Definisi Anak (Pediatric)

a. Neonatus

Neonatus adalah bayi yang baru lahir 28 hari pertama kehidupan (WHO.2014). Infant/Bayi adalah anak usia 1-12 bulan.

b. Anak (Pediatric)

Anak (Pediatric) adalah seseorang yang belum berusia 18 tahun , termasuk anak yang masih dalam kandungan. Dengan kata lain anak seseorang yang berusia 0-18 tahun (Undang-undang no 23 tahun 2002, PMK no 25 & WHO)

c. Remaja (Youth)

Remaja adalah seseorang yang berusia 0-19 tahun dan belum kawin (Kemenkes. RI)

a.1 Rumus Menghitung Usia Anak

Rumus ini digunakan untuk menghitung usia anak

Rumusnya adalah :

$$\text{Tanggal Aktual} - \text{tanggal lahir anak}$$

Contoh 1 :

Tanggal hari ini : 2 februari 2017

Tanggal lahir bayi : 2 februari 2016

Usia bayi =

| Day | month | years | | |
|-----------|-------|-------|-------|-------------------|
| 2 | 02 | 2017 | | |
| 2 | 02 | 2016 | | |
| 0 | 0 | 1 | tahun | Konversi ke bulan |
| | 0 | 12 | Bulan | (12) |
| Usia bayi | 12 | bulan | | |

Contoh 2

Tanggal hari ini : 2 April 2017

Tanggal lahir bayi : 5 Januari 2015

| Day | month | years | | |
|-----------|-------|------------|-----------------------------|-------------------|
| 2 | 04 | 2017 | | |
| 5 | 01 | 2015 | - | |
| -3 | +3 | 2 | tahun | Konversi ke bulan |
| -1 | 3 | 24 | Bulan | (24) |
| Usia anak | | (24+3) - 1 | 26 bulan (2 tahun 2 bulan) | |

Keterangan :

Jika hasil pengurangan tanggal hari sama dengan negatif (maka hasil usia bayi -1 bulan) tetapi jika hasil pengurangan tanggal hari positif (hasil usia bayi – 0 bulan)

A. Antropometri Anak

Berat badan (BB) atau *Weight* adalah gambaran massa tubuh seseorang. Sedangkan

Tinggi Badan/Panjang Badan (TB/PB) atau *Height* adalah jarak yang diukur antara tumit bawah kaki dengan puncak kepala pada saat berdiri tegak. Alat ukur tinggi badan (meteran)

Panjang Badan digunakan untuk anak usia 0 sampai 24 bulan yang diukur terlentang, tetapi bila anak usia 0-24 bulan di ukur berdiri maka hasil pengukurannya ditambah 0.7 cm.

Tinggi Badan digunakan untuk anak usia >2 tahun (> 24bulan) yang diukur dengan berdiri. Tetapi bila anak usia >2 tahun di ukur tinggi badannya telentang maka hasil pengukuran dikurangi 0.7 cm.

1. Berat Badan Ideal (BBI) atau *Ideal Body Weight*

Berat badan ideal (BBI) adalah bobot optimal dari tubuh seseorang .

Rumus –Rumus Berat Badan ideal (BBI) anak diantaranya :

1.1 BBI Anak (Pediatrik)

a. Rumus BBI untuk anak (Pediatric) Konvensional :

- BBI anak 0 -11 bulan = **(Usia Bulan) : 2 + 4**
- BBI anak 1-10 tahun = **2 x (usia tahun) + 8**

b. Rumus BBI untuk anak (Pediatric). Australia :

- BBI anak 0 - 11 Bulan = **(Usia Bulan) +9) : 2**
- BBI anak 1- 5 tahun = **2 x (usia tahun) + 5**
- BBI anak 5 - 14 tahun = **4 x (usia tahun)**

(EmergMedAustralas.2007)

1.2 Berat Badan Ideal (BBI) untuk Pasien >10 tahun :

Untuk BBI (>10 tahun) gunakan rumus:

• BBI Brocca= **(TB – 100) - 10% (TB-100)**

*(Jika TB pria <160cm dan TB wanita <150cm , tidak perlu dikurangi 10%)
(Brocca).*

Atau bisa dengan rumus:

• Berat Badan Ideal (BBI) = **22 x TB(m)² .** *(J.lemmen.2017)*

2. Perkiraan Pertumbuhan Anak

Perkiraan ini untuk memperkirakan pertumbuhan berat badan dan tinggi badan pada anak

| Perkiraan BB anak | |
|--------------------------|-------------------------------|
| 3-12 bulan | (Umur (bln) + 9) :2 |
| 1-6 tahun | (Umur (thn) x 2) +8 |
| 6-12 tahun | (Umur (thn) x7 -5) : 2 |
| Atau 1-10 tahun | (2 x umur (thn)) +4 |
| 5 bulan | 2 x Berat badan lahir |
| 1 tahun | 3 x Berat Badan lahir |
| 2.5 Tahun | 4 x Berat badan Lahir |
| 5 Tahun | 6 x Berat Badan Lahir |
| 10 Tahun | 10 x Berat Badan Lahir |

Penambahan Berat Badan

| | |
|------------|-------------------------|
| Triwulan 1 | 700-1000 g/bulan |
| Triwulan 2 | 500-600 g/bulan |
| Triwulan 3 | 350-450 g/bulan |
| Triwulan 4 | 250-350 g/bulan |

| | |
|------------|-----------------|
| Atau | |
| 0-6 bulan | 70-1000 g/bulan |
| 6-12 bulan | 300-500 g/bulan |
| 1-4 tahun | 150 g/bulan |

Perkiraan Tinggi Badan anak

| | |
|------------|--------------------------------|
| 0-6 bulan | 2.5 cm/bulan |
| 6-12 bulan | 1.25 cm/bulan |
| 1-7 tahun | 7.5 cm/tahun |
| 1 tahun | 1.5 x Panjang Badan lahir (cm) |
| 4 tahun | 2 x Panjang Badan Lahir |
| 2-12 tahun | (Usia (th) x 6) +77 |

Perkiraan Tinggi Badan Berdasarkan TB Orang tua (Biasnya ±8.5 cm)

| | |
|-----------|-----------------------------------------------|
| Perempuan | $\frac{(Tinggi Badan Ayah - 13) + TB Ibu}{2}$ |
| Laki-Laki | $\frac{(Tinggi Badan Ibu + 13) + TB ayah}{2}$ |

Perkiraan Lingkar Kepala

| | |
|-----------|---------|
| 0-1 tahun | 10 cm |
| 1-2 tahun | 2.5 cm |
| 3-5 tahun | 1.25 cm |

Sumber Pustaka : Pediatrik praktis edisi 3. 2007

3. Berat Badan Kering atau Berat Badan Koreksi (BBK) atau Dry Weight

Jika ada kondisi penumpukan cairan baik edema atau ascites maka untuk BB Aktualnya gunakan Berat badan Kering (Berat Badan Koreksi) :

- **BB kering = BB Aktual – koreksi Penumpukan Cairan**

| Area edema anak | Koreksi |
|-----------------|---------|
| Palpebra | 5 % |
| Tungkai | 5-10 % |
| Ascites | 10-15% |
| Scrotal | 15-20% |
| Efusi Pleura | 20-25% |

| | |
|--------------------------------------------------|--------|
| Hydro Thorax | 25-30% |
| Sumber Pustaka : Pediatrik praktis edisi 3. 2007 | |

Atau :

| Tingkat | oedema | ascites |
|--------------------------------------------------|----------|---------|
| Ringan (bengkak pada tangan atau kaki) | -10% BBA | -2,2kg |
| Sedang (Bengkak pada wajah dan tangan atau kaki) | -20% BBA | -6kg |
| Berat (Bengkak seluruh Tubuh) | -30% BBA | -10kg |

(di buku adisty., et.al.2012)

