuland 1977). Ymir's myth therefore has pre-Tacitean bases. This signifies that Ymir was no late Norse invention to replace Tuisto, but that the Germani never had an ancestral mythical community of origin common to all of them. There is a third tradition, pertaining to the Goths, whose mythical ancestor is called *Gapt* [gaut] by Jordanes. Later, this name reappears in Old English royal genealogies from the 7th/8th c. A.D. as *Geat*; so do *Woden* (*Óðinn*) and *Bældæg* (*Baldr*); ON *Gautr* is confirmed as one of Odin's names. Analogies with the Langobards are evident. As it is unknown whether the Old English genealogies contaminate Jordanes with local concepts or with imported ones from Scandinavia, this part of the problem remains controversial. We may thus conclude that the relatively uniform Proto-Germanic language is not paralleled either by pan-Germanic genealogical traditions nor by a uniform pan-Germanic mythology. This might be explained by the hypothesis that, while Germanic expanded as a language, those peoples who lived beyond the originally Germanic-speaking territory, especially the Nordic peoples, kept their divergent origins in mind. Basically, however, both Germanic Tuisto and Ymir traditions are cognate insofar as Tuisto and Ymir (and some of the Baltic *Jumis*) have in common that they are considered hermaphrodites, whereas the concept of twins appears in the Old Indian, Roman and the other part of the Baltic parallels. The etymology of the name *Sviones* (Tacitus, *Germania* 44f.), as conserved in *Svear*, probably appertains to the pron. stem **swe-* (Lat. *suus*). The tribal name would then signify 'we ourselves' and might point to a mythical ancestral community of origin as well.

1.7. After the pan-Germanic era, linguistic contacts among the expanding populations did not come to a stop. The Donzdorf fibula with the runic inscription **eho** was manufactured in Jutland around 500–520 A.D., and deposited in the tomb of an Alamannic female (Schwab 1999). The **alu**-formula, as well, that appears in 6th c. Alamannic runic inscriptions

has been adopted from the North and is not of Proto-Germanic heritage. Procopius (*Bellum Gothicum* II, 15) reports that during Iustinian's reign, the Eruli who had been living in Illyria without a king for some time, sent for a man of royal blood from Thule in Scandinavia, a member of another Erulian group that had previously moved to Gautland, and made him their king. The reconsideration of ancient kinship had political, not sacral motivations: they wanted to avoid having an Erulian resident on Roman soil be nominated king by the grace of Iustinian. Traditions that refer to mythical ancestral communities of origin are political necessities rather than biologically based.

2. Religious change in Old Germanic times

2.1. Changes in the practice of name-giving during the 4th c. suggest change in religious concepts. This is when the eagle and the wolf, both sacred to Odin according to later Nordic sources, made their appearance in East Germanic and West Germanic personal names (while there is no evidence of contemporary Nordic personal names). The North probably underwent further transformations in religious concepts in late pagan times, prior to its Christianization, as is attested elsewhere in the Germanic area: new religious practices became customary in the Roman Rhineland, where the custom of dedicating steles with inscriptions to certain divinities was adopted during the 2nd c. Construction of temples did not start contemporaneously for all Germanic tribes and may well be attributed to Roman influence.

2.2. According to Tacitus, the Germani did not enclose their divinities within walls but rather consecrated woods and groves to them, which indicates that they had no temples. He contradicts himself when he reports on a feast by the Marsi in the year 14 A.D. held in the *templum Tamfanae* (*Annales* I, 51): either single tribes developed individual habits, or the groves held buildings for assemblies and utensils (archeological and literary testimony: Much 1967, 185). Linguistic evidence is ambiguous: Go. *alhs* 'temple in Jerusalem' (cognate to Gr. *ἄλσος* 'grove'; the etymology proves the development from groves to temples) has cognates in OSx. and OE, but apparently not in ON, where **al* appears but mar-

ginally in place-names (see lit. in: Andersson 1992b). If the word is thus not pan-Germanic, the diverse denominations for pagan temples indicate that temple-building began after the era of pan-Germanic language; otherwise pan-Germanic expressions for temple-building would indeed exist; in the North, however, the respective vocabulary changed during the pagan era (probably due to changes in the relevant objects; cf. 8.4.).

3. Inscriptions in the older and younger futhark

3.1. Inscriptions in older futhark may be cultic, magic, or profane (see lit. in Nedoma 1998; Nielsen 1985). Strict separation of religion from magic is not possible. Magic manipulates non-human forces, whereas religion attributes freedom to the divinity: the believer subjects himself to it and is eager to win its grace. In reality, the two overlap; many religious rites are manipulative; not even the fact that magic pursues individual goals, whereas religious rites are to the benefit of society, permits actual separation of the two. Rhineland monuments from the 2nd and 3rd c. are often dedicated to divinities by individuals in exchange for divine grace. The fact that we know little of the social context underlying these sources is an additional difficulty in their classification. Inscriptions on amulets, whose function is magic-apotropaic, may implore divine protection. Amulets were used to protect individuals; if worn by priests or sovereigns they probably were to grant the welfare of the entire society. The only possible question is whether an inscription is magic-religious or profane. Such a distinction cannot even be made in the case of the earliest runic inscriptions: e. g., **raunijar** (Øvre Stabu, Krause-Jankuhn 1966, No. 31; the rune transliterated as **R** had the phonetic value of a voiced *s*, [z]). **raunijar** corresponds to ON *reynir* 'trier' and probably refers to the weapon itself. Thus its purpose may have been either magic-religious (the name is to make the weapon find its mark) or profane. Birkmann (1995, 46) refers to the dispute as to whether the Thorsberg shield-buckle (Krause-Jankuhn 1966, No. 21) was purposefully destroyed prior to its being thrown into the swamp and whether the runes it bears may have been inscribed after its destruction. If so, this might signify that the inscription refers to the divinity to whom the site of sacrifice was dedicated. The inscription,

aisgrh, might be interpreted as **aisigar* 'the furious one' (the final *h* might be a runic symbol for 'hailstorm') and could thus be associated with Odin. To judge linguistic situations in Denmark it would be necessary to know whether inscriptions on weapons deposited there were made by the victors upon sacrifice, or whether they had been carved by the enemy, namely in northern Germany or Sweden. Others of the most ancient runic inscriptions seem to be signatures by their manufacturers and bear no reference either to religion or to magic.

3.2. The invention of runes is a matter of dispute. Divine origin is attributed to them not only by Eddic poetry (the late-pagan and post-pagan elements concentrate on Odin), but even by pagan rune stones, of which the Noleby stone is the oldest (Krause-Jankuhn 1966, No. 67, late 6th c.). The word "rune" appears already on the Einang stone (Krause-Jankuhn 1966, No. 63, 2nd half 4th c.), as acc. sg. **runo**. It is etymologically cognate with Lat. *rumor*, OIr. *rín* 'secret', Go. *runa* μυστήριον, G *raunen* 'to whisper'. The early use of this word for the runes proves their mysterious quality for the ancients. Therefore the theory of sacrality is ascertained with respect to the *handed-down concepts* of the origin of runes, whereas their *graphemic original patterns* are to be sought within the range of antique inscriptions on objects of daily use, and their *practical application* is considered multifunctional. In answer to the question of whether an individual divinity or the council of all divinities should be given credit for the invention of runes, we must refer to the late-pagan poem *Vǫluspá*, which attributes the creation of universal order and of the tools of civilization to all divinities collectively (without specific mention of the runes, however).

3.3. Constant interest is aroused by eight inscriptions containing the word **erilar** (**irilar** by means of *i*-umlaut). These inscriptions appear on different materials (stone, animal horn, lance shaft, gold bracteate) and thus refer to the art of rune carving in general, and are not limited to any group of skilled professionals (e. g. rune-stone setters). The etymological sense of the word is obvious: it differs from the ON *jarl* (**er-al*) and the tribe called *Eruli* only by ablaut in the suffix (*-il-* vs. *-al-* or *-ul-*). The cognate words mean 'man', often 'noble man'. The inscriptions bear the formula **ek erilar** (or similar), followed by a (sur)name,

and – in three cases – by **haite** (or similar; i. e. ‘my name is ...’), and sometimes by ‘made (the artefact)’. Thus the **erilōr** were professional rune carvers. Special skills are declared by, e. g., **ek erilar sawilagar hateka** (Lindholm amulet, side A, Krause-Jankuhn 1966, No. 26, 6th c.). The simplest grammatical interpretation connects **sa** to **erilar** and normalizes **hateka** to **haitek*. **wilagar** is probably cognate with ON *vél* ‘tricks’; the gloss is thus ‘I, the Eril, ‘The Tricky-one’ is my name’.

3.4. Other inscriptions refer to the rune-master without involving the word **erilar**. The names he attributes to himself are not normal personal names: **owlpupewar** (Thorsberg chape, appr. 200 A. D., Krause-Jankuhn 1966, No. 20) with the second component *-pewaz* ‘servant’, while the first component most likely makes reference to the ON divinity *Ullr* (Go. *wulpus* ‘brilliance’); the Himlingøje II buckle (1st half 3rd c.) bears the attribute **widuhudar** (for **widuhundaz*) ‘wood-dog’, probably a kenning for ‘wolf’ (Krause-Jankuhn 1966, No. 10). The rune-master’s name on the Zealand II bracteate (Krause-Jankuhn 1966, No. 127; Axboe/Düwel et al. 1985ff., No. 98), which reads **farawisa** may be interpreted as ‘one knowing dangerous things’ or ‘one knowing passages’. Special skills are thus declared, although the true meaning here as elsewhere is not evident. Hultgård (1998, 720) draws parallels between self-predication of Avesta divinities, such as ‘The X (The Victor Over the Enemy, The Greedy-One ...) is my name’, and runic inscriptions, but attributes these epithets on the runic inscriptions to rune-masters. Hauck (1998, 302f.), however, qualifies such terms as cultic names for Odin. The inscriptions do not support his hypothesis; the recurring word “made” proves their relation to the artifact rather than to the mythic personage. The trickiness of the rune-master alluded to by the Lindholm amulet (other similar inscriptions do exist) may consist of the fact that he either changed his name or wrote it in coded runes in order to protect himself from demons. It is uncertain how far we may take such hypotheses. Should metatheses of letters be interpreted thus, or should we attribute it to dyslexia? The rune-master Asmuntr (**Asmundr*) Karasun of Uppland (about 1050 A. D.) often signed his name as *Asmunrt*. This, however, may simply be a case of wrong spelling, because he also signed himself in uncoded form (Jansson 1969). Where do we draw the line in these matters? Klingenberg (1973) hy-

pothesized that this was a case of gematria (i. e. use of the numerical value of the letters for magic purposes): if one admits such a possibility, then the intention to arrive at certain numeric values must have led to arbitrary orthography in some inscriptions. Alas, this hypothesis is harder to prove than Klingenberg meant it to be.

3.5. Magic-religious function is ascribed to runic inscriptions when the *fupark* or parts of it appear (alphabet magic). The same is likely for amulet words such as **alu** ‘inebriating drink, ale’ and **laukar** ‘leek’ (both did play a role in the cult); and also for **labu** ‘summons, invitation, citation’, though it is not clear who was to be invited or summoned (a demon? the spirit of a dead?); also for **ehwaz* ‘horse’, which had a certain cultic role but which may well have been the very one to be protected or to be healed. Magic-religious function is also ascribed to runic inscriptions, which were carved in connection with a funeral and were only visible from within the tomb (either by the deceased thought of as alive, or by grave robbers); and when the object was submerged as a sacrifice immediately after the runes were carved. Surely *laukr* ‘leek’ and *alu* ‘ale, inebriating drink’ found on bracteates, as well as *lin* ‘flax’, in the *Volsi* cult are magic words, but they themselves are not religious words, although these objects were used in religious ceremonies or magic practices.

4. Bracteates

4.1. Interpretation of effigies and inscriptions on bracteates is subject to controversy. They represent further development of Roman coin effigies, whereby the originals were often copied beyond recognition. The metamorphosis of the image must correspond to a new symbolic significance. This is located by Hauck (last 1998) within the field of magic and religion, in view of the function of these objects as amulets. His point of departure are several hypotheses, especially that the original emperor’s head was now interpreted as the head of the god **Wōdanaz*; that bracteates represent mythological scenes; that identical attributes of figures appearing on different bracteates signal identity of the mythological personages; that the animal on many bracteates, which often appears horse-like (corresponding to horses on the Roman prototypes), is the horse healed by Wodan in the Old High

German *Zweiter Merseburger Zauberspruch*; and that this horse must be Balder's (which is not ascertained for the Merseburg charm). Setting out thus, he finds the Balder myth represented on bracteates and even reconstructs lost Balder myths by free interpretation of bracteate images; he hypothesizes that a personage once identified by him as Balder or Loki, etc., must remain Balder and Loki elsewhere, as long as the attributes are identical. When such a personage appears in a context alien to extant myths, he does not take this as a contradiction to his hypotheses, but considers the myth as lost. He sometimes has no choice but to force the effigy interpretation and to attribute non-demonstrable meaning to linguistic material.

4.2. Of the contrapositions, Seebold's (1998) is noteworthy: elements of effigies that Hauck interprets as motifs from Germanic mythology appear in specimens so similar to the Roman prototypes that the head is recognizable as that of a Roman emperor with attributes unthinkable for Odin. As far as the inscriptions on bracteates are concerned, Seebold observed that sometimes putting down letter-like characters had more meaning in itself than the contents of these characters, as is demonstrable by some senseless imitations of Roman capitalis (Seebold 1998, 275). Nevertheless, there are many bracteates whose runic inscriptions do make sense. But where may we construct sense by assuming e.g. the abbreviation of words? Or where have illiterate workmen produced inexact copies of runic inscriptions that originally had made sense? Seebold's method is not well thought-out and many of his hypotheses are untenable: that the existence of an (abbreviated) *fupark*, e.g., might signify that "the depicted personage is a king", whereas the sources he quotes – from Tacitus to the *Rígsþula* – demonstrate that tribal chieftains, priests, divinities, as well as kings, were considered rune experts.

4.3. Starkey (1999), too, is skeptical about Hauck's theories. She emphasizes that the identity, and sometimes even gender, of depicted personages is uncertain. Some bracteates could represent healing rituals; however Odin is not the only divinity who could heal.

4.4. Thrane (1998, 223) is in search of new criteria when he raises the question of the identity of the bearers of bracteates. Because of the opulence of cultic objects found there, he con-

siders the site of the bracteate-hoard Gudme II on Funen (where several place-names point to an organized cult) to be the residence of a sacral king (1992, 358). One specific collection of nine gold bracteates might be the necklace of Gudme's "sacral king", however a precise definition of "sacral king" is missing. Otto Höfler's concept (1952a) of "sacral king" cannot be it; Baetke (1964) is perfectly right when he says that sacral royalty is undemonstrable in Germanic antiquity.

5. Names

5.1. For the North, literature on names as sources for the history of religion has been collected by Andersson (1992b); while Holmberg (1992) expounds methodological problems through instructive examples, and Reichert (1992) – in the same volume – deals with the oldest Germanic material referring to personal names and the appertaining problems of method.

5.2. The main sources are place-names referring to sanctuaries. Andersson (1992b, 508) states that place-names are "condensed descriptive texts". For example, ODan. *Othinsvæ* – today Odense – proves that a *væ* ('sanctuary'), dedicated to Odin, existed there. Few Nordic place-names may be traced back to pagan times. Place-names rarely appear in runic inscriptions (Sørensen 1998); none of them contains the name of a divinity. The other, very scarce, pagan-time documents at our disposal are foreign reports, especially by missionaries. Odense is cited by Adam of Bremen as *Odansue*. But such early sources are rare and the earliest occurrences of most place-names date from Christian times; so normally a place-name signifying 'sanctuary of divinity X' is ambiguous: it may go back to pagan times and mean 'site of a sanctuary of divinity X (worshipped by us)', or it may be recent and mean 'site of a sanctuary of divinity X (at the time of our pagan ancestors)'. Nevertheless, in both cases the existence of such a place-name by itself enables us to deduce that the respective divinity had been worshipped there in pagan times. Actually, names of sanctuaries usually reappear in the names of the settlements that arose in their neighborhood. Names are problematic when their etymological significance is not clear, or when it must be suspected that the settlement was named for historic reasons and without thorough

acquaintance with its historic past. Such misinterpretations may always be the case; their probability grows proportionally to the recentness of the place-name, and where archeological sources do not provide certainty as to the continuity of settlement. The geographic distribution of divine names contained in place-names gives us good reason to believe that a pagan background is reflected here. Proceeding merely statistically, the misinterpretation of single names becomes insignificant. The recurrence of names allows to draw conclusions about the divinities, the landscapes and the sites which were preferred for the edification of sanctuaries in pagan times (e. g., in the vicinity of estuaries admitting Viking ships, place-names involving Odin's name are significantly frequent).

5.3. It is not at all “unthinkable” (Holmberg 1992, 546f.) that, in Christian times, sites containing pagan relics were named after some pagan divinity: place-names often involve names of divinities that rarely appear in literary sources, such as *Hörn* (fem., de Vries 1970, 2, 331) and *Ullr* (masc.), whereas *Heimdall*(*l*)*r*, and maybe even *Baldur* – of outstanding importance in 13th c. myths – do not appear in place-names. The hypothesis that there might be divinities not mentioned in written myths is admissible; however it is practically impossible to deduce from place-names names of divinities which are not attested in literature. The only exception is *Niærþ* (Hellberg 1986, 62f.), who appears only in Swedish place-names, and although she is mentioned neither by Snorri nor by any other source, she may be the female counterpart of *Njörðr* since Snorri mentions that the latter had a sister. *Niærþ* may be identical to Tacitus' (*Germania* 40) *Nerthus*, his main goddess of Eastern North Sea and Jutland tribes; however, Tacitus does not mention any cult worshipping siblings.