Atau :

| Tingkat | edema | ascites |
|--------------------------------------------------|--------|---------|
| Ringan (bengkak pada tangan atau kaki) | -1 kg | -2,2kg |
| Sedang (Bengkak pada wajah dan tangan atau kaki) | -5 kg | -6kg |
| Berat (Bengkak seluruh Tubuh) | -10 kg | -14kg |

(Mendenhall.1992)

Atau BBK untuk pasien obesel bisa menggunakan formula nhanes ii Adjusted Body weight (ABW). Rumusnya adalah :

$$\text{ABW} = (\text{Berat Badan Aktual}-\text{berat Badan Ideal}) \times 0.25 + \text{Berat badan Ideal}$$

4. Penurunan Berat Badan

Penurunan berat badan bisa menjadi indikator Masalah gizi jika memenuhi kriteria, cara menghitungnya :

$$\frac{\text{Berat badan biasa} - \text{berat badan aktual}}{\text{berat badan biasa}} \times 100$$

| Waktu | Besar penurunan badan (Ringan) | Besar penurunan badan (Berat) |
|----------|--------------------------------|-------------------------------|
| 1 minggu | 2 % | >2 % |
| 1 bulan | 5 % | >5 % |
| 3 bulan | 7,5 % | >7,5 % |

| | | |
|----------------|-------------|-----------------|
| 6 bulan | 10 % | >10 % |
|----------------|-------------|-----------------|

5. ESTIMASI BERAT BADAN PADA ANAK

Pada pasien-pasien kondisi khusus yang tidak memungkinkan untuk dilakukan pengukuran maka kita bisa menggunakan rumus estimasi berat badan :

a. Perkiraan Berat badan untuk anak usia 1–16 tahun (Emerg Med J. 2012)

- Berat Badan = $3 \times (\text{usia tahun}) + 7$

b. Perkiraan Berat Badan Formula crandal dengan Estimasi LILA (Lingkar Lengan Atas) :

- BB Laki-laki = $-93,2 + (3,29 \times \text{LILA}) + (0,43 \times \text{TB})$
- BB Wanita = $-64,6 + (2,15 \times \text{LILA}) + (0,54 \times \text{TB})$

c. Perkiraan Berat Badan Menurut LILA dan Tinggi Lutut

Perkiraan berat badan menggunakan rumus ini memiliki bias estimasi, untuk wanita bisa sampai $\pm 9,9$ kg sedangkan Pria $\pm 10,1$ kg . Rumusnya adalah :

- BB Laki-laki = $(0,826 \times \text{Tinggi Lutut}) + (2,116 \times \text{LILA}) - (\text{usia} \times 0,113) - 31,486$
- BB Wanita = $(0,928 \times \text{Tinggi Lutut}) + (2,508 \times \text{LILA}) - (\text{usia} \times 0,144) - 42,543$

d. Perkiraan Berat Badan Menurut LILA dari Cerra 1984

Perkiraan ini bisa menjadi alternatif Perkiraan Berat badan. Rumusnya dan sering digunakan oleh Ahli Gizi karena biasnya tidak terlalu besar :

$$\text{BB} = \frac{\text{LILA yang di ukur}}{\text{LILA Standar cerra}} \times (\text{TB} - 100)$$

Lila Standar cerra 1984

| | |
|--------------------|-------------|
| LILA Pria | 29 |
| LILA Wanita | 28,5 |

e. Perkiraan berat badan dengan formula lorens et.all :

*BB Laki-laki = $-137,432 + (\text{TB} \times 0,60035) + (\text{Lingkar perut} \times 0,785) + (\text{Lingkar Pinggul} \times 0,392)$

*BB Wanita = $-110,924 + (\text{TB} \times 0,4053) + (\text{Lingkar perut} \times 0,325) + (\text{Lingkar Pinggul} \times 0,836)$

f. Mengukur berat badan bayi /anak dengan digendong.

BB = Berat badan total (penggendong + Bayi) – Berat badan penggendong

6. ESTIMASI TINGGI BADAN

Jika tinggi badan (TB) tidak di ketahui bisa menggunakan estimasi di bawah ini :

a. Perkiraan Tinggi Badan Formula mitchell :

- Height = $2 \times (\text{Semi-span})$

note: semi-span (setengah depan)

b. Perkiraan Tinggi Badan Formula WHO :

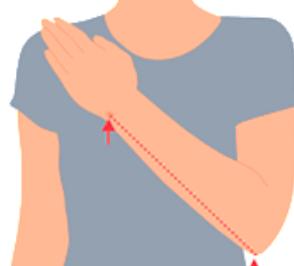

- Height = $0,73 \times (2 \times \text{semi-span}) + 0,43$

c. Perkiraan Tinggi Badan Formula Gray, et.al :

Height = Panjang Badan tirah baring

d. Perkiraan TB dengan ULNA dari Hayperuma :

- Laki –laki = $97,252 + (2,645 \times \text{ULNA})$
- Wanita = $68,777 + (3,536 \times \text{ULNA})$

Catatan : Estimasi TB dengan ULNA formula ilayperuma sering dipakai.

e. Perkiraan TB dengan Tinggi Lutut formula Chumlea :

- Laki = $64,19 - (0,04 \times \text{Usia}) + (2,02 \times \text{Tinggi Lutut})$
- Wanita = $84,88 - (0,24 \times \text{usia}) + (1,83 \times \text{tinggi lutut})$

f. Perkiraan TB dengan Panjang Depa (PD) :

- Wanita Usia <10 tahun = $23,99 + 0,75 (\text{PD}) + 0,86 (\text{usia})$
- Wanita usia >10 tahun = $28,54 + 0,74 (\text{PD}) + 0,83 (\text{usia})$
- Laki Usia <12 tahun = $21,90 + 0,76 (\text{PD}) + 0,72 (\text{usia})$
- Laki usia >12 tahun = $17,91 + 0,76 (\text{PD}) + 1,17 (\text{usia})$

g. Perkiraan Tinggi badan anak saat dewasa

- Laki-laki = $1,27 \times \text{TB} (\text{saat usia 3 tahun}) + 54,9$
- Perempuan = $1,29 \times \text{TB} (\text{saat usia 3 tahun}) + 42,3$

Catatan : estimasi ini hanya untuk gambaran sebagai pencegahan stunting pada anak, sehingga bisa menentukan intervensi.

h. Pengukuran Tinggi badan usia > 2 tahun telentang (Kemenkes 2011)

- TB = panjang badan telentang – 0.7 cm

i. Pengukuran Tinggi badan usia 0-24 bulan Berdiri (Kemenkes 2011)

- Panjang Badan = Tinggi badan berdiri + 0.7 cm

A. STATUS GIZI untuk Anak

Sedangkan status gizi anak usia 0 – 5 tahun, bisa menggunakan Z-score Berat Badan menurut Umur (BB/U), dan untuk anak usia 5 – 18 tahun gunakan IMT/U atau kita bisa gunakan tabel CDC Growth chart BB/U 2-18 tahun untuk tabel yang lain bisa Liat tabel z-score di lampiran)

a. Rumus Z-score BB/U (lihat tabel who z score BB/U):

- Jika BB anak < median =
$$\frac{BB \text{ anak} - BB \text{ median}}{BB \text{ median} - (\text{nilai BB pada } (-1 SD))}$$

- Jika BB anak > median =
$$\frac{BB \text{ anak} - BB \text{ median}}{(\text{nilai BB pada } (+1 SD)) - BB \text{ median}}$$

- Jika BB anak= median =
$$\frac{BB \text{ anak} - BB \text{ median}}{BB \text{ median}}$$

b. Rumus Z-score TB/U (lihat tabel who z score BB/U):

- Jika TB anak < median =
$$\frac{TB \text{ anak} - TB \text{ median}}{TB \text{ median} - (\text{nilai TB pada } (-1 SD))}$$

- Jika TB anak > median =
$$\frac{TB \text{ anak} - TB \text{ median}}{(\text{nilai TB pada } (+1 SD)) - TB \text{ median}}$$