5.4. The main divinities mentioned in 13th c. literature do appear in place-names, specifically *Freyr*, *Óðinn*, *Þórr*, *Ullr*, *Njörðr* and *Freyja*. There are regional differences, as documented by de Vries (1970). Alas, his attempts to project place-names back into the Bronze Age must be considered failures. Elgqvist (1955) deduced that there was a sanctuary of the god *Ullr* within today's city of Uppsala from the district name *Ullarakers hundare* (Ulleråkers härad); but *Ullr* is not amongst the divinities worshipped in nearby

Old-Uppsala listed by Adam of Bremen (4, 27) as *Thor*, *Wodan*, *Fricco*. What remains unclear is the relationship of divinities that frequently appear in place-names such as *Ullr*, to those divinities of whom there is evidence in ancient cults which – as is the case in Uppsala – are known to us from as early as the pagan era. Place-names provide information about the organization of the cult: they appear mostly in district names, e.g. *Fros hærath*, later *Fros herred*, an administrative district in southern Jutland, or OSw. *Frosfjærðunger* (*fjærðunger* ‘quarter of a hærath-district’) in Västergötland, and *Fröstolpt* (*tolpt* ‘twelfth’); it may be assumed that this district was under the protection of a specific divinity (Andersson 1992b, 538f.).

5.5. The designation of a single entity “divinity” or “gods” is rarer in place-names than names of individual gods. Sørensen (1985) interprets the place-name *Gudhem* (and similar spellings; all-in-all twelve places, plus a few probably secondary ones) as ‘home of gods’. In 13th c. literature (*Egils saga* and Snorri's *Heimskringla*), *Goðheim* and *Goðheimar* appear as the place to which the dead are led by Odin and where he retires after his own death. The name does not refer to a single god (or to the Christian God), which is evident by the lack of gen. sg. -s. Whether such places are sites of a cult cannot be proven. Furthermore, even rarer designations for the divinities collectively (or for groups of divinities) appearing in place-names, are Gmc **ansu* (maybe in the place-name *Oslo*; cf. Widmark 1989). There are also traces of ON *tívar* in place-names, distinguished from *Týr* by the lacking gen. sg. -s; e.g. *Tibirke* (*birke* ‘birch wood’) as opposed to *Tislund* (*lund* ‘grove’). Worthy of note is *dis* for a group of goddesses in a few Norw. and Sw. place-names.

5.6. Personal names reflect religious elements of a different kind. In the narrower sense they are baptismal names; they probably involve a blessing or an association with the mythical ancestral community of origin, the “Sib”. Social values are reflected by names assumed in later life upon initiation into a special group; or when a function, such as priesthood, is taken on; or by “nicknames”. In a primitive society, nicknames may have been names of honor, or else – as with the Romans –, they became part of the traditional name system, and thus represented a large group of cognomina (e.g. *Cicero* derives from *cicer* ‘chick

pea'). Name-giving in life later sometimes replaces the original name and sometimes adds surnames: the Norwegian king Haraldr, e. g., was surnamed *Lúfa* 'tuft of hair' after his oath neither to cut nor to comb his hair until he had united Norway and *Hárfagri* 'hair-beautiful' after fulfillment of his oath (*Egils saga* chapt. 3). The "professional names" of runemasters are not classified as personal names.

5.7. Some personal names involve the concept of divinities or a single divinity. Pan-Gmc are **guða-* and **ansu-*; **ragina-* is indeed pan-Gmc, documented in Frankish *Ragnacharius* from the 5th c. onward, and later on also EGmc, while the significance of the pl. 'divinities' is exclusively Nordic; in any other connotation the appellative stands for 'council', and it remains open whether names such as *Ragnarr* were secondarily connected to divinities (Janzen 1947, 87).

5.8. Many German and Dutch scholars, especially before 1950, preferred to assume a mythological context wherever there is doubt. Names under which Odin hides in 13th c. sources, the *Odins-heiti* (*Hertýr* e. g.), are interpreted by Hauck (1998, 303) as "authentic cultic names for Odin". Scandinavian research prefers profane interpretations: Wessén (1927, 74), e. g., supposed that personal names with *Frey* appertained to the Proto-Nordic appellative **fraujaz* 'lord', and only secondarily, by supposition, were thought to include the divinity's name. In a similar fashion, Sørensen (1974), contradicting Höfler (1952a), attempts to demonstrate that the name *Othinkar* does not involve the divinity's name. There can be no proof in such matters; however, the name Odin, if ever, very rarely appears in personal names. There is evidence of non-Nordic names containing the Go. appellative *wulþus* ('glory, honor, brilliance') and its cognates, but the pertinent divinity *Ullr* is exclusively Nordic; **wulþubewar** could therefore be an appellative form. One argument against this is its second component **þewaz* 'servant': i. e. name of divinity + 'servant' becomes typical from the 4th c. onward (Reichert 1992, 573); its Christian counterpart is *Theodoulos*, etc. Names of divinities as first components of personal names are late peculiarities and do not permit speculation regarding the Germanic religion (a possible exception is: *Othinkar*).

5.9. The High Middle Ages interpreted pagan theophoric name-giving as follows. The *Eyr-*

byggja saga reports that Þórolfr Mostrarskegg was initially called Hrólf, and later on, as *mikill vinr Þórs* he received the name Þórolfr. He gave his son Steinn to Þórr calling him Þórsteinn. Þórsteinn, on his part, gave his son Grímr to Þórr, thereby changing his name to Þórgrímr. Still another son of Þórolfr gave a son to Þórr naming him Þórsteinn. All of this is the saga's invention and only demonstrates 13th c. imagination (Wessén 1927, 77ff.). However, we have early analogies: Ammianus Marcellinus (XVI, 12, 25, ad 357 A. D.) mentions an Alemannian chieftain who was initiated into Greek mysteries in Gaul and, upon his return home, changed the name of his son Agenarichus to Serapio. This proves that there was a tendency to give theophoric names and to adopt foreign cults prior to Christianization.

5.10. Mythical beings hiding behind pseudonyms are not exclusively Germanic. In pagan times, Odin seems to have specialized in this; literary texts such as the *Grimnismál*, where Odin appears under a pseudonym and in disguise, have ancient bases. But the extant texts represent imaginative new versions; so we cannot be sure about any pseudonym reported in them, that it originates from pagan times. This regards both the *Odins-heitis* and names of other mythical beings; the *Völuspá* transmits dwarf names, whose version in the Poetic Edda differs from that in *Hauksbók*; and the difference to the manuscripts of the *Snorra Edda* is even more conspicuous. This proves that it was possible to invent mythical names in Christian times. Ancient names may hide amongst the *heitis*, dwarf-names, etc.; but because of lack of evidence, they cannot support any hypothesis.

5.11. We are able to reconstruct the antecedents of some of the names in heroic legends: one of their legendary heroes is *Guðþormr* (a Burgundian king). Janzen (1947, 122) associates the name to *þyrma* 'to venerate', i. e. cognate with *Véþormr* 'he who venerates the sacred'. The historical personage's name was *Godomarus*, which – in oral tradition – would have resulted in **Goðmarr*. *Guðþormr* is probably a product of 12th c. scholarly etymology; it may not represent any pagan religious concepts. *Beowulf* also cites names whose phonetics are not conform to the Nordic version: *Wæls* in *Beowulf* (10th c.) does not coincide with *Vǫlsi*, which is the personage's name in the *Vǫlsunga saga*; an ancient relation to a horse cult (*vǫlsi* 'horse phallus') is thus ex-

cluded. Names of heroes whose phonetic divergences are unexplainable were collected by Heusler (1910).

5.12. Müller (1970, 195ff.) and Beck (1986) see the meaning of theriophoric personal names in the evocation of good augury; they run parallel to animals depicted as symbols of good fortune. Christendom kept up the use of theriophoric personal names: obviously they were regarded as bearers of general bliss regardless of which divinity the animals were sacred to. In pre-4th c. Germanic they are rare (Reichert 1992). Thus the great number of Nordic theriophoric personal names are considered a specific creation of the Viking Age. The animals sacred to **Wōdanaz*, the wolf and the raven, appear in personal names no earlier than the 4th c. A.D., and the name **Wōdanaz* itself remains practically unused ever after; however “Odinic” designations are found apparently in names of rune-masters. This need not be a contradiction: according to Tacitus (Ann. 13, 57), the Hermundures and Chatti dedicated their enemies’ armies to Mars and Mercurius, the latter being probably **Wōdanaz*, which meant that they did not make prey but tried to destroy the enemies together with their horses and armaments. It is hardly imaginable, that a newborn infant could have been dedicated to Odin, as an augury of good fortune, in view of these consequences of a dedication to him; the contrary is true regarding professional names of magicians and priests. Krause (1971, 81) interprets not only **Wulþuþewar*, but also **Woduridar* (Tune stone, ca. 400 A.D.) as theophoric names of priests: ‘the rider storming ahead in ecstasy (like Wodan)’. The etymology, cognate with G *Wut* (‘ecstasy’) is certain; the reference to Odin is also probable; priesthood is within the range of possibilities. There is certainty as to the original denomination of a priest: *Vēseti* ‘one sitting at the sanctuary’.

5.13. Four of the Germanic prophetesses variously attested are known to us by their names, all of them professional ones: Tacitus names *Velaeda* (‘seer’; IE **uelēt-*; **uel-* ‘to see’) and *Ganna* (ON *gandr* ‘magic wand’); and also **Albruna* (corrupted), the first component probably cognate to ON *álfr* (a group of mythic beings) and the second component *run-* ‘secret’ (in giving personal names probably *Guðrún* ‘who received secret knowledge from the divinities’, was a prototype for similar

names). The fourth prophetess is the Semnonic woman, *Waluburg* (Gmc **walus* ‘magic wand’), who apparently ended up in Egypt in the services of a Roman officer.

6. Linguistic material in non-Nordic sources

6.1. The ancient authors do not record any words pertaining to Nordic religion. They do name peoples whose names, where etymologizable, may reflect a general system of values; but problems are insurmountable. The *Sithones*, e.g., mentioned by Tacitus (*Germania* 45) as reigned by a woman: are they Germani, Finns, or Laplanders? If their name were cognate with OIcl. *siða* ‘to practise magic’, its meaning would be obvious; if to *siðr* ‘hanging down’, ‘pendent’, they might be inhabitants of the lowlands; if the alternative were E *side*, they might be a ‘seaside’ population (Much 1967, 517).

6.2. Apart from runic inscriptions, more information is provided as late as Christianization. In Adam of Bremen’s description of the Uppsala cult, *Wodan’s* name is explained as *id est furor* and is thus cognate to G *Wut*. A scholion (i.e. additional medieval explanations) to Adam’s work is a matter of dispute: it nominates *G(h)immendegop* as the local word for the bottomless pit of the ocean which, according to Adam’s own text, King Harald approached in the far North. Adam himself calls it *abyssus*. The manuscripts containing the scholion postdate Snorri, whose *Ginnungagap* ‘the initial chaos’ might have been their source (Dillmann 1998). The word evidently is the same one, but the different spelling makes Snorri as source for the scholion improbable; the different spellings point to different sources. The best etymological interpretation of *ginn-* is from Gmc **gin-* as the null-grade of the IE root **ghei-*, which is extant in Gmc **gainōn* ‘to yawn’, and of *gap* from ON *gapa* ‘to gape, open one’s mouth wide’: thus together ‘gaping throat’. Because Adam was already familiar with the concept of an abyss, the word as well may be regarded as ancient.

7. Recent Nordic sources

7.1. Many mythological names and concepts are handed down through 13th c. sources. Their evaluation as religious evidence has been

compiled by Lindow (1988), and by comments on the *Poetic Edda* (Gering/Sijmons 1927–31; Dronke 1969–97; von See and others 1997ff.), and on the *Snorra Edda* (Lorenz 1984).

7.2. The medieval manuscripts nominate the following designations for divinities or groups of divinities: *týr* (sg.), *tívar* (pl.), *díar*, *rögn*, *regin*, *bönd*, *höpt*, *goþ*, *æsir*, *vanir*. Of these, *bönd* and *höpt* are considered more or less synonyms for ‘fettters, chains’. Dronke (1992, 657) returns to the idea that all the various concepts of fetters in mythology are related: starting with Tacitus’ Semnonic grove which may be entered only *vinculo ligatus* ‘by one tied with a ribbon’ or ‘fettered’ (?); continuing with the (9th c.) *First Merseburg Charm*, *sumir hapt heptidun* ‘some tied fettters’; and ending in the *fjöturlundr*, ‘grove of fettters’ (*Helgaqvíða Hundingsbana II*) where Dagr kills Helgi with Odin’s spear. The concept of the ritual fettering of humans and, moreover, of ‘fettered gods’ goes beyond the Germanic sphere. Therefore, and because *bönd* and *höpt* involve all divinities, we cannot agree with Höfler (1952b), who uses the Helgi Poem’s reference to Odin as proof that Odin was the divinity worshipped in the Semnonic grove.

7.3. The words *bönd*, *höpt*, *rögn* and *goð* are neuters; when applied to the Christian god, *goð* becomes masculine. The reason for the neuter gender might be abstractness; but Germanic languages also use the neuter for groups (of people) of mixed gender. However, the neuter does not permit any conclusions as regards pre-patriarchal Proto-Germanic societies. *Rögn* and *regin* are, semantically speaking, ‘advisers’, ‘counsellors’; the concept brings to mind the council of all gods upon the establishment of world-order (*Völuspá* 6ff.). It is unclear if and how *goð* is cognate to the Gmc vb. root **geut-* ‘to pour’. The fact that the Go. word for priest *gudja* is cognate (OHG *gotinc* and ON *goði* are limited to jurisdictional functions), and that *goþ* was adopted by Christianity for its god proves that it was applied to anything divine (de Vries 1970, 2,4).

7.4. *Týr* sg. is the name of one divinity and appears in kennings such as *Hanga-Týr* ‘the Týr of the hanged’ for Odin. The plural *tívar* stands for the totality of divinities. Thus *Týr* simply seems to be the divinity; etymologically it leads via Gmc **teiwaz* to IE **deiwós* ‘clear sky’, which in many Indo-European languages

means ‘god’ and especially ‘god of the sky’. Odin thus must have dislodged Týr from his pre-eminent position. The fact that Tacitus names two divinities to whom the enemy’s army was consecrated (5.12.) may signify their co-existence around 1 A.D. *Díar* is mentioned only a few times, each time by Snorri: in a kenning for the mead of poets he cites the skald Kormákr (*Skáldskaparmál* 2); the *Ynglinga saga* (chapt. 2–9) nominates the *díar* as the masters of sacrifice and of jurisdiction under Odin’s guidance; and Njörðr and Freyr are temple priests to the gods. Also Gr. *Θεοί* (and *Θύειν* ‘to sacrifice’) qualifies the divinities as receivers of sacrifice. Gmc *d* and Gr. *Θ* derive from IE *dh*; *díar* and *theoi* may thus be cognate. It is unlikely that this be incidental and that Kormákr, who admittedly was half-Irish in origin, but Icelander himself and nowhere else in his extant stanzas used an Irish word, should have used a foreign Irish word for ‘gods’ (which like *tívar* derives from IE **deiwós* ‘clear day’), and that Snorri should have adopted it without knowing it nor comprehending that it was a foreign word.

7.5. ON *æsir* is cognate with OE *ōs* ‘god’ and Go. *ansis* (acc. pl.), which is the name by which Jordanes (*Getica* XIII, 78) refers to Gothic *semideos*, the mythical ancestors of the royal dynasty of the Amali. The word is pan-Germanic for ‘god’; a goddess of war *Vihansa* appears on a Roman inscription in the Rhineland (de Vries 1970, 2, 325). Apart from ablaut in the suffix, Gmc **ansuz* is identical to Go. *ans* ‘beam’ (Gmc **ansaz*), which probably indicates divine images constructed from piles of wood. But others take these for incidental homonyms and connect **ansuz* ‘god’ to IE **asu* ‘breath’, ‘creative power’, or to the Hethitic word for ‘king’ which, in its turn, may be cognate with Gr. *ἡνία* ‘reins’ and ON *æs* ‘loop’, and – in a similar fashion as *höpt* and *bönd* – might refer to binding or bound divinities (Polomé 1989, 56). The relationship between *æsir* and *vanir* is unclear: the *vanir* are divinities of fertility; of all the possible etymologies, Lat. *Venus* is certainly the correct one. Regarding the war of the *Æsir* against the *Vanir*, *Völuspá* 23–24 only mentions that the fight was about whether all divinities should receive sacrifices and that the *Vanir* won. In the antecedents of the story of the origin of the poet’s mead, Snorri (*Skáldskaparmál* 1) reports how – in order to confirm the peace treaty – the *Vanir* together with the *Æsir* spat into a cauldron, and how, from their saliva,

the all-too-wise Kvasir was formed. Edda lays allude to the Æsir taking the Vanic god Njörðr hostage. A detailed report, parts of which, however, contradict the *Skáldskaparmál*, is found in the *Heimskringla* (4f.): the Æsir start an aggressive war against the Vanir which ends in deadlock; the Vanir send Njörðr and clever Kvasir as hostages; the Æsir, in turn, send Hœnir and wise Mímir to the Vanir. When still with the Vanir, Njörðr begat two children, Freyr and Freyja, by his sister, a tabu with the Æsir. The two of them became temple priests with the Æsir; Freyja taught the Æsir a new kind of magic. Opinions vary as to whether the *Heimskringla* is the ancient version and not merely a combination of motifs from *Völuspá* and *Skáldskaparmál*. Mythologies of various peoples report feuds between divine groups; the mythic war is not necessarily a reference to any submission of a pre-Germanic civilization to the Germani.