- Jika TB anak= median =
$$\frac{TB \text{ anak} - TB \text{ median}}{TB \text{ median}}$$

c. Rumus Z-score IMT/U (lihat tabel who z score):

- Jika IMT/U anak < median =
$$\frac{IMT \text{ anak} - IMT \text{ median}}{IMT \text{ median} - (\text{nilai IMT pada } (-1 SD))}$$

- Jika IMT/U anak > median =
$$\frac{IMT \text{ anak} - IMT \text{ median}}{(\text{nilai IMT pada } (+1 SD)) - IMT \text{ median}}$$

- Jika IMT/U anak = median =
$$\frac{IMT \text{ anak} - IMT \text{ median}}{IMT \text{ median}}$$

Kategori Z score menurut WHO

| Z-score | < -2 | -2 sampai + 2 | > + 2 |
|---------|-------------|---------------|------------|
| BB/U | Gizi Kurang | Normal | Gizi Lebih |
| BB/TB | Kurus | Normal | Gemuk |

Sedangkan Status Gizi CDC Growth Chart untuk pasien usia (5-17 tahun) :

- A. Untuk menghitung status gizi anak dengan **percentile CDC growth chart** (Liat tabel percentile WHO di lampiran)

Interpretasi Status Gizi percentile CDC Growth charts

| % | Status Gizi |
|-------------------------|-------------|
| <70 % | Gizi Buruk |
| 70-90% | Gizi Kurang |
| >90 – 110 % | Normal |
| >110 % | Overweight |
| >120% | Obesitas |
| <i>Sjarif, dkk 2011</i> | |

1. Tentukan berat badan aktual anak
2. Cari median sesuai kategori status gizi anak atau liat angka di 50th percentile
3. Selanjutnya , contoh jika kategori BB/U
 - Seorang anak A ,jenis kelamin perempuan
 - Usia 5.5 tahun,
 - Berat badan aktual 18 kg,
 - berat badan median (50th) pada tabel WHO weight for age girls (BB/U) untuk usia 5.5 tahun adalah 19 kg
 - $$\text{Status Gizi} = \frac{\text{BB aktual}}{\text{Berat badan median}} \times 100\%$$
 - $$\text{Status Gizi} = \frac{18}{19} \times 100\% = 94.7\%$$

Status Gizi anak A , Normal berdasarkan Kategori percentile CDC 2000

- B. Lalu kita bisa juga menentukan status gizi anak dengan menggunakan grafik growth chart.

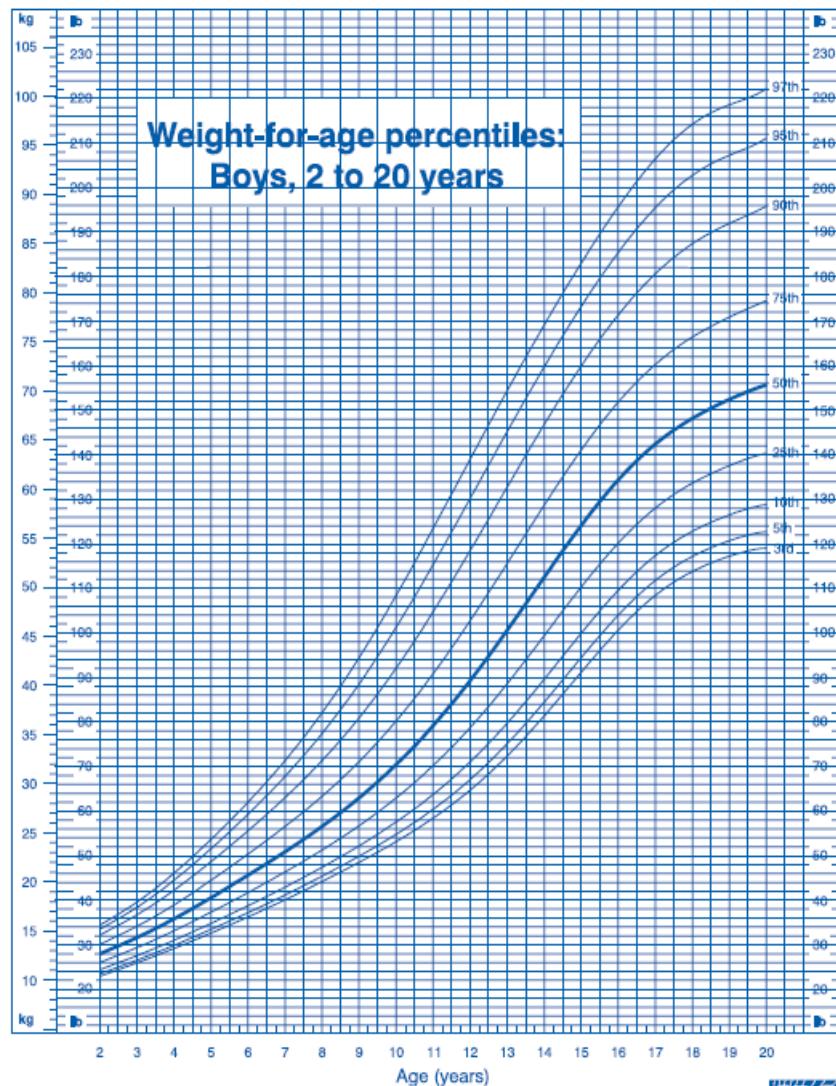

Kategori Status Gizi CDC

| | |
|-------------------------------------|--------------------|
| < 5th | Underweight |
| ≥ 5 th – <85th percentile | Normal |
| ≥ 85 th – ≤ 95 th percentile | Overweight |
| > 95th percentile | Obesitas |
| <i>Riskesdas 2010</i> | |

Caranya adalah

- Gunakan grafik sesuai kategori
- Cari titik pertemuan pada grafik ,
- lalu tarik garis horizontal dan vertikal
- liat titik pertemuannya berada di garis percentile (th) yang mana
- interperetasi status Gizinya.

Grafik dibawah adalah grafik kategori BB/U, grafik yang lain bisa dilihat lampiran.

STATUS GIZI

Status Gizi adalah ukuran mengenai kondisi tubuh manusia. Cara mengetahui Status Gizi :

1. Status Gizi Remaja :

Untuk status gizi anak usia ≥ 17 tahun bisa menggunakan IMT
(Indeks Masa Tubuh)

Rumus IMT (Kemenkes RI)

$$\text{Rumus IMT} = \frac{\text{BB}}{\text{TB}(\text{m})^2}$$

BB: Berat Badan

TB: Tinggi Badan

Kategori IMT menurut Kemenkes 2013

| | |
|-------------|--------------|
| < 18,5 | Kurus/Kurang |
| 18,5 – 24,9 | Normal |
| 25,0 – 27,0 | Overweight |
| > 27 | Obesitas |

a. Status Gizi anak menurut Percentile LILA :

Selain itu, status gizi bisa ditentukan dengan metode LILA. Metode ini bisa digunakan pada pasien pediatrik, Dewasa ataupun Lansia atau usia > 1 tahun.

$$\% \text{ percentile LILA} : \frac{\text{LILA di ukur}}{\text{Nilai Standar LILA}} \times 100 \%$$

| | |
|-------------|---------------|
| Obesitas | >120 % |
| Overweight | 110-120% |
| Gizi Baik | 85-110 % |
| Gizi Kurang | 70,1 – 84,9 % |
| Gizi Buruk | <70% |

Nilai Standar LILA

D. Rumus Estimasi menentukan Z-score BB/U

Estimasi ini di gunakan untuk menghitung status gizi BB/U anak 0-10 tahun, dalam kondisi darurat dan tidak memiliki tabel Z-score ataupun CDC.

Untuk rumus perhitungan Z-scorenya masih sama seperti perhitungan Z-score pada umumnya, hanya perbedaannya. Cara menentukan Median, -1SD, dan +1SD.