7.6. Interpretation of divine names helps us understand the functions of the respective divinities. The etymologies of the most important ones are certain: *Óðinn* from **wōds* (G *Wut*) ‘furor, ecstasy’; *Þórr* from **þunaraz* ‘thunder’; *Týr* from IE **deivos*; *Ullr* from Go. *wulþus* ‘brilliance’; *Frigg* from Gmc **fri-* ‘to love’ (IE **pri-*); *Freyr/Freyja* from IE **pro-* ‘in front’, ‘ahead’, thus ‘the Lord/the Mistress’. But there are contradictions between Nordic and Langobard myths: Frigg and Freyja are etymologically not cognate, and their functions are different (“functions” here do not refer to ruling power, war, or fertility; such categorization is not possible with Germanic divinities: Frigg, as Odin’s wife, rather than Freyja should refer to ruling power, but the etymology convinces of the opposite). The Langobard principal goddess *Frea* is etymologically identical with *Frigg* (while the North “sharpens” the semi-vowel *j* to *gg*, the South vocalizes it), and her function as Wodan’s wife is congruent. However, dog-symbolism in the Langobard tribal myth and the motif ‘dog + boar’ (regarding the combination of boar banners and dog helmets, cf. Beck 1965, 75) is in keeping with Freyja; the *Njáls* saga attributes the following verse to a Christian: *Spari ek eigi goð geyja! Grey þykki mér Freyja* [May I be spared barking gods! A bitch to me seems Freyja.] Moreover, Freyja’s riding animal is a boar (*Hyndlaljód* stanzas 5 and 7).

7.7. Alas, in some cases, where mythological interpretation of divinities is problematic,

their etymology is also uncertain; this is the case especially with *Heimdall(l)r*, *Njörðr*, *Baldr* (from IE **bhel-* ‘to shine’ or OE *bealdor* ‘lord’), *Loki* and *Hænir*. Philology, however, illuminates the function of *Urðr* as the goddess of destiny and fate. Her name is an abstraction of *verða*; in OE manuscripts *Wyrð* stands for ‘destiny’ (Weber 1969; Meid 1992, 490). *Bragi*, the god of poetry in the *Snorra Edda*, and also the oldest skald, has been explained by Indian philology: in the oldest documents (*Rigveda*) OInd. *brahman* (IE **bregħ-*) stands for ‘shape, form, distinct expression (of truth)’, not for ‘sacrificial priest’, which meaning comes later. So the oldest records of *brahman* fit to *Bragi*, both etymologically and in his function. On the other hand, Lat. *flāmen* ‘sacrificial priest’ should not be connected with *brahman*, but with IE **bhlād-men* (cognate with ON *blóta*), as phonologically expected.

7.8. The names of days of the week could – had they been translated into Germanic as early as the 3rd c. – prove that the names **Tiwaz*, **Wōdanaz*, **Punaraz* and **Frīja* already existed then. But no pre-Christian monument bears Germanic weekdays. Germani in touch with Romans certainly knew the seven-day week implemented by Augustus, but they may have never adopted the concept ‘week’. The *Völuspá*, which reflects late-pagan concepts, states (stanzas 5–6), that the council of gods organizes time. Only Night, the waxing and waning Moon, times of the Day (morning, noon, vesper, and evening), and Year are mentioned there.

7.9. Snorri’s *Ynglingatal* and Saxo’s *Gesta Danorum* are euhemeristic delineations depicting mythical personages as human beings and attributing mythic qualities to humans. Dumézil’s (1970) attempt at philological clarification as to whether *Hadingus* (Saxo, Book I) is a mythicized Viking or an euhemerized divinity has been unsuccessful.

8. Terminology of the pre-Christian religion

8.1. Baetke (1942) explores the development of the significance of words for ‘holy’, ‘divinity’ etc. to arrive at the focal point of religious concepts, i.e. for the NGmc **wīhaz* (manifest only in ON *vé* ‘sanctuary’) and **hailigaz*, which is still alive in *heilagr*, and other derivations. He clarifies the meanings of *heill*,

heilagr, etc. (1942, 58ff.), even if etymological derivation is a matter of controversy (different opinions are given by: Pokorny 1959, 520; de Vries 1977, 218ff.; Seebold-Kluge 1995, 364). *Heill* is cognate with OSl. *cělŭ*, ‘healthy, whole’, Cymr. *coel* ‘omen’, and other Celtic etyma; it might also have Gr. cognates. The ON noun *heill* in its fem. form means ‘(bona) fortuna, good luck’, and as a neuter ‘(good) omen’; its opposite thus is *óheill*, G *Unheil* ‘bad luck’. In OHG Christian manuscripts *heil* is used to translate *salus*, *salutare*. Later on it also signifies ‘omen’, and ‘amulet’ (once). The original connotation was therefore religious. The sagas speak of *heill* in connection with pagan sacrifice and prophecy through sacrifice. In 4th c. Gothic it is a greeting for those entering a hall (*De conviviis barbaris*, *Anthologia Latina* 285); in Wulfila it stands for *χαίρε*, the normal Greek greeting. It is also a salutation in OHG, OSx., OE and ON. It is not only well-wishing; it also translates the biblical salutation *osanna* ‘help’. *Heill*, “directly or indirectly related to favorable providence granted ultimately by divinity” (Baetke 1942, 79), is involved in the concept of *mannhelgi* ‘inviolability of person’ mentioned by Nordic juridic sources, and in ‘the king’s good luck’ (*fortuna Caesaris*) in Snorri’s tales of the kings Dómaldi and Óláfr trételgja (*Heimskringla* 15 and 43); and probably already in *hailag* on the Go. Pietroassa necklace (Reichert 1991–93).

8.2. Etymology helps us understand religious terms, such as *blóta*, OHG *bluozan*: the probable connection with Lat. *flāmen* ‘sacrificial priest’ has its parallel in the fact that the victim, ON *tafn* (IE **dap-no*) is also cognate with Lat. *daps* ‘sacrificial meal’ (and less close to OHG *zebar*, OE *tifer* ‘sacrificial animal’ and Go. **tibr* ‘sacrificial offering’: from IE **dip-*). The victims were not always sacrificial repast; often they were left to putrefy or were destroyed otherwise (Reichert 1999, 178ff.). Reference to ritual consumption of victims is probable when the word in question, especially OE *hūsl*, ON *húsl*, is applied to the Christian Lord’s Supper; in keeping with this is Go. *hunsl*, which stands for a food offering (Düwel 1970, 229).

8.3. A word never used in Christian rites, such as ON *blóta*, probably had pagan sacral significance (Düwel 1970, 223). Morphological criteria, such as *u*-stem inflection, next to a non-sacral *a*-stem (perhaps **ansuz* ON *áss* ‘god’ next to **ansaz* ‘beam’), are no proof of

sacrality, as non-sacral *u*-stems and sacral non-*u*-stem words exist.

8.4. The interpretation of words designating sites of worship is difficult: ON *vé* (Go. *weihs* [wīxs] ‘holy’) ‘sanctuary’, and *hqrgr*, *hof* are preserved in place-names, but they can hardly be separated from the general vocabulary (Andersson 1992a). OHG *harug* is used to gloss Lat. *lucus* and *nemus* ‘grove’; OE *hearh*, *hearg* ‘temple’, ‘altar’; *Vqluspá* stanza 7 reports that the Æsir *hqr oc hof há timbroðo* ‘they timbered *hqr* and *hof* up high’, which implies buildings (Andersson 1986). Contradictions are generally resolved by the argument that first simple stone altars were built and real buildings later on (cf. 2.2.).

45. Nordic language history and religion/ecclesiastical history II: Christianization

1. Historical background
2. The sources
3. Mission languages
4. Types of borrowing
5. Literature (a selection)

1. Historical background

Raids and voyages for trade brought the Vikings into contact with southern and western Christianity early on. Christian intolerance of paganism forced them to undergo exorcism or allow themselves to be baptized if they wished to have dealings with Christians or settle in their midst. This frequently remained a worldly, practical affair or led to syncretisms, but the superiority of Christianity soon prevailed, especially in the mixed culture of the Danelaw, and its influence was felt in the Nordic homelands in the 10th c., including the still pagan West Nordic poetry. Following scattered missionary activity from the beginning of the 8th c. onward, the task of Christianizing the North was placed officially in the hands of the archdiocese of Hamburg, founded in 831 (after 845 in Bremen). The Nordic mission followed trade routes and concentrated on Jutland and on Birka, Sweden, possibly also reaching southern Norway. Ansgar and his successors were acting partly in the interests of German hegemonic claims, so the intensity of missionary activity at any given time depended on the strength of the empire; the reactions of the populace were politically motivated as well. All Norwegian kings were Christian after Hákon góði (ca. 940–60), who was raised in England; they fought paganism with varying degrees of zeal and often with considerable violence. Hákon was forced to yield to the opposition of the independent farmers, but he probably helped to pave the way for the quick success of Olaf Trygvason (995–1000), who fell victim to a Danish-Swedish alliance, and of Olaf Haraldsson (1015–30), who justified his claims to absolute rule in Christian terms and whose death at the hands of Norwegian rebels was interpreted as martyrdom and made the Christianization of Norway complete. Both had among their retainers Anglo-Saxon bishops and clerics who later preached in Sweden as well. In Sweden the pagan party was stronger, especially among the Svear, and the Christian Olof skötkonung

(ca. 980–1021/2) was forced to retreat to more extensively Christianized Västergötland; due to further setbacks, Christianity did not prevail until the end of the 11th c. In Denmark, it had already gained ground under the first sole ruler Harald Bluetooth (ca. 936–87); as the political center shifted to England under his son Sven Forkbeard and his grandson Knud the Great († 1035), Anglo-Saxon influence grew in Denmark until Sven Estridsen († 1074/6) consolidated the organization of the Church in collaboration with Archbishop Adalbert.

Continental and Anglo-Saxon influences thus converged in the Nordic countries in a characteristic mix. Adam of Bremen protested against English presumptuousness, and kings such as Harald harðráði (1046–1066) played the English trump card in their competition with the Archdiocese for influence in Church affairs. In practical mission work, these two currents may well have complemented each other. The Roman Church was universal, and exchanges of personnel among different countries were the rule, so that, for example, German clerics could be sent abroad from England; Ansgar of Hamburg was from Picardy, and Anglo-Saxon missionaries were trained in Irish monasteries. In the beginning, missionaries came from a wide variety of countries and included representatives of the Eastern Church. The decisive fact is that Christianization made the Nordic countries, together with its languages, part of Europe. The newly founded churches were dependent on foreigners to fill the more important posts; at first, young Scandinavians were sent to school in Germany, then primarily to Paris and England from the 12th c. onward, and in the late Middle Ages to Germany once more. The Church was dependent on secular power and had to accommodate itself to established customs and social conditions, though without renouncing its new messages. As guides for living, these messages would have spread only gradually from the elites to the broader classes, as the distribution of Christian names shows: in the beginning they were found as second names given at baptism, then primarily among the daughters of leading families, and were not truly common until the 12th c. Bishoprics appeared in Denmark by the mid-10th c., in other areas around 100 years later, and monasteries appeared from about 1100

onward; these institutions must soon have included schools. The diocesan organization did not become definitive until the national churches emancipated themselves through the establishment of Nordic archdioceses: Lund in 1102/3, which was given supremacy over the Nordic countries and could thus assert itself against Hamburg-Bremen, though it remained open to German influence; Nidaros in 1153/54, which was responsible for the islands as well; Uppsala in 1164. From this point on, the Church saw itself as an authority of higher law and tried to assert monastic and papal reform plans and the newly codified canon law against secular power. Although the Church won some of these controversies, which could be bitter, in the end the kings were able to maintain their influence over the investiture of bishops. In the East Nordic area, the decline of clerical authority from the 14th c. onward led to a more personal lay piety (details in Maurer 1855; Thors 1957, 11 ff.; and in Church histories and handbooks).

2. The sources

2.1. The propagation of the new faith and a new way of life posed great difficulties for missionaries used to thinking in Latin. They either had to adapt their native dialect or use untrained interpreters, and they had to attempt to express themselves in a language without a philosophical-theological tradition of its own, to find words for concepts that ultimately lay beyond language (e.g. *óumræðiligr* = *ineffabilis*, *óumráðiligr* = *incomprehensibilis*). Their listeners would have understood them only vaguely at first, but since the new concepts were not introduced in isolation, the lexicon soon underwent a thorough restructuring. The complicated new message of faith placed the present in relation to the transcendent; it demanded a spiritualization of the individual (*inn iðri maðr* = *homo interior*, seeing with the eyes of the heart and the soul) and a new attitude toward one's fellow man that was not easy to assert under existing social conditions. Language as a bearer of ideology is a step ahead of reality, but also a part of it. For the proselytes, the innovations were manifested not least in the organization of churches, which was established in the regional laws and had to be supported by the parishes, and in new, binding customs. But *siðr* does not simply mean custom independent of personal convictions, it is both conveying and expressing the new doctrine. Thus

the word is often linked with *trú*; *heilagr siðr* and the like means religion, *forn, heiðinn siðr* the *cultus paganorum* (in EN rarer in this meaning). This corresponds to the situation throughout Europe, where the propagation of book-religion in an oral culture led to a ritualization and re-archaizing of faith into the High Middle Ages (see Angenendt 1997, 23 and passim). New knowledge and new skills (the septem artes, writing, horticulture, medicine etc.) came to the Nordic countries through the educational and social activity of the Church; linguistic coinages from translated religious literature entered into general use. It is important, therefore, not to separate the ecclesiastical-religious core vocabulary too strictly from the context of a general openness toward southern influences.

2.2. The content of missionaries' sermons is preserved only in the form of Church directives and later vernacular (fictionalized) accounts. The early conversions left traces in Viking Period runic inscriptions and in WN skaldic poetry (from the end of the 10th c. exclusively Icel.). The Swedish memorial stones in particular preserve an important, albeit thematically limited, vocabulary. In skaldic poetry up to 1050, Christian vocabulary appears either in isolated fragments, embedded in panegyric poems (especially addressed to the Norwegian missionary kings), or in occasional verses (*lausavisur*) transmitted in later prose texts. Metrical considerations generally guarantee authenticity, although younger forgeries cannot be ruled out. For example, the Christian verses attributed to Gísli definitely do not date from the 10th c., and for the fragment of *Hafgerðingadrápa* or Hallfred's last verse, such an origin is doubtful. In the 100 years after 1050, reflections of organized Christianity begin to appear, if only sporadically; from the second half of the 12th c. onward, clerical authors remodelled the old praise-poem into powerful Christian sermons, which immediately entered the written record.

Prose writing began in the west in the 11th c., in the east around 100 years later. There is evidence for that written tradition began in all regions with the laws, in which Christian law was codified in a prominent place. They transmitted some older material in modernized form, such as references to the legislation of St. Olaf and his bishop Grímkell. Translations and other religious writings must also have been produced at an early date; the especially extensive and diverse religious litera-

ture in the west is preserved in manuscripts from the second half of the 12th c. onward. Some early material is preserved only in late or even post-medieval copies, but the vocabularies of the manuscripts up to 1250 as collected by Holtzmark (1955) and Larsson (1891) are best treated as a closed group for the purpose of establishing definitive termini post quos non. Latin models aid in the semantic interpretation of the words, but the precise source text is often unknown, and misunderstandings cannot always be distinguished from creative adaptation. In these early manuscripts the religious terminology was already fully developed; after 1250 it was in general merely made more precise and supplemented with special terms or more modern synonyms. For EN a periodization of this kind is impossible. Apart from law texts and two fragments of Birgitta's revelations, the corpus documented and analyzed by Thors (1957) does not begin until the 14th c., even though the OSw. legendary and a Pentateuch paraphrase derived from a WN translation can be dated to the second half of the 13th c. The late medieval religious translations and devotional texts in Sweden and, somewhat later, in Denmark are, on the whole, products of the reform movement emanating from Birgitta's *Vadstena* (dedicated in 1384).

3. Mission languages

3.1. At the end of the 19th century, Taranger (1890) traced practically the entire WN religious terminology back to England; Maurer (1895) for his part championed a strong German influence. Phonic and grammatical criteria (especially the assignment of gender) are frequently indecisive, due to the genetic affinity of the languages, the incomplete and exclusively written nature of the sources, and the constant possibility of assimilation to the writer's native system and analogy. Different avenues of influence will have run parallel and sometimes crossed. Vernaculars other than English and German are of little significance. Despite the importance of Irish missionaries and ethnic mixing in the colonies, Celtic influence on WN ecclesiastical vocabulary is evident only in *bagall* 'crozier' (attested late), clarified as *bagalstafr* (Irish *bachall*, Lat. *baculus*; perhaps via ME); for the pagan religion cf. WN *bjannak* 'blessing', *diar* 'gods'. Irish models can also be found for WN *kross*, EN (with metathesis) *kors* 'cross', probably via England (ME *cros*), and for *klokka*, *klukka*

'bell', brought to the Continent by the Irish mission (AS rare *cluce* beside *bell(e)*, ON *bjalla*). Romance influence on ecclesiastical terminology seems in every case to have been mediated by LG or AS. The same is mostly true for the extremely numerous Latin models. But since the leading churchmen were versed in Latin from an early date, independent creations and borrowings must have taken place, even where parallels in other languages exist. Thus *oblata* is attested beside WN *ofláta*, EN *ofláte* (AS *oflæte*), and the occasional instances of *trakt(e)r* = *tractus* in Norw. and Sw. do not have to be related to each other or to MDu. *tract*. It is the same with the frequently adopted Lat. designations of rank such as *prior*, *abbatissa* (assimilated as *abbadis*), attested in skaldic poetry from the 12th and 13th c., and occasionally in prose, or the inflected forms of *crux*; in the latter forms the root-final *s*, as in ON *krussa*, may point to the Continent (MDu. *cruse* beside *cruce*, but attested in Man already in the 10th c.), while the masc. dat. *kruzi* may derive from rare AS *cruc* masc. or be a product of analogy with *galgi*. The early loanword for 'bless' in all other Germanic languages (e. g. MLG *segenen*) is based on the Vulgar Lat. form with lowered *i*; only Nord. *signa* is based on the classical form *signare* (already in Egill, Eddaic; EN in the Viking Period). *Prímssigna* 'drive out paganism through exorcism and the sign of the cross', from *primum signum*, is a purely Nord. creation that was subsequently borrowed into ME. Isolated translator's forms such as *langhyggja* = *longanimitas* or *yfirligr* = *supernus* were no doubt constructed directly on the basis of the source text. In light of the large number of loan formations in which Lat. *con-* is represented by *sam-*, it may not be necessary to derive WN *samvizka*, EN *samvit(i)* = *conscientia*, which was created in the 13th c. after various earlier translation attempts, from Cont. models such as OHG *gewizzanī* and MLG *gewēten* (Dan. *samvittighed* on the other hand, beside *samvit*, stems from MLG *samwitticheit*). As with the concept of conscience, which was foreign to them, the Germanic peoples also had difficulties with the *incarnatio*, as circumlocutions show; here WN found its own elegant solution, *holdgan* (also Mod. Icel.).

3.2. The basic terminology of Christianity had been taken over by the Germanic peoples at the time of the first contacts: the central terms for the transcendent Persons, for the organization of the Church, and for the distinction

between Christians and unbelievers. They are found everywhere in Germanic-speaking territory, thus also in South German and to a large extent in Gothic. In the Nordic countries they are among the earliest attested words; they were highly productive in the formation of new terms and have survived up to the present. Their route northward can be reconstructed only in exceptional cases.

For *Deus*, the non-specific *goð* was borrowed from the pagan pantheon, etymologically either the being that is invoked or that is sacrificed to. Egill already knew the Christian-inspired word *goðheimr*. In Christian usage *goð* is masculine, without substitution of the nominative ending; with few exceptions, the original neuter gender (often in the plural) now designates false gods. In WN, the gradual introduction of the EN form *guð* for *Deus* led to a further differentiation. For God as Lord, old words for rulers were employed, such as *dróttinn*. Later, AS poetry borrowed *hearra*, *hærra* (on the model of *senior*) from OSx., which reached West Scandinavia early on as *harri* but was then replaced by Cont. *herra*. The Romance word for ‘Christian’ is borrowed from the Franks (*kristinn*); the unbaptized are designated by the etymologically disputed WN word *heiðinn*, either a calque on *paganus* developed in early urban Christianity or a corruption of ἔθνος spread by the Goths. The basic vocabulary also included *angelus* = *engill* and *diabolus* = WN *djöfull*, EN *diävul*, OSx. *diūbal*, AS *dēofol*, in which the form of the borrowings was modified by renewed reference to the Lat. source word. In the 4/5th c. the word *κυρι(α)κόν* ‘(house) of the Lord’ was borrowed from the Greek form of Christianity still being practised in Trier or Lyon at that time. Phonetic considerations (palatalization of *k*, the presence of *y*, also broken to *iu* in Sw.) indicate that *kirkja*, *kyrkja* derive from AS *cir(i)ce*, *cyrce*. Southern Vulgar Lat. **(e)bescobo*, which was not only used for the high official, was borrowed by the pre-Franconian period; the Anglo-Saxons had already borrowed *bisc(e)op* on the Continent. WN *biskup*, EN *biskup(er)* can have reached the Nordic countries from various sources. More specialized terms point to England: WN *ljóð-biskup*, EN *lypbiskuper* (AS *lēodbisceop*) = *suffraganeus*; *erkibiskup* (AS *arce-|ercebiscop* vs. southern *erzi-*); WN *biskopa* = *confirmare* (AS *bisceopian*). The same holds true for other early loans: *munkr* = Vulgar Lat. *monicus* (AS *munuc*, Cont. *monk*, *munk*), but WN *munklif(i)* from AS *munclif*; WN *mynstr*, EN *mönster* =

monasterium, used for various religious buildings, WN *mustari* perhaps from Fr. *mustier*; and *prestr* = *presbyter*, Vulgar Lat. *prestr(e)*, AS *prēost* (*ēo* should have yielded *jó*), Cont. mostly with root-*r*, which, however, can be taken for a nominative marker (Halldór Halldórsson 1969, 122).

3.3. Early secular poetry already betrayed a considerable influence from the mixed Nord.-AS culture of the Danelaw (Hofmann 1955). Some Nord.-AS isoglosses in religious vocabulary probably stem from innovations in the Danelaw, e.g. (*kirkju*-)*sókn*, AS *ciricsōcn* for ‘churchgoing’ (on the model of legal terminology), later for *parochia* (Mod.Icel. *sókn*, Nyno. *sokn*, Dan. and Bm. *sogn*, Sw. *socken*). In Sweden, some AS borrowings reached only areas along the Norwegian border or were displaced by southern words. There is no reliable evidence for AS borrowings into Sweden via Denmark. AS words in this group include the names of important Christian holidays, except for Easter and Pentecost, terms for certain liturgical acts, and specialized words such as *rúmaskattr* (AS *römgesceot*, ME *rōmescot* ‘Peter’s pence’, probably transmitted by the English cardinal Nicholas Breakspeare in the mid-12th c. and designated expressly as an English word). Almost all of them are old, most attested before 1250, and remain in use today. The direction of borrowing is not always absolutely certain, however. WN *postuli* for *apostolus*, for example, is always traced back to AS *postol*, and the numerous Nord. attestations are supposed to prove that in England the only sparsely attested word was common in the spoken language (MacGillivray 1902, 40); but borrowing into AS is also conceivable, or both languages could have borrowed the word from the south or from colloquial Church Latin independently of one another (see Frings 1966, 18; Müller-Frings 1968, 92). In the Nordic countries the *albae* of baptismal candidates are treated as a characteristic sign of Christianity: *hvítaváðir* in Sw. runic inscriptions of the Viking Period, WN *Hvíta-Kristr*. It is therefore logical to derive ME *hwītesun(n)e dei*, first attested in the 12th c. as an alternative to the older *pentecosten*, from WN. In EN, following Cont. models, the word designates the first Sunday after Easter or the first Sunday in Lent.

Some examples of AS influence are:

Holidays: *dies natalis*: originally pagan AS *gēol*, WN *jól*, EN *jul*, beside it the rare Cont. form *náttin helga*; – *purificatio B. Mariae Virginis*, *missa candelarum*:

AS *candelmesse*, WN, EN *kyndil(s)messa* after *kyndill* 'torch'; AS *mæsse* already on the Continent from the Vulgar Lat. form with lowered *i*, while other early Cont. vernaculars have only *missa*; Dan. has southern *missæ* beside *mæssæ*; – *dies viridium* (Maundy Thursday; the baptismal candidates' day): ME *skērepursdai*, WN *skirdagr*, *skirþórsdagr*, EN *skárdagher*, *skär(a)þórsdagher*, either a loan into English or an innovation during the Danelaw (Thors 1957, 340); – *dies parasceues, passionis*: AS *langafrīgedæg*, WN *langafrjádagr*, Sw. *langafréadagher*, Dan. *langfredag*; – *dies ascensionis*: AS *hálga þunresdæg*, Nord. *helgi þórsdagr* (WN also *uppstigningardagr*, AS *úpstígan*, EN mostly Cont. *upfara*), EN later displaced by Cont. *himilsfärdh*; – *ieiunia quattuor temporum*: AS *ymbrendagas*, WN *ymbrudagar* EN *imberdagher*, beside Cont. *tämperdagher*.

Church services: AS *blētsian* = *benedicere, ordinare, consecrare* (originally from the [blood] sacrifice), *blētsung*, WN *blētsa* = *benedicere, blēzing, blezan*; Sw. only archaic, not in Dan.; – AS *hūsl*, the old word for the sacrifice used for the Eucharist, WN *hūsl*, *hunsl*, in Sw. only older and western; – AS *scrift* = *confessio, poenitentia*, WN and EN *skript*, also in Nord. compounds and derivations, such as *skripta*; – AS *calic, cælic, calc* = *calix*, WN *kalkr* already Eddaic, EN in early secular usage as *kalker*, later WN *kaleker* in both sacred and profane usage; – AS *rēcels* = *incensum*, WN *reykelsi*, EN *rökilse*; – the extended system of godparenthood, *cognatio spiritualis*: AS *godfæder, godmóðor*, Nord. *godfaðir* (before 1000), *guðmóðir, -sifjar* etc.; – AS *bēn* = *oratio*, Nord. *bæn*.

AS influence exclusively on WN: AS *ðrin(n)es* = *trinitas*, WN *þrenning*, EN on the Cont. model *thräfaldoghet*; – AS *ræðing* = *lectio, ræðingbōc* = *lectionarium*, WN *ræðingr, ræðingabók*, later *lektia* on the Cont. model, as EN *läkza*; – AS *antefn*, WN *antefna, antemna*, EN only *antiphona* (also with Sw. inflection); – AS *forerynel* = *praecursor*, WN *fyrir-/forrennari*, EN *forelöpare* on the Cont. model.

3.4. Frequently it cannot be determined whether a Nord. word was influenced from the west or the south (cf. 3.2.). The Anglo-Saxon mission, which was relatively tolerant of pagan vocabulary, replaced *wih* even on the Continent with *hālig* (WN *heilagr*, EN *hēlagher*) corresponding to *sanctus, sacer*, originally probably 'inviolable', but which was already in religious usage in pagan times; the word became the base of many Nord. derivations, some exclusively dialectal. The Christian reinterpretation of *fasta* 'fast', often attributed to the Goths, is in any case attested everywhere in the Germanic-speaking territory, as is *tiðir* for the *horae canonicae*, later for church services in general. Due to their being restricted to WN, it would seem logical to derive words like *guðspjall, -spell* (AS *god-*

spel, reinterpreted from *gōðspel* = *bona annuntiatio*) or *gjöf, gípt(a)* in the sense of *gratia* (AS *giefu*) from their English cognates, but the Anglo-Saxons introduced them to the northern Continent as well. The direction of borrowing is completely obscure in the case of *offer, offra*, attested in all Nordic countries, a "northwestern" word based on *offerre* as opposed to HG *opfern* from *operari* (Frings 1966, 42; Müller-Frings 1968, 340 ff.); AS has only the verb *offrian* and its derivative *offrung*. The concept of 'humilitas' was difficult to grasp. Of the various WN translation attempts, *litillæti, litillátr* was the most successful until *auðmjúkr* was created in the 13th c. This corresponds to EN *öpmjúker*, AS *ēaðmōd* (with wider meanings), but also to Cont. *ōdmōdi*, a borrowing from AS which competed with **thiomōti* in German. Both routes of borrowing are possible. The south is definitely the source of EN *barmhertogher*; WN *aumhartaðr*, too, more likely stems from German *armaherz* (*miseri-cors*; see Frings 1966, 26) than from the unsuccessful AS coinage *earmheort*. The synonyms for 'redemption' and 'Redeemer' show how the Nord. languages were receptive to influences of different kinds which they then developed independently. Redemption was understood in the Middle Ages as a legal buying-back, *red-emptio*. In the south, as in England, words for ransoming and liberating were thus enriched with a specifically Christian meaning: OSx. (*a*)*lōsian*, MLG *er-/vorlösen, (vor)lösere, vorlösinge*, AS *ālīesan, ālīesend, ālīesing* etc. WN preferred *lausn*, also *aflausn* ([*af*] *lausn synda* also for *indulgentia peccatorum, absolutio*), *leysa, lausnari*. Sw. *lösn* is an archaism, while *atirlösn, atirlösa* (inseparable), *atirlösare* reproduce the Lat. more exactly; *aflösn* = *absolutio* has the corresponding verb *aflösa*, Dan. *genlösere, genlösning*. Slavish imitations such as *aptrkaup* are rare in WN. In EN a different word for *liberare* dominates in Christian contexts: *frälsa*, along with *frälsare*, which plays only a minor role in WN and AS. The second important semantic field is Christ as healer, *inn hæsti læknir, salvum facere* = *gera heilan*, AS *hāl dōn*. AS *hālend* = *salvator* pushed competing translations on the Continent aside. Older texts in Sw. have *hēlare*, unattested in WN; *heilsa, hālsa* '(good) health' in the borrowed sense 'redemption, eternal salvation' on the model of *salus (til ælifrar heilso = ad perpetuam salutem)* is attested relatively early, though not often, and WN has *heilsari*, EN *hālsare*. The principal word for *salvator* in

WN, however, is the exclusively WN word *græðari*. As *auxiliator*, *adiutor*, Christ is referred to as in other languages as EN *hiälpare*, WN *hjalpari*, *hjalpandi*, from the verb *hjalpa*, attested in a religious sense already in the Viking Period runic inscriptions but probably not borrowed; WN *fulltingjari* is rarer. The search for a specific donor language also remains moot in cases in which imitation of the Lat. form is likely (see 3.1.), e. g. the various similar translations of *omnipotens* or *tiund* = *decima*.

3.5. Because of their close genetic affinity and mutual contact, and because the written record is fragmentary and starts late, the languages of the northern Continent are best treated together as Cont. In the area of Christian vocabulary, for example, none of the much discussed Frisian loanwords have proved indisputable (Ahlsson 1987). The sparse skaldic fragments before the year 1000 only demonstrate contact with England. For the following fifty years, however, southern sources can be proved for some words in WN and in EN runic inscriptions and are likely for others. In 1032 Þórarinn loftunga, associated with the Danish court in England, used *kerti*, which is not attested in AS and Sw., *altári* (in AS usually *wigbed*, *wēofod*; the translator's word *alter* is not established until ME), and *klokka* (see 3.1.). The northern Continent is also the source of Sighvat's *páskar* (1016; Sw. already in the Old Västergötland law), a loanword that Cologne successfully asserted against AS *ēastron* (HG *Ostern*; see Frings 1966, 38; Müller-Frings 1968, 361 ff.). The concept of sin was expressed in both poetry and prose by numerous words for guilt and offense (*culpa*, *crimen*). The etymology of *synð*, *synd* is uncertain (see Walter 1976, 84 ff.), though it is probably linked with OSx. *sundea* (AS *sym*); first used (in the negative *syn-dalauss*) about St. Olaf, it is attested in EN runic inscriptions and later formed the base of numerous compounds and derivations. The old WN word *likn* took on first the Christian and secular sense 'reconciliation, forgiveness', then that of *gratia* in general, after the model of LG (*líkenen* 'reconcile, settle'); in EN it had only the sense 'image, form', perhaps also 'mercy' in runic *lík(n)hūs*. The ultimately HG word *náða* appeared early in the sense of *misereri* in EN runic inscriptions, but in WN only after 1250, and was popular in the Late Middle Ages; *fyrir-/forgefa*, on the other hand, attested in runic inscriptions and WN prose before 1250, can point to England (AS

forgefan in the borrowed sense of *ignoscere*); on *siäl* see 3.7. The first clearly southern word for a Church official is WN *páfi*, attested from the beginning of the 12th c. (OSx. *pāvos*, which lost its grecizing *-s* when assimilated to Nord. morphology); it is unclear whether Ari's designation *papar* for the Irish anchorites in Iceland reflects a Celtic word or the use of MLG *pāpe* for ordinary clergy, occasionally attested in late medieval Sweden (on the Cont. distribution see Müller-Frings 1968, 355 f.).

An increase in southern influence is evident in the surviving pre-1250 WN prose and even more strongly after 1250. The older layer includes the legal term *bann* in the sense of *excommunicatio* (Sw. distinguished further between *excommunicatio maior* and *minor* as *ban* and *forbudh*, WN *forboð*); *aflát* = *indulgentia*; *upnuming*, Sw. *uptakelse* = *assumptio*; *sönghús*, EN *sanghus* 'small church' and 'choir'. *Ölmusa*, Sw. *almosa* = *ele(i)mosyna* derives from OSx. *al(e)mosa* (see Müller-Frings 1968, 88 f.); Dan. has also *almisse* from LG, while in AS a learned form *alimosina* developed into *ælmesse* colloquially. In the later period of transmission, WN *ferma* = *confirmare* (MLG *vermen*) appears beside *biskopa* from AS, attested early in EN. Further examples of this layer are *lektari* = *lectorium* (MLG *lekter*); *líða* in the sense of *pati*; EN *vastelaven*, WN sporadically *föstulavent* (MLG *vastelavent*); *leikr*, *lēker* = *laicus* as opposed to the clergy: *lærðr sem leikr*. The more frequent use of Lat. terms, as well, may be due to southern influence.