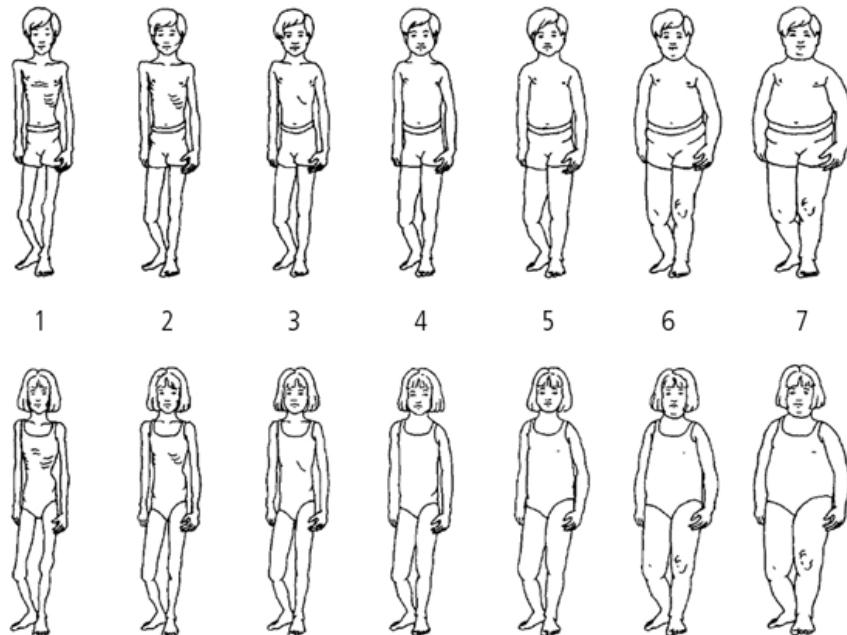

Rumusnya :

| | |
|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MEDIAN | <ul style="list-style-type: none"> • Median anak 0 -11 bulan = (Usia Bulan) : 2) + 4 • Median anak 1-10 tahun = 2 x (usia tahun) + 8 |
| -1SD | = Median - 10% (Median) |
| +1SD | = Median + 10% (Median) |

Catatan : Rumus ini tidak terlalu direkomendasikan, hanya saja bisa digunakan dan dijadikan gambaran untuk mengetahui status gizi anak BB/U secara cepat dalam kondisi yang benar benar darurat. (Suratman, AMG)

E. Status Nutrisi berdasarkan Body Image Silhouette Chart

Metode ini merupakan salah satu cara mengukur status gizi anak berdasarkan persepsi subjektif. Metode ini dilakukan dengan menunjukkan gambar , terdiri dari tujuh gambar siluet anak laki-laki dan perempuan yang diberi nomor 1 sampai 7.

Cara menggunakannya adalah orangtua anak akan diminta untuk menujuk 1 gambar yang menurut orangtua itu sesuai dengan kondisi anak mereka pada saat ini.

Interpretasi gambar Body Image Silhouette Chart

| No Gambar | Status Gizi |
|-----------|-------------|
| 1 atau 2 | Underweight |
| 3 | Normal |
| 4 atau 5 | Overweight |
| 6 atau 7 | Obesitas |

F. Sedangkan untuk pengukuran- Pengukuran Gizi lainnya :

1.Lingkar Kepala Bayi 0 Bulan :

Laki = 32 – 38 cm (Normal)

Wanita = 31 – 36 cm (Normal)

2.Lingkar Dada anak 2 – 3 tahun

BBLR = < 27 cm

Normal = >27 cm

3. LILA (Lingkar Lengan Atas)

- a.Wanita Usia Subur atau ibu hamil = < 23,5 cm (beresiko Kurang Energi Kronis (KEK))
- b. Bayi 0-30 hari = \leq 9,5 cm (resiko Malnutrisi)
- c. Balita 1-5 tahun = \leq 12,5 cm (resiko Malnutrisi)
- d. pada Laki-laki = \leq 20 cm (Resiko Malnutrisi)
- e. kenaikan berat badan normal pada ibu hamil :

| | |
|-----------------|--------------|
| IMT Normal | 11.5-16 kg |
| IMT Underweight | 12.5 – 18 kg |
| IMT Overweight | 11.5 - 16 kg |
| IMT Obesitas | 5-9 kg |

2. Estimasi Tinggi Badan anak saat dewasa berdasarkan tinggi badan orangtua

Estimasi ini tidak untuk dijadikan rujukan status gizi, tetapi hanya sebagai gambaran TB anak di masa depan.

| Perkiraan TB anak | |
|-------------------|------------------------------|
| Laki-Laki | ((TB ibu + TB Ayah) : 2) + 7 |
| Perempuan | ((TB ibu + TB Ayah) : 2) - 7 |

3. Menentukan status Gizi KEP atau protein Energi Malnutrisi menggunakan ratio Lingkar lengan atas dan lingkar kepala.

$$\text{Status Gizi : } \frac{\text{Lingkar Lengan Atas}}{\text{Lingkar Kepala}}$$

| Kategori | Nilai |
|----------------|-------------|
| Normal | >0.310 |
| KEP/PEM Ringan | 0.310-0.280 |
| KEP/PEM Sedang | 0.279-0.250 |

a. Estimated Glomerular Filtration Rate (GFR)

Digunakan untuk mengetahui Fungsi ginjal dengan data serum kreatinin:

- GFR ml/min Laki-laki = $\frac{(140 - \text{Usia}) \times \text{BB}}{72 \times \text{Kreatini serum}}$

- GFR ml/min Wanita = $\frac{(140 - \text{Usia}) \times \text{BB} \times 0,85}{72 \times \text{Kreatini serum}}$

b. Tes Kreatinin Kliren

Merupakan salah satu cara untuk perkiraan nilai GFR , Rumusnya

- Kliren creatinin

$$= \frac{\text{kreatinin urin (mg/dl)} \times \text{volume urin (ml/24 jam)}}{\text{kadar kreatinin serum} \times 1440 \text{ menit/24 jam}} \times \frac{1.73}{\text{luas permukaan tubuh}}$$

Untuk menghitung luas permukaan tubuh , menggunakan rumus du bois

Rumusnya adalah : $\frac{\text{Tinggi Badan (cm)} \times \text{Berat badan (kg)}}{3600}$

Nilai Normal kreatinin kliren :

- Laki-Laki : 97 ml/menit – 137 ml/menit
- Perempuan : 88 ml/menit -128/menit

Catatan : Mohon maaf pada handbook azura 1 dan 2 ada kekeliruan dalam penulisan nama dan rumus GFR ataupun TKK , yang benar adalah seperti yang di atas. Dan diperbaiki pada handbook azura ver 3.

Tekanan darah tinggi (Hipertensi) berdasarkan bentuknya terbagi menjadi 3:

1. Hipertensi diastolik (diastolic hypertension) yaitu tekanan darah diastol tinggi tapi tanpa diikuti peningkatan tekanan darah sistolik. Kasusnya sering terjadi pada anak-anak dan dewasa muda.
2. Hipertensi sistolik (isolated systolic hypertension) yaitu tekanan darah sistol tanpa diikuti peningkatan tekanan darah diastol. Biasanya ditemukan pada pasien geriatri (Lansia).
3. Hipertensi campuran (sistol dan diastol yang meninggi) yaitu tekanan darah pada

NCP (Nutrition Care Proses)

NCP adalah Proses Asuhan gizi terstandar yang memecahkan masalah dengan menggunakan pendekatan sistematis dan terstandar agar asuhan gizi menjadi tepat, efektif dan aman.