In the EN area, LG influence on the religious vocabulary is much more extensive. While AS created *fulwian*, *fulwiht* for *baptizare*, *baptisma* (occasionally *dyppan*, *deppen* 'dip' = *tingere*, like *deypa*, *dexfa* in WN laws), WN alone (though in conformity with Church doctrine: *abluere crimina*) adopted the legal term *skíra* 'purify' and created *skírn* even before the year 1000. In the east, *döpa* (OSx. *dōpian*), *dōp* (OSx. *dōpi*), more commonly *dōpilsa* (OSx. *dōpisli*, LG *dōpsel*) predominate from the start. OSx. (*thie*) *hēlagon* (WN *helgir*) becomes *hālghon*, first in the plural (WN occasionally has *helgonamessa* from Sw.). Other exclusively EN loanwords are *nödhiälpare*, *kättare* (rarer *villoman* like WN *villumadr*: heresy as error), *míðhlare*, *máðhlidning*, *predikostol* (MLG *predikstol*), *stift* for diocese (MLG *sticht* < *stift[e]*) beside *biskopsdöme* (like WN *biskupsdæmi* on the model of AS), names of feast days such as *hálgha líkama dagher*, *nyarsdagher*. Thanks to Birgitta's example, late medieval Sw. and, later, Dan.

texts are much richer in the vocabulary of mysticism. These terms usually reflect their Lat. sources directly, though some have older Cont. analogues or appear in translations of vernacular literature. The mystic texts translated in the west were generally intended more to educate and edify than to report personal experiences. West and east share the translation of *visio* as *sýn*, *revelatio* as *vitran* ('information', an archaism in EN), *contemplatio* as *upplitning*, and both seem independently to have translated *inspiratio* as *iblástr*, EN more frequently *inblasilse*. Exclusively WN are *leizla* 'vision' (*leiða i andarsýn*) and *birting* for *illuminatio*; EN has *opinbara* (only secular in WN), *opinbarilse*. *Meditari*, *contemplari* are expressed by reinterpreting native words or borrowing foreign ones such as *þánkia*, *hugha*, *skodha*, *betrakta*, for 'ecstasy' (*up*)*kippa*; the soul, not the Church, as *bruþ* of Christ. Following Church Lat. models, the west was more concerned with the allegorical interpretation of material phenomena (*merkja*, *tákna*, *jarteina* = *significare*) and with typology: *fyrirmerking*, (*fyrir*-)*mynd(an)* = *typus*, also *figúra* as a loanword, *fyrirmerkja*, *-greina*, *mynda* = *praefigurare*.

3.6. The Scandinavians were converted at a time when Christian terminology was already established in the other Germanic languages. Nonce formations are thus much rarer than in the tentative OHG experiments, for example, which first had to compete for survival. Yet despite the common bond of the Nordic linguistic community, the product of a shared heritage, parallel avenues of influence, and inter-Nordic exchange, special features do exist. The west was often freer and more independent in word formation and drew on its own legal and poetic traditions, e. g. in the numerous synonyms for 'sin' (such as *grand*, *glæpr*, and – shared with EN – *mein*, *sök*) and 'pride' (*ofbeldi*, *ofstopi*, [*of*] *metnaðr*, *dramb*). More attention has recently been paid to early southern influence, without, however, denying the importance of the AS mission (Halldór Halldórsson 1969 for WN, Hellberg 1986 for EN). Reliable statistics are not possible due to the high number of indeterminate cases, but estimates can be made. Thors identifies in his summary (628 ff.) the donor languages for the ca. 350 most important EN words: at least 56 per cent have Cont. sources, 20 per cent or so are from AS (including especially old and central words), less than 10 per cent from Lat., 14 per cent indeterminate. My recalculation

based on a corpus almost one-third larger and of somewhat different composition produced similar results, except that I judged the number of indeterminate cases to be somewhat higher and identified a correspondingly smaller quota of clear southern influence; even so, the latter still ran to over 50 per cent. The loanwords of the Old Västergötland law analysed by Ahldén (1945) include 28 religious terms; according to him, 6 are not identifiable with certainty, although they are probably LG, 1 is Lat. (*kapæ*), 12 Cont., and 9 AS/ME. In WN, I rate the quota of indeterminate cases very much higher; among the other categories, AS influence clearly outweighs that of the Continent.

3.7. Exclusively Nordic innovations are relatively rare (for WN see also 3.1., 3.5.). One class consists of native words that had been unique to the Nordic countries at the time of conversion and were then adapted to Christian usage. *Freista*, *fresta* took on the meaning of *tentare*, *sýkn* 'time in which litigation is permitted' became 'workday free of religious strictures', *jarteikn* 'mark' became 'miracle' (*signum*), also 'deeper meaning'; *anger* 'sorrow' in the sense of 'repentance' is exclusively EN. For *virtus*, EN had only *dygþ*, which was not used in WN until relatively late; WN attests more variation but primarily used *kraptr* for the various meanings of *virtus*, probably due to AS influence, alongside (*mann*)*kostr*, *dáð*, *dugnaðr* and other words (Tveitane 1968, 96 ff.). Another class consists of new formations, some destined for secular as well as religious usage. Unique to EN is *hughsvala* ('cool the mind'), *hughsvolare* = *consolare*, *paracletus*, where WN has *hugga*, *huggare*; unique to WN is *skur(ð)goð* for *sculptile* (cf. AS *græft*[*geweorc*], EN *skyrð* in the Pentateuch paraphrase influenced by WN). Common to all Nordic countries are WN *iðrask*, EN *idhra* 'repent', WN *iðran*, EN *íþroghe* (probably from *iðr* 'viscera'), *miskunn* for *indulgentia*, *misericordia*, also *compassio* (*miss* + **kunþi*, influenced by *ignoscere*) and *dymbildagar* 'quiet days before Easter' (bells were rung with wooden mallets). The Nordic countries are also at least relatively independent in their forms for the fundamental concepts *fides* in the sense of 'conviction' (beside *siðr*, see 2.1.) and *spiritus*. On the Continent and in England the Gmc word *galaubjan* 'become familiar', attested in Gothic, established itself in the sense of *credere*, as a substantive OSx. *gilōbo*, AS (*ge*)*lēafa*, beside OSx. *trūon* ('put

one's faith in', on the model of *fides*), *treuwa*, AS *trēowan*, *trēow*. Since *leyfa* 'praise' was unsuitable, the Scandinavians chose *trú*, *trúa* (*trúa á, í* after *credere in*; Ljungberg 1947, 151 ff., Thors 1957, 474 ff.), which remains unique to the Nordic countries today. On the Continent, the AS mission prevailed with (*hālig*) *gāst* (originally probably 'ecstasy') for *spiritus* (*sanctus*) over southern *ātum*. During the mission period in the Nordic countries, the word *andi* 'breath' – really more suitable – was chosen for all senses of *spiritus* except for 'wind'. Lat. *anima*, *animus* and *mens* (preferred in the Roman liturgy) as opposed to *corpus* were expressed by Nord. *önd*, the soul returning to God to be judged by him, also the thinking, feeling, and willing life-principle; a further word, *hugr*, the old term for 'mind' with emphasis on character, predominated in the Homily Books as in the Heliand. Before high scholasticism, these concepts were seldom distinguished precisely (Angenendt 1997, 257 ff.); *andi* and *and* are thus interchangeable, especially in the prayer formulas of the Viking Period runic inscriptions. Since the eternal soul is conceived of as distinct from the body, the conception of death shifts to a 'going over' or a 'breathing out of the soul' (*exspirare*, *animam ponere*). By the early 11th c., WN developed *andask*, later *láta önd* and *sálask* (cf. AS poetic *gāstgedal*, *gāstlēas*). The word 'soul', as well, unattested in the pre-Christian Nordic countries, was taken over already in the conversion period via the typical paths of influence: WN *sál* from AS *sāwol*, in 10th c. Man already *sāla* (more likely from the inflected form *sāwle* than OLG influence), EN usually *siala* from Cont. *seola*, *siala*, but on runestones in present-day Sweden and later in Dan. texts frequently *sāl(a)* and similar forms, Dan. and Sw. later also *sæl* from LG *sēle*.

4. Types of borrowing

The ways a language can express borrowed semantic content have been classified by Betz and Haugen, whose systems agree on all important points; this classification can be expanded or modified according to the type of language contact involved (see Schottmann 1977). In the semantic loan (loanshift extension, Lehnbedeutung), a native word takes on a new (nuance of) meaning: words for 'enemy' used for the *hostis antiquus*, *mildr* for *pious*, *upptimbran* for *aedificatio*. Loanwords (Lehnwörter) borrow both their meaning and their phonetic shape from the source language, but

are adapted in their phonetics and morphology to a varying extent: Sw. *biskuper*, *lektari* from MLG *lekter*, EN *orgha* from an incorrect analysis (suffixed article) of MLG *organ*. Borrowing often reduces the semantic range of the foreign word (see *bletsa*, 3.3.) or reinterprets it: *helviti* 'Hell' in contrast with pagan *hel*, AS and Cont. 'punishment of Hell'; *aldarfaðir* for the Old Testament patriarch from AS *eald-fæder* 'ancestor'. A transparent compound or derivation may be translated exactly in a loan translation (Lehnübersetzung) such as *consentire* appearing as *samþykkja*, or more freely in a loan rendering (Lehnübertragung) such as *aequitas* becoming *jafngirni*; since the distinction is not always clear-cut, I shall refer to both as loan formations (Lehnformung). A relatively rare type is the loan creation (Lehnschöpfung), which is based only vaguely on a formal model or not at all (examples in 3.6.). Some borrowings are merely experimental attempts at translation; many remain dialectal. On the other hand, foreign influence is not restricted to individual words: whole phrases could be translated (*göra iðran = poenitentiam facere*), and the so-called "florid" style used Lat. syntactic and rhetorical devices in its striving for an indigenous artistic prose.

If one tries to reconstruct the original contact phenomena from a relatively late and fragmentary textual record, the assignment of words to one of the types of the model summarized here proves in many cases to be uncertain. Formal correspondences can be coincidental, and the age of a word is often impossible to determine. Is *leiðrétta* a loan creation for *convertere* (Walter 1976, 117) which was later used in a more general sense, or is the religious usage a semantic loan? Is *algerr* a loan formation based on *perfectus*, or is its application to human beings and abstractions a semantic loan? Moreover, in the dynamic situation of direct contact between closely related languages, a loan translation cannot be clearly distinguished from the direct borrowing of a loanword. Sometimes it is advisable to assume the borrowing of a homonymous loanword or a loan translation instead of a semantic loan: *lidha* (a weak verb in WN) for *pati*, *standa saman* for *constare*. Allowing for the inevitable margin of error, it is possible to draw certain conclusions from the statistical distribution of the main types. In the oldest texts, the Viking Period runic inscriptions and skaldic poetry up to about 1150, semantic loans predominate with roughly half of all borrowings, while loan forma-

tions play only a minor role at about 10 per cent. In WN prose up to 1250, which faced the task of rendering abstractions, the proportion of loan formations rises to over one-third, and new semantic loans amount to just under 30 per cent. In the following period of the textual record, semantic loans drop to less than 10 per cent, since the Christianization of native vocabulary was more or less complete, while the proportion of loanwords rises above 50 per cent due to the rendering of specialized ecclesiastical terminology. The WN prose corpus as a whole shows little difference from Sw.: in the east the proportion of loanwords is slightly higher, at just under one-third, while loan formations are 7 per cent more numerous at just under 40 per cent. Comparative analysis of other Germanic languages shows that the proportion of semantic loans is generally much higher and that of loanwords correspondingly lower. This is because words that the Scandinavians borrowed from their Germanic neighbours directly as loanwords had already been assimilated to Gmc in these languages as loan formations or semantic loans.

46. Nordic language history and religion/ecclesiastical history III: Luther's Reformation

1. The context of the Reformation
2. Translations of the Bible in Denmark and Sweden
3. The language of the Bible translations – a comparison
4. Other religious literature in the initial phase
5. Later religious literature
6. Literature (a selection)

1. The context of the Reformation

As a result of the Reformation, the national languages in Scandinavia acquired a new and important functional domain when they were raised to the same high position in the religious sphere that they had previously enjoyed in the judicial and administrative spheres. Although monks and nuns had written some religious literature in their own vernacular, the language of worship in the Catholic Church was Latin, and the sanctioned translation of the Bible was the Latin Vulgate. A factor of great significance for the spread of the religious message was that the reformers were able to take advantage of the revolutionary aid afforded by the printing press, and religious texts were also to make up the majority of all the printed texts in the Nordic countries throughout the 16th and 17th centuries.

Of particular importance were the translations of the Bible which were quickly produced and printed in Danish and Swedish. The monumental Bibles (the Swedish one in 1541, the Danish in 1550, and the Icelandic in 1584) crowned the extensive work of biblical translation which had been started in the 1520s by the representatives of the Reformation. The language in the complete Bibles (those containing both the Old and New Testament) was to serve as a national standard for a long time to come. Other religious literature – catechisms, collections of sermons, prayer books and other devotional manuals, hymn books, etc. – was published in the vernacular languages to make it easier for the clergy to hold divine service according to the new model, and particularly to spread the doctrine of the Reformation. A number of polemical writings for and against the Reformation were also spread, chiefly during the years immediately before and after 1530, which encompassed the real breakthrough of the Reformation.

1.1. Roots in humanism

The success of the Reformation was due in large part to the crucial influence of Erasmus of Rotterdam, the prime representative of humanism in Northern Europe. He applied his main criteria, "ad fontes" [back to the sources], not just to the works of the classical Greek writers but also to the Bible. His edition of the New Testament in 1516, with the Greek text and Latin translation, differed in several respects from the Vulgate, and therefore helped to shake the faith in the Catholic Church and the Pope. Erasmus himself was, however, a devoted Catholic and an opponent of Protestantism; for him humanism was scholarly philology, not religion. Erasmus was nevertheless in several respects a predecessor and a model for many of the reformers. He was a great popularizer. His Latin was a living and supple everyday language, and it has been said that he used the printed book as a modern columnist uses the newspaper.

Many of those who led the intellectual debate for and against the new Lutheran movement, above all in Denmark, had their roots in the Erasmian variant of humanism. From humanism and reformist Catholicism it was but a short step to Luther's teachings, in which the Bible, the original text, was ranked above the exegeses and ceremonies of later times. The popular approach and the conviction that ordinary people could understand the gospel if only it was preached in their own language was also fully in line with Erasmus' humanism. And just like Erasmus, the reformers made frequent use of the printing press to spread their message.

1.2. Channels of diffusion

New ideas and currents were mainly spread by the Nordic students who completed and pursued their studies at foreign universities. As regards humanism, the stimulus came mainly from the universities in Paris and Louvain. Several of the Danish biblical translators were among those who studied there. Christiern Pedersen, for example, matriculated from the University of Paris in 1508, while Hans Tausen and Christiern Vinter studied in Louvain, where Erasmus himself lived from 1517 to 1521. These Nordic schol-

ars all started with humanism and then moved on to Lutheranism.

For Nordic students, however, the most important channel for Luther's ideas was the German universities. As regards ideas and culture, Scandinavia had long had close ties to Germany. The most important place for contacts with the new religious currents was of course Luther's own Wittenberg, where the Swedish reformer Olaus Petri, for example, was studying in the very year when Luther nailed up his theses. It was a natural consequence that several students should be deeply affected by the new teachings and help to spread them on their return home. For Denmark, the geographical proximity to Germany also meant that the ideas from that source could be spread quickly and directly outside student circles as well. It is not surprising, then, that the new currents, both humanism and the Reformation, quickly gained followers among the young Nordic students who were at the very centre of events. What is surprising, on the other hand, is that Luther's doctrine, mainly passed on by enthusiastic young students, was able to threaten and in less than a decade break down the power of Catholicism and the papacy in the Nordic countries. A contributory factor here was the political situation.

1.3. The political situation

The 1520s was a crucial period for the development of political and religious life in the Nordic countries in the ensuing centuries. In political terms, the decade saw the break-up of the Kalmar Union of the three countries into a Swedish kingdom and a Danish-Norwegian kingdom. This encouraged national sentiment above all in Sweden, where it became of great importance to emphasize one's independence from the former Union partners, especially as regards language. The fact that they still carefully observed developments in each other's countries, despite the dissolution of the Union, is evident particularly from the contemporary religious debate. In Denmark the decade saw a divisive struggle for the throne, a contest in which religion also played a major part. King Christiern II, who was deposed as king of Sweden after the Stockholm Bloodbath, was also expelled from Denmark in 1523, to be succeeded by Frederik I. A long time was to pass, however, before Christiern II completely gave up hope of regaining his position in Denmark. In Sweden,

on the other hand, the newly elected Gustav Vasa sat securely on the throne with no serious rivals.

For the monarchs of both Denmark and Sweden it was clear at an early stage that the doctrine of the Reformation was an excellent aid in maintaining the rights of the nation state including those of its ruler. Thanks to the Reformation, the riches of the church and the monasteries would fall to the state, which was no longer subject to the power of the Pope. At the same time, the new doctrine suited the emerging middle class, with its rejection of conservative authorities and its democratic content: God's message should not be confined to the learned but should be given to everyone. There was a distinct difference here, however, between the situation in Denmark and that in Sweden. It was only in Denmark that the Reformation received powerful support from the middle class, whereas the supporters of the new doctrine in Sweden chiefly consisted of younger theologians educated in Germany and German citizens who had moved to Sweden.

King Christiern II had shown his sympathy for the Reformation early on, one example being his summoning of theologians from Wittenberg to Copenhagen. One of the charges that the rebels, among them four Catholic bishops, levelled against him was in fact his relationship with Luther's supporters. His successor, on ascending the throne, therefore had to pledge not to allow any heretic or Lutheran to preach against the Pope. Instead, many Lutheran supporters followed Christiern into exile, and a band of ardent Lutherans established itself around him. At home in Denmark, on the other hand, the Catholic clergy managed to win the backing of the Council of the Realm and the nobility for a general ban on importing not only Luther's own writings but also those of his supporters, and for a short period also a ban on translating the Bible into Danish.