The Nutrition Care Process (NCP) is designed to improve the consistency and quality of individualized care for patients/clients or groups and the predictability of the patient/client outcomes. It is not intended to standardize nutrition care for each patient/client, but to establish a standardized process for providing care. There are four steps in the process:

1. Nutrition Assessment
2. Nutrition Diagnosis
3. Nutrition Intervention
4. Nutrition Monitoring and Evaluation

A.Nutrition Assesment di bagi menjadi 5 domain :

- Assesment Antropometri
- Assesment Biokimia
- Assesment physical-clinics
- Assesment Dietary History
- Assesment Personal History

B.Nutrition Diagnosis di bagi menjadi 3 domain :

- Domain Intake
- Domain Klinis
- Domain Behaviour

C.Nutrition Intervention dibagi menjadi 4 domain :

- Food and/or Nutrient Delivery
- Nutrition education
- Nutrition Counseling
- Coordination of nutrition care

D.Nutrition Monitoring and evaluation dibagi menjadi 4 domain :

- Food nutrition-related history outcomes
- Antropometric Measurement outcomes
- Biochemical data, Medical Test, and procedure outcomes
- Nutrition – focused physical finding outcome

A.1 Nutrition Assesment ,Diagnosa, dan intervensi Gizi

Diagnosa gizi berdasarkan Nutrition Care Proses (NCP).

Terdiri dari 3 kalimat utama P.E.S

P: Problem (Masalah Gizi)

E: Etiologi (penyebab masalah)

S : Sign Syntomp (tanda dan gejala)

Masalah gizi (P) secara umum di bagi 3 :

- a. Domain Intake (NI) : berkaitan dengan asupan
- b. Domain Klinis (NC) : Berkaitan dengan Keadaan fisik klinis, kondisi medis dan hasil lab
- c. Domain Perilaku (NB) : Berkaitan dengan Kebiasaan , perilaku, kepercayaan, lingkungan dan pengetahuan.

Kalimat Diagnosa Gizi bila di gabungkan :

Kode P berkaitan dengan E ditandai dengan S

- **Contoh :**

NI 1.2 Asupan oral in adekuat Berkaitan dengan penurunan nafsu makan, adanya mual ditandai dengan hasil recall 2x 24 jam 30% dari 1500 kkal (kurang)

NC 2.2 Perubahan Nilai Lab berkaitan dengan Gangguan Fungsi Endokrin ditandai dengan nilai GDS (Gula Darah sewaktu) 300 mg

D. Kebutuhan Gizi pada anak

Banyak rumus yang digunakan untuk mengetahui kebutuhan gizi /kalori Anak-anak.

jika status gizi pasien normal gunakan Berat Badan Aktual (BBA) untuk perhitungan kebutuhannya, dan bila status gizi pasien malnutrisi baik underweight ataupun over/obesitas sebaiknya gunakan Berat Badan ideal (BBI) untuk perhitungannya (American College of Chest Physicians equation)

Rumus Rumus kebutuhan gizi/kalori seseorang baik orang sehat ataupun pasien sakit diantaranya :

1. Rumus dari A.S.P.E.N

Rumus ini digunakan untuk menghitung kebutuhan gizi pasien DM anak (1-15) tahun. (penuntun diet anak)

Rumusnya :

Kebutuhan Energi = BB ideal (median) x Kebutuhan energi berdasarkan AKG

Kebutuhan Protein = BB ideal (median) x Kebutuhan Protein berdasarkan AKG

| Usia | Energi (kkal/kg BB) | Protein (g/kg BB) |
|------------------|---------------------|-------------------|
| 0-6 bulan | 91 | 2 |

Kebutuhan untuk pertumbuhan (kalori/hari) berlaku untuk atlit 0-18 tahun

| Jenis kelamin anak | Umur | Tambahan energi |
|--------------------|---------------|---------------------------|
| Anak laki-laki dan | 10 – 14 tahun | 2 kalori/kg berat badan |
| Perempuan | 15 tahun | 1 kalori/kg berat badan |
| | 16 – 18 tahun | 0,5 kalori/kg berat badan |

Contoh Soal :

DIKETAHUI :

- Nama : An S
- Jenis Kelamin : LAKI-LAKI
- Usia : 17 TAHUN
- Berat Badan : 50 KG
- Atlet : BOLA
- Latihan :
 1. LARI : 2 HARI SEMINGGU KEC.5,5 MENIT/KM SELAMA 1 JAM = $(1 \times 60) = 60$ menit
 2. BOLA : 2 KALI SEMINGGU SELAMA 2 JAM = $(2 \times 60 = 120)$

3. AKTIVITAS : RINGAN SEDANG (PERGI SEKOLAH DAN BELAJAR)

Perhitungan Kebutuhan :

- BMR = LAKI BB 50 = 1357 Kkal
- SDA = $10\% \times 1357 = \frac{135,7 \text{ Kkal}}{1492,7 \text{ Kkal}}$
- FAKTOR AKTIVITAS HARIAN kat : SEDANG
 $= 1,7 \times 1492,7 = 2537,59$
- FAKTOR AKTIVITAS FISIK =
 - 1. LARI = $2 \times 60 \times 10 = 1200$
 - 2. BOLA = $2 \times 120 \times 7 = \frac{1680}{2880}$
- JADI KEBUTUHAN ENERGI: **2880 kkal/minggu**
- KEBUTUHAN ENERGI/HARI UNTUK OLAH RAGA
 $= 2880/7 = 411.42 \text{ KAL/HR}$
- TOTAL KEBUTUHAN ENERGI = $2537,59 + 411,42 = 2949,01 \text{ KAL/HR}$
- FAKTOR PERTUMBUAHAN = LAKI 16 THN = $0,5 \text{ Kkal/kg} \times \text{BB}$
 $= 0,5 \text{ kkal} \times 50 \text{ kg} = 25 \text{ kkal}$
- JADI TOTAL KEBUTUHAN ENERGI atlet DALAM SEHARI =
 $= 2949,01 + 25 = 2974 \text{ kkal/hari}$

22. Cara Menghitung kalori Dextrose D5W

Misal ada infus dextrose 5%, berapa kalori ?

Jawab : dextrose 5% berarti dalam larutan 100 cc mengandung 5 gram dextrose, 1 gram dextrose mengandung 3.4 kalori.

Maka untuk menghitung kalorinya, $5 \text{ gram dextrose} \times 3,4 = 17 \text{ kalori}$. Jadi dalam 100 cc dextrose 5% mengandung 17 kalori.

Tabel Kalori parenteral

| | |
|--------------|------------|
| Dextrose | 3.4 kalori |
| 20% lipid | 2 kalori |
| 10% lipid | 1 kalori |
| Protein | 4 kalori |
| 1 g Nitrogen | 25 kalori |

E. Satuan Energi

Sebelumnya mungkin kita pernah mendengar istilah

1 gram protein = 4 kalori,

1 gram lemak = 9 kalori

1 gram karbohidrat = 4 kalori.

Darimana angka ini bisa di dapat., angka ini merupakan hasil dari penelitian dengan bom kalorimeter. Dan sekarang kita kenal dengan Faktor Atwater.

Satuan energi yaitu kalori (Kal)/kkal : 1 Kal adalah banyaknya panas yang diperlukan untuk menaikkan suhu 1 liter air dari 14,5 °C ke 15,5 °C.

1 kkal = 4,2 kJ (kilojoule)

Tabel 1. Faktor Atwater

| Zat Gizi | Nilai Energi Pembakaran (Kkal/g) | Kehilangan selama Pencernaan (%) | Energi Tersedia Setelah Pencernaan (Kkal/g) | Kehilangan Selama Metabolisme (Kkal) | Energi Fisiologis (Kkal/g) |
|----------|----------------------------------|----------------------------------|---------------------------------------------|--------------------------------------|----------------------------|
| KH | 4,10 | 2 | 4,0 | - | 4,0 |
| Lemak | 9,45 | 5 | 9,0 | - | 9,0 |
| Protein | 5,65 | 8 | 5,2 | 1,2 ^{*)} | 4,0 |

Jadi energi yang didapat adalah: 4 Kkal/g untuk karbohidrat, 4 Kkal/g untuk protein, dan 9 Kkal/g untuk lemak.