It was not until 1526, however, that a real Lutheran party arose in Denmark. This happened in the circle around Hans Tausen, who was then successfully preaching the Lutheran doctrine in Viborg, a town which under his leadership was to be the centre of Danish Lutheranism for a few years. By 1529 the new doctrine had totally triumphed there, the mass was no longer given in Latin, monasteries and churches had been demolished, and the monks expelled. All this had been able to happen with the permission of King Frederik, who had al-

ready shown his sympathy for the Reformation at the diet of the nobles in 1527. In 1529 a training college for evangelical clergy was set up in Malmö, which thus replaced Viborg as the headquarters of the Danish Reformation. Finally, Lutheranism was officially recognized in 1536, and its external framework was established by the Church Ordinance of 1537, paradoxically written in Latin, but with an official Danish version in 1539. Whereas Denmark saw the emergence of widespread popular opinion in favour of Luther's doctrine, particularly among merchants and craftsmen, it did not attract the same support among the Swedish population. The introduction of the Reformation in Sweden, where Olaus Petri and Laurentius Andreae were the driving forces, took place faster and more quietly. When Gustav Vasa forced through the Reformation at the Diet of Västerås in 1527, it was mainly as a result of royal power politics.

2. Translations of the Bible in Denmark and Sweden

Full-scale work translating the Bible got under way quickly in both Denmark and Sweden. By far the most important thing for the Lutherans was to make the Bible available, primarily the New Testament, in Danish and Swedish. These texts were their most important instrument for spreading the new doctrine. The close bonds between the religious translation work and the prevailing political situation are particularly obvious from the fact that Danish became the ecclesiastical language in Norway, and both the Bible and other religious literature were available only in Danish and were printed in Denmark. Iceland, which also belonged to Denmark, nevertheless received its own translation, albeit not until 1584.

The following section presents, in chronological order, the earliest printed Nordic translations of the New Testament (into Danish in 1524 and 1529, into Swedish in 1526) and of the whole Bible (into Swedish in 1541 and into Danish in 1550).

2.1. *Thet Nøye testamenth paa danske*, 1524 (DNT24)

The first to translate the New Testament were the Danes from the circle of supporters around their banished king, who had obviously

ly nourished plans to initiate this work even before his exile. But the actual decision was not taken until his exile in Wittenberg, where Christiern was staying with a close friend of Luther's, and where he could experience at close hand how the citizens were seized by the new ideas. Since he saw the translation of the Bible as a way to regain the throne, it was important for him that the translation should appear as quickly as possible. It was printed in Wittenberg, but chiefly for political reasons the place of publication was stated as Leipzig. It was completed in August 1524, less than two years after Luther's first German translation, "the September Testament" of 1522. The men behind the translation were three of those who had accompanied the king into exile: Christiern Vinter, Hans Mikkelsen, and Henrik Smith. While Vinter based his part of the translation on Erasmus' text, using Luther's September edition in part, the reverse was the case for the two other translators. For them Luther was the main source, while Erasmus was used to a more limited extent (Molde 1950a).

From Wittenberg the new book was sent home to Denmark, where the reaction was one of indignation. Although the ban on translating the Bible into Danish had been rescinded, it was still forbidden to import heretical writings, and DNT24 could be viewed as such, since Mikkelsen had prefaced Paul's epistles with an open letter of his own, attacking the papacy and the opponents of King Christiern. The problem was solved by the removal of this leaf, which was distributed separately (see 4.1.).

The language of the translation attracted harsh criticism. The leading Danish advocate of the Catholic doctrine, Poul Helgesen (Paulus Helie), in his reply to Mikkelsen, described the language as neither German nor Danish and went on to write: "thet som effther Danscke maals natur oc ejjedom schulde staa fore, haffuer tw seth bag oc saa forwendt, ath thet er hwercken forstandelige athskild eller beqwemellige tilhobe kommet" [what should come first, in accordance with the nature and character of the Danish language, you have put last, and twisted it so much that it is neither comprehensibly separated nor suitably put together] (Helie 1932, 49). The criticism came not just from the opposition; even Lutherans agreed with it (cf. 2.3.). Another reason for the criticism of the language was that the three translators (one from Mors and two from Scania) wrote in their respective

dialects and according to their own orthographic patterns. As a result, the reader could encounter the same word in different forms, which was admittedly not uncommon in other contemporary texts. But although the language was not of the highest class and was not to influence later Bible translations, the new translation nevertheless meant a great deal. The target group was not the learned scholar but the common man. That the translators actually did reach this group is clear not least from Helgesen's letter, where we read:

Om tith breff en agtis aff een wforstandig almwe, som ere bryggere och bagere, smeder oc skredere, swdere oc remesnedere, bardscherre og badsthumend, kødmangere och fischkere, toldere och aagerkarle, prackere oc kremmere, oc anden saadan adill [even if your letter is esteemed by the foolish peasantry, who are brewers and bakers, blacksmiths and tailors, cobblers and belt-makers, barbers and bath-keepers, butchers and fishermen, customs men and farmers, salesmen and tradesmen, and other such nobility]. (Helie 1932, 115)

The work was probably printed in a relatively large edition, since quite a few copies survive today. Despite the great haste with which it was produced, the inconsistent orthography, and the "un-Danish" language, the translation was still a true pioneering work: the first printed Nordic translation of the entire New Testament.

2.2. *Thet Nyia Testamentit på Swensko*, 1526 (SNT26)

Whereas the Danish translation was done outside Denmark on the initiative of the exiled king and as part of a political power struggle, the corresponding work in Sweden was carried out entirely within the kingdom and with the full support of the reigning king. On the other hand, there is great uncertainty regarding who actually did the translation. On one point, however, history is completely clear. At the start of the summer of 1525, Archbishop Johannes Magnus sent a letter to the cathedral chapters and the most distinguished monasteries in which he announced that the king had commanded that the New Testament should be translated into Swedish, and the letter also contained a specification of the parts of the Bible that each recipient institution was to translate. The message was obviously received with mixed feelings. Bishop Brask of Linköping, for example, declared that other solutions should be sought, either tracing the transla-

tion that Saint Birgitta had initiated, or using the Danish translation of the gospels (apparently referring to Christiern Pedersen's *Jærtegnspostil* from 1515). The languages differed so little, he felt, that the Danish version could safely be used within the Swedish church. We have no information today as to how far the translation work actually progressed in the cathedral chapters.

In August 1526, however, a finished translation was presented in print: *Thet Nyia Testamentit på Swensko*. No translator is named, and there has been an at times intensive discussion of the direct responsibility for the translation and its exact distribution between different names (see the surveys in e.g. Lindqvist 1941; Ståhle 1970). The main candidates have been Olaus Petri and Laurentius Andreæ. The latter was described by Johannes Magnus as "Christi Euangelii corruptor" in his *Historia de omnibus Gothorum Suenomque regibus*, written in exile. From the current state of research, it seems perfectly clear that Laurentius Andreæ was responsible for the Preface and Olaus Petri for the Gospel of St. John. There are very strong reasons for believing that several people were involved in the work of translation. Adell (1936) has claimed that the translation was actually done in the cathedral chapters and the monasteries and that only the final editing and marginal explanations were the work of the reformers. This theory would better explain Johannes Magnus' wrath and choice of words, and also why Olaus Petri, who served in the diocese of Strängnäs, wrote precisely the part of the Bible that was entrusted to the cathedral chapter in Strängnäs.

The General Preface, *Itt almennelighet förspråk*, explains the purpose of the translation. It says that it was done so that

fatighe eenfåldughe prester som fögo latina kunna/ och oförfarne äro j scriffenne/ och teslikes andra christna menniskior som j book läsa kunna/ mågha här åt minsto haffua enfalleligha texten/ såsom han vthaff euangelisterna och apostlana scriffuen är [poor simple priests who know little Latin and are inexperienced in the scriptures/ and other similar Christian people who can read books/ may here at least have the plain text/ as it was written by the evangelists and apostles].

Just as in DNT24, the Preface also explains a number of words, the reason being that when the text was translated, there were not always equivalent words in Swedish to serve as suitable translations of the Latin and Greek words.

The Swedish translation was based on those of Erasmus and Luther (in that order), but there are also certain traces of the Vulgate and DNT24 (Sjögren 1949, 15f.). Naturally, the translators were also familiar with the religious literature produced in Vadstena Convent. In the spirit of Luther, the reformers wanted to achieve a popular language easily understood by the general public, while simultaneously being as close as possible to the original text. Contemporary language, especially in the towns, was greatly influenced by Low German, and this, together with the dependence on Luther's translation, meant that there were many Low German words in the translation, although the aim was a decidedly Swedish language. There appears to have been a greater ambition to avoid Danish rather than German influence.

By contemporary standards, the translation showed a surprising aspiration towards consistency in the external form of the language, although different parts employed a rather large number of variant spellings. The uniformity is greatest in the so-called "normal language" section, from Galatians onwards, and in the Preface. A striking new feature in SNT26 is the introduction of the letter type <å>, which was subsequently to persist in Swedish. The forms <ä> and <ö> were also used throughout (in the original variant with a diacritic <e>) instead of <æ> and <ø>. The unusual character of these letters is also evident from the note at the end of the errata, where we read:

Kan och henda ath flere stadz finnes förseedt warit besunnerligha medh the bokstaffuar å ä ö ath then ene står för then andra thz medh en ringa ting kan rettats. [It may also happen that in some places errors have been made, especially concerning the letters å ä ö so that one stands in the place of the other, which can easily be corrected].

The choice of these characters should probably be seen as a clear emphasis of Swedish nationality, establishing a distance from Danish. Another distinctively Swedish trait, just as in the language of Vadstena, is the use of spellings in *-a*, for instance in the infinitive form of verbs, even though forms in *-e*, as in Danish, were very common both in official written Swedish and in many dialects.

It was in orthography that SNT26 made its major contribution by returning to older patterns, chiefly the half-forgotten Vadstena orthography, and thereby halting tendencies towards dissolution. As regards syntax, however, the dependence on the Latin original is evident in the large number of un-Swedish participial constructions.

2.3. *Det Ny Testamente [...] paa reth Danske*, 1529 (DNT29)

In Christiern II's circle, work began at an early stage on a revision of DNT24, or rather a new translation. This was never completed, however, since another new translation, a one-man achievement, saw the light of day in August 1529. The man behind the work was Christiern Pedersen. He had been in Denmark when DNT24 appeared, and he could see for himself both how well the translation sold and how deficient it was in linguistic terms. He himself had produced a great deal of literature, such as the dictionary *Vocabularium ad usum Dacorum* in 1510 and the above-mentioned *Jærtegnspostil* in 1515. After being forced to leave Denmark, he fled to Christiern II, and the work must have been carried out nearby, although the ex-king himself did not mention it anywhere in his correspondence. No translator is named in the printed work, but particular phrasing in the Preface reveals that it was the author of the well-known *Jærtegnspostil* who had done the translation. In the second edition, which appeared just two years later, in 1531, it was clearly stated on the last page: "Her endis det Ny Testamente som er prentet i Andorp (oc rettet paa ny igen aff Christiern Pedersen som vaar Cannick i Lund)" [Here ends the New Testament which was printed in Antwerp (and newly corrected by Christiern Pedersen who was a canon in Lund)]. In the same year he also published his translation of the Psalms, *Dauidz psaltere*.

In his Preface, Christiern Pedersen expressed the hope that "hwer mand skall vel forstaa denne danske" [every man will easily understand this Danish], unlike the previous translation, which many could not understand (cf. Helgesen's criticism in 2.1.). His main source was the Vulgate, but he had also used the translations by Erasmus and Luther, and of course DNT24.

His language was strikingly modern, simple and uniform. Molde (1950b, 44) has described it as being a pure Danish that was rarely found in translations of the time. It was influenced by neither Latin nor German. The vocabulary was not particularly rich, but it was modern and without dialectal or archaizing features (cf. also Skautrup 1947, 216). Another characteristic was that he treated the basic text with more freedom than the other translators. He did follow the source text sentence by sentence, but he did not endeavour to follow it verbatim. Pedersen himself said in his preface

to the epistles of Paul: "Skulle ieg screffuit ord fra ord lige som det staar i latinen/ Da hagde der ingen dansk forstondet dansken rettelige." [If I had written word for word exactly what the Latin says, no Dane would have understood the Danish properly.]

Pedersen's work had enormous significance for the development of standard Danish. He has sometimes been called the founder of Danish literature, but Skautrup (1947, 176) considers that he can more rightly be called the founder of the Danish written standard. His orthography was not identical with what was to become the norm, but certainly formed its basis. It was the most consistently implemented orthography of the time, and it was spread both through his writings and those by other people which he revised and printed at the press that he operated in Malmö in the early 1530s. Several other important reformers, such as Hans Tausen and Peder Palladius, abandoned their older and relatively irregular orthography and adopted Pedersen's. This was also the orthography that was to be followed, with minor adjustments, in the translation of the whole Bible of 1550.

2.4. *Biblia, Thet är all then Helgha Scrifft, på Swensko, 1541 (SB41)*

While the Danes were the first to produce a printed version of the New Testament, the Swedes managed to print a translation of the whole Bible first. When SB41 left Richolff's presses in Uppsala, it was a work of tremendous significance for the history of the Swedish language. This Bible was to serve as the general linguistic standard for two centuries, and even longer as a standard for religious language. While it is true that the spelling of the translation was slightly modified in subsequent editions, no completely new translation appeared until 1917.

The leading force in the translation of the Bible was the Archbishop of Sweden, Laurentius Petri, although he had several assistants. These no doubt included his brother Olaus Petri and Laurentius Andreae, although their contribution at the final stage was limited by the trial at which they were both condemned to death; the penalty was, however, commuted to a fine. The main source was Luther's Bible of 1534, but other editions of his were also used. For the New Testament, SB41 was really only a revision of SNT26.

To a large extent, the translators continued along the lines drawn up in the "normal lan-

guage" section of SNT26. The orthography developed the same earlier model as SNT26, for example, with postvocalic <dh> and <gh> and the doubling of a vowel to mark length, but it went much further as regards consistency. In the inflection of words, SB41 was more archaic, often eliminating the more modern, colloquial forms used in SNT26. However, it was not always the older forms that were chosen in SB41, but those that best suited the inflectional system. Here too, then, the aspiration for uniformity is obvious. The vocabulary is often described as archaizing, although this is questioned by Sjögren (1949, 104f.), who thought that it should rather be described as conservative with support in contemporary living dialects. In several cases, however, as in SNT26, the language spoken in the capital was favoured, with German loanwords appearing at the expense of native equivalents, e. g. *begynna*, *förgäta*, and *ansikte* instead of *börja*, *glömma*, and *anlete* ['begin', 'forget', and 'face']. The main linguistic contribution concerned the syntax. Sentence structure was simplified by breaking up participial constructions taken from Latin; above all, there was a decline in the use of present participles that had been so numerous in SNT26. The aim was to achieve a natural Swedish word order, although German influence sometimes made itself felt in the placing of the finite verb at the end of subordinate clauses.

A characteristic feature of SB41 is that it uses all the devices of the language to achieve a solemn and dignified style. In his description of the language, Ståhle (1970, 35) says that it is not spoken language but a language suitable for being spoken, listened to, and remembered.

2.5. *Biblia/ Det er den gantske Hellige Scrifft/ vdsæt paa Danske, 1550 (DB50)*

After DNT29, besides Christiern Pedersen's translation of the Psalter in 1531, there also appeared a translation of the Pentateuch, produced by Hans Tausen in 1535. Skautrup (1947, 152) describes it as the distinctive early biblical translation, bold and powerful, popular and vivid. The vocabulary is rich, with only a few loanwords.

The entire Bible did not appear in Danish until 1550, and, like its counterpart in Sweden, it became the prime work in the language, setting the standard for a long time to come. The translation was officially the work of a five-

man commission led by Bishop Peder Palladius. In accordance with the king's express wish, Luther's Bible of 1545 was to be the model for the work of the commission. Christiern Pedersen, however, had already done a Danish translation of the Bible, which is mentioned in a written source in 1543. It is also clear from the accounts for DB50 that Pedersen received a certain sum "fore han wdschreff først bibellen" [because he first wrote out the Bible] (Skautrup 1947, 154). How close his version was to the final one cannot be determined today, since it is completely lost, but it probably served as the preliminary working material for the commission. Everything suggests, however, that Pedersen's translation underwent fairly significant changes when it was adjusted to conform with the Lutheran Bible of 1545, which was formerly considered to have been the only model (as e. g. by Skautrup 1947, 154). Molde (1949), however, has shown that DB50 deviates from it in several places, and that other sources were used instead (earlier Danish translations and SB41).

Since the German Bible was the main source, a relatively strong German influence could be expected in both the syntax and the lexicon, and there are indeed such cases, but DB50 is still surprisingly independent in its language. Part of the explanation for this may be that the Danish reformers had already created a Danish religious language in speech and writing which could also be used for the translation of the Old Testament. Mostly, however, it is almost certainly due to the influence of Pedersen's underlying text. Skautrup (1947, 210f. and 155f.) described DB50 as a homogeneous linguistic monument in every respect: orthographically, morphologically, lexically, and syntactically. It was the perfect expression of the printed standard chiefly created by Pedersen and already recognized as the norm. It was simple and uniform in orthography and decidedly Danish in its vocabulary, with only a few Germanisms and loanwords – and unlike SB41, it was completely without archaizing elements. It was a wholly contemporary language that was used.

3. The language of the Bible translations – a comparison

That the differences between the Nordic languages were still relatively small is suggested by Bishop Brask's proposal above that the Swedes should use the Danish gospel texts,

and by Laurentius Andreae's attempts to sell the remainder edition of SNT26 to Norway, and by the wording used by the Swedish Council of the Realm in a letter to its Danish counterpart in 1506: "wij ære alle eth twngomaal" [we are all one language] (Skautrup 1947, 36). During the Union, Danish had increasingly influenced Swedish and Norwegian, chiefly in the chanceries. It was not unusual to have Danish scribes in the Swedish chancery, and vice versa. The writings of the Reformation, however, prevented the continued decline in distinctive features of the separate languages, and religious reform may thus be said to have entailed linguistic reform as well.

The task of the Bible translators was complicated by two partly conflicting requirements: to render the text literally, and to create a language that was simple and comprehensible to the ordinary reader. The different translators tackled the task in different ways, partly depending on which of the two requirements they gave priority to, which source text they used, and which linguistic ideal they cherished. As we have seen, DNT24 did not manage to satisfy the requirement of comprehensible Danish, whereas Pedersen's DNT29 gave priority to this rather than to a literal rendering of the original text. The difference between DNT29 and DB50 can in a large part be explained by the different sources: the Latin Vulgate vs Luther's German Bible. There is a similar difference in the source texts used by SNT26 and SB41: Erasmus' Latin text and Luther's German. The difference in linguistic ideals between, on the one hand, SNT26 and SB41 and, on the other hand, DNT29 and DB50 is obvious. The Swedish translators chose to go back to the older linguistic pattern, aspiring to a solemn, almost literary and archaizing language, while the Danish translators (as a result of Pedersen's powerful influence) chose a simple and up-to-date language with no archaic features and without a particularly formal tone. On the other hand, there was no difference when it came to the endeavour to achieve consistency, chiefly in orthography, or to arrive at a pure national language.

A concrete illustration of differences and similarities between the various translations is provided by renderings of the first verse of Matthew 10 in each version.

DNT24: Oc samenkaldet tuolff siine discipeler/
gaff hand thennom macht/ emod vreene aand at
the skulle vdriffue thennom oc helbrede giøre
alhande syuge oc huer soet.

SNT26: Och kalladhe han sina tolf läryungar till sigh/ och gaff them mact offuer the fwla Andar/ at the skulle driffwa them vth/ och bota alla handa siwkdom/ och allahanda kranckheet.

DNT29: Ihesus kallede sine tolf Apostle til sig/ och gaff dem mact offuer diefflene/ ath de skulle vddriffue dem/ och gøre alle helbrede aff all sot och siugdomme.

SB41: Och han kalladhe sina tolf Läriungar til sigh/ och gaff them macht offuer the orena Andar/ at the skulle driffua them vth/ och bota allahanda siwkdom/ och allahanda kranckheet.

DB50: Oc hand kallede sine tolf Disciple til sig/ oc gaff dem mact offuer de wrene Aander/ At de skulde vddriffue dem/ oc helbrede allehonde Sot oc allehonde Siugdom.

[And when he had called unto him his twelve disciples, he gave them power against unclean spirits, to cast them out, and to heal all manner of sickness and all manner of disease.]

The differences are clearly very small. At some points only one translation differs from the others; sometimes the dividing line is not between countries but translations. The two versions that differ most in syntax are DNT24 and DNT29, but in completely different ways. DNT24 is unable to make Danish out of the underlying Latin participial construction, which remains intact at the start of the sentence in a way that serves as a good illustration of what the contemporary critics meant. DNT29, in contrast, is the freest translation, and even this brief passage clearly shows Pedersen's technique of not feeling bound to translate word by word (see 2.3.). He alone permitted himself, here as in many other places, to omit the introductory conjunction. The concluding phrase, *gøre alle helbrede aff all sot och siugdomme*, also differs in many ways from the other translations, which stick exactly to the underlying text. Pedersen put in a personal object *alle* and turned the direct object of the original into a prepositional phrase (*aff all sot och siugdomme*), in which he found it sufficient to have just one *all*. As regards SNT26, the archaic feature of inversion after an introductory conjunction may be noted: *Och kalladhe han*. Both SB41 and DB50 have the modern word order here.

There are certain variations in vocabulary, and they sometimes follow the national border: Danish *soet/sot* vs Swedish *kranckheet*, and Danish *helbrede giøre/gøre helbrede/helbrede* vs Swedish *bota*. Sometimes the differences are between different translations: the counterpart to *wreene aand* 'unclean spirits' in DNT24 is *orena Andar* in SB41 and *wrene Aander* in DB50, whereas SNT26 has *fwla An-*

dar; and here too DNT29 deviates the most by choosing to render the expression with a noun only: *diefflene* 'the devils'. DNT29 alone departs from the national pattern in using the word *Apostle* where DNT24 and DB50 have *discipeler/Disciple* and SNT26 and SB41 have *läryungar/läriungar*. Only DNT24 differs from all the others in using *syuge* as opposed to the others' *siwkdom/siugdomme/Siugdom*.

In morphology, the national boundaries stand out very clearly, since the Swedish biblical translators so explicitly avoided the Danish-inspired forms in *-e*, which were common in contemporary official texts and in some dialects, and instead chose forms in *-a* in keeping with the language of Vadstena (cf. Svensson 1981). This applies to the inflection both of verbs in the infinitive (Danish *vddriffue, giøre/gøre* vs Swedish *driffwa/driffua vth, bota*) and the preterite (Danish *kallede* vs Swedish *kalladhe*), and of adjectives (e. g. *wreene* vs *orena*). In several respects the Swedish translators, as we saw above, used more archaic paradigms. In DNT24 one may note the pronoun *thennom*, formed by analogy with *hannom*; this form was common in the 16th century but was totally eliminated from DNT29 and DB50.

The most striking orthographic feature is that DNT29 and DB50 chose initial <d> for pronouns, while both DNT24 and the Swedish translations SNT26 and SB41 preferred the older <th>: *de* vs *the*. Pedersen had already abandoned spellings with <th> in 1515, and it was obviously entirely due to him that the new model caught on so quickly in writing and was further reinforced by DB50. However, the Danish chancery stuck to the older <th> for the remainder of the century. In Sweden the situation was the reverse. Thanks to the Bible translations, <th> became an orthographic norm associated above all with religious language; it was still used in the 1703 Bible, and it was not generally questioned until the early 18th century. In the chancery, however, spellings with <d> were introduced as early as the 16th century (Zheltukhin 1996). Whereas in Denmark the orthography of the Bible was modern and the chancery spelling was conservative, in Sweden the Bible was conservative and the chancery modern in orthographic terms. This clearly illustrates how differently the two Nordic Bibles related to contemporary language. In other respects too, DNT24, SNT26, and SB41 represent an older orthographic tradition in opposition to DNT29 and DB50.

The sample sentence quoted above does not show what is perhaps the most striking

graphic difference between the Swedish and the Danish translations, namely between the ⟨å⟩, ⟨ä⟩, ⟨ö⟩ of the Swedish translations and the Danish counterparts ⟨aa⟩, ⟨æ⟩, ⟨ø⟩ (cf. 2.2.). In this respect it was the Danish translations and not the Swedish ones that followed the older tradition.

To sum up, it may be said that DNT29 and DB50 presented a shorter, simpler, and even by Danish standards much more modern orthography than DNT24 and SNT26 and SB41.

4. Other religious literature in the initial phase

Since copies of the Bible were expensive and few in number, they did not reach beyond the churches and never became the literature of the people. It was instead via other religious literature and sermons that the public encountered the message of the Bible in its new indigenous linguistic form. The initial phase of the Reformation was characterized by frantic activity in translating and writing, above all in Denmark, where several people from different parts of the country were actively involved, but also in Sweden, where Olaus Petri was the sole but highly productive central figure. Naturally, Luther was the main model, and it was chiefly his writings that were translated and/or adapted in more or less free form: Luther's catechisms, collections of sermons, prayer books, and so on. Some newly written works – albeit wholly in Luther's spirit – were also created in the Nordic countries, along with translations of other Lutheran writings. Some were quite simply necessary aids for the clergy, such as handbooks for conducting the divine service, while others were works of pure instruction, argument, and explanation aimed at the general public. Topical issues included the Eucharist, matrimony, the monastic system, and the mass. An example is Olaus Petri's *Orsack hwar före Messan böör wara på thet tungomåål som then menighe man forston-delighit är* [The reason why the mass should be in the language that is comprehensible to the common man] from 1531, a short piece which has been called the declaration of independence for the Swedish language. Quite a few highly polemical works were also issued in defence of the Lutheran doctrine and attacking Catholicism and its representatives. It may be said that during the transition period there was a war for people's souls, a propa-

ganda struggle waged with pamphlets and counter-pamphlets. For the Lutherans, religious issues did not just concern the learned; they went to the trouble of explaining them to the general public in the simplest and most popular terms.

The texts of the transition period show a great diversity of individual writing patterns, which may exemplify the variety that prevailed before the coming of the biblical standard. Only a few samples of the other religious Reformation literature can be given here, selected mainly to show inter-Nordic contacts. First we present some of the polemical writings that were exchanged (4.1.), followed by examples of inter-Nordic translations (4.2.).

4.1. Polemical writings

In Denmark the years 1526–36 witnessed violent controversy with strong political undertones between Lutherans and Catholics. Matters of faith were linked to other issues, such as Christiern II's claim to be restored to the Danish throne. This polemical literature constituted the first great Danish debate in writing, a battle over outlooks on life, waged directly with the contemporary political development and it left deeper marks than any later dispute (Friis 1945, 255). The debate was carried on partly through open letters which were frequently of considerable length, often existing first in transcripts and then in printed form. It is particularly interesting that this debate was also waged across the new Danish-Swedish border. The main opponent of the Lutherans was the Danish reformist Catholic Poul Helgesen. The argument between him and the reformer Hans Tausen of Viborg was, according to Friis (1945, 253), the most bitter and dramatic in Danish disputational literature. In Sweden it was Olaus Petri who was Helgesen's main combatant. As contributions to the debate about burning issues of religion and politics, these letters differed in tone and vocabulary from other Reformation texts, with violent personal attacks and numerous abusive words. Here too, of course, the model was Luther and his polemical writings. Each side was anxious to meet the opponent's arguments point by point and in a way that was truly accessible to the common man.

The first move was in the letter Hans Mikkelsen inserted into DNT24, where he attacked the men of the Catholic church, calling them false prophets and teachers who mocked God and deceived people. The adjectives used

were “wanuittige/ forblindede oc forstockede” [insane, blinded, and hidebound]. The Catholic reply did not come until 1527, through Helgesen (Helie 1932). The tone was set in the very title page: the pamphlet was a response to “thet ketterlige wcristelige och wbesindige breff, som then wbesckemmede kettere” [the heretical unchristian and thoughtless letter which the shameless heretic] Hans Mikkelsen of Malmö had printed. Helgesen's purpose is manifest. He declared that he wrote his reply so that Mikkelsen would not have the opportunity to mislead any more people, especially not “then simpel menige mandt her wdi riget” [the simple common man in this kingdom] with his “forgifftighe oc bedrægellige raad” [poisonous and deceitful advice]. Helgesen addressed Mikkelsen as “tw arme mandt” [you poor man], “thijn stymper” [you mutilator], “thijn fule kettere” [you foul heretic], and “thijn mørcke oc gamble graa kettere” [you dark and old grey heretic]. He compared him to “then hwn dt ther kand gøø och icke bijde” [the dog that can bark and not bite] and said that Mikkelsen did not consider anyone wise unless he had either been in exile or studied at Wittenberg. On his critique of the language, see 2.1. In his reply, he followed Mikkelsen's account precisely, challenging him on point after point. He also devoted a great deal of space to the purely political issue, Christiern's right to return to Denmark and his prospects of doing so.

The same technique was used by Petri in 1527 in his reply to another letter by Helgesen which has not survived, but which can be partially reconstructed from Petri's reply. In Petri's letter the tone is likewise set in the title: *Swar uppå itt ochristelighit sendebreff som en lögnactigh Munck hetandes Paulus Helie| haf fuer vthgåå latit emoot thz helga Euangelium som nyo (aff gudz nådhe) är i liwset kommet* [Reply to an unchristian letter that a lying monk by the name of Paulus Helie has issued against the Holy Gospel which has (by God's grace) come into the light again] (Petri 1914, 151). The Devil, he declares by way of introduction, has now aroused a false and lying prophet in Denmark, Paulus Helie, who has sent a lying and blasphemous letter to the knight Tyghe Krabbe. He did not doubt that there were many learned men in Denmark who could respond to the letter, but he also wanted to do so on behalf of Sweden, since this opponent of the gospel was distributing the same letter in Sweden and could perhaps seduce some people with it. Some examples from

Petri's letter: “tw liuger j thin eghin hals” [you are lying in your own throat], “jach wil sättie tich annat för näsene Paule” [I will put something else before your nose, Paule], “en oförskämelig och odygdig ande” [a shameless and sinful spirit]. He also appealed directly to the reader: “Ther före (Christelige läsare) sätt tw ingen troo til sådane lögner” [Therefore (Christian reader) put no faith in such lies].

The Danish Catholic Helgesen and the Swedish Lutheran Petri also fought a bitter struggle in 1527–28 about basic matters of belief. It started with the questions that Gustav Vasa had sent out prior to the Diet of 1527. Responses were submitted by the leading representative of the old doctrine, Peder Galle, and by Petri. The latter subsequently had his and Galle's replies edited and published in 1527 (Petri 1914, 223 f.), after they had first circulated as transcripts. These replies also became known in Denmark, and Helgesen wrote a letter in reply, addressed to Gustav Vasa but never delivered to him. A transcript of this reached Petri, who in a new letter of 1528 faced Helgesen directly: *Jtt fögho sendebreff til Paulum Helie* [A little letter to Paulus Helie] (Petri 1914, 331 f.). In the same year, Helgesen had his reply printed, now in an expanded version (Helie 1932).

The latter examples show that polemical initiatives which crossed the national border were taken from both sides, and that letters from both parties circulated not just at home but also in the neighbouring country. They also show that transcripts and printed versions often went hand in hand, so that the different contributions first circulated in manuscript form and were then printed, sometimes with additions.

4.2. Inter-Nordic translations

Although the vast majority of the translations were made directly from German, there are also some cases of the neighbouring Nordic language being used as an intermediary. An example of this is Peder Borgsmed's *En liidhen Indgangh vj skriffen* [A little introduction to the scriptures], which today survives only in the second edition from 1530. The title page declares that the work was first translated from German into Swedish by “mester Oluff pssen Secreterer vj stockholme Ther effther aff swenske paa danske Oc nw tridie gangh forlenghedt oc förøgth” [master Olaus Petri secretary in Stockholm, then from Swedish to Danish and now for the third time extended

and expanded]. Petri's source was a Low German version of a German work written by Johannes Toltz. Petri's translation, with the title *En liten ingong i then helga scrifft* (Petri 1915) appeared in 1529. That same year, the first Danish edition was printed in Malmö, while the second was printed in Viborg the following year. This shows how quickly works were spread. The additions that Borgsmed made to the second edition included many quotations from and references to the Bible, and many vehement polemical attacks, which meant that what was originally a purely instructive text also took on the character of an assault on Catholicism. The following quotation from Petri's (1) and Borgsmed's (2) versions shows how the two translations are related in purely linguistic terms, and how Borgsmed expanded the text with his own polemical additions (italicized here for clarity):

(1) Antichrister, falska propheter, och predicare och diäffwulens tjänare äre alle the som gudz ordh, then helga scrifft förfalska, läggiandes ther noghot til, eller taghendes ther noghot aff, och ey bliffwa widh then retta scrifftennes mening, och wilia doch at thet the såå lära och så föregiffua, skal hallas lijka widh gudz bodh. (Petri 1915, 382f.)

(2) Antichrister/ falsche Prophether/ falske predickere oc dieffuelsens tieneræ/ ære alle the som gudtz oerdt/ then hillighe scrifft forfalske/ leggendhes ther noghz til/ eller taghendes ther noghz fraa/ Oc ey bliffue wedt then redthe scrifftthens mening/ Oc wille tog ath thz the ssaa lære oc forgiiffue schal holles liighe wedt gudtz budt: *sodane ære nw alle Papister oc phariseer som seg kaller moncke/ huilke mz menniske glosser forwendhe gudz sandhe ordt for theres eghen bugfylle [...]* (Fem reformationsskrifter 1987, T 118).

[Antichrists, false prophets, false preachers, and the Devil's servants are all those who falsify the Word of God, the Holy Scriptures, adding something to it, or taking something away from it, and do not stick to the true meaning of the scriptures, and nevertheless want what they thus teach and allege to be equated with God's commandments: *such are all Papists and Pharisees who call themselves monks, who with human glosses twist God's true word to fill their own bellies.*]

Borgsmed, as can be seen, followed his source word for word, with the language being only superficially Danicized in the morphology and orthography. The Swedish ending *-a* in verbs and adjectives is replaced throughout with

Danish *-e*. In his spelling Borgsmed, just like other early Reformation writers, was wholly uninfluenced by Pedersen's model. It may be noted, for example, that he used initial <th> throughout for pronouns. In syntax, the translation was a direct transfer. Even participial constructions were taken directly from the Swedish: *läggiandes* and *taghendes* became *leggendhes* and *taghendes*. Despite this, his own additions were not in stark linguistic contrast to the preceding text. The difference was rather in the style.

Early hymn composition likewise displayed a certain degree of inter-Nordic influence. In 1529 Claus Mortensen, in his enlarged hymn book, included four of Petri's Swedish hymns in Danish translation. Three of them are expressly stated to come from "thet Swenske exemplar" and the fourth was from the special collection that Arvid Pedersen had contributed (Malling 1967, 321f.). Here too the Danish translation was very close to the Swedish text, which may be illustrated by the introductory lines in the following hymn, written by Petri and translated by Arvid Pedersen. The quotation from Petri's version (1) comes from the fragment of a hymn book from 1530, while Arvid Pedersen's (2) is from the *Malmösalmebogen* of 1533, issued by Christiern Pedersen, who simultaneously adjusted the spelling.