Sistem penilaian energi dalam makanan ini dikemukakan oleh Dr W.O. Atwater pada tahun 1899. Atwater membuat eksperimen dengan menganalisis feses 3 pemuda Amerika selama 3-8 hari. Atwater menemukan bahwa hanya 92% protein,

95% lemak dan 99% karbohidrat yang diserap oleh tubuh. Perhitungan jumlah energy dalam suatu bahan makanan.

E. Kebutuhan Protein, Lemak dan KH dalam tubuh.

| | |
|-------------------|-----------------------------|
| Kebutuhan Protein | 10 – 15 % dari total energi |
| Kebutuhan lemak | 20 – 25 % dari total energi |
| Kebutuhan KH | 55- 70 % dari total energi |

Catatan : untuk total % kebutuhan protein, lemak dan KH harus 100 %. Contoh : protein 15%, Lemak 25 % dan KH sisanya yaitu 60 %.

Kemudian contoh aplikasinya.

- **Kebutuhan protein** = $\frac{15\% \times \text{total energi}}{4}$
- **Kebutuhan Lemak** = $\frac{25\% \times \text{total energi}}{9}$
- **Kebutuhan Karbohidrat** = $\frac{60\% \times \text{total energi}}{4}$

Untuk kebutuhan protein juga bisa menggunakan satuan g/Kg berat badan. Pada beberapa kondisi atau sesuai keperluan.

| Kondisi khusus | Kebutuhan protein |
|----------------------------------------------------------------|----------------------|
| Anak <1 tahun | 2-3 gram x BB |
| Anak 1-6 tahun | 1,5-2,5 gram x BB |
| Anak 7-10 tahun | 1,3-2 gram x BB |
| Anak 11-17 tahun | 1 – 1,3 gram x BB |
| Normal | 0,8 gram x BB |
| Stres ringan | 1-1,2 gram x BB |
| Stres sedang/Critical illnes/Injury | 1-1,5 gram x BB |
| Infeksi, demam, bedah minor, peradangan | 1-1,2 gram x BB |
| Pasca bedah mayor, infeksi berat, kanker | 1,4 – 1,75 gram x BB |
| Luka bakar, Malnutrisi, Sepsis, pra bedah, Multiple trauma,CHI | 1,5 – 2 gram x BB |
| Gagal ginjal akut | 0,7-0,8 gram x BB |
| Gagal ginjal akut hemodialisa | 1,2 – 2 gram x BB |
| Gagal ginjal kronik HD | 1,1 – 1,4 gram x BB |
| Penyakit Hati | 1-1,5 gram x BB |

Sedangkan untuk kebutuhan mikronutrien bisa di lihat dari AKG 2013 keluaran Kementerian Kesehatan. hanya saja untuk beberapa kasus pasien, kebutuhan mikronutrien disesuaikan dengan kebutuhan atau keperluan.

Jika menggunakan Protein kg berat badan tentunya kita akan menggunakan KH by different. Cara mudah perhitungannya :

Contoh soal :

- BB = 40
- Total energi : 1500,
- Protein : 0,8/kgBB,
- Lemak : 25 %
- KH by Different ?

Jawab :

- **Protein = $0,8 \times 40 = 32 \times 4 = 128$ kkal**
- **Lemak = $(0,25 \times 1500) = 375$ kkal**
- **KH by Different (kkal) = energi – (protein+lemak)**
= $1500 - 503 = 997$ kkal

Jadi kebutuhan gizinya dalam protein, lemak, KH dalam gram :

- Energi = 1500 kkal
- Protein = $128/4 = 32$ gram
- Lemak = $375/9 = 41,6$ gram
- KH = $997/4 = 249,25$ gram

G. Dietary History dan Perencanaan Menu.

Untuk menilai asupan seseorang di katakan baik dan tidak , kita perlu menggali data asupan dari klien. Caranya bisa menggunakan ;

1. **Metode recall 1 x 24 jam.** : mewawancarai pasien terkait asupan yang dia makan, baik itu makanan utama, cemilan ataupun minuman dari saat dia bangun tidur sampai tidur lagi dalam waktu 1 x 24 jam.
2. **Metode recall 2 x 24 jam** : sama dengan recall 1 x 24 jam, hanya saja menanyakan asupan 2 hari lalu.
3. **Metode SFFQ (Semi Food frekuensi qualitatif)** : metode ini di gunakan untuk mengetahui kebiasaan makan pasien dalam waktu yang lama biasanya 1 minggu – 1 bulan terakhir., contohnya dalam 1 minggu berapa kali pasien mengkonsumsi nasi, dll. Setelah itu dicari analisa nilai gizinya.
4. **Metode comstock:** metode ini biasanya digunakan untuk melihat sisa makanan pasien. Untuk kemudian dikonversi ke nilai kalori.

Lalu kapan asupan dikatakan baik ?

- **Rumus menghitung % asupan makan :**
- **%Tingkat asupan Makan :** $\frac{\text{Asupan Makanan (kalori)}}{\text{kebutuhan kalori}} \times 100\%$

Standar Asupan makan menurut depkes 1996/WNPG

| | |

| Kelebihan asupan | >120% |
| Normal (Baik) | 90-119 % |
| Defisit ringan | 80-89% |
| Asupan Kurang | <80% |

F. Cara Input Bahan Makanan Baru ke Nutri survey

Ada teknik khusus untuk menambahkan bahan makanan ke software nutrisurvey, jika kita ingin menambahkan daftar bahan makanan yang tidak ada dalam nutrisurvey. Contohnya Bala-bala

Langkahnya :

1. Buka software nutrisurvey
2. Setelah terbuka, di bagian nutrisurvey ada kata food (makanan). Lalu klik.
3. Lalu pilih modify food database (modifikasi daftar bahan makanan) klik
4. Kemudian klik add food (masukan bahan)
5. Masukan nama makanan . misal bala-bala.
6. Lalu di kolom energi , harus diperhatikan disana tertulis KJ (kilojoule) yang berarti saat kita memasukan energi bahan makanan harus dirubah dari kalori ke Kilojoule. Rumusnya:

- **Energi nutrisurvey= (Kalori per 1 gram x 4.2) x 100**

Contoh : dalam 10 gram Y mengandung 100 kalori.

$100/10= 10$ kal (artinya dalam 1 gram Y = 10 kal.

Jadi ketika input energi ke nutrisurvey= $10 \text{ kal} \times 4,2 \times 100 = 4200 \text{ KJ}$. Jadi di input energi nutrisurvey tulis 4200.

Sedangkan untuk mengisi kolom protein, lemak, KH dan mikronutrien. Rumusnya :

- **Protein= Kandungan gizi per 1 gram x 100**

Contoh : dalam 10 gram Y mengandung 20 gram protein.

Jadi $20/10= 2$ (artinya 1 gram bahan makanan mengandung 2 gram protein)

Input protein di nutrisurvey = $2 \times 100 = 200$.

Catatan (untuk lemak, KH dan Zat gizi mikro perhitungannya sama dengan protein)

H. Jenis jenis Diet pada pasien anak

Diet di perlukan untuk mempertahankan kondisi tubuh ataupun menunjang proses penyembuhan dari penyakit. Beberapa jenis diet diantaranya :

1. Diet gizi seimbang

Diet ini diperuntukan orang sehat. Yang jumlah kalorinya disesuaikan dengan kebutuhannya.

2. Diet Makanan Biasa

Diet ini merupakan diet makanan yang tidak berbeda dengan makanan sehari-hari. Susunan makanan mengacu kepada pola makanan seimbang.

Indikasi pemberian : makanan biasa diberikan kepada pasien anak yang tidak memerlukan diet khusus.

3. Diet Makanan Lunak

Makanan lunak merupakan makanan yang memiliki tekstur mudah dikunyah dan mudah ditelan.

Indikasi pemberian : makanan lunak diberikan kepada pasien sesudah operasi tertentu, pasien dengan penyakit infeksi, kenaikan suhu tubuh, pasien dengan kesulitan mengunyah.