(1) O Fadher wår barmhertigh och godh/ som oss wille til tich kalla/ och stenkia oss medh Christi bloodh/ som bortagher synder alla/ (Petri 1915, 563).

(2) O fader vor/ barmhiertig oc god som oss ville til dig kalle/ oc stencke oss met Christi blod/ som bortager synder alle (*Malmösalmebogen* 1533, XLVII).

[O our merciful and good father/ who would call us to you/ and spatter us with Christ's blood/ which takes away all sins].

There are also several examples of translation in the opposite direction. For instance, Arvid Pedersen's *Al then gantzke Christenhed* [The whole of Christendom] from 1529 is translated from the Danish in the 1586 Swedish hymn book: *All then ganske Christenheet* (Liedgren 1926, 207). There were obvious risks of mistranslations, since the languages were very similar. One such mistake is discussed by Liedgren (1926, 161), although he has to resort to guessing in order to explain it. It concerns the third verse from a paraphrase of Luther *Medh glädhe och fridh faar iag nw hän* [With joy and peace I now depart] in the second

supplement to the Swedish hymn book in 1572, which by all appearances was also included in the hymn book of 1549. It is a translation from the Danish *Met glæde oc fred far ieg nu hen*. Liedgren cites a Danish version which he says is from 1533: "thit dyre oc helliche ord, som synder og nør fast klinger" [thy precious and holy word firmly resounds south and north], and the Danish version from 1553: "som synder oc nør kundgøris" [which is proclaimed south and north]. The Swedish version of 1572 runs: "som synder och nød kundgöra" [which proclaims sins and misery]. Liedgren assumes that a lost intermediate version caused the Swedish mistranslation. The *Malmö-salmebogen* of 1533, on page XLVII, has precisely this missing link assumed by Liedgren: "som synder och nør kundgøris" [which is proclaimed south and north].

5. Later religious literature

Once the Reformation was secured and the basic writings were available in the national language, the work of producing religious writings entered a calmer phase. The text of the Bible was subject to only minor adjustments in subsequent editions. The greatest departure was seen in the Resen's Danish Bible of 1607, which like its successor, Svaning's Bible of 1647, was printed in octavo, and in which certain wordings were altered and mistranslations from the original were corrected. According to Skautrup (1947, 287), however, there are no grounds to assume that these led to a completely new text of the Bible; rather, it was a revision. The older Danish text underwent very small adjustments in the church Bibles that appeared in new editions in folio format in 1587 and 1633. It was also printed in octavo in 1670. The Swedish Bible did not appear in an authorized revised version until 1618, the only one published in that century; it was not replaced by a new revised edition until 1703, the Bible of King Karl XII. In Sweden, the language was likewise retained virtually unchanged; the alterations were confined to orthography and morphology. Certain systematic orthographic modifications could nevertheless occur when printers composed new editions of the existing version of the Bible (Santesson 1988).

In smaller works, prayer books, and devotional manuals, there was a general endeavour to follow the standard established by the earliest Reformation Bibles. There were certain exceptions, however, such as Mårten Helsing's

Swedish prayer book, which contains large differences between the 1567 and 1577 editions as regards both orthography and morphology. Above all, in 1567 the ending *-e* was often used in verbs and adjectives, whereas in 1577 it was replaced by the *-a* of the Bible, presumably instigated by the printers (Svensson 1981, 135; Santesson 1997, 140).

German influence, which was already substantial in the initial phase of the Reformation, continued throughout the Early Modern Swedish period and even grew in the 17th century. The many translations of prayer books and devotional manuals (Estborn 1929) were important contributory factors in this. In her study of literature in Swedish translation in the 17th century, Hansson (1982) has shown that about 70 per cent of all translations were spiritual texts. The majority of these were general edifying works and prayer books. The original or intermediary language was overwhelmingly German. It is, of course, not surprising that people turned to the homeland of the Reformation, where they could be sure that the content was pure orthodoxy. Several of the translated religious works also attained great popularity. Hansson (1982, 313) lists the 16 works that appeared in the largest number of editions in Sweden in the 17th century, and of these, ten are books of spiritual edification. Kegelius' *Tolf andelige betrachtelser* [Twelve spiritual meditations] and Neumann's *Kärna uthaf alla böner* [Core of all prayers] appeared in 13 editions each, closely followed by Förtsch's *Een andeligh wattukälla* [A spiritual well] in 12, while Arndt's *Paradijs lustgård* [The garden of paradise] reached only nine editions.

Since 75 per cent of the Swedish translators were responsible for only one work each, it may be expected that they were particularly linguistically dependent on their originals. An example of this is Andreas Petri Amnelius, who in the 1680s translated a devotional manual by Johann Qvirsfeldt. Like many other devotional books, it contained a large number of unlabelled biblical texts incorporated in the running text. Amnelius translated these direct from his source, who in turn followed the wording of Luther. This gives us an excellent opportunity to compare Amnelius' version of the biblical passages with those in the Swedish Bible. The comparison clearly shows that Amnelius stuck much more closely to Luther's Bible than the Swedish biblical translators had done, above all in the syntax but also in the lexicon (Santesson 1991). Through several

translations of this kind, Nordic devotional literature became more influenced by the German language in the 17th century than earlier.

47. Nordic language history and religion/ecclesiastical history IV: From Pietism to the present

1. Recent Nordic religious literature: a survey
2. Bible translation and Bible reading
3. Church hymnbooks
4. Other religious literature
5. Literature (a selection)

1. Recent Nordic religious history:
a survey

From the 18th century onwards, the religious life in the Nordic countries has been subjected to profound changes due to several modernising processes. On the one hand, Pietism and

revivals have contributed to a renewal of traditional Christian beliefs; on the other hand, the growing secularisation of culture and society has led to religion losing its central role in public life and becoming concentrated around private life and various types of organisations within the established church. Until the middle of the 20th century, the religious situation in the North could be characterised as being almost totally dominated by the Lutheran state church, whereas its development especially during the second half of this century shows a clear tendency towards greater

cultural plurality, where not only a secular humanism of the classic Western type has strengthened its position, but also alternative forms of religion allow for real choice, to an extent hitherto unknown. These include, in part, a broad stream of new religious movements, as well as a greater representation of traditional non-Christian religions, mainly of Islam.

1.1. The first half of the 18th century saw the breakthrough of Pietism in the Nordic countries. Pietism came from the South, from Germany, and manifested itself through the more conservative traditions inspired by P.J. Spener and A.H. Francke, through the Moravian Brethren and through various radical Pietistic movements. Many of the new forms of religious expression, especially the Moravian and the radical Pietistic, met with the scepticism and resistance of the clerical leaders. Both in Sweden-Finland (1726) and in Denmark-Norway (1741), the authorities tried to gain control over these movements by introducing laws which set certain limits on private assemblies. But at the same time Pietism in its more disciplined form, as developed by Francke in Halle, gained a large amount of power in society. It reached its strongest political influence in Denmark-Norway under the reign of Christian VI (1730–46). Like several of his counsellors, this king was moved by the new ideal of piety and introduced a number of decrees and reforms in the spirit of Pietism. The two most important for language history were the introduction of compulsory confirmation (1736) and the law on public schools for rural districts (1739).

The interest and engagement of Pietism in schools and education was largely religiously motivated. Lessons were expected to convey a fundamental knowledge of Christianity and thereby lay the basis for the church's confirmation instruction. Pietism also introduced new ideals to teaching methods: Pupils were not only to learn the most important religious passages by heart, but also to improve their reading abilities; they were to be capable of reading their catechism and Bible history on their own, gaining their own personal understanding of the subject. By encouraging the use and teaching of their mother tongue, the Pietistic education program contributed to strengthening the position of the national written language in relation to Latin.

The Pietistic revivals during the first half of the 18th century first had an impact in towns

and among the nobility. Gradually, the new spirituality also established roots in larger circles of the population. This development was aided by the rules for confirmation and the new school policy, as well as the spreading of songbooks, books of homilies and other devotional literature. Thus 18th century Pietism contributed to the shaping and spreading of a modern type of Christianity with less emphasis on baptism and traditional church affiliation than on conversion and a personal experience of faith, on moral conduct and on the community of the true believers.

1.2. In most of the Nordic countries with the exception of Iceland this Pietistic ferment was reinforced by a series of revivals in the post-Pietistic period. The great revivals of the 19th century made a particularly forceful impact when dynamic preachers launched country-wide movements (Denmark: J. V. Beck; Finland: P. Ruotsalainen; Norway: H. N. Hauge; Sweden: C. O. Rosenius, P. P. Waldenström). Strong lay activity grew out of their initiative and became organised as national societies for foreign and home missions. A wider public was reached by means of their magazines and by agents (*bibelbud*) distributing devotional books. Another indication of the importance the "awakened" placed on ardent studies of the Bible and other religious literature is found in the term *läsare* which was in use in Sweden as early as the middle of the 18th century.

A characteristic trait of Christian life in the North is the fact that most of the groups gripped by these great revivals maintained their position within the established church. Their relations to the ordained clergy and the ecclesiastical authorities have sometimes been rather strained, though, as the "awakened" have been sceptical about traditional routine Christianity as well as various forms of liberal theology. They have often wished to present themselves as the true "people of God" and held the major part of their activities in their own meeting houses (*bedehus/bönehus*), limiting their participation in church services to *rites of passage* such as baptism, wedding or funeral. Nevertheless, this tension represents only one side of the picture; just as often, clergy and lay people developed fruitful cooperation, especially when the minister himself stood close to revivalism, or at least sympathized with those ideals.

One pietistic-puritan revival which kept its distance from the established church was the one led by the northern Swedish minister L.

L. Læstadius in the 1840s and 50s. It spread all over the northern areas, especially within the Sami part of the population. In the movement's early phase, ecstatic scenes were relatively frequent, and the term "criers" (*ropare/ropere*), which already was known from earlier revivals, was used for the converts. The Læstadian revival, which later split into divergent factions, combined a conservative Lutheran attitude with a severe and sober lifestyle. Læstadianism still plays an important role as a religious force in the northern regions of Sweden, Norway and Finland.

1.3. In the second part of the 18th century, Pietism began to be challenged even in the North by theological trends following more or less the trends of the Enlightenment and seeking to establish Christian beliefs based on pure reason, or at least a well-balanced synthesis of belief and rationality. Several clergymen representing this type of Christianity contributed greatly to popular education, for instance by instructing farmers in the use of new farming methods and products. As a religious force, though, this Enlightenment theology had limited importance, since it demanded a certain degree of philosophical and literary education and therefore could not reach a large part of the population.

It was not until the second half of the 19th century that traditional forms of belief and thought began to be seriously defied, and the church encountered severe criticism, at the same time as industrialisation and urbanisation brought about profound changes to traditional community life and social patterns. Dramas and novels in the spirit of realism and naturalism were the means important authors chose to bring current problems up as a topic for debate. Many prominent cultural personalities and politicians emerged as free-thinkers, promoting liberal ideas and moral autonomy. At this point, the church, still supporting traditional authoritarian structures, was seriously challenged by evolutionism, which was inspired by natural science, and by several types of critical liberation programs (parliamentary government, socialism, women's liberation). A good illustration of this cultural change is found in the great Norwegian poet B. Bjørnson's development: In his early writings, he aimed at a synthesis of the Christian and the national heritage in the spirit of Grundtvig (cf. 1.4.), but later he acted as an enthusiastic spokesman for Darwinism and its criticism of the church.

1.4. After 1800, the ecclesiastical landscape of the North included low-church revivalist traditions as well as various forms of secularism and distinguished itself as a comprehensive national church incorporating various – even contradictory – theological programs and factions. From a historical point of view, it is worth mentioning the Romantic trends which reached the North at the beginning of the 19th century; their new appreciation of both the common European and their own national history contributed to a renaissance of high-church spirituality. Special attention should also be given to the theology of the Danish poet and clergyman N.F.S. Grundtvig (cf. 3.1.), combining central motifs of the Early Church, the Reformation and Old Nordic heritage. Not only in Denmark, but also in Norway, Grundtvigianism stood out as an influential wing of the church and in society for a long time. Through a large number of 'folk high schools' (*folkehøjskoler*), it has fostered a liberal and broad-minded type of Christianity (see art. 55).

1.5. After the Reformation in the 16th century, Lutheran Christianity was the official form of religion for all the Nordic countries and also the only one permitted. Christians belonging to other denominations had very limited possibilities to practice their religion in these countries (e.g. some Calvinists in the Danish "free city" Fredericia and small groups of Orthodox Christians in the East Finnish district Karelen and the easternmost part of the Norwegian district Finnmark). Laws guaranteeing freedom of religion were only introduced from the middle of the 19th century. Since then the Roman Catholic church and also several Protestant free churches have established their own congregations, mainly in the towns. In Norway and Sweden, the Pentecostal movement, brought over from America in 1907, soon became the largest free-church community. However, in recent years the growth in immigration from other parts of the world has led to a marked increase of Roman Catholics as well as Orthodox and Oriental Christians.

Even before the introduction of general freedom of religion, some Jews were allowed to settle in Denmark, Sweden and Finland for reasons of economic policy. Finland also inherited a small Islamic minority from their time under Russian control (1809–1917). Apart from this, it was not until the last quarter of the 20th century that the Nordic coun-

tries were exposed to a noticeable influx of immigrants with non-Christian, mainly Islamic, backgrounds. On the threshold of the 21st century, one can still maintain that the Nordic countries to a large extent form a cultural and religious unity, yet this traditional unity is increasingly challenged by cultural pluralism. A characteristic example of this can be found in Sweden, where the state church system was abolished in the year 2000.

2. Bible translation and Bible reading

In Protestant Christendom, the Bible plays an essential role as the source for Christian knowledge and the norm for Christian faith and theology. Therefore it also has a central position in the post-Reformation religious life of the North, a position which was reinforced by Pietism. Due to the influence Pietism had on school and confirmation laws, reading proficiency increased generally at the same time as frequent revivals made many people interested in reading the Bible themselves. Cheaper and more convenient editions of the Bible became common, so that nothing could prevent it becoming a widely read book. Sermons and other preaching, hymnbooks and various forms of devotional literature were further means for biblical language to penetrate deep into the consciousness of the people. Over the course of time, it has left many traces in both the literary and spoken language. A long list of biblical words and phrases – often in a more or less archaic form – have found new areas of use, independent of their original context. Many of these phrases have become such a natural part of the country's cultural heritage that a modern citizen often no longer is conscious of their biblical origin and meaning.

The importance Protestantism placed on using and reading the Bible not only during the divine services but also in the daily life of the faithful has made translating the Bible a constant challenge. Keeping pace with the development of language, all the Nordic countries have more or less continuously been working on translations of the Bible, especially after the establishment of national Bible societies in the early 19th century (Finland 1812, Denmark 1814, Iceland and Sweden 1815, Norway 1816). In the following survey of the history of Bible translation in the North after 1700, there will, however, only be limited possibilities to consider the language of the various editions in detail.

2.1. In addition to the authorized edition of the Bible from the era of the Reformation (1550: *Christian III's Bible*; third revised edition 1633: *Christian IV's Bible*), Denmark received a new translation in the 17th century (1607). This translation was more in accordance with the orthodox understanding of the Bible that prevailed at the Copenhagen theological faculty at that time. In this new edition, loyalty to the original text predominated over considerations regarding the Danish language. This text by H. P. Resen was carefully revised by H. Svane in 1647 (= the *Resen-Svane Bible*), and in the course of the 18th century it reached a more or less official status, even though the old Reformation Bible still was in use.

Due to its loyalty to the original text and somewhat heavy Danish language, people did not find the *Resen-Svane Bible* easy to understand. Some changes were made at the time of Pietism (1732, 1737), but an attempt at making a completely new translation of the Bible failed. It was only after the Danish Bible Society was founded that official revised versions of the New Testament (1819), and – much later – of the Old Testament (1871) were carried out. But this was also a relatively careful revision; the changes were restricted mainly to adjustments in orthography and morphology, and a certain modernisation of the vocabulary. On the whole, the text kept its old-fashioned, solemn language.

A number of private initiatives for a completely new translation show that the distance between the language of the Bible and contemporary Danish was strongly felt. As early as the period of Enlightenment, two editions of the New Testament were published: one by a prominent preacher at the court, C. Bastholm (1780), clearly influenced by the author's rationalism; the other by the statesman O. H. Guldberg (1794), who had found in "the spoken language of cultured people" a golden mean between a solemn, poetic style and the language of the common people. In the years 1837–56, J. Lindberg produced a more popular translation of the whole Bible; it was a piece of work in the spirit of Grundtvig (cf. 1.4.) – and also dedicated to him. It was written in "a bold and lively Danish" (Skautrup III, 258) and became widely disseminated, especially in Grundtvigian circles. A more moderate style of language – holding the archaic as well as linguistic innovations at a distance – is found in the edition (1887) of the New Testament by T. Skat Rørdam, a text which was also used frequently.

Just as Lindberg's translation had an effect on the official revision of the Old Testament in 1871, Skat Rørdam's was of importance to the very last translation of the New Testament in the Resen tradition, published in 1907. Again the work was done with great care to avoid making the congregations feel unfamiliar with the new edition. Like Skat Rørdam, the translators made a point of freeing the text from a list of "German and half-German" words and phrases that had been incorporated into the Danish Bible translation from the very beginning; now they seemed strange and even stylistically jarring.