4. Diet Makanan Saring

Makanan saring adalah makanan semi padat yang mempunyai tekstur lebih halus dari makanan lunak. Sehingga mudah ditelan dan di cerna. Makanan saring biasanya diberikan sebagai perpindahan dari makanan cair.

Indikasi pemberian : makanan saring diberikan kepada pasien yang sudah menjalani operasi tertentu, menderita infeksi akut termasuk infeksi saluran cerna, tetanus dan kesulitan makan atau menelan.

5. Diet Makanan Cair

Makanan Cair diberikan kepada pasien sebelum dan sesudah operasi tertentu, pasien dengan kesadaran menurun, suhu badan tinggi, dan gizi buruk. Makanan cair memiliki osmolaritas <400 mOsm/L, sebelum diberikan suhu makanan cair sebaiknya ada disuhu 32-37 derajat celcius,

Indikasi pemberian : makanan cair diberikan kepada pasien dengan kesadaran menurun, sebelum dan sesudah operasi tertentu, pasien gizi buruk, tidak dapat membuka mulut < 1 cm, kesulitan menelan.

6. Diet TKTP (Tinggi Kalori Tinggi Protein)

Diet ini diberikan kepada pasien yang membutuhkan energi dan protein tinggi biasanya pada pasien HIV aids, malnutrisi kurang, pre dan post operasi, luka bakar, Kanker dan post partum.

Diet ini diberikan kepada pasien pengidap penyakit HIV Aids (B26). Diet HIV Aids pada anak prinsipnya adalah Diet TKTP.

Dibagi menjadi 3 :

Diet HIV Aids I : diberikan kepada pasien HIV akut. Pasien yang mengalami panas badan, sariawan , sesak nafas berat, kesulitan menelan dan diare, bentuk makanan cair atau lumat

Diet HIV Aids II : perpindahan dari diet HIV Aids I , bentuk makanannya Makanan Lunak Bubur , atau Bubur Lauk Pauk Cincang.

Diet HIV Aids III : perpindahan dari diet HIV Aids II. Bentuk makanannya lunak Tim atau makanan biasa.

8. Diet Rendah Energi

Diet ini biasanya di berikan kepada pasien yang memiliki IMT > 25 . untuk kebutuhan gizinya biasanya di kurangi 300-500 kkal untuk penurunan 0,5 kg dalam 1 minggu.

9. Diet Rendah Garam (RG)

Diet ini membatasi asupan natrium. Menurut WHO kebutuhan garam yang sesuai adalah 6 gram (2400 mg Natrium). Diet ini biasanya di khususkan untuk pasien yang memiliki penyakit degeneratif seperti hipertensi.

- **Diet RG I (200-400 mg Natrium)**

Diet ini diberikan kepada pasien dengan edema, asites, atau hipertensi berat. Tidak di berikan garam dapur.

- **Diet RG II (400-600 mg natrium)**

Diet ini diberikan kepada pasien dengan edema, asites, dan atau hipertensi sedang. Garam dapur diberikan 2 gram/hari.

- **Diet RG III (1000-1200 mg natrium)**

Diet ini diberikan kepada pasien hipertensi ringan. Garam dapur diberikan 4 gram/hari.

10. Diet Tinggi Serat

Diet ini diberikan kepada pasien konstipasi kronis dan divertikulitis tujuannya agar proses pencernaan atau defekasi normal. Anjuran serat WHO orang sehat 24-30 gram/hari.

| Anjuran Cukup Serat untuk Anak sehat | |
|--------------------------------------|------|
| 1-3 tahun | 19 g |
| 4-8 tahun | 25 g |

| Laki-laki | 31 g |
| Perempuan | 26 g |
| >14 tahun | |
| Laki-laki | 38 g |
| Perempuan | 26 g |

Sedangkan pada diet Tinggi serat biasnaya serat diberikan 30 – 50 gram/hari.

11. Diet Rendah Serat

Diet ini diberikan kepada pasien dengan masalah pencernaan seperti Diare, peradangan saluran cerna, divertikulitis akut, obstipasi spastik, haemoroid, serta pra dan pasca bedah saluran cerna.

- **Diet Rendah serat I a :**

Bentuk makanan lumat. Kandungan serat 4 gram.

- **Diet Rendah Serat II :**

Bentuk makanan lunak bubur,tim cincang. Kandungan serat 4-8 gram.

KARBOHIDRAT COUNTING

Metode ini di gunakan pada pasien DM dengan memperhatikan pemilihan karbohidrat . sumber KH yang baik pada pasien DM yang memiliki indeks glikemik dan glikemik load yang rendah.

Indeks glikemik adalah indeks yang menggambarkan potensi karbohidrat yang terkandung dalam makanan untuk menaikan kadar glukosa darah setelah konsumsi makanan tersebut:

Cara Menghitung Karbohidrat Counting (CARBING)

a. **1 unit Carbing = 15 gram KH**

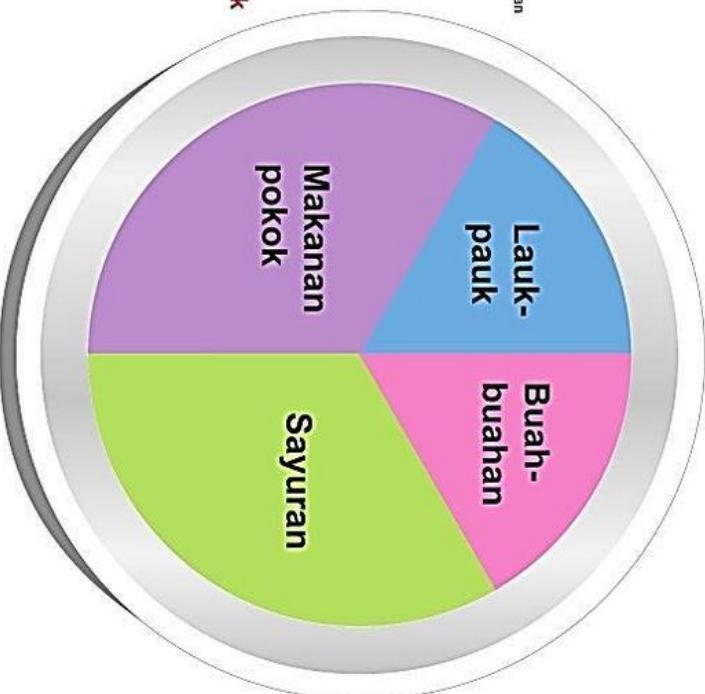

contoh Jika kebutuhan kalori kita 1700, dan kebutuhan KH 60 %

- Kebutuhan KH = $60\% \times 1700 / 4 = 255$ gram
- Setelah itu konversi ke unit carbing = $255 / 15 = 17$ carbing /hari

Sedangkan nilai carbing pada bahan makanan. Di hitung sebagai berikut :

- Contoh soal : dalam 110 gram kentang mengandung 40 gram KH. Berapa carbingnya ?
- Lalu kita hitung carbingnya = $40 / 15 = 2,6$ carbing
- Jadi dalam 110 gram kentang mengandung 2,6 carbing. Atau 1 carbing kentang (15 gram KH) = $110 / 2,6 = 42$ gram

PIRING MAKANKU : PORSI SEKALI MAKAN

Interaksi obat dan Makanan :

| Makanan | obat | interaksi |
|-------------------------------------------------------------------|---------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------|
| Makanan berserat | Tylenol (acetaminophen) | Memperlambat Absorpsi obat |
| Susu | Antibiotik, obat anti jamur | ½ dosis tidak terserap dengan baik. Bahkan tidak akan muncul efek obat |
| Makanan tinggi KH | Fe, levodova, penicilin, tetrasiklin, eritromisin | Penurunan penyerapan obat. |
| Makanan Tinggi KH | Obat Asma teofilin | Absorpsi teofilin menurun |
| Makanan tinggi zat besi | antibiotik | ½ dosis tidak terserap |
| Kopi dan jus jeruk | Fosamax | Efek obat Tidak akan terserap tubuh |
| Makanan tinggi Asam | didanisme | Penurunan penyerapan obat |
| Makanan tinggi Asam | ketoconazole | Peningkatan penyerapan obat |
| Makanan | Obat NSAiD (obat anti imflamasi) | Mengurangi iritasi lambung |
| Jus jeruk bali | Obat kanker | Mencegah pemecahan obat dalam tubuh. |
| Sebelum makan | Paracetamol, panadol, tempra | Bersifat lebih basa lemah, lebih baik obat ini di konsumsi sebelum makan kemudian di ikuti makan. Agar mempercepat proses absorpsi. |
| Jeruk bali | Obat penyakit jantung | Menurunkan tekanan darah dan denyut jantung lebih cepat |
| Tiramin (keju, ikan yang di awetkan, ragi dan produk fermentasi) | Monoamine oksidase inhibitor (MAOIs) | Menigkatkan kontraksi jantung, dan tekanan darah |
| Makanan berlemak | Obat penurun berat badan (xenical) | Tidak dapat di absorpsi. |
| Makanan suplemen | antasid | Kelemahan otot |
| Defisiensi zink | Obat rematik | Kehilangan rasa pada indera pengecap |

METs

METABOLIC EQUIVALENT

Metode ini adalah metode untuk mengestimasi kalori yang kita keluarkan dalam melakukan aktivitas fisik, atau kita bisa mengestimasi rencana aktifitas fisik yang akan kita lakukan sesuai dengan rencana kalori yang akan kita bakar.

Rumusnya adalah :

$$\text{Kalori} = \text{Berat Badan} \times \text{Mets} \times \text{Waktu Aktifitas (Jam atau Menit)}$$

Catatan : nilai Mets disesuaikan dengan waktu aktifitas, jam atau menit. kalau aktifitasnya jam, maka ambil nilai mets dalam tabel yang METs/hours,

Contoh : Tn A ingin membakar 500 kalori, BB tn A 50 kg aktifitas fisik apa dan berapa lama yang harus tn a lakukan lakukan? Tn a menyukai olahraga renang., dan jogging

6. Menentukan status pertumbuhan anak

Status pertumbuhan anak dapat diketahui dengan 2 cara yaitu dengan menilai garis pertumbuhannya, atau dengan menghitung kenaikan berat badan dibandingkan dengan Kenaikan Berat Badan Minimum (KBM).

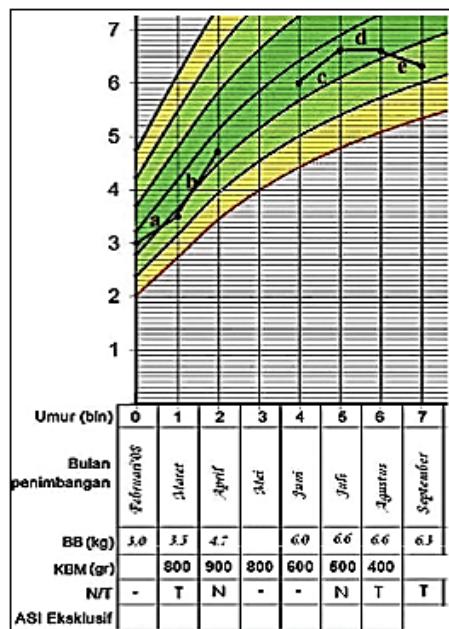

Kesimpulan dari penentuan status pertumbuhan adalah seperti tertera sebagai berikut:

NAIK (N)

Grafik BB mengikuti garis pertumbuhan atau Kenaikan BB sama dengan KBM (Kenaikan BB Minimal) atau lebih

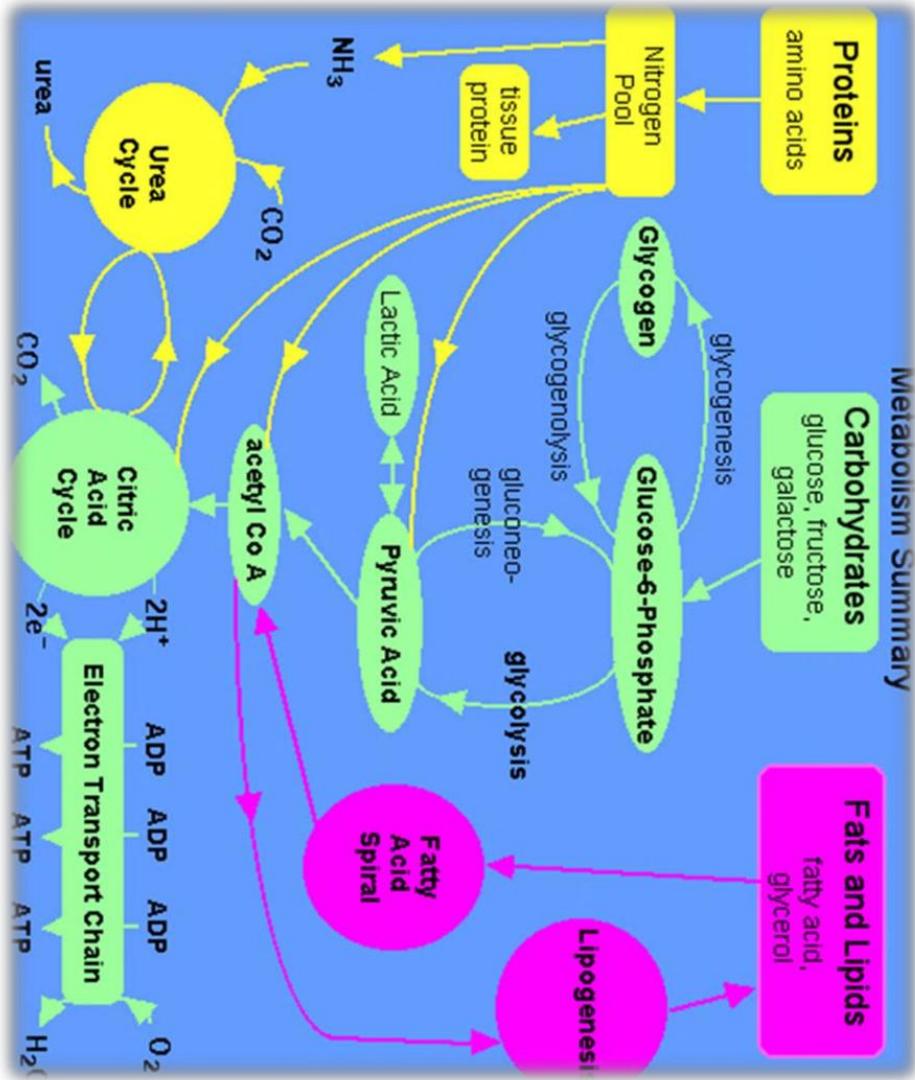

TIDAK NAIK (T)

Grafik BB mendatar atau menurun memotong garis pertumbuhan di bawahnya atau Kenaikan BB kurang dari KBM

Contoh di samping menggambarkan status pertumbuhan berdasarkan grafik pertumbuhan anak dalam KMS:

- TIDAK NAIK (T)**; grafik berat badan memotong garis pertumbuhan di bawahnya; kenaikan berat badan < KBM (<800 g)
- NAIK (N)**, grafik berat badan memotong garis pertumbuhan di atasnya; kenaikan berat badan > KBM (>900 g)
- NAIK (N)**, grafik berat badan mengikuti garis pertumbuhannya; kenaikan berat badan > KBM (>500 g)
- TIDAK NAIK (T)**, grafik berat badan mendatar; kenaikan berat badan < KBM (<400 g)
- TIDAK NAIK (T)**, grafik berat badan menurun; grafik berat badan < KBM (<300 g)
